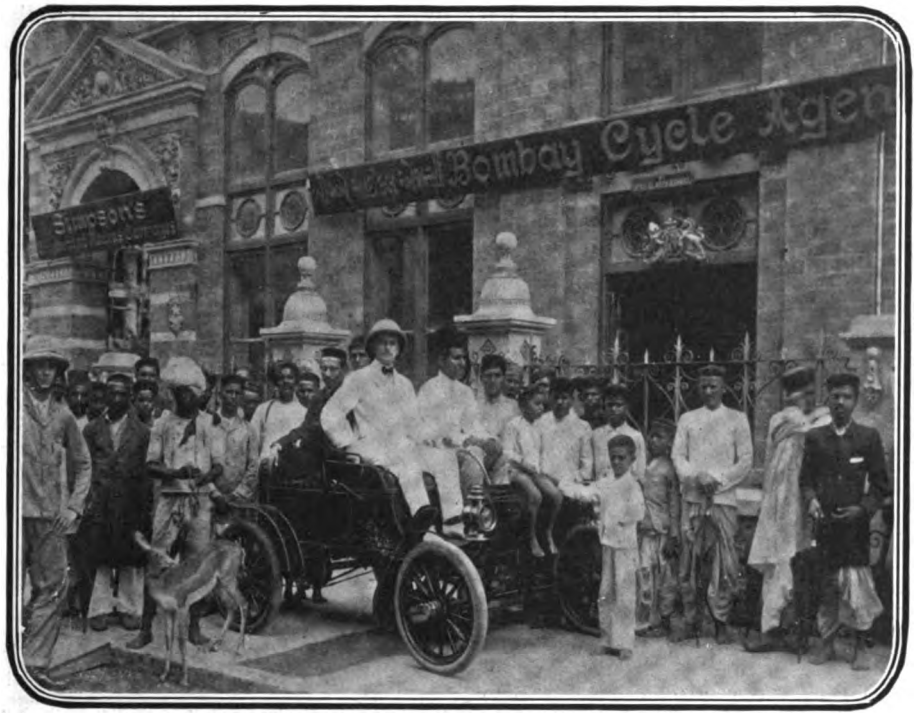
Motorists are inclined to be somewhat careless in many respects with regard to the rims to which the tire covers are attached. It often happens that after running on a deflated cover, or as the result of any slight accident, the rim gets knocked slightly out of shape, causing the edge of the rim to have a certain cutting action on the beaded edge of the cover. The rims, therefore, should be examined from time to time by jacking up the car and turning the wheel round, making a close examination of the edge of the rim in which the cover fits. By this means the slightest dent or malformation of the rim is immediately detected, and once discovered, it can be remedied in the following manner:

If the edge has been knocked down or flattened, it is rather difficult for an amateur to conveniently repair it himself, but generally a competent blacksmith can put it right, with the aid of a pair of tongs. On the contrary, if the damage arise from slight bulges, they can be removed by means of a small hammer carefully used in order to prevent denting in the rim.

It must not be overlooked that these little attentions remove the paint from the rim, and it is therefore necessary afterwards to give the parts operated upon two or three coats of paint and varnish, as an unpainted or badly painted rim will soon rust, and a rusty rim will spoil more covers than anything else.



First of New Studebakers Arrives.

At the local Studebaker establishment, at Broadway and Forty-eighth street, the first of the 1905 models has been received, and is attracting attention because of its graceful and quietly elegant lines. It is a victoria phaeton, and especially adapted for ladies' and physicians' use, being roomy and luxurious and so designed that easy ingress and egress are afforded.

The vehicle is designed to carry any type of battery, sliding partitions being fitted so they can be shifted according to whether cells of the Exide or the Edison types—the latter requiring more room—are used. An uncommonly good effect is obtained by the disposal of part of the battery in front under a bonnet; the remaining cells are carried in the rear of the body. The vehicle has a n leage capacity of forty to forty-five miles

The Automobile in India.

SCENE IN FRONT OF THE OLDS AGENCY IN BOMBAY.

For the Instruction of Providence.

So succesful was the experimental course in automobile construction conducted at Providence, R. I., by the local Y. M. C. A. last spring that it will be repeated this winter. It will open January 10, with Parker H. Kemble, superintendent of the Boston automobile school, in charge. He will be assisted by two experts on gasolene and steam engines, who are also giving instruction in the Boston school.

A series of lectures, open to ladies and gentlemen, dealing with the fundamental principles of the various types of cars, their operation, adjustment and care, are also to be given by Professor Kemble.

A shop course will be given Wednesday and Friday evenings of each week, under the direction of F. P. Barker, chief draughtsman of the Waltham Mfg Co., on gasolene engines, and instruction on steam machines will be by E. J. Loring, a well known automobile engineer.

Crawhez Gives a Cup.

The well-known Belgian motorist, the Baron Pierre de Crawhez, is presenting an international cup to be competed for by automobile manufacturers. The contest will be over a distance of 500 kilometres, and will be for both speed and reliability. Each firm entering the competition will have to send a team of three cars, and marks will be allotted in accordance with the order of arrival at the finish. The firm securing the least number of points will hold the cup for a year. The cars not completing the whole distance will be credited with as many marks as competitors, plus one.

Elected George, but he's in Doubt.

At a meeting last week E. S. George was elected to the presidency of the Detroit Automobile Club. The retiring president, F. O. Paige, refused a renomination owing to his inability to devote sufficient attention to the office on account of business pressure. Although Mr. George appreciated the honor, he declared it improbable that he could accept the office, but the members are of the opinion that he can be induced to act in the capacity.

Will Canvass for Members.

Heroic measures are to be adopted by the Kansas City (Mo.) Automobile Club to increase its membership. A solicitor is to be employed, who will endeavor to get all the motorists in the city to join the organization, the initiation fee being suspended while the canvass for new members is being conducted. At a recent meeting the members talked over plans for a clubhouse, and it is probable that a suburban location will be secured in the spring.

Seven Hundred Increase in Quaker City.

During the last eleven months 2,340 licenses have been issued in Philadelphia, while only 1,663 were called for during all of 1903, which is an augmentation of 700. It is possible that more licenses would have been issued by the municipal authorities, but a mistake occurred. This forced a number of persons to go to other counties for the tags, which are good in all parts of the State.

No Motorphobia in Kearney.

Kearney, Neb., apparently is filled with the spirit of fairness and progressiveness. As evidence, drivers of all vehicles, bicycles and tricycles excepted, are included with automobilists in the new speed ordinance passed by the City Council of that place at its meeting last week. The regulation provides for a speed of twelve miles an hour in the outlying parts of the city and for eight miles an hour on Central avenue, Aveune A, First avenue and the intersecting streets between Fifteenth and Twenty-sixth streets. In turning corners in the latter district five miles an hour is the highest speed allowed. Violators of the ordinance are liable to arrest and fine of not more than $100 or imprisonment not to exceed thirty days.

All of the members of the Council voted in favor of the ordinance except Councilman Bolte. He was in favor of limiting the territory to which the ordinance should apply to a zone extending nine blocks on each side of Central avenue. He gave it as his opinion that after that part of the city had been passed that all danger from a higher speed was eliminated. He thought if an attempt were made to regulate the speed in all parts of the city that the ordinance would be constantly violated. He said he was not in favor of an ordinance which would make lawbreakers of the people.

Alleged Thief's Long Drive.

W. H. Cunningham and wife, of Independence, Kan., are in limbo in Topeka, where they are facing a charge of stealing the automobile in which they travelled from the Kansas capital to Collinsville, Ill.

The machine is valued at $2,500. Cunningham and his wife were arrested at Lima, Ohio, to which place they went after leaving the automobile at Collinsville to be repaired. The couple say they were on their way to New York. Cunningham alleged that he had borrowed the car from Charles Woodward, of Topeka, for the trip. Mrs. Cunningham claims not to know how her husband had secured it. It was through a letter to Topeka friends describing their journey that the couple were traced.

No Novices Wanted in Butte County.

The grand jury which has recently been in session at Oroville, Butte county, California, has drawn up a somewhat remarkable automobile ordinance. One of its provisions is that no one shall drive an automobile on the public highways of Butte county unless he has had at least three months' experience with automobiles. The automobilist must also have a permit from the County Clerk, and must not drive faster than twenty miles an hour. When nearing anyone on a public highway who is leading or driving animals, the automobilist must reduce his rate of speed to three miles an hour, and if the animals are frightened, he must stop until they pass.

Endangered Mrs. Predmore's Maltese Cat.

The following choice bit of literature was furnished a Lakewood, N. J., paper by a Barnegat correspondent, who evidently has a bad case of "mixed metaphoritis":

"Fast driving of automobiles through our town is becoming a matter of daily occurrence. Somebody will yet be injured or killed. Our authorities should take some action to prevent this and stop the reckless riding; or will they wait, as usual, until the horse is stolen before they lock the stable door?"

The same rural correspondent several years ago contributed this, on the occasion of a motor cycle passing through the village one Sunday afternoon:

"One of those nefarious contraptions of the devil passed through our city last Sunday afternoon, disturbing the religious services of the Methodist Sunday school, which was in progress. It is believed the thing was a motor bicycle, but it went so outrageously fast that none of our residents could tell the nature of the beast. A demon, arrayed with goggles and leggins, was sitting on the machine, and he seemed to have little regard for the town's safety, going as fast as he could. Why, he actually came near running over Mrs. Predmore's handsome Maltese cat. We thought when bicycles made their appearance our lives were in danger, but now it is worse. The bleary goggle-eyed monsters go about seeking whom they might devour."

All the Rajahs Gave Prizes.

The Delhi-Bombay reliability trials, under the distinguished patronage of Lord Curzon and Lord Kitchener, as is known, will be held from December 26, 1904, to January 2, 1905.

The following is the official programme for this interesting contest: First day, Delhi to Agra, 133 miles; second day, Agra to Gwalior, 73 miles; third day, Gwalior to Goona, 130 miles; fourth day, Goona to Maksi, 128 miles; fifth day, Maksi to Khul Ghat, 96 miles; sixth day, Khul Ghat to Dhulia, 110 miles; seventh day, Dhulia to Igatpuri, 126 miles, and last day, Igatpuri to Bombay, 85 miles.

The prizes, and more especially their donors, are of more than usual interest. They are as follows: A cup of the value of $500, presented by H. H. the Gaikwar of Baroda for the most reliable car; a cup of the value of $250, presented by H. H. the Maharajah Cindia of Gwalior for the most economical car; a cup of the value of $250, presented by H. H. the Maharajah of Mysore for the car in the best condition after the trial; a cup of the value of $125, presented by H. H. the Maharajah of Kapurthala for the car best suited to district work in India; a $250 cup, presented by Messrs. Jeremiah Lyon & Co., of London, for the car making the best performance as regards reliabilitly and costing not more than $2,500 as landed in India; a consolation prize by the proprietors of the Times of India, value $125.

Interest Increasing in Hawaii.

Even the Hawaiian Islands are not free from the vexations of automobile speeding, as the following extract from an editorial in the Honolulu "Bulletin" will show:

"Honolulu is just getting its hand in as a tourist town, also as an automobile town. Photographs of the first automobile parade that was a thing of real beauty have been sent abroad primarily 'for tourists.' Following close on its heels comes the arrest of a tourist for 'fast and furious' driving. Perhaps the tourist likes it. Possibly more will come, finding they can enjoy the arresting fad here, as elsewhere. Whether more tourists come or more are frightened away, the community must reach a decision on some points this incident naturally suggests.

"On the other hand, is the question of arrests, determination of what constitutes scorching, to be vested in the discriminating capacity of an intelligent Honolulu policeman? Are automobiles to be held down to the staid and admittedly peaceful gait of the historic missionary family horse, with the policeman to pass personal judgment on whether the automobilist shall go direct where he started for or take a side trip to the police station that his name may be registered? We have no municipal regulations because we have no municipality, and one officious policeman can head on fifty tourists and all they represent to the town.

"With these facts in mind it is well to have a care that the town shall not unnecessarily make a fool of itself."

When Cab and Car Stuck Fast.

An automobile and a hansom cab stuck together was an amusing sight on Twenty-third street, New York, the other day. The cab was waiting for the fare, who was making purchases, and the automobile just behind had slowed up to the curb. The horse started backwards and the rear wheels became fastened to the hood of the automobile. Spectators and police tried to separate the two vehicles, but all attempts to do so were futile. Finally, acting on the suggestion of a bystander, the horse was unharnessed and the cab driver descended from his perch, and through lowering the back part of the cab the two vehicles were separated. In the meantime the lady who had hired the cab appeared and, without knowing who was to blame, accused the policeman of favoring the "rich" automobilist, and insisted on the cab driver examining his vehicle to ascertain whether any damage had been done. Reprimanding the police for their favoritism in the accident, she compelled both parties to give their names for a few cents worth of paint which had been scratched off the cab. Both automobilist and police sergeant smiled as the cab drove away.

Seventy-five automobiles have been assessed for taxation by the Tax Commissioner of Omaha, Neb. It is thought that about a dozen more cars will be rounded up before the job is ended.

For Making Light of the Law.

Recently American residents in Paris were thrown into consternation by reading that a prominent young society woman had been imprisoned for five days without the option of a fine. The cause for this drastic action on the part of the court was something in the nature of "Lese Majeste." It appears that she entered the Bois in her car after dark, when her attention was called by a policeman to the omission of rear lights. Scarcely reprimanded for this breach of the law her American ire was aroused, and to revenge herself on the following night she passed the same spot and the same officer of the law with her machine profusely decorated with Chinese lanterns. Noticing this and recognizing her as the woman he had spoken to on the previous night, the official compelled her to at once accompany him to the nearest police station. The magistrate would listen to no excuse for literally making light of the law, and sentenced her to confinement in a room in the building for five days.

The Story of "Sis's" Press Agent.

"Sis Hopkins," who in everyday life is known as Rose Melville, is a motorist of more than common note. She owns a "$5,000 machine," and has aspirations to become a racing chauffeuse. As a preliminary, she has invited Barney Oldfield to race. "Sis" is also a consistent, not to say persistent, user of the motor car. When this season's tour was arranged Miss Melville had a new steel trucked baggage car constructed to hold her automobile as well as the "Sis Hopkins" scenery. A special compartment was built for the automobile, and also berths for two attendants. The automobile compartment has its own entrance and a runway. Whenever the actress arrives in a city or town where she is to play the attendants have the machine in readiness to slide down the runway. As soon as the train stops Miss Melville is speeding off to her hotel and then takes a spin over the surrounding country before going to the theatre. At least, this is the press agent's story of the contrivance.

Motoring as a Cure for Asthma.

The automobile as a cure for asthma and other throat troubles is its newest virtue. George P. Braun, of Chicago, is the gentleman who subscribes to this belief. For several years both Mr. Braun and his daughter were compelled to go South immediately cold weather set in because of asthmatic affections. This year, however, he purchased a Locomobile, and as winter has not brought a return of their troubles, he attributes it entirely to the use of the car.

The Kaiser Will be Heralded.

Automobiles belonging to the Kaiser will be easily distinguishable, even at a distance, from the ordinary ruck by their signals, as a bugler sits on the front seat next to the driver, and uses an instrument which is very like the trumpets of the mediæval heralds. Even the little banner attached to these old-time trumpets is to be replaced on the bugles in the imperial motor stables.

STATE LAW IS NO GOOD

Any Little Community May Over-ride it Says the Wise Judge Orlady.

In affirming the decision of a lower court, which fined Samuel Bell, Jr., a Philadelphia motorist, Judge Orlady, of the Pennsylvania Supreme Court, holds, in effect, that a township can override the law of the State in the endeavor to prescribe a reasonable speed limit. The decision is of considerable importance in its bearing on the whole question of automobile legislation, and if it is not reversed will leave Pennsylvania motorists at the mercy of the legislators of townships and villages. It is directly opposed to the theory of uniform regulations throughout the State, which the 1903 law was supposed to establish. Already it is predicted that the decision will be followed by speed regulations for automobiles in all the principal townships of the Commonwealth.

The case decided by Judge Orlady was that of Samuel Bell, Jr., a member of the Automobile Club of Philadelphia, against Radnor Township, Delaware County. Radnor Township has an ordinance that limits the speed of automobiles to ten miles an hour. Bell was arrested for travelling more than ten miles an hour and fined. Bell took an appeal from the fine, but the appeal was dismissed by Judge Johnson, of Delaware County.

Bell then took the case to the Superior Court, maintaining that Judge Johnson's decision was opposed to an act passed by the Legislature in 1903, fixing the speed of automobiles at eight miles an hour in cities and boroughs, but permitting a speed of twenty miles an hour outside city and borough limits. Judge Orlady, in affirming the decision of the Delaware County Court, says:

"The State Legislature has, beyond question, the power to provide for the construction and maintenance of the public highway, whether streets in cities or boroughs, or roads in townships, and it has as full and clear power to provide regulations for their use. It must also be conceded that this power may be delegated without diminution to a local municipality. A municipal corporation has for its object the interests, advantage and convenience of the locality and its people. It is a local government possessing powers of legislation, within its delegated or reasonably implied powers, and is charged with the general welfare of the people.

"Some of the townships of the first class represent a larger population and their highways are more used than those of many boroughs. We are not prepared to say that an ordinance limiting the speed of an automobile to ten miles an hour is unreasonable when a lower rate of speed is prohibited by the Legislature in less densely settled communities. The commissioners are prima facie the best judges of what is a reasonable speed for such a vehicle in Radnor Township. No special fact is suggested in this record to show that ten miles an hour is not a reasonable limitation, nor that sixteen miles an hour—the rate at which the defendant was going when arrested—is unreasonable."

Wilmarth Now Long Island's President.

The Long Island Automobile Club dinner, held on Wednesday, was attended by eighty-two members. The affair was the first function held in the club's new house, in Cumberland street, Brooklyn.

There was no opposition to the regular ticket, which was elected by acclamation, as follows: President, Alfred Wilmarth; vice-president, Augustus A. Post; secretary, Frank L. Evans, and treasurer, Raymond Healy; governors, for one year, Frank G. Webb, Laurence Abraham and Dr. F. M. Sharp; for two years, A. R. Pardington, L. R. Adams and Z. N. Allen; membership committee, Edwin Melvin and F. B. Stephenson.

At the dinner which followed the meeting W. P. Richardson was toastmaster, and the speakers included Frank G. Webb, the retiring president; Alfred Wilmarth, the incoming president; L. R. Adams, A. R. Pardington and A. A. Post.

The secretary's report showed 123 members in good standing. In connection with the clubhouse is a garage with storage accommodation for twenty-nine machines, and all the space has been taken. The club has bought land adjoining, upon which it will erect an addition to its building, which will more than double the storage facilities.

The clubhouse is situated near Fulton street and also near the new Atlantic avenue boulevard, thus affording members easy access to one of the main routes of Long Island.

"Non-Stop" in South Africa.

A few years ago it was a case of going to the front, meaning South Africa; at present that continent is coming to the front in organizing contests for automobiles. One hundred miles reliability non-stop trials have been arranged for the purpose of testing the ability of the various makes of cars to negotiate the different, steep and awkward roads. Speed is a minor factor in these trials, and will not count at all in the awarding of the certificates, the Automobile Club of South Africa being averse to fast driving. Particular attention will be paid to the power of the engines to keep cool in making the steep ascents. The higher powered cars are, of course, more subject to overheating than the smaller, and efforts to meet this difficulty are being made by some motor agents on the spot by fitting the cars with an additional water cooling tank.

A reverse of conditions is shown recently in Turin, when the Princess Loetitia's magnificent automobile was run down by an artless cabman. The car was damaged considerably, and both chauffeur and coachman received injuries. The former, it is said, will only receive fifteen days—in the hospital, though he was wholly to blame for the accident.

GOOD ROAD TO NEWARK

Or Rather There Is Promise of One—The Plans of the Improvement.

Motorists who have dreaded the short trip between Jersey City and Newark, N. J., on account of the wretched condition of the only two roads between the cities, will be glad to know that a plan is being considered to improve one of the roads. The plan contemplates the abolishment of the Plank Road across the meadows, and the building of a concrete and granite highway to be 100 feet wide. The plans have been drawn by the county engineers of Essex and Hudson counties, and it is thought that they will be approved at the next meeting of the Joint Bridge Commission, composed of members of the two Boards of Freeholders.

The present roadway is from 22 to 24 feet in width, not including the trolley tracks, which run at each side. The estimated cost of the improvement is placed at $1,000,000. The land needed for the extra width has been offered by the Hackensack Meadows Company to each of the counties for a consideration of $1. As soon as the contract for the construction of the road has been officially awarded, the Meadows Company will transfer the land to the two counties. As the present surface of planking will be torn up, a new title will have to be found for the road, and it has been suggested that it be called the Essex and Hudson Boulevard.

According to the plans, the road will be widened from the point where it abutts on the pavement in Newark to the end of the present Plank Road in Jersey City. The engineers' drawings provide for the location of a double line of car tracks in the centre and roadways at each side, with sidewalks on the outer edges. The tracks will occupy a space of twenty feet, and there will be trolley poles in the centre between the tracks to carry the wires. The trolley company has assured the Freeholders that it will plant sod or grass seed between the ties, so as to catch the dust raised by the cars.

There will be a curb at each side of the tracks to keep wagons off and at intervals of 500 feet there will be openings, so that the road can be easily repaired when necessary. There will be sections of curbing, or bars, however, which will be put up when the opeings are not in use by road repairers, so that wagons cannot cross the tracks.

The roadways at each side of the tracks will each be 28 feet wide, and the sidewalks will be 12 feet wide. The trolley tracks will form the crown of the road, and there will be a gradual slope on either side to the walks. There will be a bed of concrete, which will support granite blocks on each roadway. A series of sewer pipes draining into the Passaic and Hackensack rivers will run beneath the sidewalks.

To Test Tension of Valve Springs.

It has been said that the liability of valve springs to variation of tension constitutes an important objection to automatic valves, in that one valve may from this cause open sooner than another, and thereby destroy the equilibrium of the engine. With valves of large opening this objection would scarcely apply, because with the greater freedom of intake the cylinders could make up towards the end of the suction stroke what they lacked at the beginning of it. In this way balance would tend to keep established. Moreover, it is an easy matter to test the tension of the springs of automatic valves, and replace any spring which has grown weak through overheating or other causes. One of the best methods of verifying uniformity of tension consists of, first, removing the valves complete. Holding one in each hand by the seating, the extremities of the stems then should be placed together so that the stems are in a straight line. A slight pressure of one hand towards the other will then cause the two valves to open synchronously if the springs are of equal tension and in order.

Good Results from New Carburetter.

Some marvellous results have been attained by the Olds Motor Works through the adoption of a new carburetter of their own manufacture, which will be fitted to all the 1905 standard runabouts (the curved dash model). The carburetter is of the float feed type and replaces the mixer previously used. Its use is said to have enabled the engine to deliver an increase of power over the 7-horse —the rated power of the standard runabout —an increase that has reached as high as 10 per cent. so efficacious is the mixture delivered to the combustion chamber by it. So much pleased are the Olds people with the device that it may be used on some of the other models.

New Features of the Mercedes.

One of the features of the 1905 Mercedes car, which was exhibited at Paris during the show, is a "perpetual sprag." This is a kind of ratchet and pawl which immediately comes into operation on the automobile showing a tendency to go backward on a hill. It is only released when the reversing lever is operated. Another distinguishing feature is that the gas is cut down when the clutch is thrown out by a lever working mechanically in connection with the pedal.

Motor Car Replaces Locomotive.

"Automobiles are cheaper and more practical" is the decision of the owners of the Silberton Northern Road of Denver, Col. For this reason they have authorized the purchase of a gasolene automobile coach to run on the tracks to carry miners to work at change of shifts. The car will accommodate about forty persons, and will cover sixteen miles in forty five minutes, at a fraction of the expense of operating a locomotive and passenger coach.

How Chains have been Improved.

In the new Whitney chains, here illustrated, there is one feature that will appeal alike to those who sell and those who use them, and which has not before been emphasized, i. e., their interchangeability. The riveted parts may be used in the cotter detachable chain or the detachable parts in the riveted chain. It simplifies matters not

a little, and considerably lessens the stock that must be kept on hand.

These chains are now being made with projecting inside links—a foreign idea that the Whitney people have cleverly adapted. The chains are also being furnished with special bronze cotter pins instead of the steel ones previously employed. Those of bronze are not only extremely tough, but, what is as important, they will not corrode, and therefore are always and despite all weathers easily removed.

Toledo Dealer's Useful Innovation.

The Litchie Automobile Co., Toledo, Ohio, have instituted a novel and meritorious special service that should meet with quick appreciation and even imitation in other cities—an "emergency service," as they aptly term it. It consists in keeping several inclosed cars always ready for instant duty for the use of doctors or nurses desiring to reach patients quickly. The cars respond to calls at any hour of the day or night.

How Hughes is Educating his Repairmen.

In order that they may acquire a thorough mechanical knowledge of the new models, Archie Hughes, manager of the Pope Mfg. Co.'s Providence, R. I., branch, has sent six of his best mechanics from the garage repair shop to the Pope-Toledo and other factories. The men left Providence last week, and will return early in the spring.

Memorable Good-bye to Deming.

To-morrow, Paul H. Deming, the manager of the White branch in New York, leaves that office preparatory to an indefinite stay abroad. His leaving was marked by a luncheon at the Hotel Astor on Thursday last, tendered in his honor by the White Sewing Machine Co. as a mark of their appreciation and by the presentation of a silver loving cup by his associates in the branch. Among those present at the luncheon were Winthrop E. Scarritt, Windsor T. White, Augustus Post, C. H. Gillette, Emerson Brooks, A. L. McMurtry and Harry Unwin. After the luncheon Mr. White made a few appropriate remarks, and introduced Carl H. Page, who for two years has been Mr. Deming's right hand man, and is to succeed him. Mr. Page presented the loving cup in the name of his associates.

Mr. Scarritt, who is becoming the Depew of the automobile world, was among the few speakers. He made a great hit when he compared the Mercedes to the Fifth avenue belle, bautiful to look upon and attracting the attention of every eye when she ventured forth in fine weather. But the stately belle must be petted and pampered, else there is trouble. The White, on the other hand, Mr. Scarritt compared to the country girl, glowwith robust health and going about her routine regardless of bad weather or other disturbing conditions.

Mr. Deming has been the manager of the White branch since its establishment in New York, and by quiet, effective work, and with out the aid of skyrockets or brass bands, has done himself and his company proud. His successor, Carl Page, is of the same effective, obliging, likeable type.

Soap as Made by the Romans.

The fact that the Rome Soap Mfg. Co., Rome, N. Y., have added an "automobile soap" to their productions is a matter of more than passing moment. The concern is one with a big reputation, earned by the merit of their linseed oil soaps, and the best evidence of this merit is the Romans' offer to refund the purchase price if their soap proves not satisfactory. The virtue of linseed oil for cleaning and polishing glossy surfaces is well known, and it is not strange that it should be turned to use on automobiles. Rome soap is put up in pails for the benefit of those who desire a money-back trial, and in barrels and half barrels for the use of those garages that know it to be equal to its claims.

About Valve Grinding.

If there is any doubt as to the need for valve grinding, and automatic valves are in question, it is only necessary to pour a little gasolene into the seatings. If drops make their way through any one, then by all means grind them. The operation of grinding is described at length in many text-books, but it is generally omitted to mention that between every two or three turns of the valve head the latter should be lifted from its seat. This prevents particles of the emery powder adhering to one spot, and cutting rings upon the face opposed to it.

TEST FOR TOURING CARS

British Club Formulates Rules Defining those Vehicles and Imposes Admirable Restrictions.

The commission appointed by the Automobile Club of Great Britain and Ireland have now issued the rules and regulations concerning the touring car race for the United Kingdom Cup. The resolutions that the special commission agreed on are that the trophy shall be put up for competition between May 1 and October 1 in each year, on a date to be fixed by the A. C. G. B. I., which is in future to be known as "The Club." The contest shall take the form of a race for touring cars, with a limited quantity of fuel. In each new race "The Club" will organize the event and recommend the place where it is to be held.

Cars may be entered by members of any recognized foreign automobile club, and of any automobile club or organization in the United Kingdom which is affiliated to the Club.

The distance of the race, including controls, shall be not less than 150 and not more than 250 miles.

The fuel to be used shall be provided by the club, and shall be petroleum spirit having a specific gravity of 0.695 to 0.705 at 60 degrees Fahrenheit. The allowance of petroleum spirit shall be determined by the Club according to the nature of the course selected and the conditions of road surface on the day of the race.

The allowance for the course selected shall be equivalent to an allowance of one gallon of petroleum spirit for every twenty-five miles of dry average road, the term "average road" signifying a course similar to the road from London to Oxford via Uxbridge, High Wycombe and Stokenchurch.

The car completing the course in the shortest time shall be the winner, subject to the compliance with these regulations.

The weight of the chassis shall be not less than 1,300 pounds nor more than 1,600 pounds. Accumulators and other ignition apparatus, the tires on the wheels, the bonnet, tanks (empty), dashboard, steps, lamp brackets and front mudguards shall be treated as part of the chassis. No ignition accumulators or magneto or other source of electric energy shall be carried except those fixed to the chassis at the time of weighing.

The load carried by the chassis, exclusive of fuel, oil and water, spare tires, spare parts, luggage and provisions, shall be not less than 950 pounds, including (1) the body with rear mud guards and their stays, floor boards and lamps; (2) the driver and one passenger, averaging not less than eleven stone each, and (3) not less than 300 pounds of loose ballast in the portion of the body in which the two unoccupied seats are situated.

The chassis shall have not less than four road wheels. The distance between the centres of the wheels on each axle (i. e., the track) shall not be less than 4 feet, and the distance between the centres of axles (i. e., the wheel base) shall not be less than 7 feet 6 inches. Efficient mud guards to the front wheels shall be fited to the chassis.

The body shall be of the ordinary touring type, properly upholstered, comfortably seated for driver and three passengers facing forward, two in front side by side and two behind side by side, on seats at least 34 inches from the ground, and giving for every two seats a clear seating space not less than 40 inches wide between cushions. Efficient mud guards to rear wheels shall be fitted to the body. The platform behind the dashboard shall not be less than 6 feet 6 inches long nor less than 30 inches wide.

Between the start and finish of the race the driver and his passenger shall alone be permitted in any way to assist a car, and no stores, supplies, spare parts or spare tires other than those actually on the car at the start shall be taken on to the car during the race. Everything (except fuel) which is on the car at the start must be carried throughout the race.

Not more than two cars by one manufacturer will be accepted. The Club reserves the right to refuse any entry, and to limit the number of acceptances as circumstances may require.

Every entry shall state the maker's selling price of the chassis, and shall be accompanied by a written guarantee by the manufacturer of the car to accept at the declared price all orders within one month after the race for exact duplicates of the chassis entered, and to deliver all such chassis so ordered complete and in perfect working order within a reasonable period from date of order, provided a cash deposit not exceeding one-third of the price of the chassis is paid at the time of giving the order. Should the manufacturer fail to comply with such guarantee, the name of such manufacturer may be struck or kept off the competitors' register, at the discretion of the Club, for such period as they think fit.

Every car shall be provided with fuel tanks capable of holding not less than twelve gallons.

The driver and one passenger shall be the only persons on the car during the race.

No fuel capable of being used for propulsion of the car question shall be carried on the car, except the fuel provided by the club.

It has been further recommended by the committee that the first race be held in the Isle of Man in September, 1905.

The Club have not up to the present procured the trophy, and a suggestion has been made that the members head a subscription list for a $500 cup in preference to having one donated.

There are seventy-nine automobile owners registered with the recorder of Nashville, Tenn.

ONE MAN REGIME IS OVER

Florida Association Takes a Hand in its Speed Carnival—Ormond no Longer Headquarters.

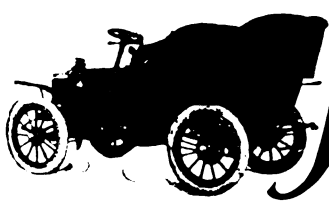
No longer is there a "sole American and foreign representative" of the Ormond-Daytona speed carnival. The former professional six-day cyclist who conceived himself to be that thing, and who carried the title on his stationery, has had a full awakening. As a result the entry blank which he rushed into print and circulated has been called in, the selected list of officials made up of men whom he had booked for the gratuities that go with the offices has been knocked awry, the particular hotel which he has boomed so industriously will not be official headquarters, and he himself will no longer be permitted to pose as the "whole thing."

It was all brought about so diplomatically at a meeting of the Florida East Coast Automobile Association that the ex-six-day "grinder" has not yet fully appreciated what happened to him. He was let down so gently that he does not know he is down, if not entirely out. He has, however, cast an anchor to windward by flirting with certain people in Cuba, where he is not so well known. He has induced the Cubans to open their highways for a series of road races or speed trials.

So far as the Florida carnival is concerned, however, there will be a revised entry blank issued this week, and C. H. Gillette, secretary of the A. A. A., and S. M. Butler, secretary of the A. C. A., will receive entries, either American or foreign, and Daytona and not Ormond will be the official headquarters of the Florida association.

Gave the Judge a Speedometer.

At the annual meeting of the Automobile Club of Buffalo, held last week, the retiring president, Judge William H. Hotchkiss, was presented with a speedometer-odometer as a token of the members' regard. The presentation was made by August H. Knoll, the newly elected executive. The other officers chosen are as follows: Vice-president, H. A. Meldrum; secretary, Dal H. Lewis; treasurer, Charles Clifton; members of board of governors, E. H. Butler, E. R. Thomas and W. H. Baker.



Rockford Clubmen Choose Officers.

The Rockford Automobile Club, of Rockford, Ill., held its annual election of officers last week, with this result: President, N. F. Thompson; vice-president, O. W. Johnson; secretary, H. W. Dickerman; treasurer, . E. Scott. E. K. Barnes and D. L. Cutler were chosen directors, the latter succeeding himself and the former succeeding Fritz Ulrich.

Physician Heads Napa Club.

The Napa Automobile Club has been organized at Napa, Cal., and the following officers elected for the ensuing year: President, Dr. E. J. Hennessey, of Napa; vice-president, Dr. Osborne, of St. Helena; secretary, F. S. Jacks, of Napa; and treasurer, Burt Norton, of Napa.

Auto-Talks
No. 3

In taking up the subject of performance in this "Auto-talk" we realize that our space is too limited to permit of thoroughly covering the subject. First, however, we will say that it is not our intention to offer as sole evidence of Autocar efficiency professional "records" or exhibition trials.

While the Autocar can show its share of these records, we believe that the average prospective purchaser is more interested in knowing the day-in-and-day-out behavior of the cars than in statements that they carried off such and such honors in such and such a contest. Following we print one of the many letters received from satisfied Autocar owners, because it tells of what was simply a private test of the car and in many respects an every-day trial.

WORCESTER, MASS., Sept. 24, 1904.

THE AUTOCAR COMPANY.

It may be of interest to you to know that I have just returned from a trip to Burlington, Vt., in an Autocar runabout, making the run in fourteen hours and twenty minutes, the distance being 236 miles over rough hilly country. In view of the fact that I had only *oil side lights* and four hours of the run was after dark it will be seen that the time was pretty fair. Over the mountain was the worst of the going, of course, but I seldom had to resort to the low gear, and then only for the *very steepest* pitches. The car is a wonder, and my companion got an eye opener in dead earnest.

The car gave absolutely no trouble except one tire, which I replaced at Rutland, as the tube was pinched.

The way it slid up those mountain roads was a caution to the natives. Yours truly,

H. E. SHILAND.

While we make no claims for the Autocar as a purely racing machine, its maximum speed of 35 miles an hour is, however, high enough so that the Autocar driver can feel he has a car to "eat upthe road" if necessary.

The points which we do emphasize in Autocar performances are these: Reliability under all conditions of roads and weather; ability to negotiate any traveled grade; extreme ease and simplicity of control, including brakes sufficiently powerful to stop the car in the minimum distance; simplicity and perfection of mechanism with consequent freedom from derangement; easy accessibility of all parts, and absence of vibration.

The Autocar has a speed range of from 3 to 35 miles an hour, and will travel 175 miles with one filling of the 10-gallon gasolene tank.

To give you a more practical idea of Autocar performance we will say that our dealers all over the country have cars for demonstrating to any intending automobile purchaser. Our booklet, which we will be glad to send you, gives full details of Autocar construction and name of our dealer nearest you.

WHITLOCK COOLERS

For 1905.

The Leading Automobile Builders have adopted the Whitlock Cooler for 1905 for the following reasons:—

1st: Because it is the most EFFICIENT radiator yet produced.

2nd: Because no other approaches it in STYLE and FINISH.

3rd: Because of its POPULARITY, being used on the leading cars.

4th: Because it is a TRIED DEVICE.

5th: Because we pursue a LIBERAL POLICY in taking care of our customers.

6th: Because we can DELIVER THE GOODS, having built about 90% of all cellular coolers made in the United States.

7th: Because our EXPERIENCE for the last two years as the largest manufacturers of coolis worth something to our customers.

We are now shipping coolers on our 1905 orders.

The Week's Patents.

777,710. Steering Mechanism for Motor Road Vehicles. Charles C. Wright, London, England. Filed January 15, 1904. Serial No. 189,163.

Claim.—1. Steering mechanism for motor road vehicles, consisting in combination of a worm, means for causing the rotation thereof, a worm wheel gearing with said worm, a lever integrally connected to said worm wheel, a fore carriage, links connected to each side of said fore carriage, a lever to whose extremities the said respective links are connected, and a link connection between said first and last named lever, substantially as described.

777,727. Driving Gear for Motor Vehicles. Hans T. Hansen, Milwaukee, Wis. Filed January 3, 1904. Serial No. 210,920.

Are your eyes bothering you? Do they ache and pain you? Do they look red and feel hot? Are you troubled with headache and neuralgia? Does it hurt you to read or sew, or use the eyes steadily?

Then don't waste another hour, but get EYE-FIX, the only sure and painless cure for all eye troubles. It never fails to give instant relief, and as it contains neither cocaine, atropine, belladonna or other dangerous elements, EYE-FIX is used universally by physicians and opticians.

EYE-FIX is good to keep the eyes well and strong. And it's the one safe remedy for every eye trouble in both young and old.

If baby's eyes are weak or sore—use EYE-FIX.

If grandfather's eyes are weak and weary—use EYE-FIX.

If your own eyes are bad from any cause—use EYE-FIX.

All druggists and opticians sell EYE-FIX at 50 cents. Ask for it and take no substitute. No other eye remedy in the world is like EYE-FIX, because no other remedy produces the same splendid results as EYE-FIX. A trial bottle for 10 cents will be sent you direct from our laboratory. Eye-Fix Remedy Co., Detroit, Mich. Dept. S.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—1903 Olds Runabout, good condition. D. N. SNYDER, Neoga, Ill.

1904 WHITE STEAMER for sale. In perfect condition; run very little. Canopy top, glass front, baskets, D. & G. lamps, extra tire, dust shield, odometer, gradometer, clock, steam whistle and horn. Cost without extras $2,275. $1,800 will buy. Reason for selling, I want a 1905 White. Address H. C. COLLIER, Binghamton, N. Y.

FOR SALE—Vises, gasoline engines, and patterns, pumps, tires, copper tanks, belting, pulleys, hangers, shafting, carburettors, lamps, Apple dynamos, storage batteries, steam car fittngs, bells, Edison mimeograph, power air compressor, chains, electric cars $100, $150; steam cars, $150 and up; Autocar. $250; Winton, $175; Winton delivery wagon, $400; Oldsmcbile, with top, $200; one hundred cars, all kinds, very low, to clear out; 75 automobiles, $100 and up, all kinds. ATLAS AUTOMOBILE CO., Pittsburgh, Pa.

Digitized by Google

Claim.—1. The combination with a driving shaft and a driving wheel mounted so as to oscillate with respect to the axis of the driving shaft, of a universal joint connection between the shaft and the wheel comprising outwardly extending forks secured to the driving shaft, and having notches in their ends, a part of the hub having inwardly extending forks provided with end notches and a block having two pairs of gudgeons in transverse planes, said pairs of gudgeons being arranged in the end notches of the shaft and hub respectively.

777,740. Variable Speed Gear. Charles Monin, Boulogne-sur-Seine, France. Filed July 9, 1904. Serial No. 215,922.

Claim.—1. A variable speed gear allowing of passing from the speed 4 to the speed 1 and vice versa, comprising a rotary shaft b extending through the apparatus, two cams or eccentrics fixed to the shaft b at angles of one hundred and eighty degrees with regard to each other, a tubular rotary shaft a surrounding the shaft b and revolving independently from safe, a plate d fixed to the shaft a and provided with two diametrical recesses crossing each other at right angles, an intermediate plate l independent from the shafts a and b, placed between the cams and the plate d, and provided with two diametrical recesses crossing each other at right angles, means for guiding the plate l in such a manner that it shall be caused to revolve eccentrically about said shafts a and b, and two cams or eccentrics fixed on the plate l at one hundred and eighty degrees with regard to each other and engaging the recesses of the plate d, substantially as and for the purpose set forth.

777,853. Device for Effecting the Radiation of Heat. Ralph B. Hanscom and George A. Prior, Hartford, Conn. Filed January 15, 1903. Serial No. 139,237.

Claim.—1. As an article of manufacture a heat radiating attachment comprising a series of similarly curved loops of continuous wire to a corresponding section in each of which is brazed a grooved metal connecting piece, whereby said series of loops may be attached to a metal chamber.

777,964. Automobile. Vincent Link, Geneva, Ohio, assignor to the Geneva Automobile and Mfg. Co., Geneva, Ohio, a Corporation of Ohio. Filed July 16, 1904. Serial No. 216,770.

Claim.—1. In an automobile, the combination of the housing for the compensating mechanism; which housing has laterally projecting tubular members adapted for connection, through springs, with the vehicle body, and has also an open front end, with an engine, and a housing which is rigidly connected with the engine cylinder and incloses the working parts of the engine, and is open at its rear end and is removably connected with the open front end of the differential housing to form one large inclosed chamber, and a supporting link which is pivoted at its upper end to the vehicle body, and at its lower end to the front end of the engine, both of the pivots of said supporting link being horizontal, and one being extended transversely of the body and the other being at right angles to said pivot.

777,979. Pneumatic Tires. Jules F. de Savignac, Marseilles, France. Filed, April 6, 1904. Serial No. 201,894.

Claim.—1. The combination, with a wheel and its tire, of a plurality of tire protecting tread sections, retaining hoops disposed at either side of the tire, and each consisting of a plurality of contiguous hoop segments, bolts for adjustably connecting said hoop-segments, and means for connecting said tread sections and said retaining hoops.

777,983. Automobile Lamp Cover. Harry S. Tompkins, Newark, N. J. Filed January 27, 1904. Serial No. 190,790.

Claim.—1. An automobile side light cover, comprising front and back portions, each having a laterally widened or flaring upper end, and side pieces alternating with said front and back portions and having narrowed or tapering upper ends, all said portions being joined at their adjacent margins.

778,025. Solder for Aluminium or Aluminium Alloys. Ricardo Fortun and Eduardo Semprun, Madrid, Spain. Filed July 2, 1904. Serial No. 215,100.

Claim.—1. The herein described solder for aluminium or aluminium alloys, including the following ingredients, silver, aluminium, zinc and tin, at least a portion of the silver, aluminum and tin being phosphorized and at least a portion of the zinc being sulphurated.

778,133. Motor Vehicle. Warren H. Keates, Atlantic City, N. J. Filed May 27, 1904. Serial No. 210,117.

Claim.—1. In a motor vehicle, the combination of an electric generator, a spring motor geared thereto, a counter shaft geared to said spring motor and also to the driving axle of the vehicle, and means for throwing said counter shaft into or out of gear with said driving axle, substantially as set forth.

778,136. Pneumatic Tire. Philip Magnus, Northcote, Victoria, Australia. Filed October 5, 1904. Serial No. 227,227.

Claim.—1. In pneumatic tires a series of segments formed of "flesh" leather, said segments having been immersed in a solution approximately of seventy (70) per cent of naphtha and thirty (30) per cent india rubber, then passed between rollers having prickers and a solution of approximately sixty (60) per cent naphtha and forty (40) per cent india rubber on the rollers, then immersed in a solution approximately of sixty (60) per cent naphtha and forty (40) per cent air, and means for securing said bricks in position, substantially as described.

778,159. Automobile Sled. Frank Walter, Cleveland, Ohio. Filed June 8, 1904. Serial No. 211,663.

Claim.—1. An automobile comprising a body portion, a motor supported thereby, a running gear comprising a forward steering axle and a rear axle, runners mounted on the ends of said axles, a shaft journalled in said rear runners, means for rotating said shaft from the motor, and spurred wheels fixed to said shaft, substantially as described.

Australian Roads Require Narrow Gauges.

Owing to the peculiar condition of the average Australian road, changes in the design of motor cars are necessary if they are to give good service in the land of the bush.

"Motor cars will never be anything of note on the Northern fields until a car has been introduced to stand on 3 feet 6 inch wheels, so that the axles will be 23 inches from the ground, and fitted with self-regulating wheels to run in 3 feet 6 inches and 3 feet 8 inches cart tracks," says a West Australian tradesman. "The running of these cars would be very expensive, too, as the gold field roads are so rough, and at times the wheel tracks so deep, that the tires would very often be torn on the inner and outer sides. But in Kalgoolie and Coolgardie and within a few miles cars are running frequently."

Correcting an Error.

In the recent issues of two or three of the prominent trade journals the price of the ORIENT Model F Light Touring Car, with Tonneau, was wrongfully given as $1500. It should have been $1650.

This error would not have caused much trouble if it had not been for the fact that dealers all over the country had gotten wind of what is going to happen and wrote us at once, as soon as the price was printed.

The Model F is a Light Touring Car with Tonneau, weighing 1450 pounds and carrying a 14-16 horse-power, Positive Air-Cooled Motor, of our latest 4-cylinder, vertical tandem type.

The Positive Air-Cooling system consists of a direct air-blast from a powerful 4-bladed fan, and a special system of flanges, the air-blast circulating completely around, above and below each cylinder, and finally escaping at the bottom.

The cooling is thoroughly adequate and efficient. We tested the motor over some of the hilliest roads in Massachusetts, last summer, and not even the paint on hood or dash would blister—even on the hottest days. That's a supreme test for air-cooling. The motor developed a speed of 35 miles an hour.

In appearance this car is a beauty, designed on essentially the same lines as our 18-20 Horsepower car, which is pronounced a triumph of motor-car designing.

The Orient line is complete, including eight cars, at prices ranging from $375 to $525, on the various styles of the Buckboard line; and up to $1500, $1650, $2000 and $2250 for the four Touring Cars. The 18-20 Horsepower, de Luxe Touring Car, at $2250, is a superbly finished car.

Write us about territory.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 38 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

THE RECORD OF THE FORD.

Victory after victory is credited to the Ford light racing car. When you consider that this car gets its power from two of our standard type horizontal motors, you must admit it is proof positive of the correctness of the Ford design and construction for speed, strength and power. The Ford cars have established a record in every day use of consistent reliability and unvarying satisfaction.

MODEL B. Price, $2000.00. Henry Ford's Latest and Greatest Success.

A striking example of the distinctive Ford construction. Weight 1710 lbs. Four-cylinder vertical motor developing over 20-horsepower. This gives our car more power for its weight than any car of equal price in the world. Consequently there is less wear on the tires and ample reserve power for steep grades and sandy roads. Wheel base 92 inches direct drive with universal coupling, cylinders 4x5 water cooled automatic oiling devices with force feed, large side entrance tonneau seating three people.

MODEL C. Price, $950.00.

The improvements on the FORD two-cylinder car places this model ahead of any car on the market at anywhere near the price. Both in style and mechanical construction this car is a year in advance of its nearest competitor. Double opposed motor of 10 actual horsepower, planetary transmission, chain drive, and increased gasoline capacity. The most stylish low-priced car on the market.

SOME GOOD TERRITORY YET FOR LIVE AGENTS. WRITE US TO-DAY FOR FULL INFORMATION.

We are establishing Agencies Write for particulars.

CLEVELAND MOTOR CAR CO., • • CLEVELAND, O.

HORSE POWER

Some of our competitors try to make CADILLAC dealers believe that we lack sufficient horse power, and that we only "claim six and one-half horse power." It is true we rated our 1903 engine at but six and one-half horse power and our 1904 engine at eight and one-quarter horse power. We had an object in doing this. We knew we had sufficient horse power to drive a CADILLAC over any road and up any hill that any automobile would go. No CADILLAC engine was sent out of our engine factory that would not test above eight and one-half horse power actual brake test after one hour's run on the block.

FOR 1905

we have continued to use the same engine in all models under $1000 00 in price. We are confident that we have increased the horse power delivered to the ground. We gear the heavier models for moderate speed and great power, the light ones for both power and speed. The superior construction of all models enable us to assure all prospective customers of greater road ability than we gave last year. The CADILLAC has all the power necessary to drive it anywhere at reasonable speed. We've never claimed any more than we had. A CADILLAC engine has on several occasions demonstrated its ability to do more work than some so called 12 to 16 horse power gasolene engines can do when mounted in a carriage.

1905 ANNOUNCEMENT

The Autocar

A NEW TYPE.

We believe that the Autocar in all its types represents the highest excellence in automobile design, workmanship and material. Every Autocar is built on honor. We feel, therefore, that our new type will meet with a cordial reception.

This car, **Type XI.**, larger and more powerful than the other types, has a four-cylinder vertical engine of 16-20 horsepower. The body is built on the newest and most approved French lines. The front seat is divided and both front and rear seats are large and comfortable.

While this car is built upon the tried Autocar principles which have been so splendidly proven, it shows a number of very important improvements making for increased simplicity, ease of operation, safety and comfort.

In fact, though Autocars have always been noted for absence of bewildering intricacy of mechanism, yet no one can but be impressed with the extreme simplicity of this new car. It is a triumph in scientific construction and arrangement.

This car has more than met our highest expectations in the road test. In fact, its performance has been a surprise to experienced automobile men. The power of the car carries it, fully equipped and loaded with five passengers up, tested 12 per cent. grades, for instance, at 20 to 25 miles per hour on the direct drive, while on the level the car attains a speed of 40 to 45 miles. The car is a superior climber on any hill.

Altogether our eight years' experience has enabled us to produce in this type, a four cylinder car we are assured cannot be surpassed by any similar car at any price.

The price of Type XI. is $2000. Ready for delivery January 16.

Type VIII.—Four-Passenger at ($1400,) and Type X.—Runabout at ($900,)

have made *Autocar Reputation.* Each stands at the head of its class for value and efficiency.

Autocars, Types VIII., X. and XI. will be on exhibition at the New York Automobile Show, Madison Square Garden.

Catalogue descriptive of the 1904-05 types will be sent free upon request. This catalogue contains also addresses of our dealers throughout the country who will be glad to give demonstrations to prospective automobile purchasers and explain in detail the merits of our cars.

"The Maxwell"

When you have ridden once in a Maxwell Automobile you may perhaps realize its smooth running qualities, its ease of manipulation, and its extreme simplicity of construction; but it is on long acquaintance only that you can fully appreciate those details of construction—those "Maxwell points," as we call them—that have made it a car to be relied on year in and year out, in any weather, on any road—a car that stays out of the repair shop, and in which "there is nothing to do but ride."

16 H. P. Touring Car
$1,550
for the present

8 H. P. Tourabout
$700
for the present

The "Maxwell" cars have no pump (thermo-siphon). Their double opposed motor shaft drive is in front under the hood and easily accessible in every part. Bevel Gear Drive. Metal Bodies. Transmission Case and Crank Shaft cast in one piece of Aluminum. "Simply perfect and perfectly simple."

MAXWELL-BRISCOE MOTOR CO.
TARRYTOWN, N. Y.

"PUT DOWN 4 AND SUBTRACT 2,"

And any teacher who knows his book and is free from prejudice cannot but tell you that the rnotor that successfully performs the subtraction and accomplishes with two strokes all that others require four to accomplish is a distinct advance in the art.

The 2-Cycle Motor used in the Elmore Car

is an advance of the sort. There is no lost motion—no useless strokes.

Our booklets will help you to "study up" on the subject.
They are free for the asking.

Veeder Mfg. Co.,
Hartford, Conn.

Gentlemen:—

We take pleasure in stating that we have equipped our entire product of STEVENS-DURYEAS the past year with your Odometers, and have not had a single complaint.

We have found your Odometers entirely satisfactory, and accurate. We shall continue to equip our runabout for the season of 1905 with same.

Very truly yours,

J. STEVENS ARMS & TOOL CO.,
AUTOMOBILE DEPARTMENT.
C. C. Hildebrand, Sales Mgr.

A bare car on which the purchaser must spend further time and money to supply deficiencies of equipment, is not as attractive as a complete, well-equipped car.

Veeder Odometers are properly a part of the regular equipment. Men want them on their machines. Our sales and re-orders show that.

Instead of trying to skin through with as little as possible in the way of equipment, assume an inexpensive liberality and supply Veeder Odometers. An odometer has a very great interest for the man who runs his own car, and when it is supplied, it conveys an impression of considerate forethought on the part of the manufacturer.

The cost of supplying Veeder Odometers is proportionate to the number of cars you sell, and is not a heavy fixed charge.

The Veeder Manufacturing Co.

26 Sargeant Street, Hartford, Conn.

Makers of Cyclometers, Odometers, Tachometers, Counters and Fine Castings.

OLDSMOBILE

AT THE NEW

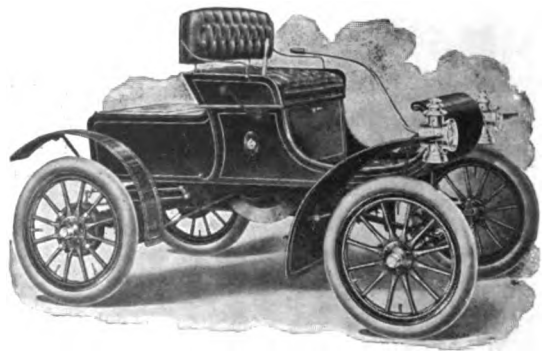
A WONDERFUL

A 20 H.P.

TOURING CAR,

PRICE $1400,

is the new member of the OLDSMOBILE family.



20 H.P. 2-Cylinder Motor. Side Entrance.

This car has been built in response to a distinct demand and has been eagerly expected by dealers and the public alike. It combines comfort with speed, hill climbing ability, and plenty of surplus power. The motor is double opposed, 5¼x6 in.; wheel base, 90 inches. Construction is simple and durable. High grade material used throughout. Noise of exhaust completely eliminated.

THE STANDARD RUNABOUT.

Price $650.

Still continues to be the most popular car ever produced. Each year has found it better and stronger and more reliable than ever. This year a new carburetor gives increased power with a less consumption of fuel. It climbed Eagle Rock in record time. M. Fournier just completed a tour of all Europe with this car, winning a wager of $10,000.

ORIENT TOURING CAR,

Model de Luxe, 18-20 Horsepower. Price, $2,250.

As we stated three or four weeks ago, our reason for withholding the illustrations of our new Orient Touring Cars was an excellent one.

We didn't want them copied this season.

The illustration shown above ought to tell you what good reason we had to fear that the lines would be copied.

There is all the sweep, and power, and massiveness of the 60 Horsepower cars, with the lightness and beauty of line and coloring that distinguish the highest priced foreign models.

Yet the price is only $2250.

The car has a 4-cylinder, vertical tandem engine, of 18-20 Horsepower, the cylinders being cooled by direct air-blast from a powerful, four-bladed fan. The air-blast circulates so perfectly, all around the cylinders, that the rear cylinder is actually cooler than the front.

Speed, over ordinary roads, 35 miles an hour. Not a racing car, but the car for five-tenths of your possible Touring Car customers, because it is simple, reliable, a quiet runner, fast enough; and in a class by itself for beauty.

Three other Touring Cars in the Orient line—the Touring Runabout; the Light Touring Car with Tonneau, at $1650, and the Touring Car, Model G, at $2000. All these cars are of exactly the same design—4-cylinder, vertical tandem engines, as in the Model de Luxe, illustrated above. In addition to these, the Buckboards, at $375 this year.

Write us.

Orient Buckboards, 1905 Model, $375.

Surrey, Price $450.

Runabout, Price $475.

The dealers throughout the country who have handled the Orient Buckboards have enjoyed a great advantage over their competitors in two ways.

1. They have been able to sell a great many buyers who could not afford to pay more than the price of the Buckboards.

2. They have sold a great many larger cars to people who first acquired a love for motoring from running about in a Buckboard.

The 1905 Buckboards are better than ever, and still lower in price. There is the Buckboard, $375; the Surrey, $450; the Runabout, $475; and the Tonneau, $525.

These are winners—you ought to have them.

Peerless

The Car of Achievement

We Base Our Claim

for the superiority of Peerless cars upon the consistent record of victories achieved during the year 1904 in every class of competition—hill-climbing contests, races open to stock cars, match races open to the world's fastest machines and special exhibitions against time.

All Peerless Owners Have Shared

in the pleasure of driving a fast car. In the little rivalries of the road, the Peerless always gives a good account of itself. The simplicity of our cars, combined with intelligent design in every detail, insures that they are always ready for service.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, January 5, 1905. No. 15

CONDITIONS IN THE SOUTH

Returned Tradesman Interestingly Surveys the Situation—Cotton Surplus Affects Prospects.

The situation in the South and the promise held out by that section of the country are among the things about which there is no settled opinion. Generally speaking, the condition of the roads is not such as tends to encourage the use of automobiles, and while few have expected great results, some of those who have covered the territory have returned with very pessimistic opinions indeed.

J. D. Anderson, vice-president of the Hartford Rubber Works Co., is one of the tradesmen who recently visited the South, and as he had no cars to sell and was merely intent on personally meeting good customers and on "sizing up" conditions and prospects, his impressions are of more than usual weight. Mr. Anderson spent nearly three weeks of December in company with his concern's Southern representative, Arthur W. Kirk. Among other places they visited Atlanta, Savannah and Augusta, Ga., and Jacksonville, Tampa, Miami and Daytona, Fla.

In Atlanta Mr. Anderson did not find conditions particularly flattering. The highest numbered car there is 82; there are probably forty machines in actual use, only one of them being a big touring car. The prospects for this year are only fair.

In Augusta, a nice little city, with good streets and with good roads in the outlying sections, there are probably twenty-five machines. Field & Kelly, the Rambler agents, appeared to be the only ones doing any business, and a very limited trade next season is in sight.

Savannah is the bright spot of the South, so far as automobiles go. There are over two hundred cars in the town, and with its thirty-four miles of asphalt streets, level surfaces and fifty or sixty miles of good "cement" roads, as they are locally termed in the suburbs, there are excellent prospects of good business. T. A. Bryson, the principal dealer in Savannah, has practically completed a three story brick garage, which he will formally open during the latter part of January.

In Jacksonville the prospect of business is fair. In Tampa there is one dealer only, and fair prospects for business. In Miami, although there are a number of machines in use that are owned by winter visitors, there is not a dealer in the town.

"The general business situation in the South, however, is better," said Mr. Anderson. "In Georgia one gets the strong impression that future prospects very naturally depend entirely upon the market price of cotton. At the present time they have the cotton with no demand, except at a price showing no profit for growing.

"To sum up the whole situation in a very few words, we can reasonably expect a very good business from the Southern territory in automobile tires during the coming season, reflecting a gradual improvement in the general business situation in the South."

Appersons Open in New York.

The Apperson Bros. Automobile Co., Kokomo, Ind., is the most recent Western concern to emulate Lochinvar and to plant its own standard in New York. It has leased the premises at No. 66 West Forty-third street, formerly occupied by the Brooklyn Automobile Co., and secured as manager L. A. Hopkins, the former treasurer of that company. A stock of the new Apperson cars is expected to arrive within the next week.

Diamond Handling in Denver.

Hereafter Diamond tires will be handled in Denver, Col., by the Overland Rubber Co., No. 1,735 Araphoe street, arrangements to that end having been recently effected. The Diamond Rubber Co.'s own branch in that city will confine itself to hose, belting and tires other than those for automobiles.

To Exploit Edison's Battery Abroad.

In Berlin, Germany, a company has been formed for exploiting and selling the new Edison battery. The directors of the new corporation consist of prominent bank directors and M. Bergmann, general manager of the Bergmann Electrical Society. The company will start with a capital of $75,000.

MUST BE FIRE-PROOF

So Say the Authorities About Decorations at New York Show—Cause of the Order.

Although the use of gasolene in even the smallest quantities at the forthcoming Madison Square Garden show has been prohibited, the local authorities are not satisfied with this precaution against fire. The solicitude felt by the Bureau of Buildings is such that it last week issued a warning to the management of the Garden, to the effect that the laws on the subject would be strictly enforced this year. Consequently Manager Young of the M. S. G. Co. sent a notice to each exhibitor that has caused no end of perturbation, misgivings and uncertainty. The notice in question read:

"This company has been officially notified by the Department of Buildings that all decorations in future shows must be fireproofed. Kindly notify your decorator."

Disquieting as this notice is, it does not entirely cover the case. It is not only the decorations that must be fireproofed, but everything that an exhibitor installs in his stand, the automobiles or other articles exhibited alone excepted. That is to say, the platforms, railings, signs, rugs, curtains, etc., if of an inflammable nature, must be treated to resist conflagration. This, however, is neither a costly nor a difficult task, nor do the solutions on the market injuriously affect the most delicate fabrics.

The appended extracts from the rules in force relating to the prevention of fires bear directly on the duties imposed on exhibitors. They were furnished the Motor World by the Bureau of Buildings, and are as follows:

"Numerous solutions and paints for the fire-proofing of fabrics, scenery and woodwork on theatre stages were submitted to this Bureau for test during the year. All of the samples submitted made a good showing, but no approvals were issued inasmuch as results in actual practice cannot be judged from samples. Acceptance of the treatment depends on tests made on the materials in each individual case, and a certificate is issued where the following specifications of

Digitized by Google

this Bureau are met: In the case of fabrics, scenery and the wood frames for the same, there must be no flame or glow after the application for fifteen seconds of the flame of an ordinary alcohol lamp or torch.

"Fireproofing solutions and fireproof paints which have been tested or are being used in this borough (Manhattan), meeting the above requirements satisfactorily are made by the following concerns: Maas Fireproofing Company, Reliance Fireproofing Company, Antipyros Klugiana, Blenio Fireproofing Company, Electric Fireproofing Company, Fireproofine Company, Frank Ring, Gordon Fireproofing Company.

"Any treatment, however, that will render the material sufficiently fire-resisting to meet the above requirements will be accepted."

To a Motor World man who put the question whether these regulations, in connection with the automobile show at least, were not new, Superintendent Isaac A. Hopper, of the Bureau of Buildings, said:

"The regulations were always on the books, but under my predecessors in office were a dead letter. Since the Iroquois fire in Chicago (which occurred about a year ago) a change has taken place, until now every theatre and place of amusement in the city has been obliged to comply with these rules. All of them are inspected regularly, and if any violation of the rules is detected they are compelled to remedy the matter at once."

At first Superintendent Hopper said that it would be necessary for exhibitors to submit to him sketches of the plan of their stands and decorations—"unless," he added, "they were erected at the last show and are still standing." Reminded that everything was taken down and carried away immediately after the show last January, he repeated that it would be necessary to submit sketches to him, as the department was held responsible for any accidents that happened. The Motor World man suggested that as there were nearly two hundred exhibitors, some of them a thousand miles or more away, and as the show opens on Saturday of next week, it would be manifestly impossible to do this. At this juncture the chief engineer of the department suggested that it would serve the purpose if he gave the Motor World a memorandum of the requirements, and this was done, as already noted.

"That will inform your readers of what must be done to comply with the law. As Mr. Hopper says, if any accident happens through the platforms or railings not being strong enough to support the weight put on them, or from fire, we get the blame. Consequently we must see that everything is done right. We have a large corps of inspectors out, and if they find anything wrong they immediately notify the exhibitor and the lessee or owner of the building, and if the matter is not remedied in twenty-four hours we close the building," said the chief engineer.

"Now, our test of fireproofing consists of applying a lamp or torch to the material treated, and if it does not 'glow or flame' inside of fifteen seconds we pass it. Our inspectors will go to each stand and select at random several pieces of the fabrics or other materials used for decorations, and if they stand this test it will be considered that everything is all right. The wood and other materials used will also be subjected to the flame test.

"We do not assume responsibility for the solutions sold by the concerns whose names are given. The first three, however, do most of the work of fireproofing, and we have never had any fault to find with them; but we test all materials on the stands. We understand, too, that these fireproof solutions are non-injurious to even the most delicate fabrics."

The Week's Incorporations.

Camden, N. J.—Martin & Hart Motor Co., under New Jersey laws. Incorporators—F. R. Hansell, Joseph F. Cotter and George H. B. Martin.

Springfield, Mass.—Geisel Automobile Co., under Massachusetts laws, with $40,000 capital. Directors—Adolph A. Geisel and Theodore R. Geisel.

New York, N. Y.—The Reo Motor Car Co., under New York laws, with $10,000 capital. Incorporators—R. E. Olds, C. Andrade and R. M. Owen.

Yonkers, N. Y.—Ardsley Motor Car Co., under New York laws, with $75,000 capital. Incorporators—T. S. Fuller, F. P. Fuller and A. E. Rittenhouse.

Milwaukee, Wis.—Curtis Automobile Co., under Wisconsin laws, with $10,000 capital. Incorporators—Orin L. Curtis, Harry Landauer and Frank Thanhauser.

Syracuse, N. Y.—The Iroquois Motor Car Co., under New York laws, with $450,000 capital. Directors—Thomas W. Pelham, Frank H. Clement, Charles T. Blanchard, L. Frank Ormsbee and L. F. Mahan.

Boston, Mass.—The Peerless Semi-Pneumatic Tire Co., under Massachusetts laws, with $50,000 capital. Officers—George H. Prescott, president, and Charles P. Cummings, treasurer.

Augusta, Me.—Leitch Manufacturing Co., under Maine laws, with $40,000 capital, to manufacture and deal in carriage and automobile bodies, also motor boats. Officers—I. L. Fairbanks, president and treasurer.

Port Chester, N. Y.—The Mianus Motor Works, under New York laws, with $100,000 capital subscribed. Officers—George Gray, president; Frederick A. Hubbard, vice-president; August P. Avery, secretary; Charles B. Allyn, treasurer.

Brooklyn, N. Y.—The Edmunds & Jones Mfg. Co., under New York laws, with $6,500 capital, to manufacture automobile and coach lamps, generators and sheet metal work. Directors—George Edmunds, William G. Jones, George Roberts, Edward C. Humphreys and Harry W. Brooks.

The Macks in Allentown.

The most recent addition to the industries of Allentown, Pa., is the Mack Bros. Motor Car Company, a concern incorporated last year with a capital of $300,000 to manufacture commercial vehicles. The concern has just purchased the plant of the Weaver-Hirsch Foundry and Machine Company and will at once move in and begin active operations. It is stated that enough orders are in hand to keep the plant busy for a year.

The company proposes to confine its efforts solely to the manufacture of such commercial vehicles as motor cars of large sizes for sight-seeing and passenger purposes, express, brewery and other trucks of large carrying capacity, equipped with motors capable of producing from 50 to 100-horsepower or more as may be desired.

Their motors, it is added, "will revolutionize the manufacture of motor cars in this country; the details of their construction are vastly different and superior to all others."

The officers are Jos. S. Mack, president; Jos. Mack, treasurer, and Leo E. Schimpff, secretary.

Jobbers Big Increase of Capital.

The New York Sporting Goods Co., the news of whose entry into the automobile supply trade was published exclusively in the Motor World last week, will not take possession of the building No. 17 Warren street, New York, which they have leased, until May 1 next. Until then business will be done at the present address, No. 61 Nassau street, which later will be continued as a retail store. Concurrent with their decision to enter the automobile trade, the capital stock of the company has been increased from $5,000 to $100,000. The added capital will be used in the automobile department. The officers of the company remain as heretofore, viz: President, P. R. Robinson; vice-president, Richard Nelson; secretary-treasurer, James E. Murray; directors, A. R. Robinson, Thomas F. Barnes and Roger F. Murray.

Bailey Remains True to Rambler.

The F. O. Bailey Carriage Co., of Portland, will handle the Rambler in the State of Maine during 1905. Last year that well known car was controlled by the Maine Motor Carriage Co., which practically was the Bailey company operating under another name. When they were this year given their choice of relinquishing either the Rambler or the other cars for which they held the agency, they elected to stand by T. B. Jeffery & Co., and will therefore devote themselves to the Rambler exclusively.

To Handle Mitchells in Milwaukee.

Three Milwaukee (Wis.) business men have formed the Curtis Automobile Co., with a capital of $10,000, and will conduct a sales and garage business in that city. Arrangements have been made to handle the Mitchell line, and a garage will be opened on Grand avenue. The principals are Harry Landauer, buyer for Landauer & Co.; Frank Thanhauser, manager at the same company's establishment, and Orin L. Curtis, a draftsman.

IMPORTANCE OF KNOW-HOW

How it Cuts an Unusually Large Figure in Automobile Trade—An Apt Illustration.

"In nearly all businesses it is the 'know how' that is of the greatest importance and possesses the most value. You may be ever so industrious and conscientious, but if you don't know how it is largely a matter of luck whether you meet with any success at all when you tackle even an easy proposition." The speaker was the Eastern travelling representative of a large Western maker, who had been discussing some troublesome phases of the industry with a Motor World man.

"Frequently the most puzzling source of trouble in a car is really the most obvious, and if the man who was at work on the car had used good judgment he could have put the car to rights in a tithe of the time he spent on it. In such cases the question arises, How much shall I charge for this job? It seems plain that, say, ten hours' time should not be put on the bill when half an hour would have been sufficient; yet it may have been actually spent, and some one must pay for it.

"Now, my plan is to always look for the most obvious source of trouble at the beginning. Three times out of five that is where I find it. But one must have, in addition to knowledge and experience, a generous supply of 'gumption,' and be able to tell almost by intuition whether he is on the right or the wrong tack. Lastly, he must take an interest in his work. If it is a labor of love, the chances of success are much greater than if the work is gone about in a perfunctory way.

"When I began to study the automobile business I came to the conclusion that a superficial knowledge of it would not do. So I took a course in the theory of the gas engine. Then I went to the factory and worked at the bench for several months. Next I went on the road and got in touch with both dealers and users, so that by this time I was able to view the industry from all sides. Then I was put to work 'rounding up' difficult cases. If there was a car that wouldn't run and the local repairing talent could not make it go, I was sent to the spot and given the task of putting it to rights. I would go north into Canada, and east, south and west, and I met with an immense amount of success, simply because I used my head and examined the parts the local men had passed by as not being worth looking after.

"There was one case that looked as if it might stump me as it had everybody else; but it actually proved very simple and scarcely worth mentioning except for the trouble it had given and the amount of work that was charged against it.

"It appears that one of our large agents had a customer whose car was of no use to him. For three or four weeks it had been worked over, taken apart, put together and then dissected again; but all to no purpose, for it obstinately refused to run. The engine was taken apart and set up again. Every bit of the wiring was renewed and new batteries put in; but all to no purpose. Go it would not. A repair bill of $30 or $40 had been run up, without a cent's worth of good having been done. At last, in despair, they sent to the factory, and the latter directed me to go there and see what the trouble was.

"I arrived, listened to the tale of woe and made some mental notes. Then I took a look at the car. I tried half a dozen things and found them all right. But certainly the engine would not run. I could not get even an explosion out of it. This puzzled me a little, for usually in such cases something wrong is found quickly. But I persevered, and a few minutes later I found it. The engine was timed wrong, and it never could have been made to run until that was fixed. In less than half an hour I had everything put to rights and the owner almost fell on my neck, so filled with joy was he. A more crestfallen set of repairmen you never saw. They expected to see me fail, as they had done, and were ready to laugh. But I had all the merriment on my side."

Its Load too Heavy for Truck Company.

Acting on the application of creditors of the Union Motor Truck Company of Philadelphia, Judge Mitchell, in the Common Pleas Court of that city last week, appointed George DeB. Myers receiver for the Union Motor Truck Company, manufacturers of automobile trucks. The company was admitted to be insolvent by its president, John P. Murphy. It is a West Virginia corporation, capitalized at $500,000. Its liabilities were fixed at $6,000, and the assets, including patents, at $4,000. The Diamond Drill and Machine Company and Clement & Sons were the petitioners.

The Union Truck Company has for several years been engaged in perfecting a gasolene truck embodying a number of original but very complicated features. In both the 1903 and 1904 commercial vehicle contests held in this city the concern entered trucks, but they performed only fairly well.

Pope Fixes His Prices.

The price of the new two cylinder Pope-Hartford car, about which there has been some little speculation, finally has been set at $1,600. Its "cousin," the two cylinder Pope-Tribune, will list at $900. The idea that prevailed that these cars replaced the single cylinder models of the same titles proves to be erroneous; the new models are simply additions to the Pope line, which will be marketed in connection with the single cylinder cars.

Eldridge Re-enters the Trade.

W. E. Eldridge, former manager of the Pope Motor Car Co.'s Boston branch, has engaged with the big Tremont Garage, of that city. His new duties will enable him to make the most of the Buick agency, recently secured.

VEEDER REACHING OUT

Making a Big Bid for the World's Trade—The Arrangements Already Effected.

If the Veeder odometer does not dominate the foreign market almost as completely as the Veeder cyclometer has dominated it for many years, it will not be for lack of effort to that end. Living evidence of this effort is at present in Europe in the person of H. J. Boon, head draughtsman of the Veeder Mfg. Co., of Hartford, who is visiting the principal automobile manufacturers of England and Continental Europe, obtaining the necessary drawings and information to enable the company to manufacture fixtures for applying Veeder odometers and tachometers to their cars. He already has arranged to have the special attaching fixtures for foreign cars manufactured in Paris.

Mr. Boon was in charge of the Veeder exhibit at the Paris show, and during the exhibition he obtained drawings or sketches of the wheel and knuckle construction of all the cars that were shown. During the show two of the Veeder form D, or dashboard, odometers were shown, one applied to a Renault and the other to a Mors dash. The instruments were shown attached to the wheels, just as they would be on the cars, and as the wheels revolved, the readings in kilometers were shown correspondingly on the dashboards. The Veeder form B odometer, a gear driven instrument which attaches to the steering knuckle, was shown on a Darracq wheel, which was likewise revolved.

The Veeder tachometers or speed indicators were shown in two sizes, the six inch scale and the 12 inch scale. As in the case of the form D odometers, they were shown on the dashboards of cars. The wheels were revolved, and the tachometers gave readings in kilometers, according to the speed at which the wheels revolved to which they were attached.

Winans Gets Michelin Rights.

E. D. Winans, who formerly was connected with the United States Agency, Michelin Tire Co., is himself now the possessor of the Michelin rights for the larger part of the Western Hemisphere. He returned from Paris on Saturday with the necessary document in his pocket conveying to him a perpetual license to vend Michelin tires in the United States, Cuba, Mexico and Central and South America. Meetings are being held this week for the purpose of organizing a company that will make the most of the license. Incidentally, Winans states that representatives of the parent company are now en route to this country to consult with their counsel, Coudert Brothers, respecting the allegement of Michelin's infringement of the G & J rights, which is now pending in the United States courts.

1905

Will be the

"Mechanically Fastened Year."

You All Know Why.

THE SUCCESS OF THAT TIRE,

the manner in which it has solved the tire problem and reduced the troubles and the cost of tire maintenance simply has compelled acknowledgment.

SUCCESS ALWAYS BEGETS IMITATION.

The Fisk was first—it is still in front. It is the only mechanically fastend tire that actually has stood the test of time. It has left off where the others are but just beginning.

The Fisk Rubber Company, Chicopee Falls, Mass.

☞ Those who are interested in motor vehicles will find the facilities and information of our office always at their command.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, JANUARY 5, 1905.

The New York Show Numbers of the Motor World will be of date January 12 and 19. As always, they will deal with the Show in comprehensive fashion, and, if anything, will be even more than usually informing in character.

Beware of Spurious 1905 Model!

Advices of a thoroughly trustworthy character indicate that the time has arrived when extreme caution should be exercised in the purchase of foreign cars—caution that should be particularly wide-awake during the continuance of the shows.

That not all of the European manufacturers were able to entirely dispose of their 1904 product is common property. It is not so well known that America is considered the most likely "dumping ground" for this surplus, and that quite an influx of well-groomed, well-spoken "dumpers" who will put up at expensive hotels is due to reach these shores at about show time. Some of them will assist agents already appointed, while others will seek to appoint agents and to make sales direct to individual purchasers.

The game to be played is the working off of the old cars as 1905 models. Already it has been attempted in this city. In one instance the sale of three cars actually was effected, and only the awakened victims' threat to air the matter in the courts served to prevent exposure. How many cases of the sort remain undiscovered is, of course, not known. It is certain, at any rate, that the foreigners have a number of 1904 cars that must be disposed of, and that America is due to receive their solicitous attentions.

In the absence of other assurance, probable purchasers will do well to obtain or examine the serial numbers of any foreign cars that may be offered them. There usually is a considerable lapse between the numbers of the 1904 and the 1905 models, and a low number on an alleged 1905 car should afford grounds for immediate suspicion.

Side Entrances and Mud Guards.

About two out of every three of the popular side entrance cars now being unveiled are marked by an arrangement of mud guards and step combined. The step almost invariably consists of a single piece of planed board, reaching from one mud guard to the other, and affording an easy and safe means of stepping into the car. In carriage construction much the same effect is obtained by employing the step of a victoria or similar vehicle to connect the two mud guards. In the latter case, however, the step is much shorter, besides being made of iron or steel and finished like the remainder of the ironing of the vehicle.

With the automobile step referred to, however, its utility alone commends it. Its appearance is anything but pleasing. It looks crude and clumsy, even unfinished and quite out of keeping with the remainder of the vehicle. Already unfavorable comment has been aroused, and prospective purchasers have expressed wonder that so unsightly a piece of work has been allowed to slip through and invite criticism. A very little time and money would have made everything right. But the wood is rough instead of smooth, and paint and varnish seem to have been applied sparingly, with the result noted. Even now it is not too late to apply a remedy and thus prevent the belief getting about that the cars referred to are hastily constructed and cheap looking.

Of some of the side doors themselves, it is fair to assume that their designers are skilled contortionists, and that they fancy that the rest of mankind and womankind are possessed of the same agility and suppleness of joints. The size, shape and position of the doors suggests nothing else.

Tires and Horseless Nonsense.

Some men wear whiskers because they believe them to be becoming; others wear them because they are too lazy to shave or too stingy to patronize the barber. Some men are given to chasing rainbows; others are given to dealing with things as they exist. Some men want tires that never will give trouble, that never will puncture, that never will require to be removed from the rim, and with such tires they desire the speed and comfort that can be obtained only with pneumatics. How such tires are to be obtained they have not the remotest idea, nor do they attempt suggestion. They simply yawp and chase the rainbow.

These observations are born of the yawpings of the Horseless Age on the tire question—which really is no question at all. The man who desires no trouble and no comfort should employ steel tires; he who desires a little more comfort at the expense of a little more trouble should use solid rubber tires, but he who would have real comfort must use pneumatic tires, and until the Horseless Age or some other rainbow chaser finds a means of carving a circle of air out of the atmosphere and of securing it to a rim, such men will be content to use air as it is confined in the other most elastic material, rubber. And as rubber will puncture and wear, the man whose sense is not of the horseless species and who values his comfort, will recognize that facility for securing such tires to rims and for removing them therefrom is of vital importance.

Fact vs. Fury.

If the stranger in New York who had occasion to run over the files of certain of the city's newspapers for 1904 failed to obtain the impression that the automobile was not a juggernaut that daily slaughtered man, woman and child, he would prove an interesting exhibit for a museum of natural history.

The reams of paper and gallons of ink that have been devoted to making the automobile appear a demoniacal instrument of death and destruction have been not short of remarkable. The ink has fairly scorched the paper, so heated have been some of the editorial utterances on the subject.

How sound are the bases on which they

Digitized by Google

were founded is shown by the Police Department's report of homicides that occurred during the twelve months. Excepting murder, they were as follows:

Building accidents, 3; automobiles, 7; derricks, 5; runovers (wagons), 62; building elevator accidents, 21; runovers and other accidents caused by cars of Interurban Co., 51; killed by cars on Brooklyn Bridge, 3; accidents on lines controlled by Interborough company, 12; killed by New York Central and other roads running into Grand Central Station and along Eleventh avenue, 20.

Of the seven deaths charged to automobiles three occurred at the same time. A drunken chauffeur drove over an embankment at midnight, and, with two of his carousing companions, was killed.

The table proves how little real substance there is in the rabid frothings against automobiles. It is chiefly sound and fury. Of course, sound attracts a crowd, and if it is ominous, the crowd will become fearful and shudder, and this is exactly the situation as regards automobiles. It is the same unreason that but a few short years ago inspired many reputable editors to volcanically assert that bicycles were juggernauts and that their riders were little short of demons seeking whom they might slay. Very many people believed it. And yet common sense would have told any of them that for any man on a bicycle to strike a human being or other obstacle meant that the cyclist himself would fall and be the most likely sufferer. It is the same unreason that causes people when they hurry out of the way of an automobile to feel offended or to fancy that they have been endangered, although daily they may and probably do jump out of the way of a dozen wagons or streetcars and not give the matter a second thought.

It really does seem about time that the thinking writers who "mould public opinion" should rid themselves of their own fears and cease playing on the fearfulness of the populace. Not one man in a million, it matters not what manner of vehicle he may guide, intentionally runs into another man. The aim of every driver is to avoid accident, and as an automobile cannot guide itself, its driver's eyes are always open and his senses alert, which, however, is more than can be said of many drivers of horses. The sight of the honest farmer and the city truckman asleep at the reins is not rare.

What is needed is less sound and fury and more cool common sense when automobiles are discussed. Such statistics as those here quoted from the New York Police Department's report plead for it most eloquently.

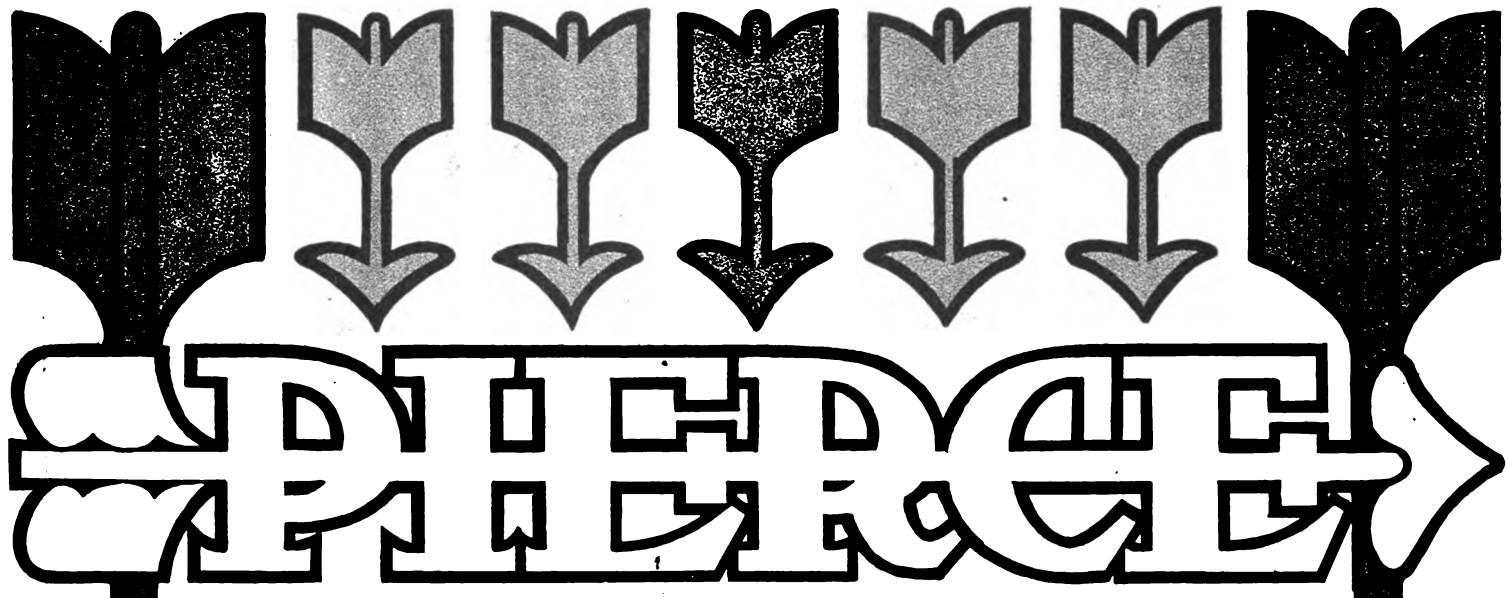
Why Powers Increase.

Powers and prices appear to be tightly linked in a skyward movement, the end of which no man can tell. For several years we have all been predicting that powers would go no higher; that already they were too great to be used to their full capacity on the average road. But this is theory, and the facts are just the other way. Powers are still increasing, not only here, but abroad. This is because users find that it is a good thing to have a reserve of power, even if they employ it only occasionally. It not only gets them out of tight places but enables them to bid defiance to hills and heavy or bad roads. They do not have to use all the power at their disposal, but it is found that an engine that is never run at its capacity will last longer and give better all-around service than one that is forced to deliver its full quota of power at nearly all times. Bridges are built to carry several times as much load as will ever be imposed on them. Foundation walls and buildings generally have the same excessive factor of safety, and no one attempts to question the wisdom of their designers. That automobiles should have some reserve power is hardly to be questioned.

Woodbury's One-Sided Selections.

It is always interesting and sometimes instructive to discover the reasons actuating the selection of a particular car. The reasons inducing the purchase by the City of New York of two foreign cars for the use of its Street Cleaning Department are of the instructive sort. When the able head of that department, Dr. John McGraw Woodbury, applied for the necessary appropriation of $5,000, a considerable ado was made over it by the daily press. It caused the importers to chuckle in their sleeves and out of them and considerably discomfited the home trade. It induced the Motor World to interview Dr. Woodbury, with the result published in another column.

None can read his comments without being convinced that that gentleman has condemned the American product on insufficient evidence. He is of that quick, nervous, impatient temperament that cannot brook petty troubles. He has made mountains out of molehills. If he fancies that foreign cars are free from such ills as broken springs and steering knuckles and clutch troubles, he is due for a rude awakening, unless he is prepared to forgive them as "acts of God." His selection of an Italian car is evidence of influence brought to bear on him, for, as a matter of record, the one public performance of that particular vehicle is a record of failure. In the Vanderbilt Cup race two of those cars started, and they were among the very first to go down and out. It took hours for a skilled machinist to induce one of them to run, and then it ran less than thirty miles. The other failed inside of ten miles. Eleven other foreign cars failed to complete the course, and even the particular French car which finished first, sustained broken springs. So much for Mr. Woodbury's assertion that foreign cars "run all the time." His statement that, although one American car did give full satisfaction, he put it aside because of its price in favor of a second hand foreign vehicle, and apparently without attempting to discover whether a used model of the American product could be similarly purchased is one other fatal flaw in the Woodbury argument.



There is no doubt of the Commissioner's honesty and interestedness, but despite the fact, it is as patent that he has not been wholly fair to the industry of his own country. He has given it a nasty and undeserved slap in the face.

Value of Good Photographs.

First impressions are valuable. In creating them nothing is more immediate or more potent than pictures—good pictures. It will be well for manufacturers of automobiles to keep the fact in mind, as not all the photographs of new cars that have appeared can be termed good, even by a stretch of courtesy. It is an open question whether these pictures have not done the cars some harm.

There really is small excuse for poor photographs, and no economy is so false as that which stints their price. At this season of the year, when snow is on the ground, polished surfaces, such as the sides of a car, reflect the whitness, and some weird effects have resulted. This and poor light and backgrounds which afford no contrast are the chief faults of many photographs of 1905 models that have reached us. Dull, unimpressive illustrations are the result. Per contra, other photographs are not short of magnificent—big, clear cut, highly finished, and every line well defined. The very sight of them inclines one favorably toward the cars.

PIERCE CARS IN 1905

The award of the Grand Prize at St. Louis to Pierce automobiles but confirms a progress that has been steady and conclusive for five years.

On their 1905 cars the George N. Pierce Company asks no odds of anybody here or abroad.

The output in 1905 will be confined to six designs and three mechanisms.

The first mechanism is the 28-32 H. P. Chassis mounted as follows:

The Great Arrow, side entrance, King of Belgium type Tonneau, $4,000.

The Suburban, - - $5,000
The Landaulet, - - - 5,000 } Enclosed Bodies by Quinby.
The Opera Coach, - - 5,000

The second mechanism is the 24-28 H. P. Chassis four cylinder, side entrance, King of Belgium type Tonneau, $3,500.

The third mechanism is our well-known single cylinder Stanhope 8 H. P. $1,200.

These cars are the result of a progress that has studied every step of the design before making the change. Some of the differences from other cars are radical, but the evidence of some of the best automobile designers is with us.

Pierce cars will invite a special study at the Automobile Show in New York City in January.

NORTHERN AUTOMOBILES

Good in all Climes

Silent as the Snow

is the operation of the Northern Touring Car. The plans of this superb vehicle called for the elimination of all noise and vibration, and every part has been carefully worked out with this end in view.

That the result aimed at is fully attained, the car itself proves.

THE NORTHERN TOURING CAR IS THE QUIETEST, EASIEST RUNNING CAR IN THE WORLD.

The motor is a 5¼x5½ two-cylinder of the opposed type, developing ample power to take the car anywhere an automobile can go. Wheel base is 100 inches, with wheels fitted with 30x4 detachable tires. Tonneau is of exceptional size, seating three passengers. Choice of four different bodies. Two-passenger body, a powerful, speedy machine, $1,500. Four or five passenger, rear entrance, $1,600, and four or five passenger, side entrance, $1,700; and, lastly, a superb limousine body, $2,500. All styles interchangeable.

WRITE FOR CATALOG 16.

The "Sturdy Northern" Runabout

long ago justified its name. With ample reserve power, strongly built and with body hung on swivel entirely independent of the frame, rough roads and smooth roads are alike, so far as riding qualities go. Its record in the hands of thousands of users all over the country proves its durability and efficiency under all conditions.

THE 1905 NORTHERN RUNABOUT, grown in everything except price, embodies all the features suggested by experience and the advancement of the art of automobile construction. Among the improvements are new body design, larger fenders, larger oil cups, full back moulded seats and numerous detailed refinements of working parts.

Largely increased facilities make it possible to now offer this sturdy, ideal "Runabout" at $650.

The NORTHERN meets the demand for a sturdy runabout, simple in construction and operation and durable enough to withstand all demands upon it, more fully than any other runabout on the market.

A WINNING PAIR WITH WINNING WAYS.

It will pay you to get in touch with NORTHERN Automobiles.

NORTHERN MANUFACTURING CO.

DETROIT, MICHIGAN.

Science as Applied to Automobiles.

Science is at the bottom of all structures, whether it is so recognized or not. Very often science is reached backwards, by "rule of thumb" methods and actual experience. It is possible to see, when the thing is accomplished, where the science comes in; it was not possible before.

The application of science to a structure called upon to carry a simple dead weight or load is the simplest thing in the world. For example, the weight and thickness of the plates of a tank necessary to contain a given amount of water, and, in turn, the weight and dimensions of the columns that will be called upon to support this tank. When the structure is called upon to carry moving loads, science enters with greater difficulty. For instance, a bridge called upon to bear the strain of a wagon and a pair of horses jolting over the rough planks. A factor of safety must be allowed to accommodate this uncertain incalculable load. This factor of safety is another name for a guess, an estimate. After all the figures are carefully drawn on a scientific basis to carry a given dead weight, then they must be multiplied by 4, 5 or some other number, which is a matter of estimate, a guess, to make the bridge safe.

Going one step further: Take the locomotive running upon a smooth set of rails and subjected to comparatively few jolts and jounces. Here the factor of safety is a different one from that of the bridge or tank. Science was used in designing a great many parts of the locomotive, but empirical or practical knowledge was called in for as many more parts in the shape of a factor of safety of varying quantity.

In the bicycle all ordinary rules of mechanics were thrown aside and the factor of safety was made smaller than it was ever before made in any machine. Science was brought into it in several, but comparatively few, places. Much was done by the process of elimination—by building model machines which, in the opinion of their builders and designers, were sure to fail, and which did fail in parts. Another model was then built, and that part or parts strengthened which had given out. In this way the lightest possible machine was arrived at. Such a method does not seem scientific, nor is it under a strict interpretation of the word "science." At the same time, it was the only way, and men of science actually conducted the experiments mentioned. It was not possible to sit down and take the formula given by our best text books and design a bicycle that would be salable. Pure theory absolutely failed, as it almost always does fail. But a knowledge of theory coupled with a wide experience is sure to win out in the end.

The automobile resembles the bicycle in this respect. The strains it is called upon to bear are immeasurable, incalculable and not possible to foresee. The average automobile gets into the ditch sooner or later, and the owner of it is not pleased if it does not come out of the ditch and go along about its business as if nothing had happened. A wheelbarrow is not submitted to such punishment as is the automobile. The unexpected culvert in the country road, the rain-worn gully, throws a strain upon an automobile that can be no more measured by scientific methods than the strains involved in a railroad collision.

Take, for example, the wheels of an automobile. Gradually we have arrived at wheels that do good work, and certainly not by sitting down and figuring out the size of the spokes, the rims and the hub by formula. The axles have been guessed at, to put it plainly. The wheel bearings have been under scientific control to a certain extent—that is, the plain journals have. The bearing surfaces have been made to apply approximately, at least, to the accepted practice of railroad and engine construction.

Scientific calculation of the dimensions of a spring would not produce a good set of springs for an automobile, simply because the load that is coming upon those springs cannot be measured or calculated. One can only guess at it.

The frame of an automobile cannot be figured, simply because one cannot know the strains that are coming upon it. The engineer has guessed at suitable dimensions. Some of them have guessed rightly and some of them wrongly. The proportion of failures have been comparatively few. Good frame design will be evolved, not from scientific formula, but from the experience gained from those now in service.

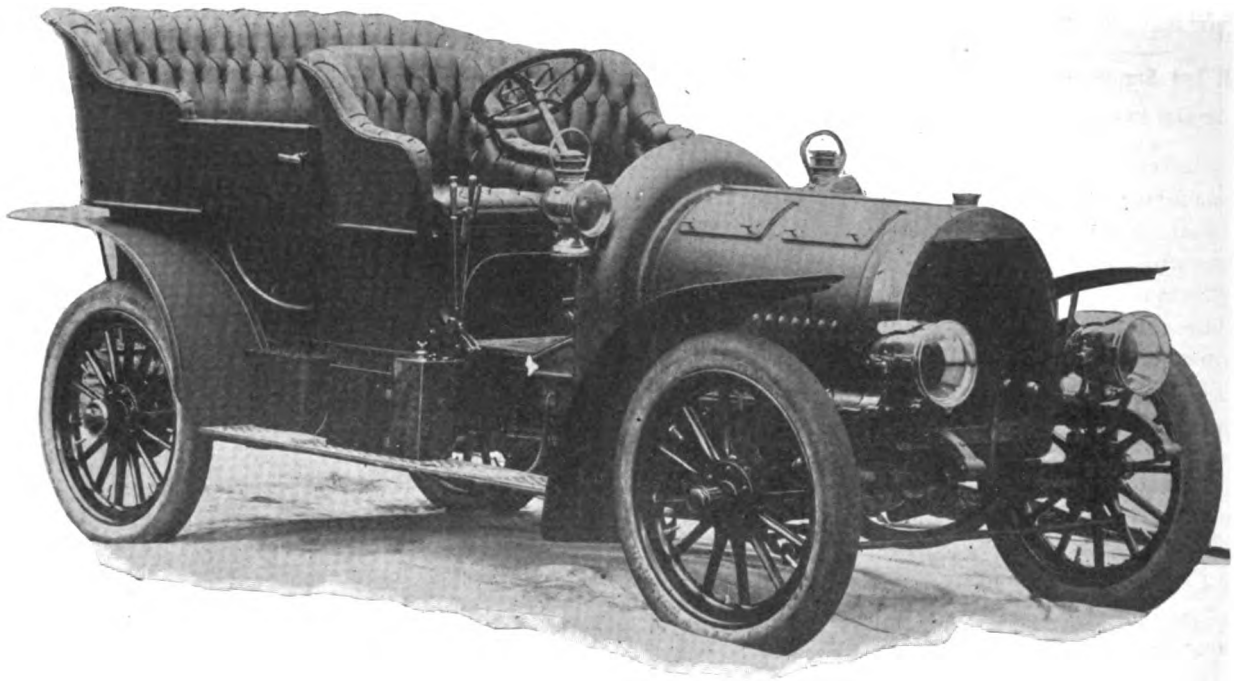
There are some points, though, in automobiles where science will come in, and come in very strongly. It will play a part in automobile design just as much as it has in steam engine design, in boiler practice and in the burning of coal or other fuel under boilers. The same problems exist in the automobile and must be answered along scientific lines, if at all.

To-day the right shape of an engine cylinder to get the best efficiency from expansion and explosion is in dispute. One engineer claims one shape, another one radically different. One is probably right or certainly better than the other. Which, can only be determined by investigation, and very careful investigation at that. Quite as much work must be put upon this problem as has been put upon similar problems in steam engine design.

It is probable that most of the gasolene consumed to-day in automobile engines is not consumed to the best advantage, either because the carburetter is not all that it ought to be or for some other allied reason.

The degree of water cooling possible for any given amount of power is in question, and quite properly so. All the heat carried away and dissipated by the water and the radiator is lost and there is no doubt about that. Some of the heat of the gas engine ought to be carried away, and must be carried away by radiation into the air or into water, but how much is the question. Water cooling or air cooling may be carried perhaps to too great an extent. The efficiency of the engine may be seriously cut down. Only careful scientific, practical investigation can determine these points.

The degree of compression in an automobile engine creates no end of discussion. Theoretically, the higher the compression the more power. Practically, this is not so, because of practical reasons. Overheating takes place, premature explosions take place, and more efficiency is lost by undue increase of compression than is gained. There is a midway point somewhere that can only be found by careful investigation along scientific lines.



The size of exhaust valves and inlet valves, their location in the engine, as regards each other, and cooled surfaces are talked of, each man having his own idea. Just the proper arrangements and dimensions will be decided by careful investigation, and in no other way.

It was assumed by a great many that because certain manufacturers had made bicycles in years past, and brought them to a high degree of perfection, that they could jump directly from the manufacture of bicycles of a perfect type to automobiles of a perfect type. The size of the problem confronting them was not properly realized. The automobile is a most complicated structure, called upon to endure more punishment than any other vehicle of transportation.

If no scientific investigation is undertaken, the points in question will gradually work themselves out after a long period of years. Schools and colleges will take up the investigation suggested after a while, when they learn that there are such problms. Scientific study will be obtained in that way.

But, if the manufacturers would only take up this same line of investigation when the time is ripe, much more could be obtained in a much shorter space of time. Moreover, the manufacturer standing back of and close to such investigation can do far more efficient work and reach much more practical results than any scientific school can possibly do. The school is not close enough to the industry and the practical side of it. It

Digitized by Google

THE FOUR CYLINDER ROYAL OF 1905.

works its experiments out along lines too scientific. There is no practical man around to hold the scientist down.

The scientific results obtained are studied by the practical men, and finally a commonsense result is arrived at, or a commonsense interpretation of the results is found.

Science has plenty of chance in connection with the automobile, but the best results will be obtained by a combination of science and practice and a systematic series of investigations into the vital prolems of the industry.

One of the most common errors in designing is to try to formulate something where there is nothing to formulate. Most of the few real failures in automobile design may be traced to the use of too many scientific formula, and not using the results of practical experience. The problems are so complex that scientific formula cannot be applied. A Belgian engineer tried to design entirely from scientific formula and made a 7 H. P. automobile that weighed 2600 pounds.

It is quite as useless to attempt to apply scientific formula to automobile design as it is to measure bricks with a micrometer. It may look scientific, but it is not.

HENRY SOUTHER.

Some Illuminating Facts.

In prosecuting their work of establishing their chain of depots at which their Prestolite tanks charged with gas may be bought or empty tanks exchanged for full ones, the Concentrated Acetylene Co., Indianapolis, have met with marked success. They have already appointed 106 agents between New York and Denver, all of whom will carry the tanks in stock. With 700 tanks in use during October, November and December, it was found that the average time of service—that is, before recharging was necessary—was seventy-two days.

Reproducing the Mercedes.

In the endeavor to build an exact replica of the 1905 Mercedes the Daimler Mfg. Co., who hold the American rights, have found it necessary to import a number of parts and some of the raw materials from which other parts are made, due, they say, to inability to induce steel makers of this country to produce the necessary alloys.

For example, the crank shafts will be of nickel steel from the makers supplying the parent company. The axles, gears and gear shafts will be forged from a special imported steel, identical also with that used in the Cannstadt Mercedes. The aluminum castings will be of practically the same composition as, and of equal strength to, those used abroad; and the small parts of steel and bronze will be required to stand the same tests. Even the radiator tubes are being made thinner than anything yet attempted by American makers, in comformity with the gauge of the originals.

In certain vital parts of the machine the actual parts made or used by the parent company have been imported. Thus, the axles will be not only of the same steel, but from the same forge shops and the same dies as those used by the parent company. The same is true of the steering gears and the ball bearings, which, used throughout the transmission system, are by the Daimler people said to constitute "one of the secrets of the extraordinary efficiency of the Mercedes cars."

Enormous Growth of French Industry.

The Chambre Syndicate de l'Automobile has just made a report to the Council of State on the growth and present extent of the automobile trade in France during the last few years. In 1898 French makers delivered 1,850 automobiles; in 1904 they delivered 22,000. The total value has grown from $80,000,000 francs ($16,000,000) in 1898 to 176,000,000 francs ($35,200,000) in 1904. The value of exportations in 1898 was 1,750,000 francs ($350,000); in 1904 it was 74,000,000 francs ($14,800,000).

Salaries now paid amount to 80,000,000 francs ($16,000,000). The industry employs 55,000 workmen, 25,000 miscellaneous employés and 20,000 chauffeurs and machinists.

Gives Cup to Encourage Body Building.

Recognizing that the increasing demand for comfort in automobile bodies is so rapidly adding to their weight that it is almost impossible for the manufacture of pneumatic tires to keep pace with the growing loads, M. Michelin has offered a trophy, to be known as the Michelin Cup, which shall be awarded to the constructor of the lightest automobile body for real touring. The body must have been run over a certain distance, and due regard paid to the matter of suspension. The cup has been accepted by the A. C. F., and a committee of selection is about to be formed. The cup will be of the value of $5,000.

Norwalk Has Visions of a Factory.

Negotiations are reported to be in progress between a "very desirable automobile concern," name not given, and a Norwalk (Conn.) business man, looking to the removal to that town of the plant of the concern. The latter is described as being desirous of increasing its output, and needs more factory space for that purpose.

Beginning Janugry 1, S. T. Klingensmith took over the duties of superintendent of the Keystone Automobile Co., of Pittsburg. He was formerly in charge of the branch of the Lake Side Battery Co., of Chicago.

CHANGES IN MERCEDES

Many Small but Significant Alterations Mad and Several Innovations Adopted.

The much-talked-of 70 H. P. Mercedes model has made its appearance on "the other side," and while it contains no sensational departures from the standard Mercedes practice, there is embodied in its construction a number of interesting features that are being commented on, particularly in French manufacturing circles. The car is unusually large; it is designed for a wheel base of from 86 inches to 101 inches, while the track is 56 inches.

The new features of the engine are that the two cylinder castings are further apart than usual, that the gear wheels (which are now fitted in front instead of behind) are enclosed in an aluminum casing, that the governor gear is, in consequence, slightly modified, that larger valves are used, that the igniters are fitted to the cylinders at an angle instead of on the side, as formerly, and that the cam gear operating them is entirely cased in. It is, moreover, designed to run at a higher maximum speed than previous engines—at 1,400 instead of 1,100 revolutions per minute—and all the bearing surfaces are proportionately larger. A special characteristic of the low tension igniters is that the insulated terminal can now be removed separately for cleaning, and that there are small pet cocks (for introducing gasoline to the contact points) arranged above the igniters in the cylinder heads, in addition to those fitted centrally above the cylinders.

A peculiar innovation is the provision of small spring-loaded valves in the top of each water jacket, which presumably serve the double purpose of relieving the pressure, should any steam be generated in the cooling system, and of enabling all air to be let out when filling up with water.

A considerable change has been made in connection with the lubricating system, which is now rendered automatic by the introduction of a mechanically driven pump, of the gear-wheel type, that supplies the required quantity of oil to all the bearing surfaces, and dispenses with the "splash" system.

Another important improvement is that the sliding exhaust cam shaft, which reduces the compression in all four cylinders, is automatically operated by the starting handle itself; the mere action of pushing the handle back into its engaging position renders it quite easy to turn the crank shaft.

The method of controlling the engine has been materially modified, and although the carburetter acts in very much the same way as before, yet a disc valve has been substituted for the piston valve. The throttle valve is now connected with the clutch pedal, so that the power of the engine is automatically reduced when the clutch is withdrawn, while an accelerator pedal is now provided for having a converse effect when depressed.

Owing to the increased length of the frame, and to the desirability of keeping the side chains reasonably short, the differential counter-shaft and the bevel wheels driving it are no longer contained inside the change-speed gear-box, but have a separate casing of their own which lies some little distance behind the gear-box. The position of the change speed-gear itself remains unaltered, and its design is practically the same as before. The gear-lever, however, is arranged so that it is drawn back towards the driver for the "second," for the "third," and for the "reverse" gears, while it is pushed forward, in the alternative slots, for the "first" and the "fourth" speeds—an arrangement which is a return to previous practice.

Perhaps the most ingenious innovation is the provision of an automatic sprag of the pawl-and-ratchet type, on the counter-shaft, which has already been referred to in these columns. This is so arranged that the pawl only comes into contact with the ratchet wheel when the car begins to move backwards, and that the pawl is, further, automatically lifted up out of the way when the reverse gear is introduced. This sprag device consequently needs no attention from the driver, and although it is always ready to come into action, yet—unlike most devices of its kind—it is quite silent. The pawl is normally controlled by a fibre friction wheel fitted on the counter shaft, and its connection with the reversing gear is made by a simple rod that forms a continuation of—and is hinged to—the sliding shaft in the gear box. The only drawback there appears to be to this device is that it is impossible to push the car backwards—as, for instance, in the garage—unless the clutch is held out of engagement, for the pawl can only be drawn out from the ratchet-wheel by introducing the reverse gear, and consequently the engine would prevent the car from being pushed, unless disconnected by the clutch.

Two foot brakes are, as usual, provided, in addition to the hand brake on the driving wheels. One of these is on the front end of the second-motion-shaft, and the other on the counter-shaft; both have hollow drums into which water is automatically admitted to cool them.

Kries Coquetting with Greenwood.

It develops that the deal whereby the Standard Engine and Automobile Works will locate at Greenwood, Ind., has not yet got beyond the talking stage. Joseph Kreis, representing the concern, was in Greenwood last week endeavoring to sell the eighty town lots offered as a bonus. Upon his success depends the success of the venture. Mr. Kries emphasizes the ability of those he represents to secure a bonus elsewhere in case Greenwood turns a deaf ear thereto, and local interests are asking for assurances that the plant will be operated if the proposed bonus is secured. Thus far the lots are not selling rapidly.

EFFECT OF SIDE ENTRANCES

Gives Designers Wider Scope for Their Talents and Purchasers More Latitude.

Until the appearance of the side entrance body nine out of ten cars carrying more than two passengers were of the tonneau type, in which the passengers sat facing partly forward and partly crosswise. This was not as comfortable a position as one facing entirely forward, as in a body of the surrey type, but this was considered to be compensated for by the greater passenger and luggage carrying capacity of the tonneau. This aside, however, there was little choice, for a rear entrance almost put a surrey arrangement of seats out of the question.

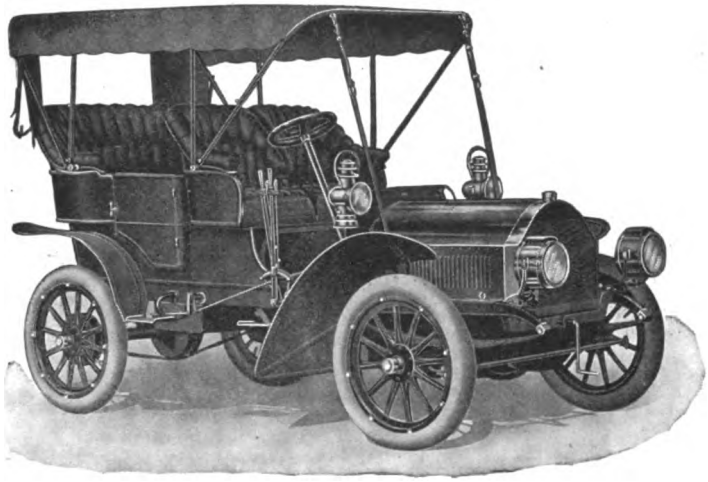
With the side entrance, however, the body designer or builder has his choice of the two types. The result is that surreys are distinctly gaining ground, without, however, pushing the tonneau into the background. The latter has, as stated, its advantages. If the outside body dimensions are sufficiently generous there is room, by carrying the seats forward on each side, to seat three or four persons without crowding, as well as to leave some room for luggage. With a surrey, however, only the width of the body can be utilized, and at the most there is room only for three passengers. But a surrey—or forward facing—seat is considerably more comfortable when a long ride is to be taken; both because there is more room for the legs and because there is no necessity for craning or twisting the neck to see in front.

So far, the result is that there is great diversity of opinion on the subject. Designers are no longer restricted to one model. They can take their choice of a variety of patterns, or even evolve a new type, as they did when they produced the now well known tonneau. It is by no means improbable that a composite body, incorporating the good points of both the tonneau and the surrey, will appear, in which case a warm welcome would almost certainly be accorded it.

Slusser Goes with Harrolds.

R. W. Slusser, who was in charge of the N. A. A. M. exhibit at the St. Louis Exposition, has been added to the staff of the Harrolds Motor Car Co., New York. Than Slusser few men have had more of that experience that should serve him to advantage in advancing the Harrolds line, Pierces and Oldsmobiles, in this vicinity.

Lake Shore to Adopt Motors?



From Buffalo comes the interesting rumor that the Lake Shore Railroad has ordered 100 gasoline engines with which to equip cars to fight the interurban trolley lines in its territory.

A. R. Bangs, Boston, Mass., has added the agency for the Baker electrics to his accounts.

Stevens's Four-Cylinder Car Appears.

As it was known to be in course of preparation, the submission of an entirely new and radically different Stevens-Duryea model will create little surprise in well informed trade circles. It is of the steadily wing family of side entrance cars, with a four cylinder vertical motor mounted in front under a hood. It is rated at 20 horsepower, weighs 1,650 pounds and lists at $2,500. As

THE 1905 STEVENS-DURYEA, $2500.

the illustration makes plain, the car is designed along good lines, and presents a distinctly pleasing appearance.

The pressed steel frame of channel section is carried on semi-elliptical springs, those in front being 40 inches long and the rear ones 44 inches. The front axle is tubular, 2 inches in diameter, and the rear one of 2¾ inch sections. These carry 30-inch artillery wheels, shod with 3½-inch heavy Fisk tires. The wheel base is 90 inches and the tread 56 inches.

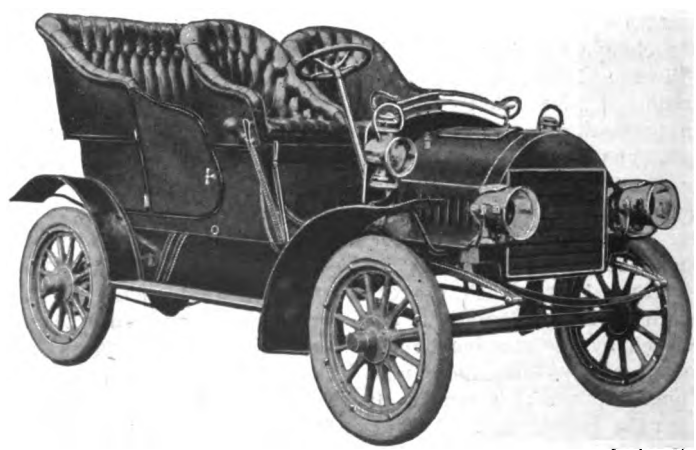
The engine has, as stated, four vertical cylinders, cast separately, and with water jackets and heads integral with the cylinders. The cylinder dimensions are 3⅞x4½ inches, and the valves are on the same side, the inlet being mechanically operated.

The transmission device consists of sliding gears in conjunction with a propeller shaft and bevel gear drive to the live rear axle. Three speeds and a reverse are furnished, and the drive is direct on the high speed. The clutch is of the multiple disk type, with leather bearing on steel, affording a splendid grip. A single float feed carburetter is used, with an automatic compensating device.

Reversible wheel steering is used, with Elliott steering pivots. The motor and transmission shafts have bronze bearings, the front wheels conical roller, and the rear wheels and pinion shaft flexible roller bearings. There are two expanding brakes on rear hubs and one constricting brake at rear of gear case. The method of lubrication is by multiple sight feed—the gravity system.

A cellular cooler of the Mercedes type is fitted, the circulation being by centrifugal pump. Jump spark ignition, the current being supplied by dry cells. Both ignition and throttle are operated by hand.

Jeffery's Expanding Export Trade.



The progressive King of Siam will hereafter move about in an American automobile—a Rambler. Thos. B. Jeffery & Co. have already shipped the car—a 1905 model, with canopy top and every other appointment that fashion and regal ideas could conceive. It is expected to start the Siamese trade Rambler-wise. It is but one of approximately one hundred Ramblers that have been shipped to the Orient by Jeffery & Co. during the past season, due in part to the excellent work done by their representative who toured the Far East in 1903 on a Model E car. Indeed, during the last ten days shipments of Ramblers were made to New Zealand, Australia, South Africa, Siam, India and Italy.

Regarding the New Reliance.

The rejuvenated Reliance Automobile Mfg. Co., Detroit, Mich., which recently received an influx of new capital ample to place it on a sound and prosperous footing, is preparing to market a car that is expected to prove a tempting bait for buyers seeking exceptional value for their money. Ample facilities for its manufacture are possessed by the Reliance company, and it is preparing to turn out 1,000 of these cars for the 1905 trade. A sales organization commensurate with the producing end is being perfected, and it will undoubtedly prove equally effective.

The car, which is styled the Reliance, is of the popular side entrance type, similar to the original Reliance car, which, although it is not generally known, is claimed to have been the first car in this country to be built as a tonneau with side entrance. The power plant consists of a double cylinder opposed engine, rated at 16 horsepower, and possessing remarkable flexibility. A distinctive feature is the control system, the friction clutch and expansion brake being operated entirely by means of a single foot pedal, which is claimed to give the entire speed range of from two to forty miles an hour on the direct drive, affording free use of the hands and prolonging the life of gears indefinitely. Spark and throttle control is secured by means of ratchet levers mounted on the steering tube, the supply of fuel being regulated for uniform speeds in this way, with a foot accelerator for emergencies.

The wheel base is 92 inches, and the car weighs about 1,700 pounds. The price is $1,250.

THE 1905 RELIANCE, $1250.

How Imports Have Increased.

Just over 500 is the record of foreign cars imported into this country during 1904, making almost double the number entered during 1903. The value of these 500-odd cars is placed by Appraiser Whitehead of the Port of New York at, approximately $1,700,000.

How great the increase is may be seen from a comparison with the previous year, when the automobile imports at New York were 253 machines, which the appraiser found to have a total value of $800,000.

Harvey T. Andrews, Assistant Appraiser of the Ninth Division of Appraiser Whitehead's office, who is charged with the immediate examination and appraisal of automobiles, said that naturally the appraised values of the automobiles as returned to Collector Stranahan give an inadequate idea of the price paid to agents on this side by the public. To the appraised values as returned by the customs officers are added the customs duties, agents' commissions, freight charges and other expenses, so that by the time the automobiles are turned over to individual buyers the selling prices far exceed the values put upon the machines by the Custom House.

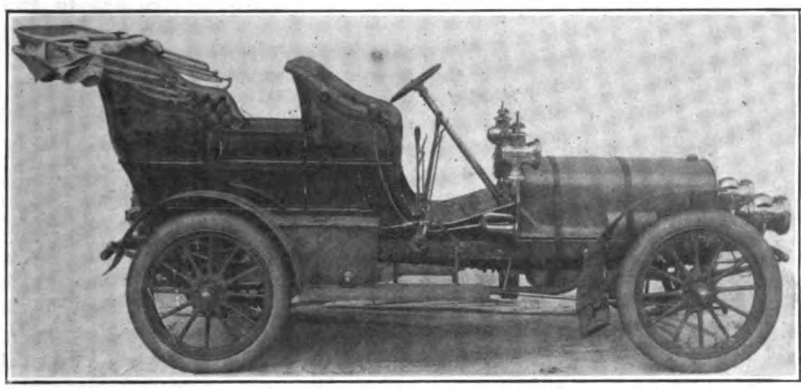
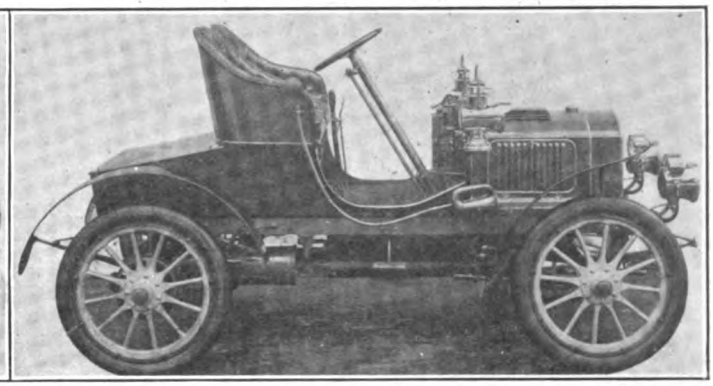
ACME'S 1905 LINE

Pennsylvania Concern's Attractive Productions Bear Signs of a Strong, Improving Hand.



Among the concerns that will this year market a side entrance car of approved modern design, with a four cylinder vertical engine, is the Acme Motor Car Co., Reading, Pa. This car, which is styled the Acme Type 8, is, as the accompanying illustration makes plain, of handsome appearance, and quite bears out the claims put forth in its behalf by the Pennsylvania concern during the past few months. It will be the company's leading model. In addition, there will be marketed two double cylinder cars—a tonneau and a touring runabout—and a single cylinder runabout.

The Acme Type 8 is rated at 30 H. P. and priced at $2,750, with folding Cape Carte top and full equipment. Type 6 is a 16 H. P., rear entrance tonneau car, listing at $1,650; Type 10 is termed a touring runabout, having seating capacity for two passengers regularly, with a dos-a-dos attachment, developing 16 H. P. and costing $1,000; while Type 9, at $800, is the lowest priced model. It is a runabout and is rated at 9 H. P.



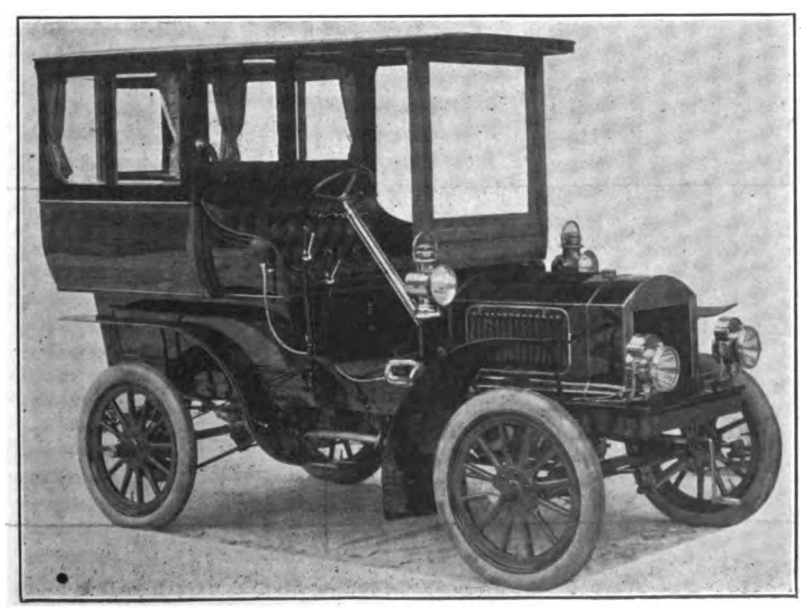
The chassis of Type 8 consists of a pressed steel frame, mounted on semi-elliptic springs front and rear, the former being 42 inches long and having 7 leaves, and the latter 48 inches with 9 leaves. This chassis is imposed on 34-inch artillery wheels, having 12 spokes each and shod with 4-inch tires of any standard American make. The wheels are set well apart, the base being 102½ inches. The tread is 56 inches, and there is 10 inches clearance between the ground and the lowest part of the mechanism. The front axle is tubular, 2 inches in diameter, and the solid rear axle is made of 1½ inches square nickel steel.

The car is driven by a four-cylinder vertical engine, mounted in front under a bonnet. The cylinders are cast separately, the water jackets and cylinder heads being integral with the cylinders. The latter have a bore of 4 inches and a stroke of 5 inches. The engine speed ranges between 200 and 2400 R. P. M., the rated power, 30-Horse, being developed at a normal speed of 1000 R. P. M. The valves are located on the same side, the inlet—which is automatic—being immediately above the exhaust.

The transmission is of the well known sliding gear type, with double chains to the rear wheels. Four speeds forward and a reverse are provided, the drive being direct on the high gear. The transmission bearings run on balls, while rollers are used for the wheels and jack shaft, and plain bronze for the engine bearings. Two compensating band brakes are fited to the rear wheels and a similar number on the jack shaft back of the differential. Steering is by wheel, irreversible, with quadruple screw and nut. A governor is fitted on the throttle, which is also controlled by a lever; a hand lever controls the ignition.

ACME, TYPE 8, $2750.

ACME, TYPE 10, $1000.



Ignition is by jump spark, with coil and high tension magnet; current is provided by high tension magnets and storage batteries.

A float feed carburetter is employed, automatically compensating and governing. The clutch is of the conical type, the surfaces being leather against cast iron. The clutch is self centering and self contained, and there is no end thrust on the bearings.

The body is of the double side entrance tonneau type, seating five to seven passengers; the front seats are of the popular divided type. The car weighs 2,300 lbs.

Types 6 and 10 have many points of similarity, both being driven by a two cylinder vertical engine having cylinder dimensions of 4x5 inches and developing 16 H. P., at a normal speed of 1000 R. P. M. The same general design employed in the four cylinder engine has been adopted in the case of the one in question. The frames, however, are of armored wood, with platform springs, on the Type 6, and semi and full elliptical springs on the Type 10. The wheels of the former are 32 inches, with 3½ inches, and the wheel base 84 inches; while the latter has 28 inch wheels, 3 inch tires and 79 inches wheel base. Both cars have three speeds and reverse, the Type 10 having sliding gears and double chains and Type 6 sliding gears and bevel gear drive.

A single cylinder engine drives the Type 9, the dimensions being 4⅛x5 inches, developing 9 H. P. The transmission is identical with that of Type 10, as are the frame, wheels, wheel base and other important details. The seats are divided, with sloping back; a dos-a-dos is also fitted.

ACME OPERA 'BUS, $2000.

Morris Names His Committees.

Standing committees to serve during the ensuing year have been appointed by President Dave H. Morris, of the Automobile Club of America, as follows:

House Committee—Capt. Homer W. Hedge, chairman; Gen. George Moore Smith, Robert Walton Goelet, W. H. Browning and J. V. Black.

Law Committee—Winthrop E. Scarritt, chairman; W. W. Niles and another to be chosen.

Committee on Membership — Emerson Brooks, chairman; Clifford V. Brokaw and John V. Trevor.

Racing Committee—George I. Scott, chairman; William K. Vanderbilt, Jr., and D. H. Morris.

Library Committee—A. R. Shattuck, chairman, and Philip T. Dodge.

Good Roads Committee—A. R. Shattuck, chairman; William Rockefeller, J. F. Plummer, Jr., and M. D. Chapman.

Runs and Tours Committee—M. M. Belding, Jr., chairman.

Foreign Relations Committee—Chauncey Gray Dinsmore, chairman.

Exhibition Committee—Gen. George Moore Smith, chairman.

Motor Boat Committee—J. H. Carpenter, chairman; Frank Croker, P. Chauncey Anderson and C. V. Brokaw.

Technical Committee—Dr. Schuyler Skaats Wheeler, chairman.

Chicago Thief Confesses.

Time was when automobiles were safe from theft, both because of the knowledge required to operate them and by reason of the fact that, if stolen, they would be difficult to dispose of. Both obstacles have been overcome, however. Whether chauffeurs have turned thieves or thieves learned the art of chauffeuring is still not clear; but it makes no particular difference which it is, as long as automobiles are stolen. The latest development is that dealers are to be found who will buy stolen cars. A Chicago thief who was run to earth last week confessed that he had disposed of one of the cars he had stolen to a Wisconsin dealer. The latter must have been either extremely credulous or downright dishonest to have purchased the car from an utter stranger.

Another Tall Tale from Paris.

Parisian motorists who wish to earn a few dollars "on the side" have hit upon a new scheme, and as a result automobiles plying for hire are appearing on the streets of Paris in a new guise. A certain number of them daily take their stand like ordinary fiacres, and any one who is desirous of going out for a day, half day or even an hour's automobile run can engage their services. They are generally driven by experienced chauffeurs, who appear usually to be the owners of the vehicles as well as their drivers, and it is stated that their politeness to customers forms an agreeable contrast to the offensive demeanor which is a characteristic of the Paris cabby.

Germany's Two Open Contests.

The International Herkomer touring competition, so-called because it was originated by and its most valuable prize donated by Hubert von Herkomer, the famous Bavarian painter, which was to have taken place last summer, will be conducted in August next. The conditions and minor details of the contest have just been given out.

The Herkomer competition is open to members of any automobile club whose names are sent in by the secretaries of the clubs, accompanied with the entrance fee of $60, to the secretary of the German Automobile Club before May 31, 1905. The Herkomer competition will occupy six days, as follows:

First day—Exhibition in Munich of all vehicles entered, to be judged upon as to beauty and practical use of coach work.

Second day—Hill climbing contest on the Kesselberg, four and one-half miles.

Third day—Speed trials on level stretch in Forstenrieder Park, near Munich, three and three-fifths miles.

Fourth, fifth and sixth days—Touring reliability trial over this route: Munich, Bruck, Ausburg, Ulm, Tübingen, Baden-Baden, Stuttgart, Nuremburg, Regensburg and back to Munich. An observer will be placed on each car during the touring trial to note the number of involuntary stops, their cause and length of time. Reliability and not speed will count.

The prizes offered are numerous and valuable. The Herkomer trophy, valued at $2,000, must be won twice within three years to become the property of any competitor. The second and third competitions are to take place in the country of the previous winner, under the management of the club to which the competitor belongs. The winner in the Herkomer competition will also receive an honorary prize, a work of art valued at $400. The winner in each years contest will have his portrait painted by Hubert von Herkomer. A silver trophy, valued at $200 will be given for the best average speed in hill climbing and running on flat. Another silver prize, worth $200 will be given for the handsomest and most practical coach work.

The Bleichroeder international race will start immediately after the Herkomer competition, and will last two days. The race is open to all racing machines weighing up to 2,204 pounds, and in case of magneto ignition, up to 2,222 pounds. The entries close June 30, 1905, and the fee is $60. A hill climb up Kesselberg will be the first day's attraction, and on the following day a three and three-fifths mile run in Forstendrieder Park. The best average time will decide the event. A first prize of $1,600 cash and a second prize of $400 cash is offered.

The present coaches in Denmark are to be replaced by automobiles. This is the result of the activity on the part of the Automobile Club of Denmark, which for some time past has been endeavoring to persuade the authorities to relinquish the primitive vehicles and replace them by automobile 'buses.

For Use in the Gold Fields.

The four cylinder Columbia which L. L. Patrick recently purchased in San Francisco to carry passengers between Tonopah and Goldfield, Nev., made the trip overland from the Golden Gate without any mishap except a broken spring owing to bad bridges near Sacramento. It reached Reno, Nev., one of the most difficult trips in the West, in four days, though some of the roads were in very bad condition. There are no roads to speak of in the vicinity of Tonopah, and operators are compelled to use a compass to guide them. The distance between Tonopah and Goldfield is about thirty miles, and a Winton Quad, which has been carrying passengers between the two places, is giving excellent service over the rough mountain roads.

Want the Golden Gate Opened.

Some of the roads in Golden Gate Park, San Francisco, are closed to automobiles, and an effort is to be made by the San Francisco Chauffeurs Association to have them opened. A committee has been appointed, consisting of President T. P. Jarvis, Robert Turner, F. W. Hoadley and A. J. Cleary, to send a letter to the Park Commissioners asking for more liberty. The letter will be followed by a petition bearing the signatures of motorists and of many horsemen and owners of private conveyances who do not object to automobiles. Both the letter and the petition will contain a clause from the rules of the association calling attention to the fact that members violating any ordinance will be expelled.

Why the Mayor is Wroth.

Mayor Jeffrey of Columbus, Ohio, will recommend to the Council of his city that an amendment be added to the local law regulating automobiles prohibiting any one but the owner of a car from taking out a license. He recently had a narrow escape from being run over by a scorching motorist who was driving a car which he did not own and which bore a license tag which had been secured by still another person. The Mayor is also in favor of enforcing that part of the present regulation which requires motorists to use lamps at night which throw a light on their license tags.

For the Exploration of Sahara.

Further exploration of the Desert of Sahara in automobiles is likely to take place. M. Pierre de Marglaida, a member of the Algerian Automobile Club, has given a challenge cup for the automobilist who penetrates farthest into the Sahara each year. The cup will become the possession of the holder after being won thrice. The conditions will be fixed by the Algerian club.

Suit Based on Inferior Gasolene.

Dr. Wilbur S. Conkling, of Des Moines, is a gentleman of large faith. He has commenced an action in the district court asking for $1,000 from the Standard Oil Company for the burning of his automobile, claiming that an inferior grade of gasoline was sold to him.

ROAD RIGHTS IRREVOCABLE

Counsellor Terry Digs Deep into Legal Authorities and Quotes Them to Advantage.

In the opinion of Charles Thaddeus Terry, counsel to the National Association of Automobile Manufacturers, the order issued a short time ago by the County Court of Grant County, W. Va., excluding automobiles from the highways, is clearly unconstitutional. This contention is upheld by Mr. Terry in an elaborate opinion, fortified by citations from decisions in that and other States, which he has prepared at the request of the N. A. A. M. To a Motor World man on Wednesday Mr. Terry stated that he believed that it would be an easy matter for any motorist in Grant County to have the order revoked by instituting legal proceedings with that end in view.

The order in question was issued on October 5 last, and was widely commented on at the time. The full text of the order is as follows:

"At the County Court held for the County of Grant, at the courthouse thereof, on the 5th day of October, 1904, the following order was made and entered:

" 'It appearing to the court that by reason of the running of automobiles upon the highways of Grant County, injury to both the person and property of some of its citizens has been sustained;

" 'And it further appearing to the court that the public sentiment of the people of the county is against the running and operation of such machines in this county, it is thereupon ordered that all persons be and are hereby prohibited from running and operating automobiles, or machines of like character, upon any of the highways of this county, and the several superintendents and surveyors of roads of the county are directed to strictly enforce this order. Any one violating the provisions of this order will be subject to a penalty of $100.' "

It appears that David L. Luke, a motorist resident in Grant County, approached the N. A. A. M. on the subject of the validity of the order. The executive committee of the association gave the matter attention at its last meeting, and directed Mr. Terry to prepare an opinion on the validity of the order for the benefit of Mr. Luke and any other persons interested. This Mr. Terry did, and the result is the opinion referred to, which is lengthy and deals with the subject in an exhaustive and able manner.

"This order absolutely forbids and prohibits to automobilists the use of the public highways in Grant County, and would be comic in its absurdity were the results of its enforcement not so pernicious," he says. "However, the logic and propositions of law necessary to determine that so despotic a mandate cannot long stand are not far to seek. The very purpose of the framers of the United States Constitution, as stated in the preamble thereto—namely, to secure the blessings of liberty to ourselves and our posterity—would be far from accomplished if such an order could be permanently enforced. It is so much in contravention of the very spirit of liberty dominant in the United States that any American schoolboy should, without hesitancy, declare it void. When we seek to give the grounds for the unconstitutionality of this order our difficulty comes not in finding reasons, but in attempting to make any orderly arrangement of our reasons. They may, however, all be comprehended under the following general heads:

"First—It is an illegal usurpation of the powers of the legislature by the judiciary.

"Second—It is in violation of the Fifth and Fourteenth amendments of the United States Constitution and in violation of Article II, Section 6, of the West Virginia constitution, in so far as it deprives citizens of both liberty and property without due process of law.

"Third—It is an excess of the police power of the State, and a deprivation of both liberty and property without due process of law.

"Fourth—The order discriminates between users of the highways and deprives automobilists of the equal protection of the law, and is therefore unconstitutional and void."

In regular order Mr. Terry then proceeds to marshal his facts in support of these contentions. Referring to the first, he traces the functions of two of the three branches of this country's government, viz., the legislative and the judicial. The function of the latter, he says, is to interpret and construe the laws made by the legislature. The province and duty of judges is to determine what the law is upon existing facts, while that of the legislature is to make laws. He cites decisions, some of them from West Virginia, to support his claim that courts have no power to make laws, and that even legislatures have no right to delegate their power to courts. He quotes from the constitution of West Virginia to the effect that the three branches shall be "separate and distinct so that neither shall exercise the powers properly belonging to either of the others." This condition of affairs must continue to exist until the constitution itself is changed, he says.

The second contention is next taken up, viz., that the order is a violation of both the United States and the West Virginia constitutions.

"The constitution of the State of West Virginia, Article II, Section 6," he says, "provides:

" 'No person in time of peace shall be deprived of life, liberty or property without due process of law.'

"The Fourteenth Amendment of the United States Constitution contains a similar provision, together with the guaranty that no State 'shall deny to any person within its jurisdiction the equal protection of the laws.' It is not necessary that a man's property be physically taken from him before it can be said that he has been deprived of his property, nor that he be imprisoned before it can be said that he has been deprived of liberty. The proposition that a citizen is deprived of both liberty and property by restriction of his right to use his property as he may see fit is one that cannot be doubted. Likewise deprivation of a party of any of the rights which are possessed by persons generally is the depriving of his liberty within the meaning of the Constitution.

"The general law on this subject is well stated in 10 A. M. & Eng. Ency. of Law, 2d Ed., 209-299, as follows:

" 'It is also considered that any person may be deprived of his property without any physical taking thereof, and the Constitution is violated by any law which destroys the value of the property, takes away any of its essential attributes or deprives the owner of the lawful use of it.'

"An extended examination of the authorities discloses that this view is sustained in the cases generally.

"In the matter of Jacobs, reported in 98 N. Y., 96, Judge Earle says:

" 'The constitutional guaranty that no person can be deprived of his property without due process of law may be violated without the physical taking of property for public or private use. Property may be destroyed or its value may be annihilated. It is owned and kept for some useful purpose, and it has no value unless it can be used. Its capability for enjoyment and adaptability to some use are essential characteristics and attributes without which property cannot be conceived; and hence any law which destroys it or its value or takes away any of its essential attributes deprives the owner of his property.

" 'The constitutional guaranty would be of little worth if the legislature could, without compensation, destroy property or its value, deprive the owner of its use, deny him the right to live in his own house or to work at any lawful trade therein.

" 'So, too, one may be deprived of his liberty and his constitutional right thereto violated without the actual imprisonment or restraint of his person. Liberty, in its broad sense, as understood in this country, means the right not only of freedom from actual servitude, imprisonment or restraint, but the right of one to use his faculties in all lawful ways, to live and work where he will, to earn his livelihood in any lawful calling, and to pursue any lawful trade or vocation. All laws, therefore, which impair or trammel these rights, which limit one in his choice of a trade or profession, or confine him to work or live in the specified locality or exclude him from his own house or restrain his otherwise lawful movements, are infringements upon his fundamental rights of liberty, which are under constitutional protection.' "

The third contention is then taken up, viz., that the order is in excess of the police power and a deprivation of liberty and property without due process of law.

"Any legislation to be warranted by the police power must be exercised for the benefit of all classes of the public, and must not

Digitized by Google

work an oppression upon any one class," he says. "The moment the legislature passes the limits required by the necessities of the public, regarding the use of the particular thing regulated, then the constitutional provisions regulating the deprivation of property or liberty are violated, since such restrictions cannot be deemed to constitute due process of law. It hardly requires any argument to show the order under consideration is both unreasonable and beyond the limits required for the protection of public safety. The extreme unreasonableness of the law may be seen when we consider the damage that might result from the prohibition of his right to operate an automobile."

"The rule as to the exercise of police powers is clearly set forth by the United States Supreme Court.

"In the case of Lawton vs. Steele, 152 U. S., 38 L. Ed., 385:

"'To justify the State in thus interposing its authority in behalf of the public it must appear, first, that the interests of the public generally, as distinguished from those of a particular class, require such interference, and, second, that the means are reasonably necessary for the accomplishment of the purpose and not unduly oppressive upon individuals. The legislature may not, under the guise of protecting the public interests, arbitrarily interfere with private business or impose unusual and unnecessary restrictions upon lawful occupations. In other words, its determination as to what is a proper exercise of its police powers is not final or conclusive, but is subject to the supervision of the courts.'

"This case has been generally quoted and approved by the State courts. In the New York case of Colon vs. Lish, 153 N. Y., 188, the court says:

"'The legislature is not vested with the power to arbitrarily provide that any procedure it may choose to declare such shall be regarded as due process of law. If it possessed that power the guaranty of the Constitution would be rendered unavailing and private rights of citizens would be within its absolute control.'

"Similarly in the case of the matter of Jacobs, previously quoted, we find the following:

"'Under the mere guise of police regulations personal rights and private property cannot be arbitrarily invaded, and the determination of the legislature is not final or conclusive.'"

Finally, Mr. Terry supports his fourth and last contention, that the order is void as discriminating between users of the highways, and its corollary that this deprives automobilists as a class of the equal protection of the laws. He ascribes the order to an "insane and jealous prejudice" against automobilists. He contrasts the danger from a horse and an automobile, to the favor of the latter, saying that accidents from its use result only from careless or reckless handling. The famous case of Mason vs. West, 61 App. Div., 40, is referred to, in which it was held "that the use of the streets must be extended to meet the modern innovation of rapid locomotion," and that it is not meant "that an automobile or any other modern means of conveyance is an unlawful or improper user."

Proceeding along this line, Mr. Terry says that it is too late to question the fact that the automobile has come to stay. He declares that the time is now almost passed when automobilists are regarded as criminals. Highways have always been considered public property, and each citizen may use them in such lawful manner as he sees fit, provided he does not interfere with similar rights of others.

The provisions of the order in question should in reason apply to all vehicles alike, says Mr. Terry. If it does not it is void. He cites decisions in support of this, one of them, in the case of Walston vs. Nevin, 28 U. S., 578, as follows: "Unless the law operates alike on all persons and property similarly situated, equal protection is denied and such legislation is unconstitutional."

Crossed Desert and Mountain Range.

Covering 110 miles over mountain roads, across numerous streams and part of the Mojave Desert, and climbing from sea level to an elevation of 7,000 feet in 7 hours and 25 minutes actual running time is one of the latest achievements to the credit of an automobile. This trip was made recently from Los Angeles, Cal., to the Big Horn mine, at the summit of the San Gabriel Range, by F. C. Fenner, a mining engineer of Los Angeles. The journey was made in a White steamer, which was driven by H. D. Ryus, of Los Angeles. They encountered a rise of 800 feet in the last mile and a half.

The entire time consumed by the journey was 9 hours and 5 minutes, of which 1 hour and 40 minutes were used for dinner and other stops. On the return trip, the next day, the car travelled the last seventy miles into Los Angeles in 4 hours and 45 minutes. In addition to its passengers, $2,500 in pure gold was carried—and over a "hobo" infested route, too.

Mr. Fenner is general manager of the Lowell & California Mining Co., and is required to make frequent journeys to the Big Horn mine. He was so pleased by the performance of the car that he bought it from the White agency on his return to Los Angeles.

Farson Resigns the Presidency.

Chicago clubmen are mourning the resignation of President John Farson, which was presented last week. Nominally the resignation does not take effect until March 1. By agreement, however, the actual duties of the presidency fell upon Vice-President Ira M. Cobe on January 1.

"My business compels me to be in New York so much of my time," Mr. Farson is quoted as saying, "that I have felt it justice to the club to resign. There is the most harmonious feeling in the club."

It was only about a couple of months ago that John Farson was unanimously re-elected president of the Chicago Automobile Club. He has long been the leading spirit in the opposition to the numbering and licensing schemes of the Chicago authorities, and again and again has thwarted them in their efforts to enforce them. His cleverly planned and executed injunction coups have attracted wide attention, and he has held his club to a pretty consistent stand of opposition in spite of some disposition to vacillate.

U. P. to Use Railroad Automobiles.

Dispatches from Omaha, Neb., state that the Union Pacific Railroad at last has adopted a type of gasolene motors to use on its branch lines in Nebraska and Kansas. This month will see a number of them installed, it is said, and soon all the smaller branches of the company will be equipped with this type of motive power, to the exclusion of the locomotive.

In general appearance the new car is about the size of an ordinary railroad coach, one end being fitted up for passengers and the other end as a baggage and freight car. The motor is between the two. It is expected that the car will develop sixty miles an hour, and its use will enable the company to give more frequent service on its branch lines. Only a motorman and conductor are necessary to run this car, and the company will save the expense of train crews.

Seven Nations File Entries.

Seven different countries have qualified for competition in the Bennett Cup race by depositing $600 each with the Automobile Club of France and making formal entry of a team. The list closed on Saturday, December 31, as under the rules governing the contest entries must be in the hands of the cup holding club by the end of the year. The seven countries entered are Germany, Great Britain, Austria, the United States, Italy, Switzerland and France, the latter being now in possession of the cup.

The Green Dragon a Trotting Horse!

The practice of applying fanciful titles to racing cars has its drawbacks. Thus the Panama Star and Herald prints an alleged cable dispatch from Fresno, Cal., gravely stating that "the world's trotting record had been broken by the American horse 'Peerless Green Dragon,' driven by Barney Oldfield." Not even the fact that the time given was for fifty miles, in 48:39 1-5, shed light on the Panama publication.

Woe of Panama's Lone Motorist.

There is just one automobile in Panama, and its owner, D. Carl Henry, is not wholly happy. "The available gasolene has given out," he writes the Motor World, "and I am awaiting the arrival of a fresh supply from the States before I can use my car."

A movement is on foot among French motorists to establish a "Ligue des Chauffeurs." It will be formed along the lines of the Motor Union in Great Britain.

ABOUT BALL BEARINGS

Signs of Increasing Favor Apparent—Souther Answers Some of the Objections to Them.

Ball bearings are slowly and surely creeping into favor again. There was a time when they had received some very black eyes, and were apparently sidetracked forever. Gradually some of the lighter machines adopted them on the wheels or elsewhere, and they gave satisfaction. Naturally, manufacturers of a medium sized machine began to use them, and were successful by simply increasing the diameter of the balls used.

Six or seven years ago the writer broached the question of ball bearings to one of his clients and was laughed at, saying they were absolute failures for heavyweights. I took the ground then that if the size of the ball was suitably proportioned to the weight it must carry they would be successful. It is logical and natural to believe that if a small ball will carry a small load, a large ball will carry a larger load.

Such has proved to be the case, and I now firmly believe that, with a perfectly designed bearing, there is no service to which a ball bearing may not be applied successfully, as far as the wear of the bearing is concerned.

The only obstacle met with is the difficulty of making large bearings cheaply and as accurate as they must be. It is difficult to get a large cup, perfectly symmetrical, and keep it so during hardening and tempering operations.

The design of the bearing is much more important than the quality of the material entering into the balls and races. It is quite possible to design a bearing which will crush or otherwise destroy any balls or cones that go into its make-up. Bearings have been seen by the writer so constructed that when the load came upon the ball, the tendency was to thrust it, not normally or nearly so, against a bearing surface, but toward a wedge-shaped opening, the ball acting as the wedge and tending to spread apart the elements of the bearing or be crushed. No ball or material can stand under these circumstances.

Another idea that has led many designers into trouble is that the ball must have point contact only and run upon a line, the smaller the better. This idea is most fatal to a ball bearing. The moment a little pressure is brought to bear upon a ball, it bears upon a surface by compressing the metal, instead of upon a point. As it rolls along it deforms the surface of the metal repeatedly in finding a suitable area upon which to support its load. After this deformation has gone on for a little while, the steel begins to disintegrate, if it is hard, or spread out if it is soft. The bearing goes to pieces very rapidly under these conditions. The obvious and only way to avoid such behavior and to get the very best out of a ball bearing is to give it what it will take, and it must have a suitable surface to run upon while carrying a heavy load.

The experience of the writer has shown that this solution is entirely possible for all ball bearing construction, and that there will be no deterioration of ball or cone or cup when so constructed.

The radius of the cup and cone should be made to conform to the radius of the ball as nearly as is commercially practical.

Objections will be raised that this will increase the friction of the ball bearing to a very great extent. In answer to this objection the writer can state that careful tests made under very heavy loads have positively demonstrated that the friction between the ball bearing in which the radius of the ball conforms closely to that of its bearing surface and one where a ball bears on a point only is immeasurable; in fact, the friction of the ball bearing may be practically disregarded as an element in the construction of an automobile. When compared with the friction of the tire rolling on the ground, it is nothing.

HENRY SOUTHER.

Why New Bids were Called for.

Bids for "one or more" automobiles were recently advertised for by the San Francisco Fire Commission, but no cars have yet been purchased. There is quite an interesting story behind the delay in purchasing the machines, which were to take the place of buggies for the use of the chiefs of the department. When the various dealers read the specifications upon which to base their bids they were amazed to find that but one firm had any chance to get the contract, as the specifications were so worded that the Autocar was the only machine that fitted the description. The dealers selling other cars made such a strong protest that the bids were rejected and a more flexible set of specifications were ordered drawn up that would give all machines a chance in the competition. It is said that in the original specifications even the width of the seat was specified as 38 inches, which is the width of the Autocar seat.

For Quick Seasoning of Wood.

A new method for seasoning timber has been adopted by several European automobile works. The advantages claimed are that the process seasons newly felled timber within a few days, increases its strength, toughness, durability and resiliency. It reduces also the porousness, thereby diminishing its tendency to shrink, expand, or warp, and split, and it prevents dry rot and the penetration of wood-destroying germs. As it improves the appearance of many kinds of woods, it is particularly suitable for decorative purposes. The process is both novel and simple, every fibre becomes thoroughly impregnated, and owing to the reduction of the porousness of the wood it gives a much finer polish. The cost of the whole process, which is applicable to every kind of timber, compares most favorably with that of other methods of preserving and seasoning timber.

WOODBURY, HIS REASONS

Why He Chose Foreign Cars for City Use Imagines They Give no Trouble.

In asking a week or two ago for an appropriation of $5,000, with which to buy two automobiles for use in his department, Commissioner John M. Woodbury of New York's Department of Street Cleaning stated that he proposed to purchase foreign cars with this money. He was quoted as saying that the latter at $2,500 apiece were vastly better than domestic cars at $1,800.

With the purpose of "drawing out" Major Woodbury and ascertaining why he considered foreign cars superior, a Motor World man sought and found the Commissioner at his office in the Park Row Building on Wednesday morning. In spite of his being a tremendously busy man, working under double or triple pressure in consequence of the ten-inch fall of snow the night before, Major Woodbury gave generously of his time in discussing the subject, and showed himself to be keenly interested and possessed of a splendid grip of the essentials of the matter.

"Yes, I got the money, and now have the cars in service," he said in reply to the first question. "They cost me $2,500 apiece; one is of French, the other of Italian manufacture; both were second handed, but neither had been driven more than a few hundred miles."

"You prefer foreign cars and consider them superior to the American product?"

"Yes."

"May I ask why?"

"Because they are," the major replied with a snap of his jaws and an emphatic nod of his head.

"But again, why?"

"Because they are; because they run—run all the time, everywhere and under all conditions.

"Now, look here: We have more than one thousand miles of streets to look after. We must inspect these—not slowly and at our leisure, but in a hurry and at all times. No horse can do the work we have to do. Therefore we use automobiles. We have a number of them—not foreign ones only, but several domestic ones—and shall want many more. Where we shall get them is a question of absorbing interest. We load these automobiles up with four or five men and send them all over town, over rough streets as well as smooth ones. We stop suddenly and we start suddenly, and that is where most of the domestic automobiles fail. They won't stand the racket."

These remarks were hurled at the Motor World man in disjointed sentences and amid many interruptions. Clerks ran in and out of the office, delivered messages and received orders, the telephone rang about every other minute, and documents for Major Woodbury's signature were thrust under his hands whenever the latter were not otherwise employed.

Digitized by Google

Two sheepish looking teamsters were brought in and summarily discharged by the Commissioner himself, after a short and heated dialogue, they having been caught red handed in the act of dumping snow taken from the streets into manholes. In the midst of this episode the Motor World man made a move to withdraw, but Major Woodbury stopped him with voice and extended arm.

"Come back here," he cried. "I want to talk to you. Tell me why we can't make as good automobiles as they do abroad?"

He was assured that we could and did, and half a dozen names were mentioned of cars in the foremost rank. In return Major Woodbury was asked if his poor opinion of domestic cars was based on actual experience with them.

"Of course it is," he replied. "Don't you suppose every dealer in town has been to see me and get me to try his car? Of course they have, and a nice time I have had with them."

"Well, what happened? Give me some specific cases."

"I'll give you plenty of them," was the quick reply. "To begin with, there was the Franklin (an air cooled car); we hadn't got half a mile with it before it heated and stopped dead, and we had to abandon it. Then there was the Knox; it did get us to Brooklyn, and there it broke down. What happened to it? Why, it broke down."

"But there must have been some particular part that gave way. It couldn't have been like the One Hoss Shay and gone to pieces all at once," it was suggested.

"Oh, I suppose not, but I don't know. I never heard what ailed it. Next there was the Winton. Its transmission gear went all to pieces and it stopped.

"What caused it?"

"Well, we found that a piece of wire that was in the street flew up and got caught in some part of the gear and caused the damage."

"But wouldn't the same thing have happened to your French car or any other?" was asked.

"Oh, no; it wouldn't have hurt it," was the confident reply.

"But why?" the Motor World man persisted. "If that wire had got caught in the sliding gears of the French car I am sure it would have stripped or broken them; such things have been known to happen, even to French cars,"

"Well, if it had it would have been an act of God," was the naive reply.

"There's the Pope-Toledo," he went on. "We tried it and it did well; we thought it would prove all right, but then it broke a rear axle in a rut, and, of course, that ended it. A Ford did pretty well, too, but something, I don't remember what, happened to it."

"There was the Premier we tried last year," remarked an official who had been an interested listener to the conversation. "It ran all right, but we broke a steering knuckle one time and an axle another. But we did have a pretty heavy load on it," he added.

"What do you think of the Searchmont? Is that a good car?" asked another official.

"It isn't made now, but the last cars they turned out all right; they were learning to make a pretty good car."

"Well, that Searchmont is the best domestic car we have in the service," was the reply. "It runs all the time, the same as the French car."

"There is the Locomobile," said Major Woodbury, coming into the conversation again after declaring that one American car was "putrid," so bad was it. "We tried one of them; it was the very latest 'agony,' I believe, and it did very well indeed. I have no complaint to make of it."

"Why didn't you buy a Locomobile then?" he was asked.

"Because I didn't have $6,000 to spend for one. I got two second hand cars for $5,000."

"But why not buy a second hand Locomobile?"

"Didn't know anything about the old patterns, while I did know the French car. I could not afford to experiment."

When told that the 1905 Locomobiles were but little changed from the 1904 pattern Major Woodbury remained unconvinced or indifferent. The foreign cars ran and the domestic ones did not; that was the way he put it. No amount of questioning availed to bring out instances of structural weakness or to show that any account had been kept of the behavior of cars left with the department for trial purposes. Whenever any mishap occurred that was, apparently, regarded as final; the car was put aside and another one put through its paces. No one could listen to Major Woodbury and believe aught but that he was sincere in his denunciation of American cars, or that he would rejoice to find cars equal to the second hand foreign ones that he spoke of. But it was equally plain that unfortunate experiences with some domestic cars—some of them extending some distance back—had disposed him to view them with strong suspicion.

"Don't suppose for an instant that I think all French cars are good ones," he said. "On the contrary, there are many bad ones. But the good ones are good all through, and they are built strong and heavy and will, therefore, stand the rough usage we subject them to. When we can get domestic cars equally cheap and good we shall do so. And I hope that day will soon come.

"Now, don't you go to work and write up a flaring interview with me. If you do I shan't let you see me again," he said as the Motor World man started to leave; but there was a twinkle in his eye that robbed the inhibition of much of its force.

Fire Department Closes Another Garage.

"When garages jeopardize human lives their licenses to store gasolene must be taken away from them. We cannot afford to run any risks at all in such cases," is the way George E. Murray, superintendent of the Bureau of Combustibles, explains the attitude of the New York Fire Department on the garage question. Tadini F. Gerome, whose place of business is at No. 71 South Washington Square, is the latest garage owner to fall under the ban, his license having been revoked on Friday last by Fire Commissioner Hayes.

The revocation, which is the second within a few weeks, is the result of a rigid investigation into the conditions surrounding garages in the city. The first garage to lose its license was that of the Michelin Tire Co., which was told of in a recent number of the Motor World. In the rooms above the Tadini garage forty people are employed and several families live there, while three hundred people are employed in a factory at the rear of the place. The place was heated by two large stoves, which Mr. Murray recently told the Motor World would not be allowed in garages, and the storage tank was inclosed in a wooden partition, while the regulations state that partitions must be of brick or stone.

Fierce Fire Did Not Touch Gasolene.

The long expected report telling the result of the investigation into the cause of the fire in the Standard Automobile Co.'s garage, in West Thirty-ninth street, was filed with Fire Commissioner Hayes last Friday by Fire Marshal Peter Seery. The investigation was made by Assistant Fire Marshal John P. Prial, who agrees with the opinion expressed by the Motor World regarding the probable cause of the fire in the following words:

"In my opinion, the fire was caused by gasolene vapor entering the lower door of the furnace, which was frequently open, and igniting. The weather was cool and doors and windows were kept closed, so that vapor had a chance to accumulate."

One remarkable feature of the fire which was brought out by the investigation was that the storage tank under the floor was not damaged at all. On the contrary, it had preserved its contents intact. To again quote Mr. Prial:

"Gasolene tank was intact, and after a test the tank showed that it contained considerable gasolene. In fact, occupant claims that it had lost none during fire. In some cases gasolene tanks on cars that were in the very heart of the fire were intact, only a few having exploded. Those that were intact had contained gasolene previous to the fire, but it appears that gasolene vaporized during the progress of the fire, as at present they contain little or none."

Gives Cup to Demonstrate Slow Speed.

C. L. Charley has given $1,000 for the creation of a cup to be given to the car which covers ten miles in the fastest time and ten miles in the slowest time. The idea of this contest, which will take place this month at Ormond Beach, is to prove to buyers that high powered automobiles can be run also at a snail's pace.

The control of the race Mr. Charley is willing to leave unconditionally to the Automobile Club of America. He only stipulates that the contest must be held on Ormond beach, and that the competing cars must be those which figure in the other races during the meeting.

A. E. MORRISON, MANAGER OF THE PEERLESS BRANCH, GIVING A PARTY OF BOSTONESE A WINTER DEMONSTRATION.

To Give Meaning to Mile Records.

Those much discussed mile records—52 2-5 seconds, made by Oldfield at Denver, and 52 4-5 seconds, made by Kiser at Cleveland—will probably fail of acceptance by the Racing Committee of the American Automobile Association. Chairman Pardington said yesterday that a mail vote had been taken on the question, and that he expected to make a formal announcement of the result some time this week. Both of the records claimed are for intermediate miles, and as it is known that the reports of the timers do not agree as to the time by miles in each of the record breaking rides.

The action of the A. A. A. will put a stop to the practice of picking intermediate miles in record trials of 25 to 50 miles, and require that one-mile records constitute one-mile performances. The honesty of the timers at Denver and Cleveland has not been questioned, but it seems to be the general feeling that th chances of an error in such cases are too great to allow such mile records to be officially accepted.

Has Hurt Fox Terrier Trade.

The automobile's latest crime has come to light. A dispatch from Paris states that the growth of automobilism has practically destroyed the trade in fox terriers. Fox terrier breeders say that the dogs are far too lively to sit still in a swiftly moving machine. On the other hand, the more sedate collie has had a marked rise in favor with chauffeurs. The classic poodle is completely out of date, and toy bulls reign supreme for the present among lap dog varieties.

Glidden's Wire From the Fijis.

On New Year's Eve Globe Girdler Glidden was in the Fiji Islands. In spite of the seventeen hours difference in time, Mr. Glidden decided to send good wishes to his friends in America. Accordingly he calculated the time accurately enough to have the message arrive in Boston about three minutes after midnight. In one of the messages the donor of the Glidden Cup stated that the inhabitants of the island had christened his motor car "Father of all devils."

Mrs. Kirk's Christmas Present.

A Christmas present to be proud of was that given by David M. Kirk, of Pittsburg, to Mrs. Kirk. It is a 32 H. P. Pierce Great Arrow, with a special limousine body, designed to seat six passengers, and was ordered through the Banker Bros. Co. The car is fitted up elaborately, having an electric heating and lighting plant and every other convenience found in broughams and similar vehicles.

Where Touring is Expensive.

In the majority of small Bavarian towns the automobilist is made to contribute to the wear and tear of the roads. In order to carry out this bylaw effectually a fixed sum is collected in tolls at the boundaries of the respective villages or towns. To go from Bamberg to Nuremberg it costs 55 cents for the distance of seventy-three kilometres. The fare by train is $1.25. This manner of increasing the municipal receipts added $1,200 in six months to the wealth of one small town.

Railway President's Electrical Timer.

Colonel E. H. R. Green, of Dallas, Texas, whose fame as the son of Hetty Green is greater than his renown as the president of the Texas Midland Railroad, and who of late has been prominently in the eye because of his racing cars, has invented an electrical apparatus for timing them. "Copper tapes stretched across the track at intervals register the time on watches placed in the judges' stand," is the description wafted up from Dallas. Mr. Green is also interested in a project to build a three-mile track.

Barney Oldfield has felt impelled to rise to deny that he is in St. Louis to assume the management of an automobile company.

TO GRIND OUT NEW LAWS

New England Legislative Mills Unlimbering for Action—New Hampshire in Line.

In five of the six New England States legislatures are convening this week. The exception is Vermont, which has recently ended its session. That automobile legislation will be brought up in some form or other in each of the other five states there is regarded as certain.

At the present time in all the New England States, with the exception of New Hampshire, laws have been passed governing the operation of motor vehicles. These laws are nearly uniform, particularly those relating to registration of cars and drivers. They have been copied one from another, Vermont being the last state to enact a registration law.

New Hampshire stands alone among the States. There is no law on its statute books in any way governing speed or registration of vehicles. But it is known that at the coming session of the legislature at Concord there will be passed some sort of laws. Just what they may be is problematical.

Whatever laws are passed by the Granite State legislature will be of interest to thousands of people, not alone throughout New England, but all over America. New Hampshire, by reason of its delightful climatic conditions in summer, is the mecca of thousands of visitors from every State in the Union. Among the number are hundreds of motorists. Therefore, while it is not expected that New Hampshire will place itself on record as fawning to owners of these vehicles, still it is thought that there will be no prejudicial sentiment animating the representatives.

An idea of what New Hampshire may enact in the way of automobile legislation has been given by one of the members of the State legislature. He says that when the session opens in January a bill will be presented to enable the State to construct good roads.

This bill has already been drawn up, and it is said to have the sanction of the Governor. It was indirectly brought about by the increase in the number of vehicles, particularly automobiles, which have been traversing the roads lately. The benefit to the State and the public will be inestimable. These proposed roads, three in number, will go through the Connecticut valley, another to the sea, and the third through toward Maine.

There will also be regulations regarding speed. What this may be is merely conjecture. It will probably vary from ten or a dozen miles in the cities to a limit of perhaps twenty outside. That there will be a registration law is practically certain. It will be about on the same lines of those in the other States.

Y. M. C. A. will Instruct Ladies, too.

Springfield, Mass., will next week be added to the increasing number of cities having regularly organized automobile instruction schools. It will be opened on January 11 in the local Y. M. C. A. building, and will be divided into two courses. The first of these will consist of a series of eight lectures on the construction, operation and repair of gasolene carriages of all types, by Parker H. Kemble, superintendent and consulting engineer of the Boston automobile school. The first of these lectures, which will be held on Wednesday evening, January 11, will be free. All the eight lectures will be open to both men and women, and will be held weekly on Wednesday evening. The Springfield Automobile Club has contributed $100 toward the expenses of these lectures.

The second part of the course will be for men only. It will consist of six talks by D. L. Gallup, instructor of mechanical engineering in the Worcester "Tech," illustrated with parts of the automobile. They will be given on Monday nights, beginning with January 16, and will be upon the engine construction and repairs of minor breaks. These will be followed by shop demonstrations at the factories of the Knox and the Stevens-Duryea companies. At the end there will be a course in driving automobiles for those who have successfully completed the shop course.

Lights for All in Massachusetts.

A bill has been drafted for presentation to the Massachusetts legislature providing that all vehicles shall carry lights after dark. Motorists throughout the State are being urged to support it, a systematic canvass being conducted with that end in view.

The proposed bill provides that every vehicle propelled by muscular power, carriage or bicycle shall from an hour after sunset to an hour before sunrise, when travelling on a public highway, carry lights which shall be visible 300 feet in front and in the rear of the vehicle.

Legislative Deluge in Indiana.

So many ambitious members of both houses of the Indiana State Legislature have announced their intention of introducing automobile bills during the coming session that it has been suggested that a special joint committee of House and Senate be appointed to receive the many bills and embody the principal features of all of them in one measure. One of the bills proposes to legalize twenty miles an hour in the country and ten miles an hour in cities and towns. This bill provides for a fine of $200 for each violation.

Up "Pike's Peak or Bust."

Out in Colorado they are still talking of the proposed "Pike's Peak or Bust" climbing contest, which they hope to run next summer. The most tangible thing about the affair that has developed to date is the agreement of the Colorado Springs Chamber of Commerce, which thinks the affair would be a good advertisement for the city.

OPPOSES INTER-CITY RECORDS

Chicago Club Takes Action to Suppress Such Scorching and Aims to Form State Association.

Indiscriminate road racing has been formally frowned upon by the board of directors of the Chicago Automobile Club in resolutions which they recently adopted. Their action is a result of the many attempts at record breaking between the Western metropolis and nearby cities, Milwaukee, South Bend, Cleveland and St. Louis being favorite objective points for the would-be record breakers. The directors believe that such rides are responsible for much ill feeling toward all motorists on the part of farmers and the officials and citizens of the smaller towns through which the record breakers travel at high speed.

The resolutions are as follows:

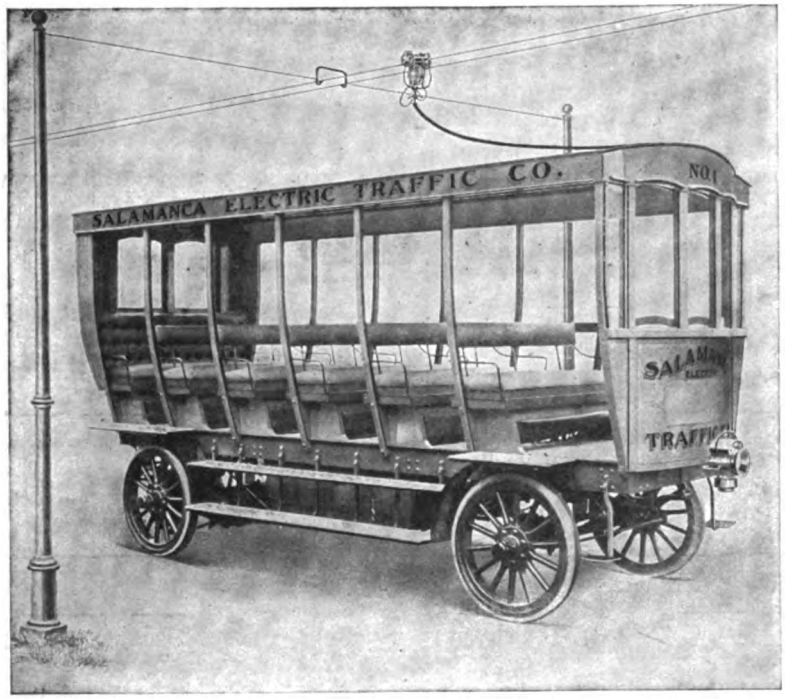
Whereas, The attention of the board of directors has been called to the increasing number of automobile road races and attempts to lower the record for automobiles between Chicago and certain other cities; and,

Whereas, In making such attempts automobiles are driven at a high rate of speed, in excess of the rate permitted by law; now, therefore,

Be it resolved, That it is the sense of the directors of the Chicago Automobile Club that such road races and attempts to lower records should not be indulged in by members of this club without having first obtained permission from the various municipal corporations through which the route to be traversed shall pass.

The directors have instructed Secretary Gorham to send invitations to each automobile club in the State of Illinois to send a delegate to a meeting which is to be held at the Chicago Automobile Club, on February 8. The directors hope to then form a State association of automobile clubs, which will work for better roads and for more reasonable legislation. It is planned to have the association issue a road book of the State and to erect signs along highways which are used by motorists.

Boston's New Club Chooses Officers.



Bay State Automobile Club is the title of Boston's new club, the organization of which has been formally completed by the election of the following officers: Lewis R. Speare, president; F. H. Tudor, vice-president; H. L. Bowden, treasurer; J. C. Merrison, secretary; Harry Fosdick, A. E. Gilmore and W. W. Burke, directors. Mr. Speare is of the well-known oil producing firm which bears his name; Mr. Tudor is an official of the Massachusetts Automobile Club, and Mr. Bowden is the Waltham millionaire who has earned fame on the track. The new club purposes reaching out for members in all parts of the State, and to "do things" will be its aim.

TO TRY TRACKLESS TROLLEY

New York Town Purchases Cars and Prepares to Operate a Public Service.

While much has been heard of the trackless trolley, very little has been seen of it in this country. Salamanca, N. Y., has, however, actually moved in that direction, and a service of the sort is expected to be in full operation next spring, when the Salamanca Electric Traffic Co. erects its pole line. The

accompanying illustration shows the first of the semi-inclosed electric omnibuses with which the line is to be equipped, the cars being manufactured by the Auto-Car Equipment Co. of Buffalo. The first one is equipped with a storage battery of forty-two cells, 15 M. V., which will give the car a radius of forty miles on a single charge over level roads. As soon as the pole line is installed the storage battery will be dispensed with.

The car shown is 16½ feet long, with a wheel base of 10 feet and a 5-foot track. It has double motor equipment and direct chain drive to rear wheels, platform springs, three point suspension. The axles are solid steel, with roller bearings throughout. The heavy artillery wooden wheels are shod with 36-inch endless solid rubber tires, 4 and 5 inches wide, respectively. A gear wheel steering device is used. The frame of the chassis is made of seasoned oak, 7x2½ inches, placed edgewise, and the frame is armored with a steel plate 3-16 inch thick bolted to the oak. The brakes are internal expanding, operating in the drums attached to the rear wheels, which also carry the driving sprocket and have extra wide bearing surface. These brakes are foot operated, with an interlocking ratchet, and can be held by the driver on a steep grade.

The body is semi-inclosed, and has, crosswise, four seats, each accommodating four persons. The seats are upholstered with box spring cushions. Five of them have upholstered lazy backs, while the rear seat has a solid back, which is also upholstered. The floor is covered with battleship linoleum. The top is constructed in the same manner as the tops of open streetcars, with self-acting waterproof side curtains, which slide in the grooves of the wooden standards. The car is vestibule front and rear, with a drop sash. The interior has mahogany finish on natural wood. The car is lighted by three overhead incandescent lamps of 16 candlepower, and there is an electric headlight. On the panel front of the vestibule inside are distributed the volt and ammetres, double pole double throw main switch and charging switch, cut-out, etc. The car has an alarm gong, a signal bell for starting and stopping and a fare register.

The horizontal controller is placed under the front seat. The controller lever is at the extreme left, and is provided with four speeds ahead and three reverse. The maximum speed of the car is twelve miles an hour.

The Salamanca company has built and equipped a new power house, and is operating on schedule time at a five cent fare. The present equipment provides for a line of three and one-half miles, and it is expected that this will be extended next spring.

Following the idea of having "taximetre" regulators on horse drawn cabs in Paris, the company operating them fitted an automobile with the same device, which measurer gives the exact distance within a few yards covered by the cab, and also marks the amount due. No extra charge will be made for the automobile, the fare being the same as for other cabs. If it "were not for the 'taximetre' and the red flag," it is added that "the new car might be mistaken for a private brougham."

NO MORE CARBIDE FOR HIM

Bitter Experience that Convinced One Motorist that there are Better Anti-Freezing Materials.

"As an anti-freezing mixture, calcium chloride is all right as long as your water circulating system works properly. But just as soon as anything goes wrong with it, you are bound to have trouble," said a New York tradesman recently.

"It has been my practice for a number of years to fix up my demonstrating cars with an anti-freezing mixture. I have tried glycerine, but it does not satisfy me. In the first place, it is pretty expensive. The best you can do, even if you get the inside wholesale price, is $1 per pound, and it will cost from that price all the way up to $8 per pound, depending on where you buy it. While it does not evaporate very quickly, it does deteriorate, and in a short time you must clean out your tanks and pipes and put in a new supply of both water and glycerine.

"For this reason I always gave the preference to calcium chloride, and got pretty good results from it until this year, when I met with a very peculiar experience. It is my custom to buy the necessary ingredients and prepare the mixture myself. I put four pounds of the salts to each gallon of water, and as the tank of my car holds four gallons, there was sixteen pounds of the salts in the cooling apparatus.

"Everything went well until one day my pump got out of order and the liquid ceased to circulate. Consequently the water got hot, boiled and finally evaporated—all without my noticing that anything was wrong until it was all gone. Unfortunately, as I discovered shortly, only the water had evaporated. The salts were still there. They had caked in the bottom of the pipes, and were as hard as rock. Nothing I could do would get the deposit out, short of taking a cold chisel and hammer and cutting it out. That is what we had to do, and it took many long hours. Now I am very careful not to use calcium chloride as an anti-freezing mixture."

'Frisco Want Less Oil and Less Noise.

Several times legislation prohibiting the dripping of oil from automobiles to asphalt streets has been threatened, and now San Francisco motorists are in a fair way of being saddled with an absurd law on the subject. An ordinance requiring suitable devices to be attached to automobiles for the purpose of preventing oil drippings being deposited on the public streets was passed to print by the Board of Supervisors of that city last week. Supervisor Lunstedt also contended that the noise made by automobiles while standing still in the public streets, owing to the machinery being allowed to run, was a greater nuisance than dripping oil, and suggested that another ordinance prohibiting the noise be passed. He promised to submit such a measure.

SHAKE-UP SHAKES OUT NEW LIST

Florida's Revised Programme Not of One-Man Variety—Starting Date Set Back One Day.

Having caused the withdrawal of the programme sent out by its self-styled "sole American and foreign representative," the Florida East Coast Automobile Association last week issued the official list of events for the Ormond-Daytona carnival, January 24 to 28, it having been decided that the racing shall not begin until Tuesday, 24th. Entries close on next Tuesday, the entry fee being $20 for each event. The list is as follows:

One hundred miles, international, for the W. K. Vanderbilt, jr., Trophy.

One mile, international championship, for the Sir Thomas Dewar Challenge Trophy.

One mile, time trials, classes A (1,432 to 2,204 pounds), B (851 to 1,432 pounds), and C (551 to 851 pounds).

One kilometre, time trials, classes A, B and C (weights as in events No. 3).

Ten miles, Ormond Derby, open, for the Major C. J. S. Miller Trophy.

Fifty miles, Daytona Handicap, open, for the Florida East Coast Automobile Association Challenge Cup.

One kilometer, Record Race, open, for the H. L. Bowden Trophy.

One mile, steam cars, for the Colonel R. C. Clowry Trophy.

One mile, cars of sixty horse power and under, amateur owners only to drive, for the Colonel L. C. Wier Cup.

Fifty miles, open to American built cars only, for the Lozier Trophy.

Ten miles, Mercedes cars only, for the Allen-Halle Trophy.

Ten miles, Fiat cars only, for the Hollander and Tangeman Cup.

Twenty miles, open, for the Edward R. Thomas Championship Trophy.

Five miles, stock cars, $1,001 to $1,800, inclusive.

Five miles, stock cars, $1,801 to $2,750, inclusive.

Five miles, stock cars, $2,751 to $4,000, inclusive.

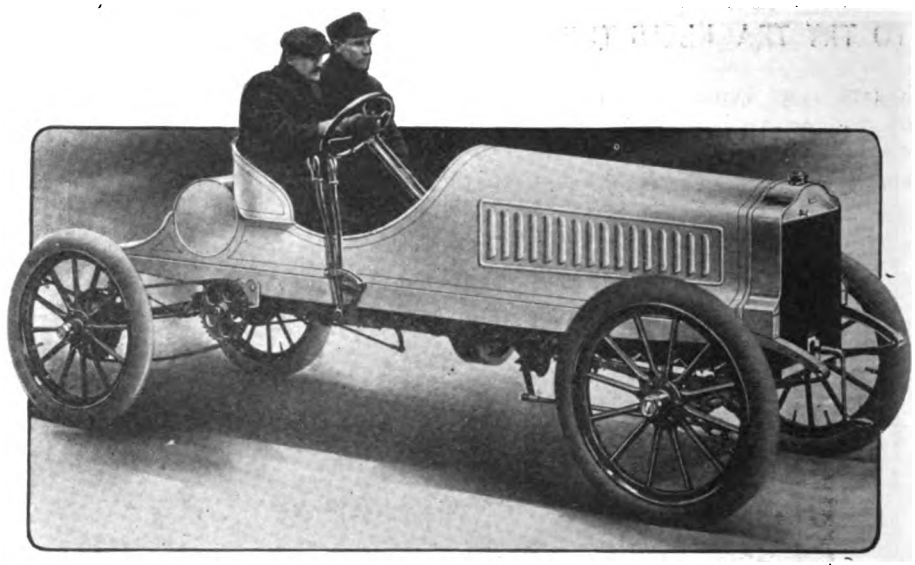
Five miles, handicap, open only to the first four cars in events Nos. 14, 15 and 16. No entry or fee required.

Five miles, stock cars, $4,001 to $6,000, inclusive.

Five miles, stock cars, $6,001 to $8,000, inclusive.

Five miles, open.

Five miles, stock cars, $8,001 to $10,000, inclusive.



Five miles, Great Ormond Handicap.

Five miles, gasolene stock cars, $650 and under.

Five miles, stock cars, $651 to $1,000, inclusive.

Ten miles, stock cars, $1,001 to $1,800, inclusive.

Ten miles, stock cars, $1,801 to $2,750, inclusive.

MAJOR C. J. S. MILLER'S 6 CYLINDER 60 H. P. THOMAS, WHICH HE WILL DRIVE IN THE FLORIDA SPEED CARNIVAL.

Ten miles, stock cars, $2,751 to $4,000, inclusive.

One mile, time trials, stock cars, price classification as in above events.

Ten miles, handicap, open.

One kilometer, Class A (1,432 to 2,204 pounds).

One kilometer, Class B (851 to 1,432 pounds).

One kilometer, Class C (551 to 851 pounds).

One mile, Class A, as above.

One mile, Class B, as above.

One mile, Class C, as above.

Gymkhana race.

Green Sets Up 100 Mile Record.

To the Dallas (Tex.) Automobile Club belongs the distinction of running the first one-hundred-mile track race in this country, the club having promoted such an event on the fair grounds track on January 2. Colonel E. H. R. Green, one of the club members, who had donated a trophy worth $250 for the race, won the contest, covering the 100 miles in 2:06:00 in a 24 horsepower Pope-Toledo. Five cars in all were entered.

A. B. Wharton, of Fort Worth, Texas., driving a Columbia car of the same horsepower as Colonel Green's machine, was tied with the latter until a bolt broke during the seventeenth mile. Up to that time there had been a great contest between them, and they had been making the miles at the rate of 1:14. The club recently joined the American Automobile Association, and the meet was the first it had held under A. A. A. rules and sanction.

Will Talk Good Roads in Florida.

Thirty-six State and territorial assemblies are to be visited by the crew of the "Good Roads" train, which will start on its travels for the year on January 9 from St. Louis over the Missouri, Kansas and Texas Railway. The National Good Roads Association is the sponsor for the train, which will be operated over other roads after it has finished its work along the line of the M., K. & T. The annual convention of the National Good Roads Association will be held at Jacksonville, Fla., on January 19, 20 and 21.

A. C. A. Clubhouse Will Cost $420,000.

Dave H. Morris, president of the Automobile Club of America, has called a special meeting of the members of the organization for Tuesday evening, January 10, at the club house. The report of the Board of Governors telling of the plans proposed for the new club house and garage will be discussed, and it is likely that some definite action will be taken toward providing the organization with a home of its own.

The plan suggested for the building of a club house and garage calls for the expenditure of about $420,000. It is proposed to raise among members of the club $150,000 by issuing second mortgage 4 per cent bonds in denominations of $500 and $1,000 each, the balance of the $420,000 being taken care of by money on hand and a first mortgage. The Governors of the club have secured the underwriting of more than $100,000 of the second mortgage bond issue. As the Governors believe it advisable that as many members of the organization as possible should be holders of the second mortgage bonds, they have invited subscriptions from their fellow-clubmen until the entire $150,000 has been subscribed.

Wallace to Sell his Racing Cars.

William Wallace, the well known amateur racing motorist of Boston, has announced that his racing cars are for sale. This does not mean his permanent retirement from racing, but he will not be a competitor at the Florida races, as had been expected. To a Boston interviewer, Mr. Wallace made the following statement: "Retire from the racing game? Well, hardly. It is too great a sport. My cars are for sale, it is true, but that simply means that I am going to South America soon to attend to putting the machinery into some mines there. I will be absent from Boston for five or six months, and as my cars will be of no use to me during that time, I have decided to dispose of them."

Digitized by Google

Highwaymen, Revised Edition.

Spurred by the example of those ingenious Jerseymen who set up a mock court of justice on the public highway and administered "justice" to unsuspecting motorists, pocketing the cash received from fines, some Minnesota marauders have turned the trick by establishing "kangaroo courts" on the roads near St. Paul. Gay automobilists, sprinting down country roads at a twenty-mile clip, have been hauled before a bewhiskered justice of the peace, fined heavily, lectured solemnly and told to go and sin no more. Investigation in several instances has proved that both the constable who made the arrest and the magistrate who failed to season his justice with mercy were sharpers. The man with the big stick was not a real constable, and the man with the judicial aspect had no right to impersonate a justice of the peace.

The fact that each town or village in Minnesota has the right to regulate the speed of automobiles while inside its limits gives opportunity for the smooth work of the men who have been holding moot court down Shakopee way. The automobilist, innocent of wrongdoing, is easily victimized when he is apprehended in a country district for driving his machine faster than the local ordinance permits. He does not know what the provision of the ordinance may be, and when, as has been done a number of times recently near Shakopee, he is stopped in the highway and placed under arrest for fast driving, he gladly accompanies the supposed constable to the nearest justice of the peace. Several times the justice has held his kangaroo court in the woods, and farmers say that when the automobile driver has disappeared his money has served to furnish the necessary refreshment for a gathering of choice companions of the road.

Chicago Contributes a Joke.

The halcyon days of the fairy tale originator have by no means passed; he is still ever ready to feed to a gorging public that which they crave. A versatile writer in the Chicago Record-Herald tells of a city automobile on a rampage that skipped the sidewalk and took a header into a shoemaker's basement shop, turning a few somersaults and finally stopping with its wheels in the air, revolving and sputtering. The old cobbler was found jammed into a corner, unhurt, but dazed.

"What did you think it was?" his rescuers gasped.

"I tought," he breathlessly replied, "dot it vas a customer vat vos mad apout his shoes!"

Triangle to Denote Dangerous Turns.

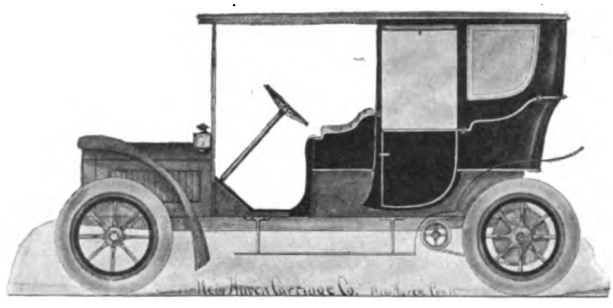
To denote dangerous turns to automobilists triangular signs have been erected in some parts of England. In order to make the idea practical at night time, the same sign is painted on the glass of the street lamps.

The Law That Indiana Farmers Want.

The farmers of Elkhart County, Ind., are very bitter against automobilists, and have circulated a petition to be presented to their representatives in the State legislature. The petition asks for the enactment of a law with the following provisions:

1. Compelling owners and operators of automobiles to provide for each machine large numbers on either side conspicuously displayed at all times.

2. Establishing a speed limit of five miles an hour when passing a horse or horses being driven or ridden on a highway.



3. Subjecting automobile owners or operators to a heavy fine for refusing to come to a full stop when signalled to by a rider or driver of a horse or horses.

4. Making it a penal offence for operators or owners of automobiles leaving their victims without rendering all reasonable assistance when an accident has occurred, caused by any form of horseless carriage or autocar, and holding owners of all such vehicles responsible for damages caused by them.

Orders Another Railway Automobile.

Two more railroad automobiles to carry passengers have been ordered by the Uintah Railroad, according to reports from Denver. The road runs from Mack, Col., into the Uintah reservation, in Utah, and has had one machine in operation for several months which has given excellent satisfaction.

Automobile Buyers

Desiring really luxurious Tonneaus, Limousines or Landaulets that will be very durable, ride easy, finely painted, having the same attention paid to details they received in their fine horse drawn Broughams and Victorias, can obtain same from the **first** firm in America to build **Automobile Bodies.**

WHITLOCK COOLERS

For 1905.

The Leading Automobile Builder have adopted the Whitlock Cooler for 1905 for the following reasons:—

1st: Because it is the most EFFICIENT radiator yet produced.

2nd: Because no other approaches it in STYLE and FINISH.

3rd: Because of its POPULARITY, being used on the leading cars.

4th: Because it is a TRIED DEVICE.

5th: Because we pursue a LIBERAL POLICY in taking care of our customers.

6th: Because we can DELIVER THE GOODS, having built about 90% of all cellular coolers made in the United States.

7th: Because our EXPERIENCE for the last two years as the largest manufacturers of coolis worth something to our customers.

We are now shipping coolers on our 1905 orders.

THE WHITLOCK COIL PIPE COMPANY

HARTFORD, - CONNECTICUT.

The Week's Patents.

778,289. Combined Internal-Combustion and Air Engine. Henning F. Wallmann, Chicago, Ill. Filed August 21, 1900. Renewed December 16, 1902. Serial No. 135,462.

Claim.—1. In an internal-Combustion engine, the combination of a combustion-cylinder, a double-acting compressor, a crank-shaft, pistons in operative connection with said combustion-cylinder, crank-shaft and double-acting compressor, respectively, means for delivering air from said double-acting compressor to said combustion-cylinder on the same side of the piston thereof with each successive cycle of said engine, a source of fuel and means for delivering charges thereof during predetermined cycles only to the same side of the piston of said combustion-cylinder and withholding the same during intermediate cycles.

778,320. Radiator for Autocars. Antoine Loyal, Paris, France. Filed June 16, 1902. Serial No. 112,003.

Claim.—A radiator for motor-vehicles, comprising a vertically disposed series of small continuous parallel tubes bent back and forth into a plurality of parallel horizontal courses, the several tubes of each course being each in a different horizontal plane, a series of parallel radiating tie-plates through each of which all the tubes of each course extend and to which they are rigidly connected, and collectors of large capacity connected to the ends of the tubes.

778,375. Speed Regulator for Explosive Engines. Karl Reinhardt, Dortmund, Germany. Filed November 25, 1903. Serial No. 182,656.

Claim.—In an explosive engine, the combination of the cylinder and inlet valve, of a gas conduit and two air conduits, a valve controlling the same, operating means therefor constructed to move said valve on the charging stroke to first open one air conduit, then to close that conduit and open the other air conduit and the gas conduit, substantially as described and for the purpose set forth.

778,399. Speedometer. Arthur H. Brown, Lynn, Mass., assignor of one-half to Waldo L. Pevear, Lynn, Mass. Filed September 28, 1904. Serial No. 226,255.

Claim.—1. In a speedometer, the combination with a rotatable member, of a pump connected with said member to be driven thereby, a fluid-supply tank or vessel, means for connecting said supply tank with said pump to form a circuit, a fluid in said circuit, a gage communicating with said circuit and responsive to variations in pressure of the fluid in said circuit, and a valve actuated by the fluid pressure in the circuit to regulate the pressure upon the said gage, substantially as described.

778,417. Muffler for Internal-Combustion Engines. Frederick Lamplough, Willesden, England. Filed July 25, 1904. Serial No. 217,993.

Claim.—1. In a muffler for internal-combustion engines, the combination with an expansion chamber into which the exhaust gases are led, of an eductor having an air inlet and an outlet the area of which latter is less than that of the air-inlet, substantially as and for the purpose herein described.

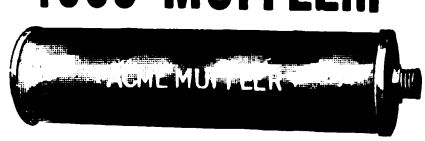
778,425. Heat Radiating Device for Internal Combustion Motors. Henry J. Muntz, Poughkeepsie, N. Y. Filed January 6, 1904. Serial No. 187,869.

Claim.—1. The combination with a cylinder for internal combustion motors of metal

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

A MORE UNIFORM MIXTURE can be obtained by the use of our automatic air governor when applied to the Oldsmobile mixer. This means more power and speed. Easily attached. Not necessary to remove mixer. Sent upon receipt of price, $2.50. Circular upon application. MORE-POWER CO., Box 175, Lowell, Mass.



FOR SALE—Winton quad. In best condition, with four hundred dollars worth of extras on it. Very best reason for selling. It will pay you to investigate, if you are comtemplating buying an automobile at a bargain. Address, Room 403, First National Bank Building, Danville, Ill.

FOR SALE—4 passenger side-entrance car bodies, in good condition at considerably reduced price. DETROIT CARRIAGE CO., Detroit, Mich.

WANTED—Fifteen to twenty traveling salesmen by a well-known and established tire manufacturing company, making standard goods. Only active men who know how to work effectively and all the time need apply. Exceptional opportunity for men of the right sort. Address, TIRES, P. O. Box 649, New York.

FOR SALE—Vises, gasoline engines, and patterns, pumps, tires, copper tanks, belting, pulleys, hangers, shafting, carburettors, lamps, Apple dynamos, storage batteries, steam car fittngs, bells, Edison mimeograph, power air compressor, chains, electric cars $100, $150; steam cars, $150 and up; Autocar. $250; Winton, $175; Winton delivery wagon, $400; Oldsmobile, with top, $200; one hundred cars, all kinds, very low, to clear out; 75 automobiles, $100 and up, all kinds. comb strips having the flaring ends of their teeth cast in said cylinder, substantially as described.

778,451. Speed and Distance Recorder for Tram-Cars, Motor-Cars, &c. Henry Hartley and Vincent Canova, Birmingham, England. Filed February 4, 1904. Serial No. 192,012.

Claim.—1. In speed and distance recorders having a continuously travelling log sheet or register for tram-cars, motor-cars and the like, the combination consisting of a scriber adapted for movement at right angles to the direction of motion of the said log sheet or register, a spirally grooved spindle engaging and imparting movement to the said scriber, and a centrifugal governor connected with and imparting motion to the said spindle, substantially as set forth.

778,455. Motor-Vehicle. Ralph C. Lewis, Boston, Mass. Filed April 19, 1904. Serial No. 203,876.

Claim.—1. The combination with a vehicle, of a hood mounted thereon, a motor-cylinder located within the hood, and a rearwardly and inwardly inclined deflector having its outer end projecting from the exterior of the hood and its inner end located directly contiguous to, but spaced from the cylinder for directing air against the same.

778,460. Spring for Automobiles or the Like. John W. Nesmith, Denver, Colo. Filed September 19, 1904. Serial No. 225,017.

Claim.—1. In a vehicle, the combination with the supporting-axle and vehicle-body, of an elliptical spring supported by the axle, a spiral spring supported by the central portion of the elliptical spring, and a connection between the body and spiral spring, substantially as described.

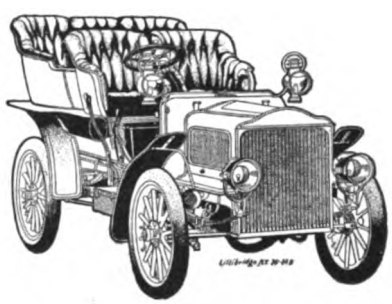
778,495. Pneumatic Tire or Other Flexible Tubular Article. Arthur H. Marks, Akron, Ohio. Filed May 3, 1904. Serial No. 206,146.

Claim.—1. A tire cover comprising a plurality of layers of thread, said layers being of varying degrees of elasticity and arranged with the layer of maximum elasticity innermost and each succeeding layer of less elasticity than its predecessor.

778,496. Pneumatic Tire or Other Flexible Tubular Article. Arthur H. Marks, Akron, Ohio. Filed May 3, 1904. Serial No. 206,147.

Claim.—1. A tire-cover comprising layers of fabric, each layer being cut at a different angle, the innermost layer being cut approximately bias, and each succeeding layer at a greater angle than its predecessor, for the purpose set forth.

778,542. System of Equilibrium for Motors. Arthur C. Krebs, Paris, France, assignor to Ste. Ame. des Anciens Etablissements Panhard et Levassor, Paris, France. Filed August 9, 1901. Serial No. 71,516.



Claim.—1. In a two-cylinder motor, means for equilibrating the disturbing couple created by the reciprocation of the masses of t' e pistons and their rods, which consists of a fly-wheel unsymmetrically proportioned, and a counterweight upon the crank, the fly-wheel and the counterweight being arranged and proportioned to produce a couple which equilibrates said disturbing couple.

778,560. Supporting and Shifting Battery for Automobiles. Allan H. Whiting, Orange, N J. Filed September 9, 903. Serial No. 173,877.

Claim.—1. In combination with an automobile, a support for suspending a battery case beneath the same, said support consisting of a ledge or angle iron providing a channel-way for receiving the corresponding part of the battery case, and opposite the said ledge a second adjustable support for receiving its corresponding portion of said battery case.

PATENTED

Chicago, Dec. 22, 1905.

Morgan & Wright,

Chicago.

Gentlemen:

It gives me the greatest pleasure to let you know how well the Morgan & Wright tire has stood up on our Knox automobile. The machine was delivered to us in April with a set of ------ tires on same. Inside of a month one of these tires was used up. It was then replaced with a Morgan & Wright tire which has outlasted the three original tires which have gradually been replaced with your clincher. This tire, which was put on in May and run almost ever since, looks as good as new.

Yours very truly,

CHICAGO BATTERY COMPANY.

Secretary.

A tire that has MADE GOOD to car owners everywhere, under all sorts of conditions.

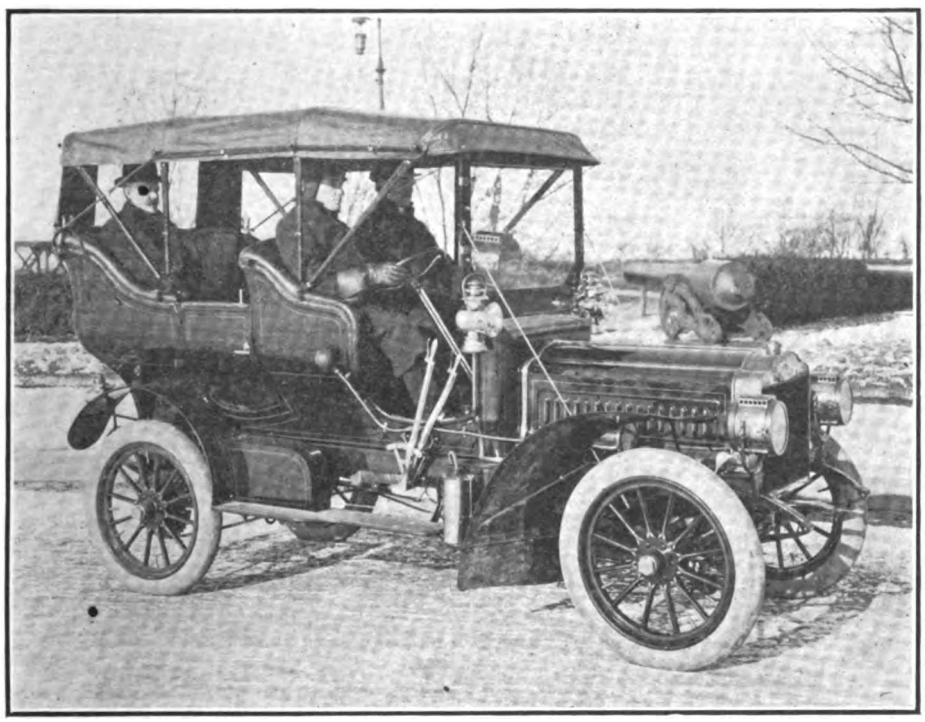
Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about Feb. 1st, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

The 1904 edition is now out of print.



Sent upon receipt of 6 cents in stamps for postage.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

You Will Not Miss it by Adepting Our Bevel Gear Drive Rear Axle or Our Transmissien Goar.

YOU WANT AN

OLDSMOBILE

—TEN SOUND REASONS WHY:

1. Oldsmobiles have more reliability, more comfort, more value received and better appearance. We build by thousands to give these qualities at a low price.
2. Our guarantee is the broadest and our care of customers the best.
3. We build the largest quantity and the greatest variety of light cars. Some one of them is sure to fill your requirements.
4. "Oldsmobile" spells "economy." Maintenance cost minimum. Ask an Oldsmobile owner.
5. Mt. Washington and Eagle Rock hill again proved Oldsmobile hill climbing qualities. You take steep grades on high gear with all our new cars.
6. Oldsmobiles go wherever you see them, and you see them wherever you go.
7. Business and professional men are our largest customers. To them the Oldsmobile means a saving of at least two hours' time per day.
8. The only light car to receive gold medal at the St. Louis Fair. We got two of them. Oldsmobile merit is universally acknowledged.
9. Twenty years' experience and unequalled manufacturing facilities make the Oldsmobile the best thing on wheels.
10. "As good as the Oldsmobile" is often heard. What could be better?

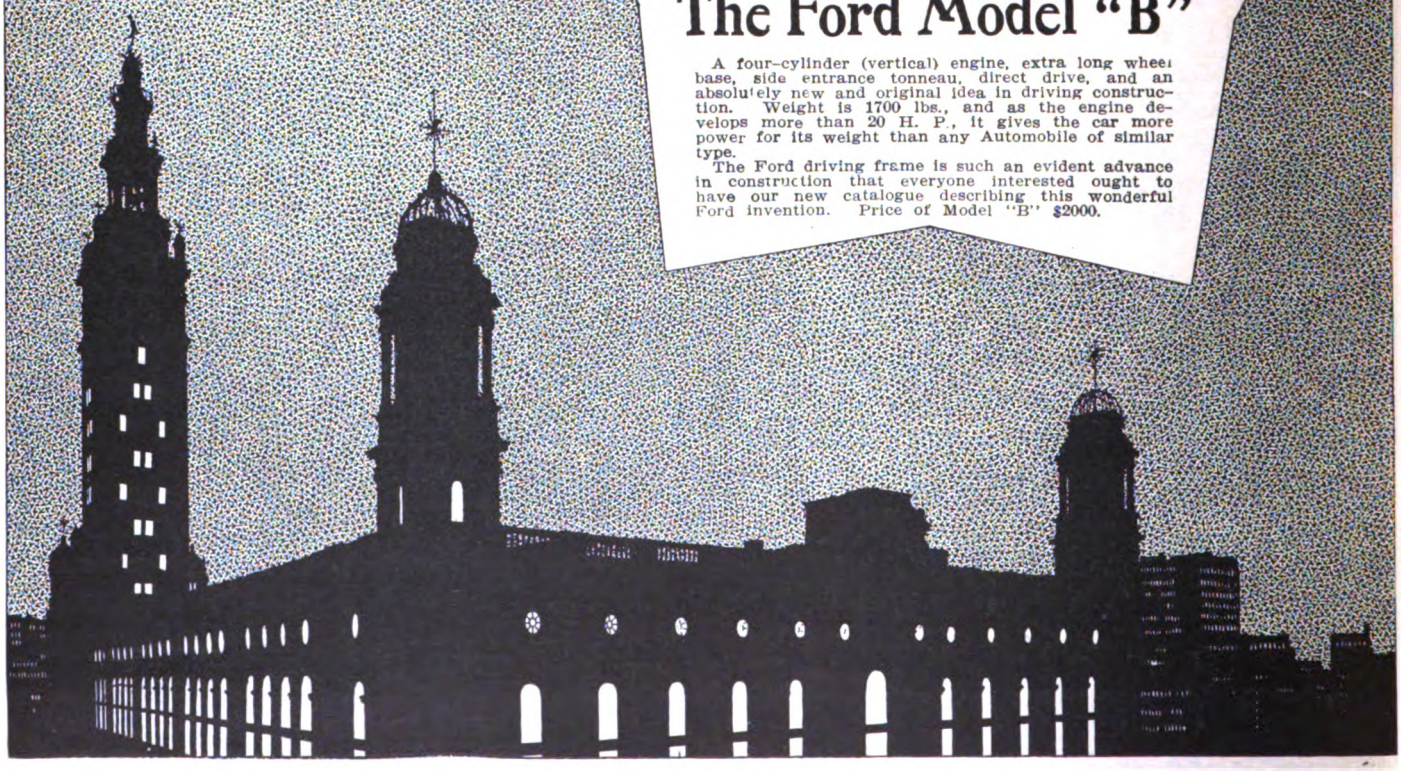
The FORD Cars are the Stars of the Show.

The Ford Model "C"



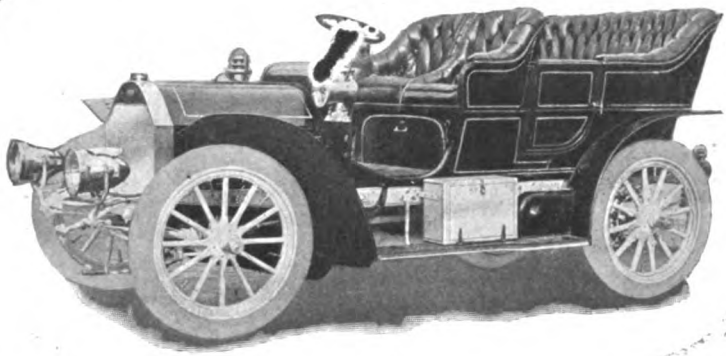
has a 10 H. P., double opposed motor with the successful Ford planetary transmission, a lengthened wheel base and perfect distribution of weight, making it the most practical car on the market for business or professional men or for ordinary family use. The price of Model "C" is $950, with detachable tonneau, so the car can be used as a runabout if desired.

The Ford Model "B"

A four-cylinder (vertical) engine, extra long wheel base, side entrance tonneau, direct drive, and an absolutely new and original idea in driving construction. Weight is 1700 lbs., and as the engine develops more than 20 H. P., it gives the car more power for its weight than any Automobile of similar type.

The Ford driving frame is such an evident advance in construction that everyone interested ought to have our new catalogue describing this wonderful Ford invention. Price of Model "B" $2000.

Economy of maintenance, always a feature of the Ford cars, is further guaranteed in the 1905 Models, by light, strong construction and mechanical simplicity and excellence.



TO AGENTS:—If the Ford Agency is not taken up in your territory, it's to your interest to see us about it.

WINTON

These Advantages are Exclusive Winton Features.

All working parts immediately accessible and removable, without detaching cylinders from crank case or uncoupling oil, water, electric or air connections.

Air control, whereby operator can graduate speed from 4 to 60 miles an hour, without touching a speed lever or changing gears.

Ignition by gear-driven magneto and single non-vibrating spark coil. No dry or storage batteries. No intricate, multiple, vibrator spark coil.

Lubrication absolutely automatic and positive. No springs, needle valves, sight feeds, or pressure. Lubrication in exact proportion to motor speed. No splash lubrication anywhere—even connecting rod bearings oiled mechanically.

Springs of unique design, combine resilience and resistance in ideal proportion. Add 30 per cent to life of motor. Take half the wear off the tires. Make motoring always comfortable.

Screw and nut steering gear, cannot wear unevenly. Cannot "wedge"—hence is always safe.

Simplicity.—One pedal and two levers control all transmission clutches and brakes. Operation easy to learn.

Price.—Cars of equal horse power are listed by other makers at from $500 to $3,000 higher than Winton prices, and have none of the exclusive advantages of Winton construction. Winton cars combine highest quality with lowest price.

1905 ANNOUNCEMENT

The Autocar

A NEW TYPE.

We believe that the Autocar in all its types represents the highest excellence in automobile design, workmanship and material. Every Autocar is built on honor. We feel, therefore, that our new type will meet with a cordial reception.

This car, **Type XI.**, larger and more powerful than the other types, has a four-cylinder vertical engine of 16-20 horsepower. The body is built on the newest and most approved French lines. The front seat is divided and both front and rear seats are large and comfortable.

While this car is built upon the tried Autocar principles which have been so splendidly proven, it shows a number of very important improvements making for increased simplicity, ease of operation, safety and comfort.

In fact, though Autocars have always been noted for absence of bewildering intricacy of mechanism, yet no one can but be impressed with the extreme simplicity of this new car. It is a triumph in scientific construction and arrangement.

This car has more than met our highest expectations in the road test. In fact, its performance has been a surprise to experienced automobile men. The power of the car carries it, fully equipped and loaded with five passengers up, tested 12 per cent. grades, for instance, at 20 to 25 miles per hour on the direct drive, while on the level the car attains a speed of 40 to 45 miles. The car is a superior climber on any hill.

Altogether our eight years' experience has enabled us to produce in this type, a four cylinder car we are assured cannot be surpassed by any similar car at any price.

The price of Type XI. is $2000. Ready for delivery January 16.

Type VIII.—Four-Passenger at ($1400,) and

Type X.—Runabout at ($900,)

have made *Autocar Reputation.* Each stands at the head of its class for value and efficiency.

Autocars, Types VIII., X. and XI. will be on exhibition at the New York Automobile Show, Madison Square Garden.

Catalogue descriptive of the 1904-05 types will be sent free upon request. This catalogue contains also addresses of our dealers throughout the country who will be glad to give demonstrations to prospective automobile purchasers and explain in detail the merits of our cars.

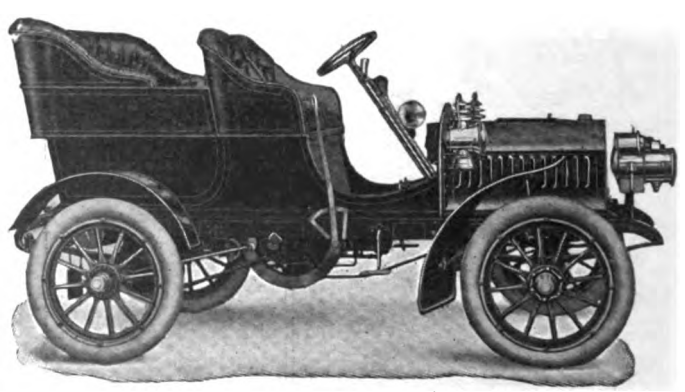
The WAYNE CARS

MODEL "C." PRICE $1250.00.



The Wayne Model "C" is a five passenger touring car, 16 H. P. double opposed motor, planetary transmission, 90-inch wheel base, double side entrance tonneau; in fact, a $2500.00 car in everything but price.

The motor and fly wheel are hung under the chassis frame, making the centre of gravity low. This improves the running of the car, giving stability in turning corners and, by decreasing skidding on the curves, lengthens the life of the tires, so that the expense of running the Wayne is less than any car of similar type.

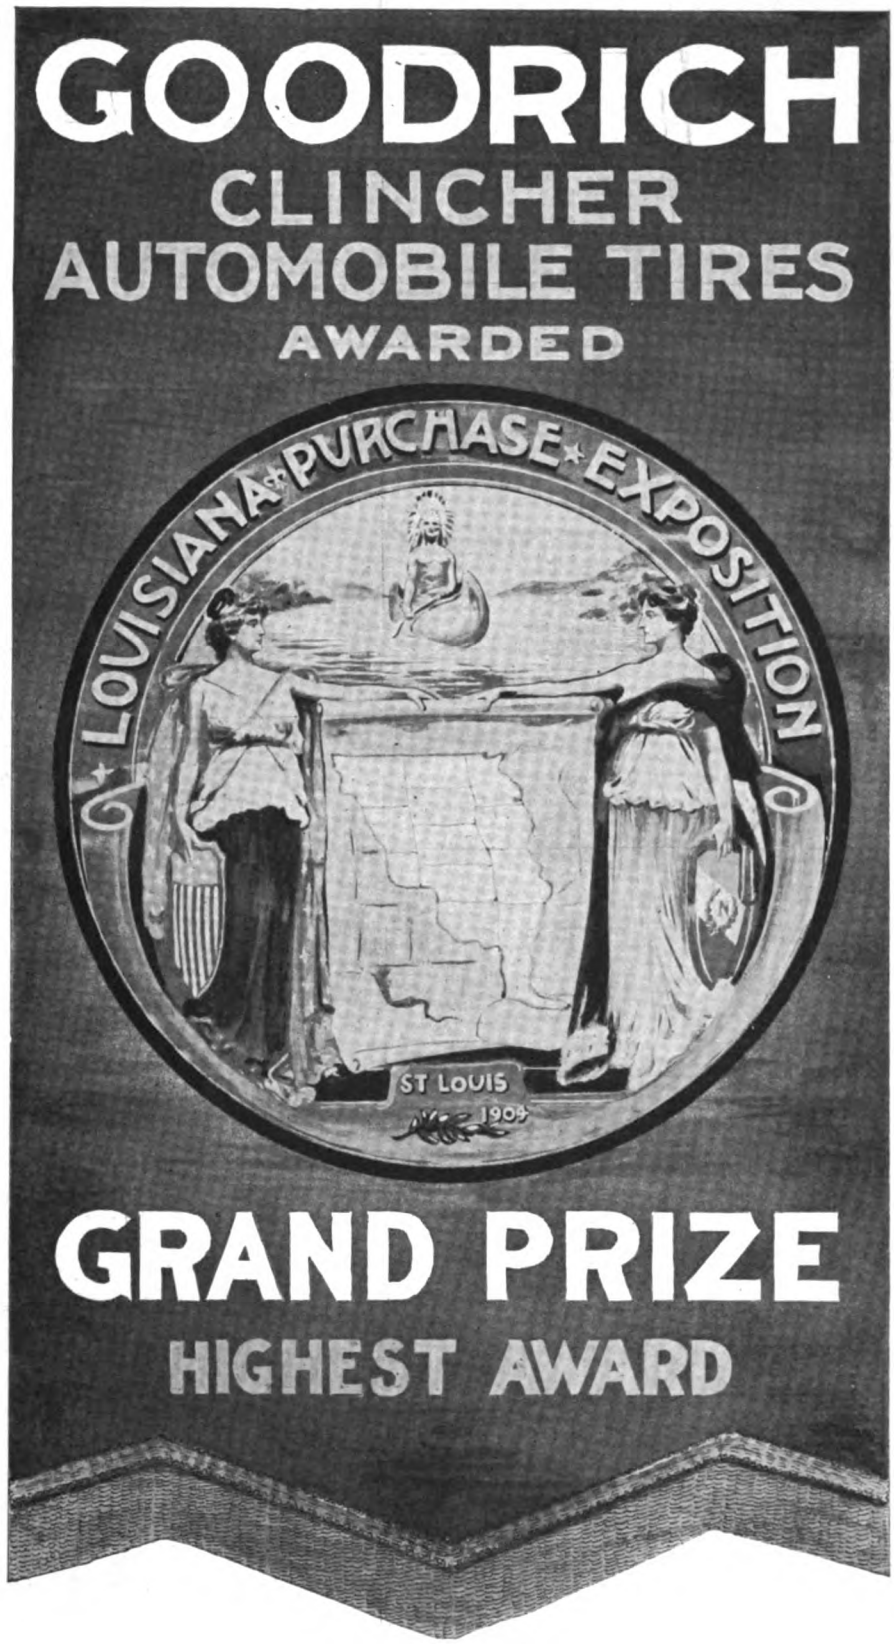
Model "A" has practically the same mechanical construction as model "C," except that the tonneau has a rear entrance and is detachable, enabling this model to be used as a runabout if desired.

Seven years hard labor has been spent in developing and perfecting the Wayne Cars, and this alone assures purchasers of freedom from many troubles found in new and experimental designs.

The Wayne Model "B" four-cylinder Touring Car will be the talk of the show. 24-28 Horse Power, bevel gear, direct drive, sliding transmission, wheel base 102 inches, side entrance tonneau, weight 1550 lbs. Price $2000.00. This car has fewer parts than any 4 cylinder Automobile made.

MODEL "A." PRICE $1200.00.

NEW YORK SHOW. SPACE C. CHICAGO SHOW. SPACES 107-108.



We shall be glad to demonstrate the merits of our cars at the New York and Chicago Shows, or to send our catalogue to those who appreciate quality and reliability at a moderate price. Will you write us to-day?

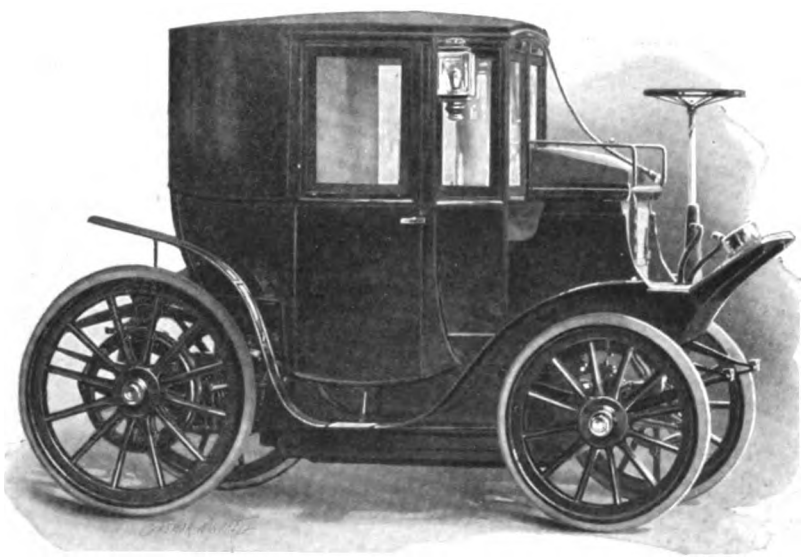
Columbia ELECTRIC

Mark XLI is an entirely new electric light, fast, of wide radius of action, luxurious in comforts, artistic in design and elegant in appointments and finish. It is the most resourceful light electric carriage yet built. Leading constructive features are steel chassis, single motor, chain drive, side lever steer, new and simple controller, with three speeds forward and two reverse, and equal division of battery weight over both axles.



The body follows the most approved Victoria lines with swing panels, and allows for ample seat room and harmonious battery disposition. The hand-buffed leather hood is perfectly fitted and lined with the finest broadcloth.

Mark LXI realizes an ideal vehicle for town and suburban use where a 15-mile speed is sufficient, and is high in favor with physicians, ladies, and others who find electric power best for their requirements.

Supplied standard in green and royal blue, with upholstering to match.

Mark LXI. Victoria-Phaeton, $1,850.

The new electric light runabout, mark LX, is the fastest, most efficient, and widest in range of single battery charge of any electric carriage of similar weight. Exclusive of the body it is the same car as the Victoria phaeton, and a season's popularity and successful use attests its many qualities of automobile worth.

Price, $900.

Columbia Town Carriages

Columbia supremacy in the building of Electric Town Carriages for private service—Broughams, Landaus, Landaulets, Hansoms and Rear Boot Victorias—is universally conceded. Perfect in design and equipped with every possible device that can add to the comfort of the occupants, these vehicles are the vogue with New York society people and are extensively used in other large cities. They have many important electric and mechanical features, found in carriages of no other make, which are the result of our years of experience in providing for the requirements of purchasers who demand the very best of everything that pertains to vehicles or their use.

The leading position of Columbia electric commercial vehicles—light and heavy electric delivery wagons and trucks—is equally well established.

Separate Catalogue of Columbia Electric Carriages and Columbia Electric Commercial Vehicles will be sent on request.

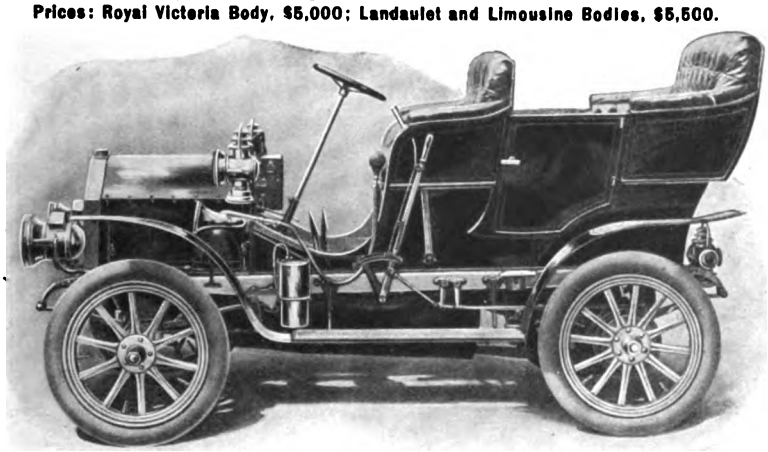
Columbia GASOLENE

The new four-cylinder 35-40 h. p. Columbia, Mark XLV, perpetuates the main features which placed its predecessor, Mark XLII, first among American cars, and incorporates such changes in details as have been suggested by a year's use. Most important among these is a new carburetter of the aspirating type, which represents the very latest and best practice and gives material increase of power. Another new and important feature is the spark and throttle control, by means of two levers so mounted on a revolving head within the steering wheel as to insure great delicacy of adjustment. The new pedals operating the clutch and foot brake are much larger than formerly, while the hand brake and speed changing levers are of new and greatly improved design. Added convenience in operation is secured by a dash-mounted mixture changing lever; compression releasing rod extending through both the cooler and the dash, so that it can be worked from either end; oiler driven by flexible shaft, replacing belts; and folding side-opening bonnet, arranged to open from either side and also bodily removable, and fenders which can be instantly taken off for close motor inspection.



Mark XLV., 4 Cylinder, 35-40 h. p. Price, $4,000.

The standard side-entrance tonneau body with 108-inch wheel base is of an entirely new design, which we believe to be the best that can be devised for an open car with full width cross seat at the rear. The lower rearward curves harmonize perfectly with the general design, and have a tendency to deflect dust. The upholstering is of the richest and most enduring character. The body is painted dark green and the running gear yellow. Canopy or cape tops are supplied to order.

With the Mark XLV chassis, with the wheel base extended to 112 inches, we supply Royal Victoria, Landaulet and Limousine bodies. The Royal Victoria is ideally suited to park and boulevard driving, where speed is desired and a considerable distance is to be traveled. It is also a delightful touring car. The Landaulet and Limousine bodies meet every requirement for winter use and inclement weather touring. On these cars the style and color of the painting and trimming are at the purchaser's option.

Prices: Royal Victoria Body, $5,000; Landaulet and Limousine Bodies, $5,500.

SPECIAL BODIES
2 Opposed Cylinder 18 h.p.

Mark XLIV. made its first public appearance as a class winner in the Eagle Rock Climbing Contest Thanksgiving Day. It has a double horizontal opposed 18 h. p. engine under forward bonnet, sliding gear transmission, propeller shaft drive, three forward and one reverse speeds operated by a single lever, automatic cylinder lubrication, standard spark plugs, foot-operated throttle, expanding metal to metal foot-operated clutch, hand and foot brakes, and spark advance lever in the steering wheel. The wheel base is 81½ inches. The luxurious side-entrance tonneau body is beautifully upholstered in dark green morocco. The entrances are broad and easy of access, and the car comfortably seats four persons. The body is painted dark green with gold striping, and the gear in long-wearing straw color. The long running boards have rubber, brass-bound treads. Equipment includes gas headlights, oil side and tail lights, horn and tools.

$1,750

Catalogue of Columbia Gasolene Cars will be sent on request.

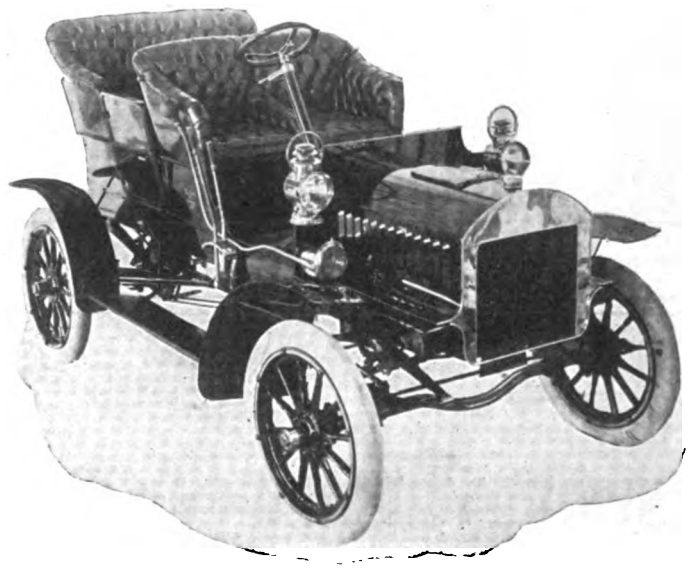
The INCOMPARABLE WHITE

THE CAR FOR SERVICE

HE WHO IS WISE

Takes this factor into account when selecting a car: "Are the records to which attention is called in connection with each make, those of a single machine or of the cars of a single year; or, on the other hand, has this make of machine, from the first, made a consistent record for excellence?"

A systematic survey of the claims of various makes of cars discloses the unique position of the White. Since its first appearance, in 1901, it has consistently won first honors in *every* reliability test. The great collection of White trophies—first prizes in track races—bear the dates 1901, 1902, 1903 and 1904. Each year White owners have taken the longest, hardest tours.



Have *you* made this all-important comparison?

Write to us for Literature which may help you decide.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, January 12, 1905. No. 16

PANHARD CRIES "ENOUGH!"

Famous French Firm Withdraws Opposition to Selden Patent and Injunction is Entered.

There was a considerable fluttering on the top floor of Macy's dry goods store on Tuesda night; in fact, even the lights flickered ominously. It was the night that that collection of some fifty foreign cars, most of them 1904 models, which is denominated "importers' saloon," was exposed to private view. At about the same time that the band was blaring, news reached the roof of the drygoods store that one of the most important of the foreign manufacturers, Panhard & Levassor and A. Massenat, their representative in this country, had "struck their colors" and surrendered to the Association of Licensed Automobile Manufacturers, or, in other words, had acknowledged the validity of the Selden patent and discontinued legal opposition. It was not news of a nature to cause the spirits of most of those interested in the "saloon" to bubble.

Panhard & Levassor's capitulation is complete. They not only recognize the validity of the Selden patent, but agree that judgment and an injunction against them shall be issued. The settlement, of course, carries with it adjustment of back royalties and payments on future importations.

The suit which, as usual, was brought in the name of the Electric Vehicle Co., was filed December 28, 1903. In their reply, the Panhard attorneys caused some little comment by citing patent No. 493,082, of March 7, 1893, granted Clarence Gillette, Gloversville, N. Y., which applies to a "new and improved road wagon," adapted to use "steam, compressed air, electricity, etc."

The settlement of the suit naturally has caused elation in the Association of Licensed Automobile Manufacturers, particularly as Panhard's surrender was made in the face of the Gillette patent and despite the fact, they say, that all the testimony in the Ford case was placed at the disposal of the Panhard counsel.

Flare-up Expected in Fredonia.

Interesting and perhaps sensational developments are looked for next week, when, on January 17, at Youngstown, Ohio, the creditors of the bankrupt Fredonia Mfg. Co. hold their first meeting. The hearing will reveal a condition of affairs unexpected and extremely discouraging for the creditors, according to Referee W. C. McKain, who last week issued the necessary notice for the meeting.

Receiver McKain reports that the books show that there are 325 creditors of the company, and that the total liabilities are $72,500. The total assets consist of $3,185 in the hands of the State receiver and three unfinished automobiles and seven unfinished carriages, upon which there are chattel mortgages to the amount of $3,300. It now develops that one year before the Fredonia company made an assignment it sold all its real estate to Mrs. Mary A. Smith for $20,000 in cash and $16,000 in mortgages. The deed of this sale was not offered for record until the day before application was made for a receiver.

Westinghouse to Build Cars?

Pittsburg advices state on alleged "good authority" that the Westinghouse interests will in the near future install an automobile factory in the plants at East Pittsburg.

It is added that the first two cars built in the Westinghouse's French factory recently arrived in Pittsburg and are at present stored in the garage of George Westinghouse at his residence on Homewood avenue.

Bowman Reads the Writing on the Wall.

Sidney B. Bowman, who long has been one of the most vehement shouters regarding the superiority of foreign cars, has seen the great white light that gradually is breaking on the handlers of the imported product. Through H. J. Koehler, the S. B. Bowman Automobile Co. has just secured the New York agency for the Buick car.

Panhard to Form American Company.

Concurrent with their settlement with the Association of Licensed Automobile Manufacturers, it is authoritatively stated that Panhard & Levassor will incorporate an American company.

NEW SHOW DEAL

End of Triple Alliance Brings Matters to a Climax—Licensed Manufacturers Likely to Secure Lease of Garden.

It is almost beyond peradventure that the show which will be inaugurated in Madison Square Garden, New York, on Saturday night will be the last one conducted by the triple alliance—the National Association of Automobile Manufacturers, the Automobile Club of America and the Madison Square Garden Co.

The contract which bound them together for a period of three years will then terminate. It is not likely to be renewed; indeed, before the show will have closed on the Saturday following it is almost certain that the situation that will develop will be akin to the explosion of a dynamite bomb thrown into the very centre of the trade.

Certain surface indications are pointing with no uncertain finger to the Association of Licensed Automobile Manufacturers as the most likely sponsor of the show of 1905.

While confirmation of the statement is not possible, that it is well founded the developments of the next few days are more than apt to prove.

It is understood that the A. L. A. M. will ally itself with no other organization; it will conduct its show unaided and, according to one story, without cost to its members. Of course, if the deal is consummated—if it has not already been consummated—it will mean that only steamers, electrics and licensed gasolene cars will be exhibited in Madison Square Garden next year, and possibly for a term of years.

That such a result will cause a widespread sensation goes without saying, and that it will affect several of the meetings that are due to occur next week is as undoubted. It will cause an entire rearrangement of show affairs.

POPE FILES FIRST REPORT

Shows a Fair Profit and a Healthy and Encouraging State of Affairs.

According to its annual statement, made public this week, the Pope Manufacturing Co., in its first year of existence, was successful in earning a fair profit, while its predecessor, the American Bicycle Co., never was able to keep from sinking deeper in the financial mire.

The Pope year ended July 31, 1904, the balance sheet showing a profit of nearly $51,000. The income account is as follows:

Gross earnings	$7,226,589
Expenses and cost	5,995,793
Net earnings	,230,796
Other income	62,158
Total income	1,292,954
General expenses and interest	1,241,961
Balance net earnings	50,992

The balance sheet, dated July 31, 1904, follows:

Cost of properties	$18,523,632
Expended during year	392,270
Properties not used	538,008
Other capital expenditures	297,166
Inventories (at or below cost)	3,111,398
Accounts receivable	734,904
Bills receivable	98,154
Miscellaneous investments	126,330
Cash	283,[illegible]
Total assets	24,104,965
First preferred stock	2,500,000
Second preferred stock	10,000,000
Common stock	10,000,000
Stock Federal Co. outstanding	105,600
Bankers' loans	1,095,000
Accounts payable	310,054
Payrolls accrued	43,317
Surplus	50,992
Total liabilities	24,104,965

Commenting on the report, a director of the company says:

"We are very well pleased with the result of our last year's business.

"The company has a surplus of quick assets over liabilities of $3,000,000. As there is only $2,400,000 of first preferred stock issued which represents the money paid in at the time of the reorganization, the quick assets not only represent 100 cents on the dollar for the first preferred stock, but $600,000 in addition. The auditors, Jones, Caesar & Co., of New York, have marked down all the fixed asests to a very low valuation, yet their figures show real estate and plants amounting to $4,700,000, which, with the $600,000 above mentioned, gives an actual cash valuation to the second preferred stock of over $50 per share, and good will, patents, licenses, trade marks, etc., represent the balance.

"The year just ended was the first year of the new company, and, as is necessary in such cases, a great deal of time and money was spent in readjusting and organizing the business, replacing bicycle machinery with automobile machinery, etc. The most gratifying feature of the report is that the automobile business showed a handsome profit.

"The bicycle business is only susceptible of a fixed amount of sales, regardless of the amount of money spent in advertising, and this department has now been so organized that only such plant capacity will be devoted to that department as is necessary to supply the natural demand for bicycles, and that department this year should show a fair manufacturing profit.

"The number of bicycles sold last year was about 89,000. The number of automobiles sold were about 300 Pope-Hartfords and Pope-Tribunes, 569 Pope-Toledos and 355 Waverly electrics. A great many more Toledo cars could have been sold, but plans had originally been made to make 500, and by putting on a night force 569 were finally finished.

"The following statement of December 1 shows a most interesting comparison for the business of four months of this year, August 1 to December 1. The company has sold in that period 16,000 bicycles, against 12,000 last year, and has on hand unfilled orders for 22,000, against 14,000 last year.

"The company has sold and delivered 149 gasolene automobiles, against 90 last year, and has on hand unfilled orders for 501 gasolene cars, against only 3 last year. It has sold and delivered 115 electric automobiles, against 500 last year, and it is believed that filled orders for 38, as against 19 last year.

"The Toledo factory report for the month of December shows orders received for 172 more cars during December, making total orders received for the five months of 706 Pope-Toledo automobiles.

"This year double the last year's product has been put in the factory, viz., 1,000 cars, against 56 last year, and has on hand unafter the New York and Boston automobile shows the entire product for the year will be sold."

Stimulating Electrics in the West.

A notable addition to Milwaukee's retail contingent is the Electric Vehicle and Supply Co., which was incorporated a short time ago with $25,000 capital. A new building at Third and Wells streets has been secured and fitted up with charging outfits and other paraphernalia. The Studebaker and other lines of electric vehicles will be handled.

It is the intention of the concern to establish charging stations at various points throughout the State. Eight of these have already been opened on the road to Chicago.

Brokaw in Selden Net.

W. Gould Brokaw, the New York millionaire, has been added to the list of those who must prove that they are not using imported cars in violation of the Selden rights. He was served with the necessary papers on the 3rd inst., and has since been chirping about forming a syndicate to fight the case.

To Enlarge Lamp Factory.

So greatly has its business of making automobile lamps increased that the James W. Brown Mfg. Co., of Columbus, O., will at once begin the enlargement of its plant. When this is completed, the capacity will be materially enlarged.

TIRE FACTORY FOR DETROIT

Big Rubber Company Secures Option on Site and May Build Plant There.

It is not improbable that the Rubber Goods Mfg. Co. will establish a tire manufacturing plant in Detroit. The recent visit of Charles H. Dale, president of the company, to that bustling automobile centre gave rise to the report, and on Tuesday, after his return to his New York office, Mr. Dale admitted that the report did not lack substance. To a Motor World man he stated that while in Detroit he had met a number of representative men identified with the automobile industry, and, after viewing the field, had obtained a ninety days' option on a desirable factory site. Whether or not a plant will be erected will be officially decided within that period.

Mr. Dale also confirmed the report the Rubber Goods factory at New Brunswick, N. J., heretofore operated by the India Rubber Co., had been taken over by the Hartford Rubber Works Co., and will be used in adding to the production of perfected Dunlop tires. He was plainly very proud of the success of the new tire.

He said that the company decided last winter that this tire was built on the right principle, and that, after thoroughly testing he method of attachment under all sorts and conditions of usage, they decided to make it the leading production of the Hartford Rubber Works, but that they never anticipated the immense demand for the Dunlop tire so early in the season. It was the orders in hand that impelled them to take over the New Brunswick, N. J., plant.

During the last month this factory has been thoroughly overhauled and put in excellent condition for the manufacture of Dunlop tires. In a short time it is estimated that, with the immense facilities at the command of the Hartford Rubber Works Co., they will be able to turn out one thousand tires a day. In furthering their campaign the Hartford people have made an unusual departure by purchasing outright some ten automobiles, which are being used by their own men in demonstrating the Dunlop. One car, representing the product of the nearest manufacturer, is attached to each branch, and radiates therefrom.

Will Retail Now, Manufacture Later.

It is the purpose of the newly formed Evans Automobile Co., of Columbus, O., to eventually embark upon the manufacture of automobiles. For the present, however, only a retail business, including a garage, will be conducted. The concern's capital is $30,000, and it organized by electing these officers: J. Cyrus Morrison, president; Smiley Caldwell, vice-president; George W. Smith, secretary; Charles E. Leist, treasurer, and William E. Evans, general manager. Quarters at 63 East Gay street have been leased.

Digitized by Google

LOOKS LIKE A LOAN EXHIBIT

Fifty Cars, Chiefly Old Models, Constitute a "Salon"—One Lonely American There.

What is officially styled the "Importers' Salon," but what is in fact a display of about fifty foreign cars, most of them 1904 models, suggesting a loan exhibit, was formally inaugurated last night. It occupies the top floor of Macy's bargain drygoods store, Thirty-fourth street and Broadway, New York.

It was informally opened the night before, Tuesday, at which time the vulgar throng was denied admission, and only those who had received invitations attended. According to the press agent, Senator Chauncey M. Depew would deliver the "inaugural address" at that time and press a button that would shed electric light on the subjects displayed. But the Senator was conspicuous by his absence. The speechmaking and button pressing were performed by the versatile and obliging Winthrop E. Scarritt. The press agent had also heralded that the Ambassadors of France, Germany, Italy and a few other places would come on from Washington and beam on the crowd of Americans whom the importers hope to separate from their dollars. If the ambassadors had agreed to do anything of the sort, they failed ignobly. Instead of coming themselves they sent certain of their understudies, who beamed as well as they knew how.

As of the gilded brick, it must be said that the decorations are pretty and in good taste. The prevailing tint is green, the signs over each booth are of this color and, with the "impressive" display of 1904 cars, coupled with the odor and close proximity of the bargain counter, suggest that green was selected in the hope that it might find lodgement in the American eye. As a side show there is an alleged Japanese "tea garden," which fills a lot of space which otherwise would have been filled chiefly with echoes.

The preponderance of 1904 models makes evident that the "salon," or "saloon," as nearly everyone laughingly dubs it, holds little that is new or novel or instructive. Three American cars, Franklins, are included in the collection. Their display is in violation of the N. A. A. M. agreement, but one of the Franklin local representatives, bearing the American name Comancho, talks airily of the violation and asserts that as Franklin could not obtain all the space at Madison Square Garden that was asked for, he is justified in getting it elsewhere.

There are ten or twelve accessory firms—chiefly handlers of foreign wares—displaying their goods. And, oh! yes, the Macy dry goods store is very naturally occupying the most generous space, and, of course, showing some of the garments that are daily displayed on the bargain counters of the lower floors of the same building.

Cadillac Makes an Acquisition.

What is substantially a consolidation of two Detroit concerns that have been so closely linked as to have been almost one has been effected by the merging of the Leland & Faulconer Mfg. Co. into the Cadillac Automobile Co. For three years the former have been making the Cadillac engines. Under the new order of things Henry M. Leland becomes general manager of the Cadillac Co., and Wilfred C. Leland, assistant treasurer.

It is a jointure that means much to all concerned, Henry M. Leland's reputation as a thinker and designer being of the highest order. For nearly forty years he has been at the head of large manufacturing institutions, seventeen of them being spent with Brown & Sharpe. Twenty years ago he located in Detroit and founded the Leland & Faulconer Co. Since then his mechanical genius has had free scope and has been used to the fullest advantage. The fine tools and machinery that he has evolved and the fine goods produced have served to keep his fame secure. One of the most notable of his comparatively recent creations was the machinery for cutting bevel gears for bicycles, previously considered an impossibility.

Still Fighting Bankruptcy.

A severe setback was received this week by the stockholders of the embarrassed Chicago Motor Vehicle Co., of Harvey, Ill., who are seeking to have the resumption of operations made possible. Judge Kohlsaat, sitting in the United States District Court, declared the concern bankrupt. This will not be accepted as final, however. An appeal taken from Judge Kohlsaat's decision will continue the fight until next October, when the United States Circuit Court of Appeals will hold a session.

It was given out that the liabilities consist of $60,000 worth of merchandise claims, $8,000 labor claims and $150,000 mortgages on the company's plant at Harvey, Ill.

Matheson Will Build in Spring.

The Matheson Motor Car Co., Holyoke, Mass., which has bought a five-acre site on the Grand Boulevard, Detroit, is to erect its new factory on that site in the spring. Pending its completion, the company has opened a Detroit office at No. 910 Hammond Building, in charge of F. A. Hinchman, of Detroit, who has recently been elected treasurer of the company, and F. F. Matheson, secretary. The company's main office will continue at Holyoke, Mass., until the plant is removed to Detroit.

Wolverine to Come East.

Land comprising one and one-half acres at Suffren, N. Y., has been purchased by President Charles L. Snyder of the Wolverine Motor Works, Grand Rapids, Mich. The property will, it is stated, be used for the erection of a plant for the manufacture of automobiles, to be begun in the spring. When completed the concern will remove from Grand Rapids and begin operations at the new plant.

TREATY OF PEACE SIGNED

Kansas City's Warring Dealers Bury their Hammers and Agree on Rates.

Kansas City, Jan. 6.—In Kansas City peace reigns once more. Although it may not be generally known, peace has not always reigned here; indeed, until Friday last, the dealers were at each other's throats. It was one of the very few places in the country in which prices of every nature were being slashed to the quick.

How much longer the war would have waged had not C. A. Wardle, the travelling emissary of the Association of Licensed Automobile Manufacturers, appeared on the scene is a matter of conjecture. Wardle's duty is to keep his eye on such disturbed centres, and although the embattled dealers did not know it when he arrived, he carried with him a sprig of olive and a vial of troubled-water oil. But when he waved the sprig, hands that clutched throats released their grips, and then Wardle had a chance to point out to them the folly of it all and the benefits of the get-together spirit.

This accomplished, he had the former warriors meet at the festal board in the Baltimore Hotel last night, and there, under mellowing influences, Wardle unbottled his famous fluid, and in no time at all the licensed dealers and the independent ones, all of whom had gathered, permitted the dove of peace to perch over them. They quickly saw that improvement in their respective businesses was impossible under the conditions that had prevailed, and were not slow to reach a mutually satisfactory agreement. It assures a wholesome order of things in the future, assurance which will be further strengthened by the formation of the Automobile Trade Club of Kansas City, which it was decided to formally organize on the 14th inst.

In addition to Wardle, those present at last night's meeting were as follows: E. P. Moriarty, of E. P. Moriarty & Co.; Henry C. Merrill, of the Kansas City Automobile Co.; Fred Patee, of the Cadillac Co.; J. O'Mara, of O'Mara & Ledwidge Automobile Co.; E. Richter, of Richter Bros.; G. J. Ferguson, of the Ferguson Implement Co.; F. D. McMillen, of the Western Automobile Co.; Karsher & Greenlease, P. A. Pollock, of the Belmont Automobile & Cycle Co., and E. Caps, of Caps Bros. Mfg. Co.

The agreement entered into, which probably will prove of interest and instruction elsewhere, is as follows:

Not to sell any new automobiles of current year's model at less than list price, F. O. B. factory.

Not to allow more than the folowing on any second hand automobile taken in trade, viz.: 1904 models, 60 per cent of list price; 1903 models, 50 per cent of list price; 1902 models, 40 per cent of list price.

All supplies and tires to be sold at catalogue prices, no supplies and tires to be

Digitized by Google

purchased of any supply house which sells direct to users at less than standard list prices.

No commission on sales to be allowed to chauffeurs or to anyone not an authorized salesman.

Livery rates.—Not less than $4 for the first hour, and $3 per hour each hour after the first for each automobile rented.

A charge of not less than 60 cents per hour to be made for all repairs including punctures.

Storage.—The charges for storage to be as follows, viz.: $20 per month for 5-passenger cars; $15 per month for small 4-passenger cars, under $1500 in price; $12.50 per month for runabouts; $17.50 per month for large 4-passenger cars. Delivery to be $2.50 extra per month or 30 cents for single deliveries.

Gasolene to be charged for at the rate of 20 cents per gallon. Cylinder oils to be not less than 75 cents per gallon. Lubricating oils to be not less than 50 cents per gallon. Washing and polishing, $1 per car. Towing to be $2 per hour, or any fraction thereof.

Iowa Retailers to Incorporate.

Incorporation papers are being prepared for the Davenport Automobile Co., of Davenport, Ia., with a capital of $10,000, and will be filed at once. The principals are F. L. Bills and P. C. Peterson, the latter a practical automobile man. The firm of Stottenberg & Reimers, automobile dealers, have been bought out by Bills and Peterson, and their quarters at 115 and 117 Harrison street taken possession of. Arrangements have been made to handle the Northern car.

Sweden Orders a Carload.

The receipt of a carload order for Michigan cars from Sweden is reported by the Michigan Automobile Co., Kalamazoo, Mich. Their Model D car was the one selected by their foreign customer. The Michigan people have recently made a shipment of the same style of machine to Wellington, New Zealand, and say that foreign inquiry is showing a very marked increase.

Mead to Make a Change.

It is proposed to reorganize the Mead Cycle Co., of Chicago, which has been dabbling in the automobile business for a year or more. The plan is to style the new company the Mead Motor Co., and to make George S. Lewis president. The present premises at Nos. 1,243-45 Wabash avenue will be retained.

Waite to Join Royalty.

George S. Waite, manager of the Cleveland branch of the White Sewing Machine Co., has resigned that position to connect himself with E. Shriver Reese in the sale of Royal cars. Waite was with the White Co. for a number of years, and is well known in the trade.

The New York agency of the Matheson touring car has been placed with Shepard Bros., 500 Fifth avenue.

DAIMLER DROPS WAGONS

Peculiar Reasons that Brought About the Decision —Will Now Build Touring Cars Only.

In discontinuing the manufacture of commercial vehicles to devote themselves wholly to the production of the American Mercedes touring car, the Daimler Mfg. Co. has exactly reversed its policy. The reason for this radical action is uncommonly interesting and, while not unusual, is rarely permitted to enter into discussions bearing on business vehicles. It is the old question of not only obtaining but of retaining competent drivers.

C. M. Bouggy, president of the Daimler Company, says that, as usual nearly all the Daimler wagons were sold in or near large cities, and that it was the invariable experience of the purchaser that as soon as a young man had been properly broken in to drive the machine, he forsook his "job" for the more congenial employment of a chauffeur or demonstrator. As the owners of the vehicles could not afford to maintain training schools for private owners and garage keepers, it became apparent that, until equilibrium between supply and demand should be reached in the chauffeur market, it would be impossible to give the business vehicle a fair test on its own merits as a money saver.

The Week's Incorporations.

New York, N. Y.—Diamond Rubber Co., under New York laws, with $10,000 capital. Directors—T. B. Smith, E. B. Root and J. W. Ingram.

Milwaukee, Wis.—Franklin Automobile Co., under Wisconsin laws, with $5,000 capital. Incorporators—Henry W. Ramien, H. L. Ramien and Richard B. Ramien.

Brooklyn, N. Y.—The Rockliff Motor Truck Co., under New York laws, with $50,000 capital. Directors—Sidney D. Van Wagner, Charles H. Patterson and Charles Rockliff.

Columbus, Ohio—Dayton Motor Car Co., under Ohio laws, with $50,000 capital. Incorporators—John W. Stoddard, John F. Campbell, William J. Jones and Harry Croninger.

New York, N. Y.—The Michelin Tire American Agency, Inc., under New York laws, with $35,000 capital. Directors—Eben D. Winans, George W. Wilder and Charles D. Wilder, New York.

Columbus, Ohio—The Evans Automobile Co., under Ohio laws, with $30,000 capital. Incorporators—G. W. Smith, W. E. Evans, Smiley Caldwell, J. C. Morrison and Charles E. Leist.

Milwaukee, Wis.—Orlando F. Weber Co., under Wisconsin laws, with $80,000 capital, to manufacture automobiles and parts. Incorporators—Orlando F. Weber, Alfred Recke and A. F. Solliday.

Reading, Pa.—Reading Automobile Co., under Pennsylvania laws, with $20,000 capital, to manufacture automobile specialties. Incorporators—Harry O. Koller, James O. Koller and James Rick.

Milwaukee, Wis.—Middleton Mfg. Co., under Wisconsin laws, with $200,000 capital; to manufacture automobiles and parts. Incorporators—William C. Middleton, Frederick S. Middleton and Albert S. Schrewe.

Springfield, Mass.—The Rubber Appliance Co., under Massachusetts laws, with $50,000, to manufacture a collapsible rubber wash basin for automobiles. Officers: President, S. J. Rosenfeld; secretary and treasurer, D. E. F. Radasch; directors, S. J. Rosenfeld, D. E. F. Radasch and Samuel McWhorter.

Eisenhuth Effects Reorganization.

Plans looking to a reorganization of the Eisenhuth Horseless Vehicle Co., of Middletown, Conn., were put into effect last week. As a result new officers and directors were elected as follows: President, I. E. Gates, New York; vice-president and general manager, G. T. Schull, Middletown; treasurer, Charles Babbadge, New York; assistant treasurer, Vaughn M. Coyne, New York; secretary, D. H. Hilton, New York; general superintendent, D. F. Graham, Middletown; superintendent, J. Unser, Middletown; sales manager, F. C. Carter, Middletown; directors, I. E. Gates, G. T. Schull, J. A. Hilton, D. H. Hilton, J. W. Eisenhuth and D. F. Graham.

The concern manufactured what was formerly termed the Graham-Fox car, fitted with a compound gasolene engine.

Fire Inspectors Prod Stearns.

Walter H. Stearns, of 154 East Fifty-seventh street, is the latest garage keeper to receive the attention of the Bureau of Combustibles of the New York Fire Department. Though it was at first reported that he had been conducting the establishment for over a year without a license, this turns out to be an error. Stearns had been an unwilling violator of some of the regulations for garages, but will have the necessary changes made in his premises at once. When this has been done he will be allowed to resume his business.

Chicago Concern Changes Name.

Hereafter the Automobile Exchange, No. 1,502 Michigan avenue, Chicago, will be known as the Holmes-Schmidt Motor Co. The officers are G. E. Holmes, president, and Otto B. Schmidt, secretary and treasurer. A number of changes are being made in the premises, among them being the transforming of the first floor into a garage and room for demonstrating cars. The salesroom and office will be on the second floor. The Ford is the concern's leader.

Hannan Takes on Michigans.

George E. Hannan, of No. 1445 Welton street, Denver, Colorado, has taken the agency for the Michigan light touring cars for the coming season. He is said to be the largest dealer in Denver, and had the agency for the Olds line last season.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, JANUARY 12, 1905.

The Routing of a Bugaboo.

It was probably just as well that the use of gasoline was almost uniformly prohibited at the earlier exhibitions, as it is now, so that the cars could not be shown in operation. Otherwise most of the prospective buyers of cars would have been frightened off—the attendants would have suffered from cranial aches, simulating those of the morning after variety, and very likely the sheriff would have had to step in and levy on the exhibits to pay the hall rent. For, if there was one thing that early attempts produced in a superlative degree, that thing was noise combined with a generous measure of smell. No necessity then to look up and down the road to see if a car happened to be coming; they announced their approach from a distance, and a very general comment on the part of the uninitiated was "How do they stand the racket?" meaning the occupants, of course.

Each year has marked a decided improvement in the production of an increasingly efficient engine that will work silently. Once the mistaken idea of loss of power through muffling down the exhaust was relegated to the limbo that holds so many other exploded theories, more attention was paid to this important requisite of comfort, with the result that the average car to be seen at the shows doubtless could be run without discomfort to the spectators, who usually surround every exhibit so closely.

The bugaboo of earlier years where mufflers were concerned was "back pressure." Both the presence and effect of it were exaggerated to a great degree in the mind of the average engine builder of the time. There seemed to be no escaping the fact that a certain amount of power must be wasted between the cylinder and the air, until experiments were made with various types of mufflers that effectually silenced the exhaust, and it was found, as a surprise to many, that the loss of power was a negligible quantity.

The old pepper-box type was probably the first to meet with any general acceptation, but very shortly gave way to enclosed silencers employing variously arranged baffle plates, and this form has now been brought to a point of development where the need of further attention to the subject seems almost superfluous. Those old timers, in many instances, were little more than boxes, built with or without a theory as best suited their inventors, who were usually too busy in remedying other defects to regard comfort as an essential. And the majority of them overlooked the necessity of maintaining the aperture through which the expanding gases escaped of a uniform size of not less diameter than that of the exhaust opening itself. Hence the bugaboo of back pressure.

Once the exhaust was adequately silenced; other noises, hitherto unheard because drowned in the din of the former, impressed themselves on the improver, and it is not too much to say that what with the great advancement in the cutting of sprockets and chains, and the adoption of the shaft drive, these also have practically been eliminated.

Of course, there are still cars that go thumping along, and some of these were particularly noticeable during the past season, owing to the fact of their being so far in the minority. Then there are cars that hammer and pound, but that's another story and doesn't involve mufflers. It is safe to say there will be fewer noisy and ill-smelling cars running on our roads during the coming season than have ever graced them before in the history of the industry.

Handling Second-Hand Cars.

Like the bicycle industry when at the height of its prosperity, improvements in the automobile field have followed upon the heels of one another with such rapidity that the question of what to do with the second hand cars will soon become pressing. In the first stages of development changes were so radical that old models of motor cars, like the primitive forms of safeties, were forced into retirement by their very ungainliness as compared with the models that superseded them; few self-respecting men wished to be seen in public driving them. And, despite the fact that all motor cars begin to look more and more alike, and there is less difference between the models of each succeeding year, second hand cars grow amazingly in number, and the question of what to do with them comes with increasing force to an agent every time he has to dicker about taking a model of the previous year in trade.

Not that it is at all likely that this phase of the industry will ever reach a crisis similar to that solved by piano dealers during the last year by the cremation of about a thousand old squares which had been taken in trade no end of times. Though long past its youth, a piano may still live on to torture all who are compelled to endure it, but the average motor car will eliminate itself by reaching the junk pile through the ordinary processes of wear and tear long before reaching any such venerable age, so that a consideration of this side of the question is not called for.

On the other hand, the question of handling this constantly growing number of hand-me-downs, more or less of which must always be taken in trade by every agent, has assumed such proportions that one large dealer seriously contemplates the opening of a store under a totally different name, merely to take care of this influx. By this means nothing but the spick and span new models of the present generation will greet the intending purchaser's eye, and he will not be tempted to look for bargains. The second hand cars will be confined to another quarter entirely, apparently having no connection whatever with the first.

True, it will not be so easy to change the second hand buyer's intentions for the better so readily by finally persuading him to purchase a new car, where this method obtains, but the reverse of the proposition holds true,

Digitized by Google

and the dealer in question rightly assumes that even where a prospective purchaser will have none but a used car, he will be positioned to direct him to the "very best place to obtain one."

It is certain, at any rate, that the display of a second hand car on a salesroom floor is frequently a distraction, and any means that lessens its influence is of real value and merits earnest consideration.

Lengthening of Wheel Bases.

Only a year ago there was a revulsion abroad against extremely long wheel bases. It was felt that the movement in that direction had been carried unduly far. Racing cars had been copied for touring models, with the result that the length of the latter approximated the former, and weak and sagging frames were the entirely unnecessary outcome.

To-day foreign wheel bases are as long as they were, and in this country longer. The side entrance body is chiefly responsible for this right about face. It has compelled a lengthening of the frame, and this necessity caused the ban on the practice to be withdrawn. Consequently designers have been given practically a free hand in the matter, and have availed themselves of it to a remarkable extent.

Looking over the leading 1905 models, as at the approaching shows, the observer will notice a number of cars having wheel bases of 100 inches and more. When it is recalled that only a year or two ago such bases as 60 and 70 inches were considered fairly long, and that only a short time before that the "dumpy" runabouts of unlamented memory were the vogue, the tremendous change that has been made will be apparent. The first steps toward longer chassis were taken in response to a demand for easier riding cars; this was still in evidence when tonneau cars became popular and made it desirable to place the axles still further apart. Then came the side entrance, and necessitated still another lengthening.

It is easy to see that these long wheel bases materially increase the car's liability to give trouble. This is, of course, well known to designers and builders, and they take what they deem to be sufficient precautions against sagging, twisting and buckling frames. It can be determined only by actual use whether they have done enough. They have to build strong and provide against the severest stresses and strains, and each time they lengthen the frame the problem of giving it strength to support the weight of engine, transmission, etc., becomes increasingly difficult. Whether it has been solved in all cases only the future can disclose.

At last it has been revealed why certain supersensitive motorists of Dorsetshire, England, objected to using license numbers bearing the initials "B. F." It will be recalled that a great hue and cry was raised about these initials a few weeks ago, letters were written to the Times, Parliament was petitioned to permit a change, and it was stated that many motorists of the shire were going into adjoining counties and buying their numbers, to the sore loss of the Dorsetshire treasury. Through it all, however, no mention was made of the reason for the dislike of the mystic letters "B. F." Now it appears that the average Britisher—whether of bucolic or urban origin—interprets these letters as meaning "bloody fool." It was made clear to us by an Englishman, and it seems that we are very dense not to have known that any motorist carrying a tag with "B. F." on his car would have "bloody fool" yelled after him! If it had been "D. F." now, we might have "tumbled."

It has a tendency to emphasize our immaturity to have it made known that, although automobiles are taxed 45 per cent by our beneficent government, the law under which this duty is levied does not contain the word "automobiles." The Dingley tariff was drawn in 1897, and at that time the motor vehicle, while made in small numbers, was quite unknown to our solons. Consequently when the first foreign car reached this country the customs authorities were much puzzled to know how to classify it. They finally hit upon "manufactures of metal" as being pretty close to what an automobile was, and as such manufactures were assessed 45 per cent ad valorum, it was decided to assess automobiles in this sum. The practice has, of course, continued ever since.

It is in no carping spirit that the suggestion is let fall that if, within two weeks, frost an inch deep does not fall on the top floor of Macy's drygoods store, in New York, it will be because that floor has lost its natural affinity for frost or because one of those whose fingers is deepest in the "salon" pie is an uncommonly able newspaper man attached to an uncommonly influential New York daily. To believe that the American public can be long hoodwinked into paying for the "privilege" of gazing upon a small assortment of foreign cars, chiefly 1904 models, such as have been shown in salesrooms during the last twelve months, is to fully believe Barnum's historic remark.

To put it mildly, those officers and members of the Automobile Club of America who permitted their names to be used as "patrons" of the "wildcat" or unsanctioned show now running on the top floor of Macy's drygoods store, in New York, did not display the best of good taste. Shorn of empty excuses, that display was designed to detract from the Madison Square Garden show, in the promotion of which the A. C. A. is a co-partner and from which it will derive a considerable revenue. To even passively join with those who would lessen its success is not playing fair or exhibiting that mutual co-operation and goodwill due from one partner to another.

The New York Herald is able to exist because of American manufacturers and merchants, but if it is a real friend of the American automobile industry, the fact has yet to be effectively demonstrated.

COMING EVENTS.

Jan. 11-15—New York, Importers' Show, Macy's Dry Goods Store, top floor.

Jan. 13—New York, Motor and Accessory Manufacturers, annual meeting, Hotel Astor.

Jan. 14-21—New York, National Show, Madison Square Garden.

Jan. 16—New York, American Automobile Association, annual meeting and election.

Jan. 19—New York, Superintendents' and Engineers' Branch of the Association of Licensed Automobile Manufacturers, meeting.

Jan. 20—New York, National Association of Automobile Manufacturers, smoker.

Jan. 21—New York, National Association of Automobile Manufacturers, annual meeting.

Jan. 21—New York, Automobile Club of America, annual banquet, Astor Gallery, Waldorf-Astoria.

Jan. 23-28—Ormond-Daytona, Fla., third annual speed carnival.

Jan. 23-28—Philadelphia, Automobile Show.

Feb. 4-11—Chicago, National Show, Coliseum.

Feb. 13-18—Detroit, Automobile Show.

Feb. 20-25—Cleveland, Automobile Show, Gray's Armory.

Feb. 27-March 4—Toronto, Automobile Show.

March 6-11—Buffalo, Automobile Show, Convention Hall.

March 13-18—Boston, Automobile Show, Mechanics' Hall.

March 13-18—Boston, Importers' Show, Symphony Hall.

March 27-April 5—Washington, Automobile Show.

THE INDUSTRY IN DETROIT

Impressive Figures Showing How it Gradually has Expanded and the Volume Attained.

Some interesting figures regarding the growth of the automobile industry in Detroit were given out last week by John B. Howart, chairman of the Board of Commerce in that city. From one lone concern in 1901 with $500,000 capital, the industry has grown until during 1904 there were fifteen new companies incorporated, while the amount of invested capital had increased to more than $4,500,000. Mr. Howarth made public these facts in the course of an interview regarding the industrial development of the "City of the Straits," and his remarks concerning the automobile manufacturing business were as follows:

"Up to the end of 1901 this industry was represented in Detroit by a single company, with a capital of $500,000," he said. "In 1902 two other companies were incorporated, one with $300,000 and the other with $50,000 capital, making the total investment for use in Detroit $850,000. In 1903, by additions to the capital of old companies and the incorporations of new ones, this was increased to $2,200,000. During the year just closed fifteen new companies were incorporated, with authorized capital of over $2,000,000.

"As showing the progressive character of the industry, there was one company organized in February with subscribed capital of $75,000; lately it increased its capital stock to $400,000. Three other companies which began business within the year have already found it necessary to increase their capital.

"Aside from the companies engaged in the manufacturing or assembling of automobiles, there are three other large concerns and many smaller ones, whose industry is directed almost entirely to the manufacture of automobile engines and accesories. These concerns added not less than $500,000 to the capital actively employed in this industry, making a total of over $4,500,000 invested. Still another company, with a capital of $500,000, has purchased a site for a factory and is about to remove here from another city. The direct exports of automobiles from Detroit during 1904 were about $150,000.

"The automobile output is valued at not less than $10,000,000. The indirect exports by way of the Atlantic and Pacific seaboard were probably five times as much as the direct exports. Detroit automobiles have been sent to Mexico, South America, South Africa, New Zealand, Australia and Japan, to every country in Europe, to Turkey, Persia, India, Burmah and almost every country of Asia."

Edward Campbell will open a garage at Marion, Ind., and conduct sales and repair departments. He will handle the Winton car.

No Foreign Cars for Croker.

Whatever Major John M. Woodbury, the head of New York's Street Cleaning Department, may say derogatory to the American product in defending his purchase with the city's money of two foreign cars, his views are not shared by Edward Croker, Chief of the Fire Department. A Motor World man met the latter one day this week, and remarked Major Woodbury's opinion of American cars as quoted at length in last week's Motor World.

"Humph!" ejaculated Croker, and added: "Thinks American cars won't run, does he? Well, if he'll follow mine for a while, he may learn something about them."

As Chief Croker uses a big Columbia touring car in answering alarms, which require him to go everywhere and at high speed and at all hours, his opinion probably is worth a great deal more than that of the Street Cleaning Commissioner. At the time he delivered his all sufficient comment he was in the Electric Vehicle Co.'s New York depot, negotiating the purchase of two additional cars, which added emphasis to what he had said.

Will Give Away Automobiles.

There is small room for doubt but that the exhibit of Charles E. Miller, the well known supply man, will be a storm centre during the New York show. Without violation of the Selden rights, he has brought from France some fifty thousand automobiles, and these he purposes giving away during the week. The cars are of three models, two being types of touring cars and the third a racer. One of the touring cars and the racer are of golden finish, and blowing on the "tailboard" produces a shrill whistle; the other is of silver finish, and is mounted on a stickpin. Miller will occupy two spaces at the show, and as he himself expressed it, he "will give an imported automobile to all who find his exhibit on the top floor." His space there is rather small, and it was difficult to tell whether or not his remark was satirical.

Realizing that the little conceits make uncommonly effective souvenirs, when he placed his order, Miller did so conditional on no others being shipped to this country previous to February 1. Until then he will enjoy a "monopoly."

Boston Show Needs More Room.

The Boston show management is considering the advisability of renting Paul Revere Hall, so as to secure needed additional space. Mechanics' Hall, where the show is to be held in March, is more than twice the size of Symphony Hall, where the 1904 show was held, and it was thought that there would be more room than could be utilized. The demand for space still continues, however, hence the consideration given Paul Revere Hall. The latter is in the Mechanics' Building, but separate from the main exhibition hall.

VALUE OF GOOD LOCATION

Aptly Illustrated by the Sales of a New Store of a New Company.

"Talk about location! We've the best in the city. Already we have done enough business to pay our rent for a year, and we have scarcely got started," said R. G. Howell, who looks after the city sales for the Harrolds Motor Car Co., to a Motor World man one day this week.

"As an advertisement alone the store is almost worth the rent," he continued. "See our location; fronting on Broadway from Fifty-eighth to Fifty-ninth streets—no retail merchant in New York, except John Wanamaker, has an entire Broadway block—and also on Fifty-ninth street, facing the park. Columbus Circle is one of New York's centres now, and the number of people passing our store is immense. We have our big glass windows on both streets artistically lettered, which in themselves would prove a great attraction. With the Olds and Pierce cars behind them they compel people's attention.

"All this is from an advertising standpoint. In the way of selling and demonstrating it has equal or greater advantages. We are practically in the park. There is only one line of car tracks to cross and no streets to thread our way through, giving nervous passengers spasms. A hundred feet and we are away from clanging bells and trucks and teams of all sorts. Yes, sir; it has downtown beaten a mile, and we are thoroughly satisfied, both with the outlook and what we have done already."

Why American Cars are Preferred.

"Though English made cars still have a preferential tariff of 10 per cent over foreign made ones in New Zealand, yet motors of American make have a far better sale, for the simple reason that they are made for local requirements. A few days ago I asked a motoring friend why he did not purchase an English machine. His conclusive reply was, 'English and French machines don't track,'" says a correspondent writing from Timaru, New Zealand, to the Autocar. He also states that the wheel gauge in New Zealand is practically the same as in Australia and America, that is, from 58 to 62 inches. The worn wheel and horse tracks on a road are each about a foot wide, so he deems it unsafe to purchase a car with a gauge less than 54 inches. The correspondent also dwells upon the importance of having the engine built slightly higher than is done for other countries. The bad condition of the roads and the numerous small streams which have no bridges necessitate the parts affected by going through the water being set high.

Louis Ohnhaus, of Ft. Wayne, Ind., has disposed of his interest in the Randall Motor Co., of that city, and will open a salesroom and garage of his own.

MORRISON AMID HIS CUPS.

A. E. MORRISON, OF BOSTON, AND HIS TROPHIES OF THE YEAR.

The Show of American Achievement

The 1905 Exhibition in Madison Square Garden Will Demonstrate its Right to the Title—Four Cylinder Motors and Side Entrance Bodies the Most Conspicuous Foreshadows but the Improving Hand will be Apparent Everywhere.

At no previous show has there been such an outgiving of entirely new and of redesigned and reconstructed cars as will be submitted to public gaze on Saturday night. It is scarcely short of a revolution. Nothing more conclusively demonstrates the great strides that have been made by the industry or reveals more clearly that the point has at last been reached where no comparison with anything produced elsewhere need be feared. It is scarcely too much to say that there is no more to be learned from across the water designers; certainly it is not going too far to predict that hereafter American designers will impart as much as they absorb.

Comparing the show that opens Saturday night with its two predecessors at Madison Square Garden, one is led to characterize it as the show of achievement. It is quite fair to regard 1903 as the year of promise and 1904 as the year of progress. Reasoning along these lines, one is impelled, as already stated, to style 1905 as the year of achievement. Having evidently come to the conclusion that the public want cars with vertical engines in front under a hood, they have, after considerable experimentation, produced cars of this type in great numbers, and now present them in the confident expectation that they will "make good."

Of this large number of new models many, perhaps most, have already been described and illustrated in these columns. A few have managed to prevent the withdrawal of the veil of secrecy that has enveloped them during the period of experimentation, test and construction; but nearly all of them will make their first public appearance on Saturday night. The throngs that will assemble at the Garden will find on nearly every stand entirely new cars, not all of them, it should be stated, of the vertical cylinder engine-in-front type. The stands where new models do not appear will be few and far between, and even many of the old patterns have, while still retained, been subjected to a process of reconstruction that will materially alter them for the better.

Next to the rush to the four cylinder type of car, which is, of course, the most noteworthy feature of the day, the greatest attention is being given to body construction. It is remarkable how this has progressed within a year. On the eve of the 1904 show the tendency to give prominence to canopies and glass fronts was remarked in these columns. Faint signs of dissatisfaction with the rear entrance tonneau body was also noted at about the same time. When the show opened it was seen that canopies and glass fronts were even more predominant than had been expected. But of closed bodies and side entrance tonneaus or surreys there was, with two or three notable exceptions, absolutely no sign. The exceptions noted were objects of curiosity as well as admiration. But they were as oases in a desert, surrounded on all sides by open and rear entrance cars.

Even in advance of the opening of the present show it is known that the concerns that will fail to have a side entrance car for their leading models will be very few. In fact, side entrances will scarcely be a matter of discussion; they are accepted already as the "proper thing" without demur or objection. If the four cylinder car is not accepted with equal unanimity, it is because a very considerable section of the trade still holds aloof entirely from the movement or has retained its horizontal cylinder cars while at the same time bringing out a four cylinder model.

A few of these four cylinder models have already made their appearance. Among them are the Thomas, which has been marketed for a number of weeks. It displaces the three cylinder type sold last year, and at $3,000 has been recognized as marvellous value. At least one of the new Winton models—the 16 horsepower Model C, listing at $1,800—has been shown at the Winton agencies.

New four cylinder cars that will be shown for the first time, although they have already been described are the following: The 28--30 horsepower Cadillac, listing at $2,800; the 20 horsepower Ford, the price of which is $2,000; the 16—20 horsepower Autocar, at $2,000; the 18—20 horsepower Orient, at $2,250; the 28 horsepower Acme, at $2,750; the 20 horsepower Stevens-Duryea, at $2,500; the 28 horsepower Haynes, at $3,000, and the 30—35 horsepower Lozier, at $5,000. It is also known that there will be shown four cylinder cars of these makes: Studebaker, Corbin, Yale, Mitchell, Duquesne, Pungs-Finch, Covert, Wayne and a few others.

The conclusion that the horizontal type of engine has disappeared, which is apt to be drawn from the foregoing lengthy list, is, however, a mistaken one. Such concerns as Haynes-Apperson, Cadillac, Ford, Autocar and Stevens-Duryea are retaining their time tested models of the opposed type, while concerns that put out this type alone are the Olds, Elmore, Rambler, Pope-Hartford, Northern, Knox, Michigan, Buick and Maxwell, a very respectable list.

A novelty is the appearance of a six cylinder car, the Duquesne. It will make its debut on Saturday.

Although the four cylinder car may occupy the centre of the stage, it will not prove the "whole thing." Such two cylinder cars as the new Oldsmobile, the new Pope-Hartford and the Maxwell, listing at well under $2,000, are most attractive creations that really establish new standards of values.

There is this to be said of practically all of the American cars—each possesses an indi-

Digitized by Google

viduality that is distinctly marked. There is no slavish design of body, no sameness in hoods or radiators. Each is sufficiently different from the other to render instant recognition possible.

Because the American engine maker and the American body builder have brought themselves abreast of their foreign competitors, it is not merely in engines and bodies that the improving hand has shown its strength. In frame construction, in carburetting devices and in ignition appurtenances will be found a number of marked developments.

In tires, the advance of the mechanically fastened types will be made apparent. If it may be said that there is any pronounced feature or development in this department of the trade, the mechanical fastening must of right be considered the most conspicuous.

Taken all in all, it will be seen that the show will contain much more of novelty than it has ever done. The upward tendency of both powers and prices, even as compared with last year, will be made plain. The extremes of price are between $375 and $7,500, which does not materially differ from the preceding show, but the average price is considerably higher.

The Exhibitors and their Exhibits.

The exhibitors—alphabetically arranged for convenience in locating them—and the wares they will display are as follows:

M. F.—Main floor.
E. P.—Elevated Platform.
U. B.—Upper balcony.
B. E.—Balcony extension.
E. H.—Exhibition hall.
R.—Restaurant.
F. T. B.—First tier boxes.
C. B.—Central boxes.
F. A.—Fourth avenue rooms.
C. H.—Concert hall.
S. T. B.—Second tier boxes.

(ALPHABETICALLY ARRANGED.)

Apperson Bros.' Automobile Co., Kokomo, Ind., Block K, M. F.—Apperson 4 cylinder touring cars.

Autocar Co., Ardmore, Pa., Block I, M. F.—Autocars, comprising the new 4 cylinder vertical and two double cylinder opposed models.

American Motor Co., Brockton, Mass., Block N. M. F.—Marsh cars and motorcycles.

American Roller Bearing Co., South Framingham, Mass., Block U, E. P.—American roller bearings.

American Ball Bearing Co., The, Cleveland, Ohio, Block X, E. P.—Ball bearing axles, wheels, etc.

American Coil Co., West Somerville, Mass., Block X, E. P.—Coils.

Auto Supply Co., New York City, Spaces 1 and 2, U. B.—Supplies.

Austin Automobile Co., Grand Rapids, Mich., Block A, E. H.—Austin cars.

America Co., Inc., Rockford, Ill., B. E.—Specialties.

Acme Motor Car Co., Reading, Pa., Block H, E. H.—Acme cars, including the new 4 cylinder 28 horsepower model.

Autocoil Co., Jersey City, N. J., Space B, C. H.—Coils.

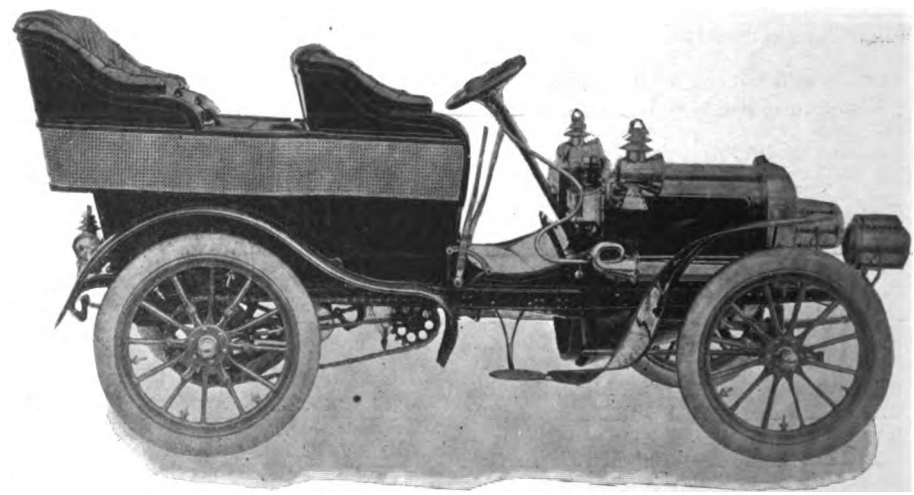
POPE-TOLEDO OF 1905

Famous Car Undergoes Considerable Refinement—Some of the Changes Made.

Few of the new models have been awaited with more interest than the Pope-Toledo. It finally made its appearance this week and proves to have been worth waiting for.

30 H. P. POPE-TOLEDO, TYPE VIII.



The leading Pope-Toledo feature, "direct drive on the high speed with all gears out of mesh is retained," but is worked out in more effective manner, the entire transmission device being considerably altered, the free use of ball bearings—which has been an ear mark of the car—having permitted of some desirable refinement.

The essential features of the car are as follows:

The cylinders are plain cylindrical castings with no cased water jackets, and are machined outside concentric with the bore, thus insuring an even thickness throughout, consequently there is no difficulty of warping out of shape due to unequal expansion or contraction. The upper part of cylinder is surrounded by a spun copper water jacket secured at its lower end by being let into an annular groove surrounding the cylinder and caulked with lead, and at the top extending over the end of the cylinder, forming the gasket between head and cylinder. The cylinder heads are water jacketed elbow castings, containing the exhaust and inlet valve chamber, also ignition plug, which is placed directly over the centre of the cylinder. Each head has projecting arms cast on them which extend out and meet corresponding arms on adjoining heads, and are tied together by means of a bolt and capped washer, thus insuring the perfect alignment of the cylinders.

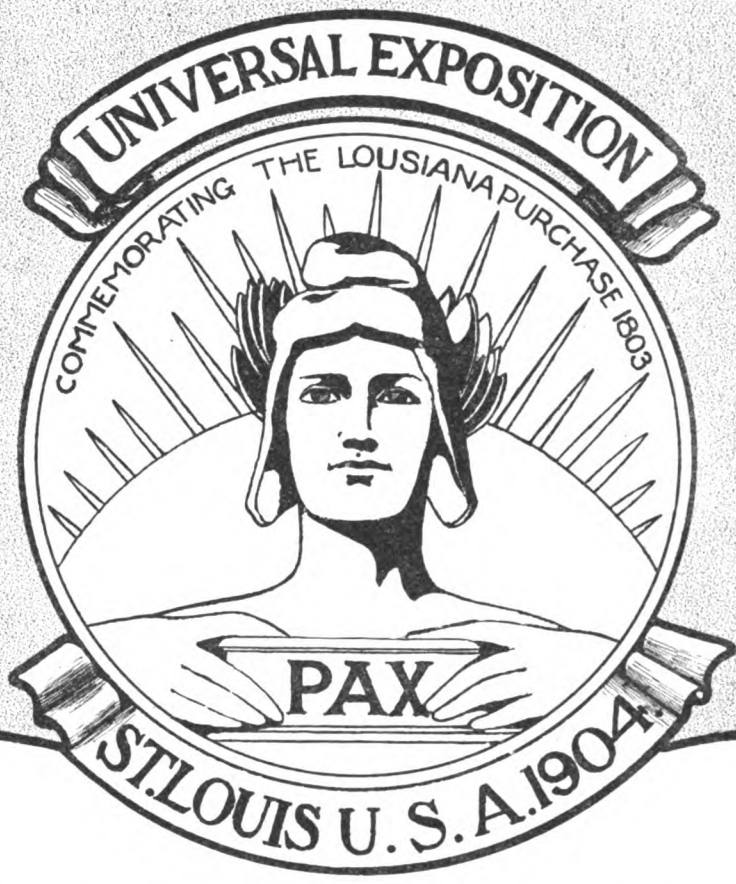
The crank shaft is a weldless drop forging of high grade steel and is turned in special fixtures designed and built in the Toledo factory. The object of these special fixtures is the production of a perfectly straight and round shaft, and no expense has been spared to attain this end. A flange is turned on one end of the shaft, to which the fly-wheel is bolted, not depending on keys to hold it. The crank shaft bearings are five in number and are of the finest phosphor bronze. The bearings are reamed after bolting into the case and then scraped to a perfect fit to the shaft itself.

The crank shaft bearings, crank pins and cam shaft bearings are oiled by the splash system. Just enough oil is used in the bottom of the case for this purpose and yet avoid an over-quantity being thrown into the cylinders. The cylinders are fed with a special form of mechanically driven oil pump. The feed of this pump is always in sight of the driver, thus avoiding any uncertainty in the important matter of cylinder oiling.

20 H. P. POPE-TOLEDO, TYPE X.

The commutator is of the rubbing contact type and is driven by spiral gears from the cam shaft. The location is such that it may readily be inspected and cleaned. Oil does not affect it; in fact, it is provided with a wick oiler, which keeps the bearings and contact surface constantly oiled, thereby insuring long life.

The fan for circulating air through the radiator is belt driven and is provided with ball bearings.



The change speed gear in this model is in principle the same as formerly employed, with modifications and considerable improvements, the most noticeable being the adjustable ball bearings on the drive shaft, which can be taken up for wear or loosened in the same manner and with the same tools as are used on the jack shaft bearings. The high speed clutch on the differential has been strengthened and the reverse gears arranged to be thrown out of mesh on all speeds forward. The speed ratio between the engine and jack shaft has been increased from one to ten-sevenths, which permit use of larger jack shaft sprockets and thus get quieter running and longer life out of the chains.

Another improvement of great importance to the efficiency and life of the transmission is the removal of the countershaft and gears from the bottom of the gear box and arranging them in the rear of and in the same horizontal plane as the jack shaft. This arrangement, with the addition of a centre support and the substitution of ball bearings for plain bearings, produces a quieter and smoother running combination and prevents chattering of the gears.

The direct drive on the high speed with all gears out of mesh and silent is retained, but the result is accomplished in a different manner: The gear box, which is of aluminum alloy in two parts, divided horizontally, is hung on transverse cross members of the frame. In addition to this support, the jack shaft brackets, to which are secured steel casing tubes brazed in flanged ends bolted to the gear box, are hung between and securely bolted to the vertical flanges to the side of the members of the frame. This arrangement forms one complete and rigid unit of frame and transmission, and prevents any loss of power between engine and sprockets due to springing and twisting of the frame. The jack shaft and drive shaft ball bearings, outside and in, are all adjustable from the outside without removing any part of the gear box, by means of a spanner wrench being applied to ball cup. This transmission gives three speeds forward and one reverse, all being controlled by means of one hand lever.

PIERCE

The Pierce Car was awarded the Grand Prize at the St. Louis Exposition as the best expression of an American car built for American conditions and American temperaments.

The Grand Prize thus awarded is but a recognition of a standard toward which we have been working for five years, and which we believe we have attained.

The six cars which we have built for 1905 comprise the best we know of successful motor car building.

Catalog and technical descriptive matter sent on request.

FIGURING HORSE POWER

The Formulæ That Apply and Why They Afford Only Approximate Results.

With the approach of each annual exhibition, much comment is called forth by the widely varying results obtained by different designers of motors with so little apparent variation in dimensions.

It is a matter of common knowledge that attempting to follow the empirical constants evolved for the steam engine led gas engine designers so far astray in the first instance that one and all dropped them forthwith, and seemingly they have never come together again. The indicated horsepower of any engine is equal to 1-33,000 multiplied by the product of the mean effective pressure, the area of the piston, length of stroke in feet and number of power strokes per minute. In the case of steam engines this is usually expressed by the formula

$$\text{H. P.} = \frac{\text{PLAN}}{33{,}000}$$

in which:

P. Mean effective pressure in pounds per square inch.

L. Stroke in feet.

A. Piston area in square inches.

N. Number of power strokes per minute.

Taking into consideration actual working conditions, and allowing for drop in pressure from various causes, the results of this formula will be found to fall within close limits of error. But with the explosive engine so many disturbing factors are present that it is almost impossible to predict from cylinder dimensions, speed and fuel what power a given engine will actually develop. The most that can be done is to say what it should produce, granted that the numerous conditions of effective working are complied with.

Assuming a given compression sufficiently short of the practical limit as not to involve any danger of spontaneous combustion, a speed that is neither unreasonably low nor excessively high, that the various parts have been correctly designed, that the mixture is good and ignition takes place at the proper point, that the resistance of the various ports and passages is not so great as to prevent the cylinder receiving an approximately full charge, a formula may be evolved which will, as above mentioned, show the best result theoretically that may be expected from an engine of given bore, stroke and speed.

By omitting the compression factor, the man who visits the show or who reads in a catalogue that the stroke and bore of a motor are of given dimensions, and that R. P. M. are of a specified number, may obtain approximate results by following this simple formula, the calculation in this instance giving the brake or actual horsepower.

$$\text{B. H. P.} = \frac{D^2 \times L \times N}{18{,}000}$$

in which:

D. Piston diameter in inches or bore.

L. Stroke in inches.

N. Revolutions per minute.

The denominator varying according to the design of the engine and the character of the fuel.

By assuming a piston speed, this may be simplified to such an extent that, given the piston diameter, what any engine is capable of producing may be known with but little calculation.

General practice in four-cycle engines favors a piston speed of 500 feet per minute, in small stationary and marine engines up to 700 feet, and in automobile motors 800 to 1,000 feet, so adopting 600 feet per minute as a mean, we have

$$\frac{2 L \times N}{12} = \text{piston speed in ft. per minute, or } = 600$$

$$L\ N = 3600$$

$$\text{B.H.P.} = \frac{D^2 \times 3600}{18{,}000} = \frac{D^2}{5}$$

in which D, L and N represent the same values as above. Thus with this piston speed the horsepower per cylinder would equal approximately one-fifth of the square of the bore. In other words, an engine, with a 5x6 inch cylinder, should produce 5 horsepower at 600 R. P. M., but this is somewhat lower than the speed of the average automobile motor. The denominator four will approximately express the difference represented by an additional one to two hundred revolutions per minute, and the same engine at 750 R. P. M. will produce 6¼ H. P., and so on in proportion as the speed increases.

For gasolene, E. W. Roberts, in the gas engine handbook, gives the following:

$$\text{B. H. P.} = \frac{D^2 \times L \times N}{13.500}$$

and this has been found to work out well in practice.

But the engine builder who blindly follows set formula is vastly disappointed at the concrete result, and the majority of those who have started with them as a working basis, toiled over a long and weary road, full of vexatious obstructions before producing a motor that fulfilled expectations to any extent.

Formulae, generally speaking, represent maximum values obtainable under ideal conditions, and this is particularly the case where they have not been continually modified and readjusted as the result of experience extending over a number of years, as is the case in automobile motor practice.

The Veteran and His Home Made Car.

At the forthcoming Lewis and Clark Exposition there will be shown a home made automobile manufactured by a veteran of the Civil War, Major R. B. Walker, an Oregon City machinist.

After exhibiting the vehicle, which will have a capacity of more than 1,000 pounds and will weigh about 840 pounds and be driven by steam, the engine being 7½ horsepower, the major expects to make a trip across the continent from Portland, Ore., to Portland, Me., in the car.

ABOUT COMPOUND ENGINES

The Efforts to Evolve Them and Why They Have Made Small Progress.

While it is now forty years or more since M. Beau de Rochas evolved the principle of the successful internal combustion engine—more often termed the "Otto cycle" through the fact of the latter inventor's having applied it—the period of greatest development of this power has been virtually confined to the past twelve to fifteen years, as has that of its rival in the automobile field—electricity.

More economical than steam at the outset by reason of its adaptability to the use of low grade fuels, the cost of maintenance has been so low as compared with other power, and so many other problems have engrossed the entire time and attention of designers and builders, that the question of further cheapening by means of a repeated utilization of the expansion of the exploded gases, or compounding, has not received much thought. The steam engine has been brought to the last point of ecffiiency by the repeated expansion of the steam until the latter falls to atmospheric pressure, and as the compound engine is much more effective than one utilizing but one drop in pressure, so the quadruple expansion—using the steam at four successive stages of pressure—has been found to be the most economical.

However, the different nature and action of the fuel, as well as the limitations of the internal combustion engine, have been such as not to readily permit of utilizing the expansion of the exploded gases more than once. In the steam engine cylinder a much better vacuum is present than can be obtained with the hydro-carbon engine, owing to the manner of exhausting the burnt gases, and there is no retarding action due to the lack of power and the necessity of compressing the fresh charge on the inward stroke. The steam is admitted at a point of compression regulated by the cut-off and expands more evenly, while the most effective expansion of the fuel in the hydro-carbon engine is brought about by exploding it at a point very slightly before the dead centre on the compression stroke is reached, and is more in the nature of a blow.

By an accurate computation of the amount of fuel to be exploded in the compression chamber of a cylinder of given dimensions, it is evident that this can be so adjusted as to utilize a very large percentage of the effective expansion of the gases in but one operation—from the highest point of compression to slightly more than atmospheric pressure at exhaust. When this result is attained, we have what even the novice declares a "smooth-running" engine; one that operates almost noiselessly at full speed with the minimum need for muffling. It is the combination of a properly designed engine equipped with an effective carburetor of the right capacity—both adjusted to pro-

Digitized by Google

duce the best result, and, needless to say, there are any number of cars whose builders, after years of study and experimenting, have found just how to bring about this condition.

But this has been such a difficult stage to reach for many that there has been little desire and less time to experiment with compounding. A single expansion engine that will perform all that is expected of it has been the goal, and still is, with not a few. And with those who have attained to this there is a greater desire for further improvement along the same lines than one to delve into new complications, which, in the light of the present efficiency and needs of the automobile engine, promise little.

However, experiments have been made looking to the development of this type of internal combustion engine, but, as is readily evident, more with a view to applying it to stationary power purposes, such as electric lighting, in which the better balance obtainable is a greater advantage than for motor cars.

More attention has been given to the subject in England than probably in any other country, and though the engines constructed were successful, they have never been placed on the market. As no material economy is effected, it is much to be doubted if the advantages gained compensate for the additional complications in the form of an extra cylinder, crank, connections, etc., and the necessarily intricate valve mechanism. There is the added advantage of eliminating the muffler, as the burnt gases are expelled from the low pressure cylinder at atmospheric pressure, but a muffler is far cheaper and equally effective.

Patents were granted in that country several years ago on a compound gas engine, and one of 100 I. H. P. was built and gave satisfaction. It was equipped with two high pressure cylinders on either side of the expansion cylinder, and was of the four cycle type, thus obtaining two impulses—one explosive and one expansive—per revolution. The latter was found to add very little to the power of the engine, but was of great benefit in its scavenging effect, entirely ridding the high pressure cylinder of burnt gases. Silent operation was obtained by a simple system of distribution operated by a rotary valve, and for stationary power purposes the engine had much to recommend it.

It will be recalled that an attempt has been made to apply the same principle to the automobile motor in this country, but up to the present without any marked success. While a high state of efficiency has been attained in the four-cylinder vertical motor now favored in general practice, improvements are constantly being made, so that it is difficult to predict what the end will be, nor that in the process of evolution this type may not disappear. But as economy in fuel consumption is one of the features of the problem that will solve itself as increased efficiency is obtained, little attention may be expected to be given at present to such a radical departure that promises so little as does compounding.

WATER JACKETS NOT FINAL

Sir Oliver Pronounces them Wasteful and Suggests Substitutes with Red-hot Cylinders.

That he could not regard the water jacket as final in the construction of gasolene engines was the conclusion of Sir Oliver Lodge in a lecture delivered before the Automobile and Cycle Engineers' Institute, London, England, last month.

He first treated of the firing and combustion of the charges in the cylinders of cumbustion engines and the best methods of effecting the best results, and pointed out that for the purpose under review a gaseous mixture was better than a vaporous mixture, but remarked that a mixture of gas and air, in which the liquid fuel was sprayed into the latter, was coarser than the steam which issued from the spout of a kettle. A gas was simply a liquid divided ad infinitum. The bits consisted of molecules themselves. Sir Oliver then demonstrated by sketches on the blackboard the action of atoms in mixed gaseous bodies and the behavior of the combustion of such bodies, showing that compression of the charges was necessary to bring the ignitive particles in closer relation to each other in order that the combustior might be more rapid and the effect more pronounced.

He pointed out that each ignited particle fired the next one, and that therefore combustion of such charges really occupied an appreciable time. Rarefaction prevented combustion; compression aided it. It was also pointed out that the combustible atoms in a mixture must not be regarded as stationary. They were always in a state of motion, and the more lively that motion the more rapidly would the combustible atoms encounter each other. Therefore it was necessary to keep the temperature high, as an increase of temperature made the atoms more lively.

Then Sir Oliver showed that exact chemical mixtures did not give the best results from a combustion point of view. The reasons underlying the causes of powerful and weak explosions were attributed to the presence of other gases, which had a retarding influence upon the combustion by getting between the inflammable particles in the same way that water penetrated between the grains of sand. To get the best results, mixtures should be compressed and then ignited at several points at once. The lecturer then discussed the most desirable point at which charges compressed by pistons into the combustion chambers of cylinders could be ignited, and was in favor of doing so as near the piston as possible.

The speaker then demonstrated the undesirability and waste caused by water jacketing, and dwelt upon the possibility of motors with redhot cylinder walls. He could not regard the water jacket as final. The alternative might come in the shape of a turbine or Pelletan wheel, in which the disks and the walls might be redhot with advantage. Sir Oliver pointed out that if the air or gas were sufficiently compressed it would ignite combustible matter introduced to it, as in the Diesel engine, but thought that electrical ignition might be regarded as the natural method of producing the desired effect. He then showed that low tension ignition depended upon self-induction and magnetic induction. Self-induction might be called electrical inertia, and it was not always realized that electricity possessed inertia. Starting an electric current was like starting a barge in the water. Time was required for the current to attain its maximum velocity, and the spark at a spark gap was practically the smashing of the air by the current in bridging the gap.

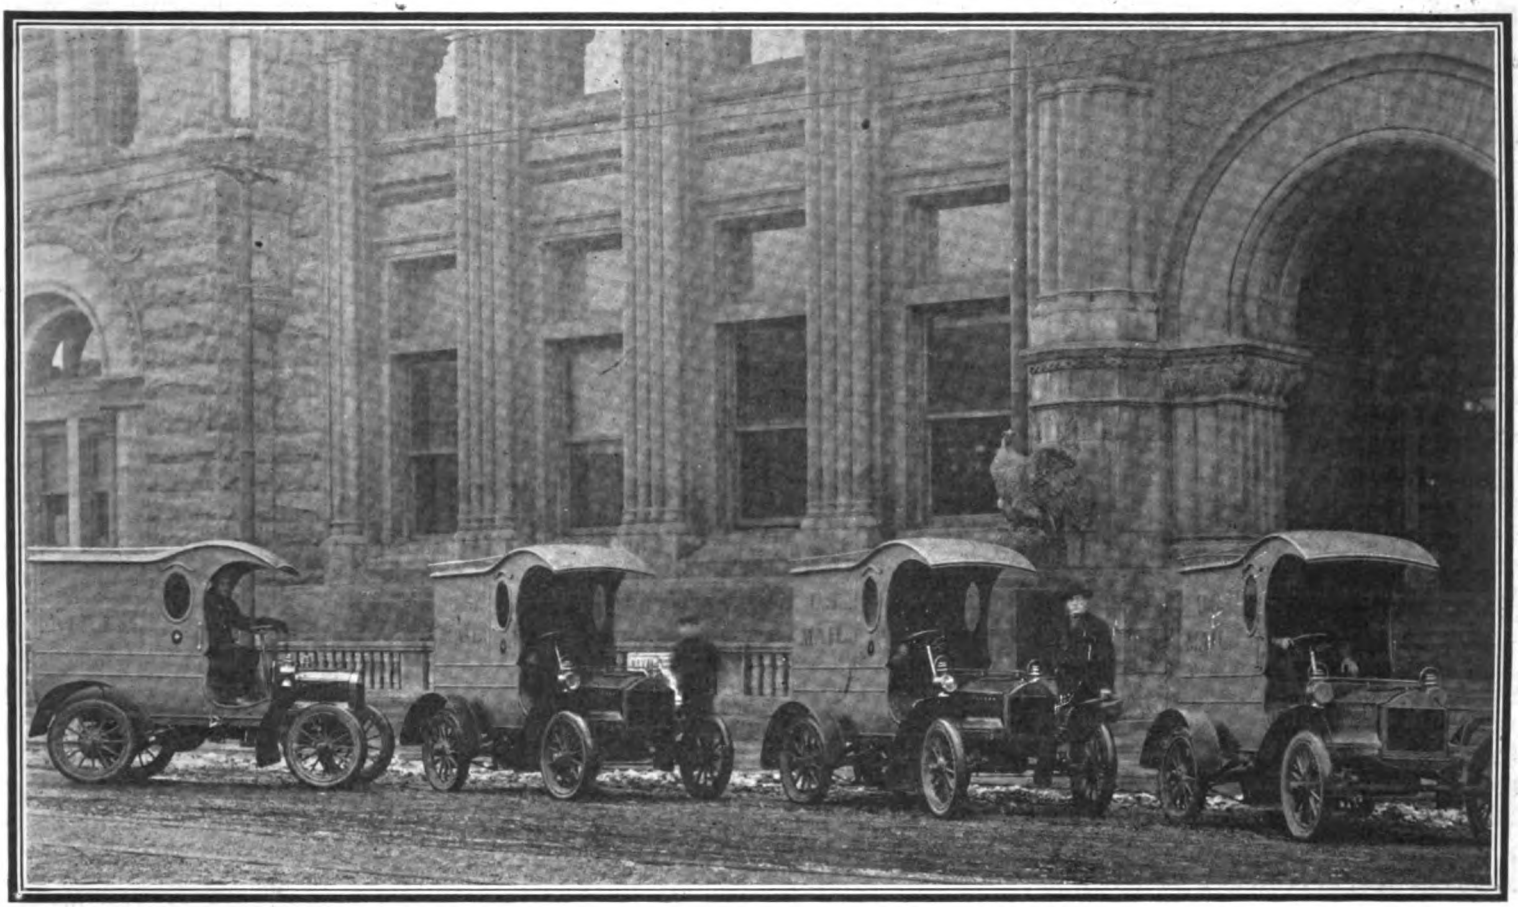
Detroit's Y. M. C. A. School Expands.

The automobile school of the Detroit (Mich.) Y. M. C. A. has grown so fast and the demand for its work is so great that new men have been added to the corps of instructors. Bernard Fishback, who was formerly connected with the Searchmont Automobile Co., but is now superintendent of the erecting department of the Packard Motor Car Co., will have charge of the elementary course, and F. L. Faurote, assistant superintendent of the testing room at the Olds Motor Works, will have charge of the advanced course. Messrs. A. P. Brush, of the Cadillac Automobile Co.; H. W. Coffin, of the Olds, and E. J. Stoddard, of Parker & Burton, will still retain their connection with the school as lecturers. The winter term opened on January 3, 1905.

Why Some Men Select Foreign Cars.

The real reason why some men purchase foreign cars in preference to the domestic product was recently unconsciously disclosed by a wealthy and bewhiskered snob who chances to be a director of the Automobile Club of America and who figures as a "patron" of the little collection of imported machines now being displayed on the top floor of Macy's dry goods store.

Another member of the club—one of much more prominence than the snob in question—had just remarked his purchase of one of the biggest and most reputable American cars, hearing which the snob rejoined:



"You don't buy your clothes in Baxter street, do you?"

Shattuck Pleads for Good Roads.

A. R. Shattuck, former president of the Automobile Club of America, appeared at a meeting of the Chamber of Commerce of New York last Thursday and urged the members to indorse a resolution urging the expenditure of $50,000,000 on the highways of the State. The resolution was referred to the executive committee.

In the Service of Uncle Sam.

THE OLDSMOBILE MAIL WAGONS AS EMPLOYED BY THE DETROIT POSTOFFICE.

A. C. A. Prepares to Build.

The much-talked-of plan for a clubhouse and garage for the Automobile Club of America assumed definite shape at a special members' meeting held last Tuesday night in the organization's present quarters, at 753 Fifth avenue. The board of governors was authorized to form a construction company, if they deem it advisable, to take over the site of the clubhouse and garage and carry on such building operations as the governors may direct. The stipulation is made that the construction company must first enter into a contract with the club to sell the property with the building back to the organization when the structure has been completed. A building committee, comprising Albert R. Shattuck, chairman; Colgate A. Hoyt and Dr. S. S. Wheeler, was appointed by the board of governors and confirmed in a formal resolution by the club members.

Another resolution directed the board of governors to secure a site "located in such part of the Borough of Manhattan as they shall deem most desirable, and to erect thereon a suitable clubhouse and garage." The president and treasurer were "authorized to sign all papers, contracts, agreements, mortgages and bonds in relation to the building of such clubhouse and garage which are approved by the Building Committee." President Dave Hennen Morris presided at the meeting, at which much wealth was represented. Among those present were Homer W. Hedge, Charles E. Miller, J. D. Thompson, Orrel A. Parker, Winslow E. Buzby, A. R. Shattuck, J. V. Black, George F. Chamberlin, John Jacob Astor, George B. Adams, Jefferson Seligman, James L. Breese, William H. Browning, Henry C. Cryder, S. W. Taylor, Emerson Brooks, A. H. Overman, G. G. Bain, F. G. Bourne, W. W. Niles, Frederick B. Cochran, Arthur Iselin, Robert Goelet, W. E. Scarritt, Alan R. Hawley, J. A. Blain, R. W. Meade, Charles S. Towle, Augustus Post and Carl H. Page.

The Lady Meets the Promoter.

Mrs. R. F. Woodward, who is described as one of the best known horsewomen on Long Island, is reported to be the chief promoter of an organization to take over the racetrack at Huntington, L. I., with a view to running fairs, horse shows and automobile meets. Many prominent residents of New York and Brooklyn are said to be interested in the project. A former six-day bicycle racer, is also alleged to have given his more or less valuable approval to Mrs. Woodward's projected enterprise. He is said to have told the lady he could see no reason on earth why national meets should not be held on the track, and even "unselfishly" volunteered to arrange and manage a meet some time during the coming season.

Rhode Islanders Elect and Eat.

The Rhode Island Automobile Club, of Providence, held its annual election and banquet last week. Officers for the ensuing year were elected as follows: President, Dr. Julian A. Chase; first vice-president, William Penn Mather; second vice-president, Darwin Almy; treasurer, Howard D. Wilcox; secretary, Elliott Flint; governors, to serve until 1908, Charles O. Read and Darwin Almy.

The election was held in the clubrooms in the Crown Hotel, after which the members adjourned to the Wellington Hotel for the banquet, President Chase acting as toastmaster. Among the speakers were President Harlan W. Whipple, Augustus T. Post and Secretary C. H. Gillette of the American Automobile Association, and President Asa Goddard of the Worcester Automobile Club. Mr. Gillette reminded the clubmen that the first automobile race in this country was run at Narragansett Park, in Providence, during 1888, when eight machines competed in a five-mile contest.

"A beautiful two-seated, canopied, light touring car, with a seating capacity for four persons," is to be the principal prize at a baseball carnival to be held at Dubuque, Iowa, on February 6 to 11. The vehicle cost $900, and the tickets will be sold for 10 cents each.

MURPHY'S PARTING BLAST

New Jersey's Retiring Governor Urges Low Gear Law and High Annual Fee.

If it had been delivered by an incoming instead of an outgoing executive, the message of Governor Franklin Murphy, of New Jersey, would doubtless carry more weight. The message, which was read to the New Jersey State Legislature at Trenton on Tuesday, contained a veritable broadside at automobilists. In fact, the Governor was so taken up with the subject that he devoted three times as much space to the "Regulation of Automobiles" as to any other single subject. In this section of his message he offers two suggestions, one an almost entirely new idea, though the other is based upon the long prevalent theory in New Jersey that automobilists are legitimate prey for all sorts of exactions.

As a means of stamping out the "scorching evil," Governor Murphy advocates a law which will compel all automobiles using the highways of the State to be so geared that a greater speed than twenty miles an hour would be impossible. He thinks that automobiles have been so improved that such a plan is feasible, as the cars could be so fixed they could still use their reserve power to climb hills. The other plan would lead a disinterested observer to think that the Governor was taking a leaf from the book of those gentle New Jersey bandits who not so long ago waylaid automobile parties on lonely roads and then, in the assumed guise of officers of the law, proceeded to fine each individual member of the party without any discrimination. He proposes that the Legislature revoke the present law, which provides a perpetual license for the modest fee of one dollar, and offers a somewhat astonishing substitute. Charge all automobilists five dollars a year for permission to use the State highways, says the Governor, and he adds, as a sort of sop to the automobile fraternity, and allow the State authorities to be guided in some slight measure by the automobile clubs in picking out the highways which would be built or improved with the funds collected for licenses.

That part of the Governor's message relating to the regulation of automobiles was as follows:

"I desire to call the attention of the Legislature to the necessity of a revision of the present law concerning the regulation of automobiles. That law was carefully considered by the Legislature when it was passed two years ago, and it is generally regarded as, upon the whole, perhaps the best law that has been passed by any State. The difficulty lies in its enforcement. The speed is limited on country roads to twenty miles an hour, but a large number of machines that are constantly used on the roads of the State have a speed of thirty or forty, or even fifty miles an hour, and they use it. In cities the speed is limited to eight miles, and in certain other localities to varying speeds up to the highest limit.

"There seems to be an infatuation in the running of a machine that incites the driver to get the best possible out of it whenever he thinks he can do so with safety, and, notwithstanding a certain element of danger, the exhilaration of the sport is such that it seems to be impossible for him to resist the temptation to send his machine along at its utmost speed whenever he may do so without being arrested for violation of the law. Indeed, he forgets the law in the pleasure of the sport.

"The result is that horses are frightened, and women and children who are out for a pleasure drive have their enjoyment greatly diminished, if not wholly destroyed, by the fear that their horses may run away because of the machines, and in many cases accidents happen which result in permanent injury, and much too often in loss of life. I understand perfectly well the attitude of the automobile driver. He thinks that there is little, if any, danger, and he assumes that the people will get out of the way and that the road will be made clear for him by other vehicles, which, up to the time of the invention of his death-dealing machine, felt that they had the right to the road.

"Hardly a day passes when the papers do not speak of some serious accident caused by the automobiles. It may be to the occupants, or to the helpless and frightened citizen ,but death and accident are of daily occurrence. If the number of accidents from reckless automobile driving could be collected, their number would be appalling, and I think it is not going too far to say that, however alluring and interesting a sport may be, no one has a right to pursue it at the cost of permanent or fatal injury to others. I am informed by those who are qualified to know that if the law were fully observed, and no machine was ever run at a speed to exceed twenty miles an hour, at least ninety per cent. of all the present accidents would be avoided. It seems to me, therefore, to be clearly the duty of the Legislature to provide for the strict enforcement of the law, which limits the speed to twenty miles an hour.

"Fortunately, this can be done without the slightest difficulty. When the present law was passed, I suggested that the machines should be so geared that it would be impossible that the speed named could be exceeded. At that time I was informed that the power necessary to cause a machine to ascend the grades on our steepest roads was such as would cause them to make a much higher speed on the level, but improvements have been made so that a machine can be geared to attain a speed not to exceed twenty miles an hour and still have a reserve power which will take it up the steepest grade. I earnestly recommend, therefore, in the interest of a frightened and suffering humanity, that the present law be so modified that no machine shall be permitted on the roads of this State unless it shall be geared so as to make a speed higher than twenty miles an hour impossible.

"The present law requires a license of $1 to operate an automobile in the State, and, having once paid the dollar, the privilege continues indefinitely. The number of licenses issued amounts to over 7,000.

"I think a license fee of $5 a year can be obtained without serious objection, and I suggest that the law be amended to require this, and that it be provided that the sum obtained from the sale of licenses to automobilists, which may easily reach upward of $30,000 per annum, shall be expended on the improvement of the roads of the State under the supervision of the commissioner of roads, controlled, as far as he may think wise, by the requests of the automobile clubs of the State, and the sum expended on the roads from this source be in addition to any sum appropriated by the Legislature.

"I think, also, that the examination of automobilists is not as thorough as it should be. A man who drives an automobile should be enough of an engineer to understand his machine, and better supervision for his more thorough examination should be made. It is important, also, that he should not only understand his machine, but should also know the law which governs the use of automobiles in the State, and I suggest, in the proposed amendments to the law, that the examination of the driver shall include his knowledge of the automobile law, as well as the construction and operation of his machine.

"I understand perfectly well how much my suggestions as to speed limit will be objected to by those who have high-powered machines built for speed or for speed contests. But the answer is swift. No pleasure is justified, nor will it be indulged in by humane persons at the cost of fatal injury to others. Let high-powered machines be built, and let them be run on tracks prepared for the racing. Let them be taken there and taken away by other contrivances, but let them be kept off the roads absolutely, and let the punishment for any infringement of the speed law be imprisonment for not less than thirty days, without any exception whatever. The speed law cannot be enforced as long as the penalty for infringement is a fine."

Indianians Prepare for Battle.

The Marion (Ind.) Automobile Club has taken steps to combat the hostile automobile bills which are likely to be introduced in the State legislature in the near future. At its last meeting of the organizatiton Charles Michaels was appointed as chairman of a committee, with authority to select his associates, which will arrange with other clubs in the State to have their interests represented at Indianapolis when the session of the legislature opens.

EFFECT OF NIGHT AIR

Ingenious Attempts to Explain the Changed Behavior of Motors After Sunset.

On "the other side" the discussion of the question, "Why does an engine run so much better at night than during the day?" has attained strength and volume that have brought with them a number of attempted explanations that are at once interesting and ingenious, although none has yet advanced the proposition that the better running at night may be due to the fact that license numbers are not so much in evidence.

Here is what one of the foreign motorists deems the "true explanation":

"Assume the engine running full power and the atmosphere dry. Then a perfect carburettor will supply a full charge of exactly such proportions of petrol vapor and air as will result in complete combustion. Now, if we suppose the atmosphere to hold a certain quantity of water vapor in suspension, as is the case in damp weather, I think consideration will show that for every reason loss of power will follow: For (1) the atmosphere is less dense and there is less pressure to force the charge into the cylinder, (2) the water vapor will be converted into steam on entering the hot cylinder, and so greater resistance to compression will be offered, (3) the heat developed by the first part of the explosion will be taken up in part in expanding the free steam, and combustion will consequently be checked, and (4) (most important of all) the air being less dense, there will not be the same proportion of oxygen available, and combustion will therefore not be complete. In considering these points, the simple principle of the petrol engine should be borne clearly in mind, namely, that the mixture of petrol vapor and air, when ignited, burns and forms carbonic acid gas and water (in the form of steam), and that it is the expansion of these gases, caused by the heat generated on their formation, which gives the power. The greater the heat, therefore, the greater the power.

"On a bright, clear day the radiation of heat from the earth's surface is free and uninterrupted owing to the absence of clouds.

"When the sun sets, this radiation is very rapid and quickly cools down the air in the neighborhood. This fall in temperature causes a portion of the moisture in the air to condense and be deposited; consequently the air is rendered a more efficient component for the mixture, and any engine inhaling it should develop greater power.

"This explanation is that given to account for the familiar phenomenon known as "fall of dew," and will be found in any text book on physics."

Another party to the discussion affirms in all seriousness that his car runs better when "far from the madding crowd," suggesting that there may be necessary new legislation to prevent the contamination of the atmosphere in large cities. His engine, he adds, "seems to take the bit in its teeth and fairly romp home." Sounds like the actions of a "dinner bound" nag, but here is his humble opinion of the cause:

"I believe, to get the maximum of work from a petrol engine, the cylinder must be hot (not overheated), and these short runs tend to thoroughly warm up the cylinder, thereby thinning the coating of lubricating oil, and, if the piston rings are in good condition and a good fit, allowing the piston to work easier (without loss of compression) than if the cylinder were cold and the oil therefore thicker, tending to clog the piston ring.

"But not only this, the hot cylinder warms the gaseous mixture at points furthest from the point of ignition, making it of a more even and higher temperature all through, this, I believe, tending to quicker and more instantaneous combustion than would be the case if some portions of the mixture were of a lower temperature than others, the colder portions having more of a burning action than an explosive one.

"Now, as a contrary cause, I have observed that on approaching the country from the town the engine runs better, due to the air being purer, this purer air aiding combustion owing to the greater proportion of oxygen which it contains.

"I would suggest the theory, therefore, and would be glad of confirmation or correction, that during the day the sun absorbs a certain amount of oxygen from the air, varying in proportion as the sun shines brightly for hours or only intermittently, and that as the sun goes down and night approaches the air gets cooler, this cooler air containing a greater proportion of oxygen, therefore forming a better mixture.

"To this I ascribe the fact that an engine developing a certain power requires less air in the colder months than in the warmer months to develop this power, the smaller volume of cold air containing about the same amount of oxygen as a proportionately larger volume of warm."

The explanation put forward by the next correspondent is short and to the point. It is a gem, and really deserves a niche in the Hall of Fame. He accounts for the phenomenon "by the higher atmospheric gases that come from the leafage, trees, etc., which does not show itself in the daytime. This causes a richer mixture, a better explosion, and so more power in the engine," entirely overlooking the fact that the composition of the atmosphere is kept practically constant by the absorption of carbonic acid gas by plant life and the radiation of this revitalized air by the sun's heat. Consequently more "atmospheric gases from leafage" are produced during the day, but the sudden drop in temperature at sundown renders the air proportionately denser and richer in oxygen. This is very noticeable in the invigorating effect of the air shortly after sunrise in spring and summer, which disappears in a few hours.

The density of the atmosphere naturally varies with its temperature, and the effect on a running engine would be very marked if the latter were suddenly transferred to a cold storage room on a warm day.

Berlin Motorists Become Patriotic.

The Berlin Automobile Club is forming a "voluntary corps" of automobilists, to serve as a regular section of the Prussian troops in time of war. The military authorities have accepted the offer of this corps and thanked the club for its initiative.

Members of the corps will furnish their own automobiles, but if it can be shown that the automobile is of real service in the field the authorities have the intention of organizing another corps on a more decided military basis. The question of the utility of the automobile in war time has been much discussed in Berlin for some years, but opposition toward making so expensive and seemingly uncertain experiment has been so strong in some quarters that there has never before been a practical trial. The club has engaged competent engineers to study the subject of the type of car most suitable for use in the field, and to outline their general idea of the role the automobile should play in war time.

Russian Devises a Sleigh-Boat.

For crossing Lake Baikal a Russian engineer has invented a combination motor sleigh and boat. It will run over the ice or in the water. Its form resembles that of a boat, below which are set two steel bars, which serve as runners. The sleigh is propelled by a wheel driven by the gasolene motor, the wheel having points to enable a grip of the ice to be obtained. When the boat is in the water the motor is connected to a propeller by a clutch.

Lottery at the Paris Show.

Every visitor to the Paris Salon received a numbered ticket entitling him to participate in the "Tombola" or draw for the hundred or so prizes which are annually offered by various firms in connection with the exhibition. The draw took place on Sunday evening, at the end of the show. The first prize was at 10 horsepower car, the second a piano and the third a car body.

Paris's "Chair of Automobiling."

For a new industrial college shortly to be opened in Paris a chair of automobilism is to be jointly supported by the State, the Department of the Seine and the city of Paris. Students at the college have to undertake a four years' course of lessons, and will not reach the motoring instruction until the first three years are passed.

Where Horsepower is Taxed.

Six dollars a year and $1 a unit horsepower is the heavy tax imposed by the province of Liege, in Belgium. Chauffeurs and owners are warned that any mistake make in filling out their declaration will be severely punished, either by fine or imprisonment.

WHY AIR-SHIPS DON'T FLY

A Subject that Examplifies the Paramount Importance of Getting the Proper Motor.

At first sight the question, Why won't air-ships fly? will strike the average motorist with about the same force as would the question, Why wouldn't the Keeley motor work? The Keeley did work, but not very long. So does the flying machine fly, but the sickening regularity with which it comes to earth or takes to water are, to say the least, painful.

To go back a few years, Why has nothing more been heard of Count Zeppelin's tremendous creation? The largest of its kind ever attempted, the prediction of its value in peace and war halted at nothing short of the impossible. Why did Santos Dumont drop with such amazing frequency? Why did the Mediterranean airship contest end in the wet? Likewise, why did Professor Langley bathe in the Potomac so often? Why were the much advertised St. Louis airship races one and all a fiasco—in other words, why were there no St. Louis races and no claimant for that $100,000? It isn't necessary to look to the stars for answer. Aeronauts have had more than half a century's experience in building balloons, and one of the latter has made a highly successful trip of twelve hundred miles—with the wind. It had no motor. The most of instances cited had motors that were things of beauty, but not a joy, for more than than a few minutes at a time, when they quit, often for all time.

Engineering formulæ only become of value through long experience, and after their application and its results in actual practice have become definitely ascertained. The first designers of internal combustion engines took the experience of the steam engine builder as a guide, for it was the only data available. There is no necessity of recalling the result, for it is now many years since the builders of motors and motor cars came to a realization of the fact that there were no standards to follow, and set about making their own.

In the light of present day success the years of struggle with cylinder dimensions, stroke, compression and the thousand and one details that harassed the man who would build an engine of a certain power that would run and develop that power, are like a nightmare. At one period of this process of evolution there were scarcely two engines of identical dimensions on the market at the same time, while others that varied but a fraction of an inch in bore or stroke were rated several horsepower apart at practically the same speed. Scarcely any two agreed on the matter of the admission of the fuel to the cylinder and the manner of freeing the latter from the burnt gases simultaneously, but the question of ports or valves and their dimensions resolved itself into one of the latter (in the case of 4-cycle engines), on which point there still exist two distinct schools. Likewise the majority of other differences have either been settled by agreeing on a standard worked out as the result of long experimenting or, as in the case of the radical diversion of opinion as to the efficiency of automatic or mechanically operated valves, by setting up two or more standards.

Instead of taking advantage of the hard-earned experience of the motor car builders, many designers of gasolene engines for aeronautical purposes have gone ahead almost entirely on their own hook. To a certain extent only have they begun where the man who by dint of perseverance in the face of heart sickening failures, finally learned to build a motor, left off. They have accepted his power formula, and using it as a basis have in many instances, almost regardless of mechanical or other limitation, tried to improve upon them. The results have been amazing to contemplate—on paper, and equally amazing to the man who has tried to operate one of these creations. With the use of a few hundredweight of metal, seldom reaching or exceeding the quarter-ton mark, is produced a motor confidently rated by its builder to give 20 to 30 H. P. By the mere use of a pencil, paper and a few figures, 10 to 20 pounds of metal in conjunction with the usual mixture of gasoline and air properly exposed under compression, are to be compelled to raise 33,000 pounds one foot per minute, or its equivalent in effective work—and they do in theory. Oh, no; the figures don't lie, but the motor does, as a rule, except when it is cranked.

In order to reach this marvellous result, speed is the greatest desiderata, and the airship motor is designed to run at 2,000 to 2,500 R. P. M., despite its attenuated cylinder walls and moving parts. The moving parts of a high speed reciprocating engine must be light in order that too great a proportion of the power developed be not consumed in turning the engine alone, so that it is not ordinarily in this feature that the engine is greatly at fault. But, consider for a moment what 2,000 R. P. M. involves. Given a stroke of 6 inches, it means a piston travel of 12,000 feet a minute; in other words, bearing surfaces are being rubbed together at a speed of more than twenty miles an hour, and the engine is air-cooled. In the space of sixty seconds each valve must open and close one thousand times. At 2,000 R. P. M., but .03 of a second is available for the completion of each revolution, and but .06 of a second is consumed in the performance of the four parts of the cycle necessary to an explosion. Light will penetrate a focal plane shutter and cover every part of the sensitized plate in a camera in 1-1200 of a second, but a gasolene mixture will not fill a cylinder and simultaneously expel practically its own bulk of exploded gases in the course of .015 of a second, as is necessary in the case of a two-cycle engine. Where a four-cycle engine is concerned, this length of time (.015 seconds) would be available for each operation—i. e., suction and exhaust, but in either instance as the effective area of the valve or port opening is but a small fraction of the space to be filled, its limitations are sharply defined. Still, in spite of this and numerous other shortcomings, these engines do run—at times—but their operation is more of a mystery than their failure to do so, and it is usually only after persistent tinkering for days at a time that they start—more often to the surprise of the inventor than otherwise—only to lay down again in a short time. A replica of the experience met with in the first automobile engines, though from different causes.

All questions of balloon or aeroplane in the background, the principal reason why one or the other will not fly where wanted, for any length of time at least (record performance is between one and two miles), may be appreciated in a glance at some of the numerous reasons why the motor, usually built by the inventor from his own original ideas, won't mote, and there you have it. Even a trolley car comes to a stop when the power is off.

ARIEL.

"Jail 'em," Says Connecticut's Executive.

Connecticut's simple and effective automobile law has hitherto been regarded as almost a model of its kind. But it evidently does not please the Governor of the Nutmeg State. Even the requirement that all rubber tired vehicles shall carry lights after dark does not got far enough to suit him; he wishes it made to apply to all vehicles—which would be a rattling good step.

The views of Connecticut's Executive relative to the law are given in the appended extract from his annual message:

"The law regulating the speed of automobiles on our highways has proved a failure, largely because the penalty imposed for its violation is not severe enough to insure its observance," he declares. "I recommend that the penalty for the violation of that law be increased so as to permit a jail sentence in aggravated cases. I am credibly informed that wealthy residents of other States, who use Connecticut merely to run over it, boast of the fines they have to pay, and count pursuit by the officers of the law a part of the fun of the transit of the State. Every automobile should be distinctly numbered. There should be no exception.

"The loopholes in the present law are taken advantage of to abuse and discredit it. The bicycle lantern law is dead and ridiculous. In my opinion, the public safety would be greatly advanced if the law required all wheeled vehicles out after dark to carry lighted lanterns."

White numbers on a flaring crimson ground will show the 1905 automobile license numbers of motorists in the staid Quaker City. For these tags and a renewal of his license for 1905 each Philadelphia automobilist must pay $1 or get a license in some other county. At the license bureau in the City Hall there were 2,338 licenses issued for last year, while in 1903 only 1,663 machines were registered.

OLDFIELD'S TONGUE WAGS

Talks Freely of Mile Records and Lets Fall Some Unpleasant Intimations.

Barney Oldfield has some friends with peculiar ideas. If only part of what he told a Detroit interviewer is true, some Denver friends of the track champion "have something coming to them." Oldfield's remarks are especially interesting, in view of the fact that A. R. Pardington, the retiring chairman of the American Automobile Association's racing board, intimated strongly this week that both the Oldfield and Kiser mile records would be rejected. A mail vote of the members of the racing board has been taken and Mr. Pardington has referred the whole case for final decision to the directors of the A. A. A. at their meeting in New York next Monday. Though Oldfield made an intermediate mile at Denver in 0:51 1-5, according to his press agent and some few partisans, the fastest intermediate mile announced at the track side that day was a full second slower, or 52 1-5 seconds, it being the fourth mile of an eight-mile ride.

"The fastest mile ever driven in an automobile on a circular track was in 53 seconds, and I did it several times at Los Angeles," said Oldfield in Detroit.

"I never claimed that mile in 51 1-5 seconds at Denver, which, I see, the racing board has refused to allow," he continued. "That was a mile like Kiser made. You remember Kiser claimed one in 52 4-5 seconds in Cleveland, and friends of mine who clocked it got it in 56. Anyhow, it was advertised, so I did not object when Denver friends of mine sent out that I had driven in 51 1-5, but I never asked the racing board to sanction it. I did claim a mile in 53 1-5 seconds that day, and have since claimed miles in 53 flat at Los Angeles, where the meet was regular and sanctioned, and I guess this record will be allowed."

After having paid his respects to Kiser, Oldfield proceeded to air a few of his views regarding the timing of races at Ormond Beach, which should not increase his popularity when he arrives there. In the course of his remarks he hinted that records depended on the timekeepers. When he was asked how fast he expected to drive at Ormond he answered:

"I don't know, but my machine is to-day faster than was Vanderbilt's when they allowed his record of 39 seconds. Funny thing about that record of Vanderbilt's. He drove in 39 one day, they said, and next day I beat him in 46, and it was 49 when he finished.

"The whole trouble is this: Everybody is motor speed mad. They all overestimate the Ormond beach; there isn't a man who underestimates it. The man who built my Green Dragon wrote me and said he expected that I would drive in 33 seconds there. That's all up to the timekeepers. I'll drive as fast as any man ever did."

Only Horses May Soil 'Frisco's Streets.

When the ordinance requiring the attachment of suitable devices to automobiles, in order to prevent oil drippings being deposited on public streets, came before the San Francisco Board of Supervisors for final passage last week no difficulty was experienced in putting it through, and it is now a law.

Not satisfied with this, however, an ordinance was introduced prohibiting unnecessary or unusual noise to be emitted from the exhaust pipes of automobiles; it was referred to the street committee.

It was asserted in support of this ordinance that complaints have been made to the supervisors that the "chug-chugging" of motor wagons while standing by the curb has in many cases been very annoying. Especially has this been the case when the machinery has been permitted to run at full speed while the vehicle stood in the street in a residence section. The exhaust of a gasolene or steam engine, it is said, often makes such a loud noise that it annoys an entire neighborhood. This is particularly the case when such annoyance occurs late at night and when persons in the vicinity are sick.

It is contended that the power can be reduced so that the machinery will not make enough noise to be objectionable. In the bill submitted there is a provision that no machine shall stand on the street longer than five minutes with the engine working at full speed. After that length of time it will be obligatory on the chauffeur to reduce the speed of the machinery.

Col. Green's Record by Proxy.

Later advices from Dallas, Tex., give the information that Col. E. H. R. Green did not drive his Pope-Toledo when it won the 100-mile race there on January 2 in 2 hours 6 minutes and 42 2-5 seconds, as reported in last week's Motor World. The driver who piloted the machine on its long journey was Oliver Savin, who is one of Colonel Green's chauffeurs.

The fastest single mile was covered in 1:05 2-5. In the third mile, while passing another competitor, the Pope-Toledo struck a fence post and an axle cap was knocked off. Savin said he was forced to shut off power and skid around the turns. One of the tires blew up in the ninety-sixth mile, but the car finished the remainder of the distance without stopping to replace the tire. Col. Green's Pope-Toledo and Franklin car; a Peerless, owned by J. Howard Hughes, of Houston; A. B. Wharton's Columbia, from Fort Worth, and a Cadillac, owned by George Schofield, of Dallas, were the competing machines.

"Sockituem," say These Jerseymen.

For overpowering, undiluted "nerve" and brazen effrontery, a proposition made, apparently in good faith, by the freeholders of Middlesex County, N. J., is a long way in front. A committee of these freeholders will recommend to the legislature that a tax of $10 a year be levied upon non-resident automobilists for the use of the stone roads of the State, the money derived from such tax to go to the road appropriation!

FOR A CONSOLATION RACE

Frenchmen Can't Enter Enough Cars in Cup Contest and Provide for the "Also Rans."

Announcement was made last Friday that the French government had decided to permit the contest for the Grand Prix de l'Automobile Club de France, which is to be run in connection with the International Bennett Cup race over the Auvergnat course.

A Parisian daily newspaper, the "Auto," has come out with a novel plan to establish cash prizes for the makers of the first cars to finish in the Grand Prix de l'Automobile Club de France race. The paper has started a subscription for the purpose, and will itself give the maker of the victorious car a check for $20,000, while the total amount subscribed will be awarded to the makers of the second, third and fourth cars.

The race was established owing to the contention of the French manufacturers that it was unfair to France that entries in the International Cup contest should be restricted to three cars for each nationality. It will be open to all, regardless of country. It is reported from Paris that many of the French manufacturers are disinclined to enter the elimination trials for the International Cup on account of the great expense involved. The makers must pay an entry fee of $2,000 for each car entered, which entails an expenditure of from $2,000 to $6,000 for each manufacturer whose product competes in the trials.

The Auvergnat course, over which the two big races will be run in June, was used for the Tour de France race in 1899. It starts from Clermont-Ferraud, and the route passes through Rochefort, Bourglastic, Pontaumur, Pontgibaud and then back to Clermont-Ferraud, the course being in the province Puy de Dome. It is a very trying course, as there are many hills and several steep zig-zags. The total distance of the course is 135 kilometres. There are three railroads to be crossed, over which it is proposed to erect temporary viaducts.

The Rush to Register.

Beginning the day after Christmas, there was a small sized rush to register cars at Trenton, N. J. This sudden increase is ascribed to the giving of automobiles as Christmas presents. It brought the number of cars registered up to December 31 at the office of the Secretary of State to 7,820 automobiles of all types. This figure represents the entire number licensed to run on New Jersey roads since the approving of the State automobile law, March 23, 1903.

When the law was first passed the machines most registered were of the light runabout type. Steadily that type of machine has disappeared in applications for licenses being sworn to in the office of the Secretary of State, until now there are none being registered at all.

Common Sense on Honolulu's Bench.

Honolulu's first trial of an automobilist for "furious and heedless" driving through the streets of that city ended with the discharge of the motorist by Judge Whitney, before whom the case was tried. C. W. C. Deering, a tourist visiting the island, had been arrested for driving his White steamer at a rate of speed which was considered excessive by the mounted patrolman who made the arrest. The trial aroused much interest among Hawaiian motorists, who were naturally much concerned with the outcome. Mr. Deering's arrest was the one referred to in the editorial of the Honolulu Bulletin, which was reprinted in the December 29 issue of the Motor World.

The trial was virtually a test to determine whether or not automobiles were amenable to the regulations provided for vehicles drawn by animals. Judge Whitney's decision was that under existing laws automobiles were exempt, as there was no statute regulating the speed of automobiles on the streets of Honolulu. Mr. Deering admitted that his machine had been travelling between twenty and twenty-five miles an hour, but added that he had it under perfect control and was exercising due care. He said that while such a rate of speed would be dangerous for crowded city streets there was no risk incurred on the open roads. If he had met any vehicles he could easily have avoided running into them.

In rendering his opinion and discharging Deering, Judge Whitney said that it appeared that the defendant had been going at a speed of between twenty and twenty-five miles an hour; that he was exercising care and that he was able at any time to avoid any obstruction that might have been in the road; he was not heedless in his progress, and the only point that remained to determine was in reference to the speed itself; inasmuch as there was no statute regulating the speed of automobiles, and inasmuch as there seemed to have been no furious or heedless driving, unless it could be called such merely because it happened to be twenty-five miles an hour, there was nothing in the evidence to prove a violation of Section 217 of the Penal Laws and the defendant was discharged.

Seattle Wants Fire Engines.

Out in Seattle, Wash., there are men who believes that automobile fire apparatus will supersede the horse drawn sort, and who take a radically different view of the questtian than Chief Edward Croker, of the New York Fire Department, who is anxious to use self-propelled engines, but cannot get around the side-slipping difficulty. At a recent meeting of the Seattle Board of Public Works, City Engineer Thomson suggested that the city take steps to install automobile fire apparatus. He stated as his belief that such a course would save money for the city, owing to the fact that the horses now used had to be replaced so often and at such a great expense. He also thinks they would give better service than the present horse drawn apparatus.

Binghamton Wrestles with "Chauffeur."

"A correspondent wants to know how to pronounce the word 'chauffeur.' Some people call it 'shofer,' some call it 'shawfewer,' John D. Rockefeller pronounces it 'chofer,' and we recently heard one lady talking volubly about her 'chaffer.' One unlettered, but ingenious fellow, has been known to refer to an automobile driver as a 'chiffoner,'" says the Binghamton Herald.

"The second pronunciation, with the accent on the 'fewer,' is about as near right as any of them, although some cultured people prefer 'shofer.' If you own an automobile and can hire a chauffeur you can pronounce it any old way, and those of your friends who are without a machine will in no single instance refuse to ride with you on that account. Some of them will even give you a hint that they think a ride in a motor car (that's English for automobile) would be just too delightful for anything.

"When you go to get your machine at the garage you should be very careful to state that you are on your way to the 'garrazzhe," with the accent on the last half of the word. If you can't do that people will understand you if you say that you are going to the automobile stable, or the place where your whizz wagon is kept."

"Big Four" to Employ Automobiles.

Reports from Benton Harbor, Mich., have it that the "Big Four" railroad will soon install gasolene propelled railroad automobiles on its line between that city and Indianapolis. The competition of the interurban electric roads is given as the cause of the adoption of the gasolene machines. Other reports say the road will also use railroad automobiles between Danville and Urbana, in Illinois, and Elkhart and Indianapolis, in Indiana.

Motor Stage Line in Texas.

Daily passenger service was begun on New Year's Day by the automobile line between San Antonio and Pleasanton, Tex. The big machine, with its load of passengers, left San Antonio at 8 a. m., and arrived at Pleasanton at 10:25, the distance being between thirty and forty miles. The machine will carry the United States mail in addition to passengers.

Why New London is Proud.

New London, Conn., is crowing over the achievements of the automobile chemical engine of Niagara Engine Company No. 1. One night last week it was sent out with its crew of fifteen men, and, despite the snow covered streets, the machines climbed the steep hills without trouble. In addition to the fifteen men, the machine carried one thousand feet of hose.

No Trolley Tracks for Tampa.

Word comes from Florida that the promoters of the proposed streetcar line for Tampa will use gasolene passenger vehicles, if they succeed in obtaining a franchise. The first line is planned to be run from West Tampa to Ybor City, passing through the business district of Tampa on each trip.

Railroad Automobiles in England.

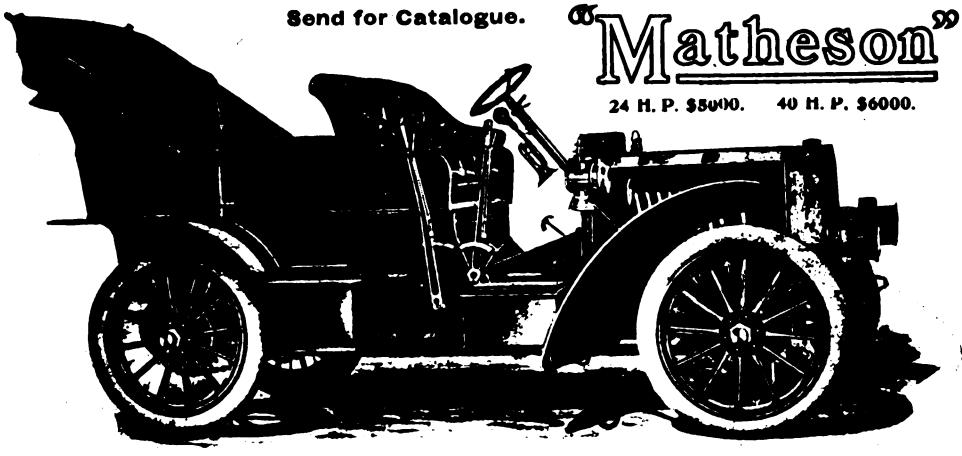
While not a few railroad automobiles are regularly run on various American railroads, both as standard equipment and as offsets to trolley car competition, railroad managers in England have not neglected the subject. In this country all of the machines are driven directly by gasolene engines, but in England for some time past the Northeastern Railway has had two rail automobiles in service, the motive power for which is supplied by a Wolseley gasolene engine, which drives a dynamo, thus generating electricity for the propulsion of the car. This gasolene-electric system, which has also been adopted in some types of motor driven omnibuses, promises good results, but it has the drawback of waste of efficiency through the transformation of power.

A light car, capable of seating thirty-two passengers, has been built by the Great Northeastern Railway Company, and equipped with two four cylinder gasolene engines of the Daimler type. This car was successfully run from Doncaster to London in September last, and since the 20th of that month it has been making experimental trips on the branch line between Hatfield and Hertford. As was only to be expected, a number of difficulties have been met with in regard to details of the machinery. These have been overcome, and the car is now running regularly on a nine-mile branch, making four round trips daily, but not carrying passengers.

A great feature of the Great Northern car is the lightness of its machinery, which weighs only two tons. It seems probable that more powerful engines will have to be installed in future vehicles of this type, so as to enable a trailing vehicle to be hauled when the traffic demands it. A capacity of thirty-two passengers is small even for a short country branch; moreover, it is very desirable that the rail automobile should be able to haul a horsecar or other non-passenger vehicle occasionally; otherwise a locomotive may have to be kept constantly in attendance.

The total weight of the Great Northern car is only eleven tons, as compared with an average of quite thirty tons for the steam and gasolene-electric cars, so that, even if the gasolene vehicle were to be doubled in size and power, it would probably still be lighter in proportion to its capacity than either of the other types.

Japanese Using Motor Wagons.



On more than one occasion have automobiles proved their value to both Russians and Japanese in Manchuria during the war. The roads in this vicinity are veritable mires and bogs, but when "Jack Frost" sets about his work the snow hardens and the roads become a practicable means of communication. Of this state of affairs the Japanese are taking full advantage, and are bringing up their provisions from their bases at Antung and elsewhere on motor wagon—at least that is the story that comes across the seas.

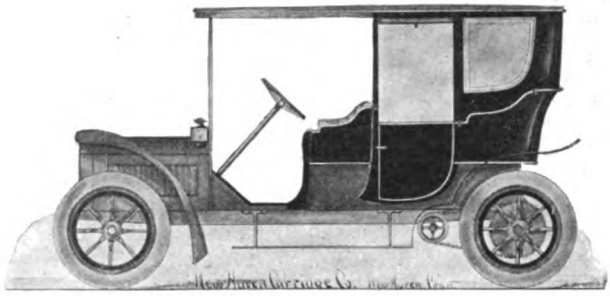
Send for Catalogue.

"Matheson"

24 H. P. $5000. 40 H. P. $6000.

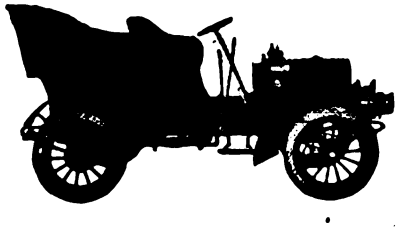
"America's Finest Motor Car."



CHARACTERISTIC FEATURES.

Self-starting from the seat.
Practically Noiseless.
Absence of Vibration.
Four-cylinder Vertical Engine.
Valves, in the head.
Automatic Carburettor, never requires adjustment.
Automatic Speed-Control, by Governor.
Automatic Lubrication.
Single-Lever Control.
"Make-and-Break" Ignition.
Irreversible Steering-Gear.
Four Powerful Brakes.
Timken Roller-Bearings.
Armored Frame.
Road Clearance of 12 inches.
Side Entrance.
Aluminum Body.
Wheel Base, 106 inches.
Imported "Continental" Tires.
Imported Honey-Comb Radiator.
Long Life—insured by using greater factors of safety in every vital part than ordinarily employed.
Speed—Guaranteed 40 to 60 miles an hour, according to H. P. and gear.

MATHESON MOTOR CAR CO., - Holyoke, Mass.



N. Y. Agents, Shepard Bros., 500 Fifth Ave

Automobile Buyers

Desiring really luxurious Tonneaus, Limousines or Landaulets that will be very durable, ride easy, finely painted, having the same attention paid to details they received in their fine horse drawn Broughams and Victorias, can obtain same from the **first** firm in America to build **Automobile Bodies.**

THE NEW HAVEN CARRIAGE CO., New Haven, Conn.

The YALE $1600

THE YALE WILL MEET THE REQUIREMENTS OF MORE PROSPECTIVE PURCHASERS THAN ANY AUTOMOBILE ON THE MARKET.

You can offer a prospective purchaser more for his money in the Yale than in any other automobile made.

You can offer and guarantee him a dergree of Efficiency, Dependability, Luxury and Simplicity of operation to be found only in other cars costing twice as much.

The Yale provides what nine out of ten automobile purchasers want. A roomy, comfortable-riding, beautiful appearing family touring car with power sufficient to overcome all road difficulties and to develop a rate of speed that will satisfy any desire to "ride fast."

Send for new catalogue and investigate the Yale at your first convenience.

THE KIRK MANUFACTURING COMPANY, 950 Oakwood Avenue, TOLEDO, OHIO.

Member Association of Licensed Automobile Manufacturers.

Notice to the Public.

ALL USERS OF GASOLINE AUTOMOBILES AND ALL INTENDING PURCHASERS ARE HEREBY NOTIFIED:

That there has been a complete surrender by the Panhard & Levassor Company, of Paris, France, and the members of that corporation who represent it in New York City, to the rights of the Association of Licensed Automobile Manufacturers, under the Selden patent by the recognition of the validity of the basic U. S. Letters Patent No. 549,160, granted to George B. Selden, November 5, 1895.

A capitulation has been made also by the present American representatives of the Mercedes automobiles hereinafter named.

In the future all Panhard motor cars, brought into the United States by or through Panhard & Levassor, or Smith & Mabley, and all Mercedes cars brought in by Allen, Halle & Co., through their representatives, Smith & Mabley, all of New York City, will come in under licenses granted by the Electric Vehicle Company, of Hartford, Conn., under the Selden patent, with the authorization of the Association of Licensed Automobile Manufacturers.

Suits had been brought and vigorously prosecuted against the representatives of the Panhard and Mercedes cars for infringement of the basic Selden patent, No. 549,160, by the unlicensed importation of the cars named, and this surrender now clears the way for these makes of foreign cars to have license plates attached to them, when sold by or cleared through the parties named herewith.

The royalty on all Mercedes and Panhard cars heretofore brought in by the parties named since January 1, 1903, having been adjusted, Selden license plates will be furnished the present owners of such cars upon application to the agents.

The full list of licensed importers (who represent all the leading makes of foreign cars) from whom cars may be purchased, or through whom they may be cleared in any port of entry, without liability of suit for infringement of the Selden patent, is now as follows:

AUTO IMPORT CO.,	1786 Broadway, N. Y.
SIDNEY B. BOWMAN AUTOMOBILE CO.,	52 W. 43d St., N. Y.
THE CENTRAL AUTOMOBILE CO.,	1684 Broadway, N. Y.
HOLLANDER & TANGEMAN,	5 W. 45th St., N. Y.
F. A. LA ROCHE CO.,	147 W. 38th St., N. Y.
STANDARD AUTOMOBILE CO. OF N. Y.,	136 W. 38th St., N. Y.
SMITH & MABLEY, INC.,	513 7th Ave, N. Y.
PANHARD & LEVASSOR,	232 W. 13th St., N. Y.
WORTHINGTON AUTOMOBILE CO.,	547 5th Ave., N. Y.

All persons are now finally warned that suits will be brought against firms and individuals who import hereafter any gasoline automobiles, of any foreign make, through any entry port of this country, or who buy any foreign made gasoline automobiles not imported by, or cleared through, one of the licensed importers above named.

William A. Redding, Esq., attorney, of 38 Park Row, New York City, has been authorized to make adjustments with persons who have in the past unwittingly infringed the Selden patent by the importation or purchase of unlicensed foreign made automobiles, and who choose now to guard themselves against prosecution.

The American manufacturers now licensed under the basic Selden patent, No. 549,160, are:

APPERSON BROS. AUTOMOBILE CO ..	Kokomo, Ind.
THE AUTOCAR CO.,	Ardmore, Pa.
BUICK MOTOR CO.,	Flint, Mich.

Are your eyes bothering you? Do they ache and pain you? Do they look red and feel hot? Are you troubled with headache and neuralgia? Does it hurt you to read or sew, or use the eyes steadily?

Then don't waste another hour, but get EYE-FIX, the only sure and painless cure for all eye troubles. It never fails to give instant relief, and as it contains neither cocaine, atropine, belladonna or other dangerous elements, EYE-FIX is used universally by physicians and opticians.

EYE-FIX is good to keep the eyes well and strong. And it's the one safe remedy for every eye trouble in both young and old.

If baby's eyes are weak or sore—use EYE-FIX.

If grandfather's eyes are weak and weary—use EYE-FIX.

If your own eyes are bad from any cause—use EYE-FIX.

All druggists and opticians sell EYE-FIX at 50 cents. Ask for it and take no substitute. No other eye remedy in the world is like EYE-FIX, because no other remedy produces the same splendid results as EYE-FIX. A trial bottle for 10 cents will be sent you direct from our laboratory. Eye-Fix Remedy Co., Detroit, Mich. Dept. S.

The Week's Patents.

778,497. Pneumatic Tire or Other Tubular Flexible Article. Arthur H. Marks, Akron, Ohio. Filed March 31, 1904. Renewed November 10, 1904. Serial No. 232,132.

Claim.—1. In a tire-cover, a plurality of layers of fabric constructed and arranged so that the elasticity of each layer decreases beginning with the innermost layer, for the purpose set forth.

778,626. Steering Mechanism for Automobiles. Fred H. Bogart, New Britain, Conn., assignor to The Corbin Motor Vehicle Corporation, New Britain, Conn., a Corporation of Connecticut. Filed September 20, 1904. Serial No. 225,172.

Claim.—1. In a steering apparatus, a rotatable shaft, bearings therefor, a worm on said shaft, a plunger arranged parallel to said shaft, a rack on one side of said plunger engaging said worm, a second shaft and a link connected thereto and to said plunger.

778,627. Automobile Controlling Mechanism. Fred H. Bogart, New Britain, Conn., assignor to The Corbin Motor Vehicle Corporation, New Britain, Conn., a Corporation of Connecticut. Filed September 20, 1904. Serial No. 225,173.

Claim.—1. In an apparatus of the character described, a hollow shaft, a second shaft extending there through projecting below the lower end thereof, a sleeve mounted on the lower end of the hollow shaft and spirally movable thereon, a sliding connection between the said sleeve and said inner shaft whereby when the angular position of said snafts is varied the sleeve will be shifted longitudinally upon its support.

778,632. Engine. George C. Cannon, New York, N. Y. Filed November 5, 1903. Serial No. 179,933.

Claim.—1. A valve-operating cam, comprising a sleeve forming the body or main part, and reverse and ahead cam-sections spaced from each other on the sleeve, the reverse-section having essentially square or longitudinal shoulders and the ahead-section having one square or longitudinal shoulder and a triangular shoulder, the said reverse and ahead cam-sections being set opposite to each other.

778,653. Electric Battery. Arnold Gabrielson, Milwaukee, Wis., assignor of one-fourth to Ole H. Lee, Milwaukee, Wis. Filed July 21, 1904. Serial No. 217,457.

Claim.—An electric battery, comprising a zinc cup, coated with mercury on its inner surface, with a lining of paper soaked in dilute sulphuric acid, and filled with a mix-

WANTS AND FOR SALE.

ire of coke dust, powdered graphite and al-ammoniac crystals, wet down with a potsh solution, and sealed; a battery carbon upported by and within the filling mixture said zinc cup; binding posts on the said up and carbon, and an insulating covering round the said cup.

778,707. Igniting Device for Internal Combustion Engines. Fritz Reichenbach, Charttenburg, Germany. Filed February 26, 904. Serial No. 195,414.

Claim.—1. In a quick-running internal-ombustion engine, the combination with the ngine-shaft and the means for rotating it, f a fly-wheel, a magnet fixed thereto, an -shaped stationary armature, formed with nd pieces which are as long as the spaces etween the ends of the poles of the magnet nd completely bridge said spaces during the otation of the magnet, a bobbin surrounding aid armature, whereby the rotation of the y-wheel will generate an electric current in aid bobbin and there will be no air gap beween the armature and magnet during the otation of the magnet, and means for utiliz-ng the currents thus generated for igniting he explosive mixture in the engine cylinder.

778,710. Steering Device. Joseph H. Robason, Quincy, Mass., assignor to Frank Buress, Quincy, Mass. Filed July 11, 1904. Serial No. 215,994.

Claim.—1. In a steering device for a motor-vehicle, a casing provided with a groove in its exterior and a bracket projecting into said groove fast to said casing and adapted to be fastened to the body of said vehicle.

778,768. Shoe Protector for Wheel Tires. Clifford A. Worthington, Trenton, N. J. Filed August 24, 1904. Serial No. 221,984.

Claim.—1. A shoe protector for automobile tires formed of rubber and canvas moulded into shape, and braced longitudinally by a thickened portion extending along the tread and thickened portion extending along each free edge and tapered downwardly along the end of the protector, the said ends being molded to a thin edge, and eyelets embedded in the reinforced longitudinal edges, the said canvas being exposed on the inner side of the shoe, substantially as described.

778,791. Axle for Automobile Vehicles. William S. Morgan, Russell, Minn. Filed February 11, 1904. Serial No. 193,155.

Claim.—1. In combination with a driving-shaft, comprising an intermediate section and end sections flexibly connected thereto for angular movement, an axle, comprising steering-knuckles forming flexible connections between the intermediate and end axle-shaft sections, and having inner and outer members provided with bearings for said axle-shaft sections, respectively, said bearings including removable members to facilitate the attachment and removal of the driving-shaft sections, bolts, pivotally connecting the inner and outer members of the steering knuckles together, trusses secured to and by said bolts and also to certain of the removable bearing members of the steering knuckles, and connections, independent of the axle-shaft, between the inner members of the steering knuckles, substantially as described.

778,810. Motor-Vehicle. Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass. Filed May 12, 1904. Serial No. 207,629.

Claim.—1. In an automobile, the combination with a vehicle frame comprising side bars, of an opposed cylinder engine frame arranged transversely to the vehicle frame, and hung by its cylinder portions from the under sides of the said side bars, thereby bracing the vehicle frame transversely and so mounting the engine as to give it a low center of gravity.

778,811. Motor-Vehicle. Thomas L. Sturtevant, Quincy, and Thomas J. Sturtevant, Wellesley, Mass. Filed July 6, 1904. Serial No. 215,460.

Claim.—1. In an automobile, the combination with a vehicle frame, of a dashboard, a carbureter supported by said dashboard, and a fuel supply tank located above the level of said carbureter and delivering fuel thereto by gravity.

The Car Too Good for the Price.

Meet us at New York, Chicago and Detroit Shows.

16 h. p. (and lots to spare); weight 1750; speed, up to 45 miles.

Price, complete, **$1,250**

Thoroughly Proven in 1904.

To Please the MOST People

Let us tell you, Mr. Agent, that the Reliance at $1,250 will "make a hit" at first sight with a greater percentage of widely different kinds of "prospects" than any car you can get for your 1905 line.

Construction, trimming and finish finest on any car at any price. Unique control system—every speed on direct drive without touching gear levers.

Big tonneau, with comfortable side entrances; double-opposed motor; full elliptic springs that make the Reliance the easiest riding American car regardless of price or reputation; wonderful hill climber; extremely quiet in operation.

100 CARS READY FEBRUARY 1. WE HAVE A SYSTEM OF GUARANTEEING DELIVERIES.

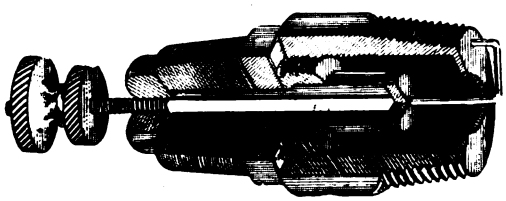
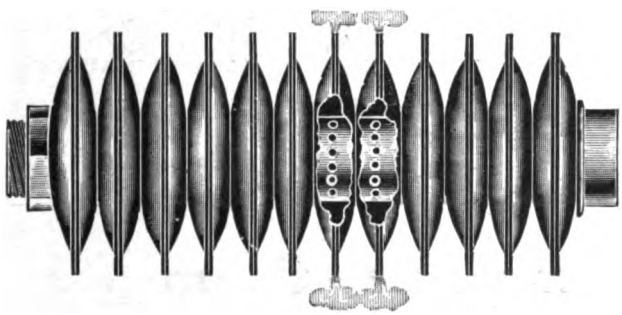
WHOLESALE RETAIL

Largest Manufacturer of Auto Specialties in the World



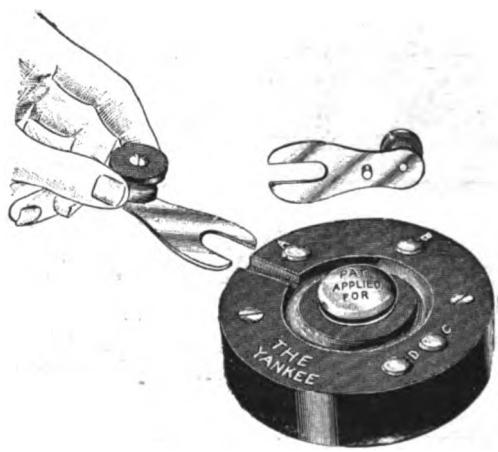
1905 Yankee Non-Vibrating Steering Wheel
Price, $10.00

Takes up all the vibration and at the same time has greater tensile strength for steering purposes than the old-fashioned wheel. Very ingeniously constructed. Write for descriptive circular.



1905 Yankee Grade-Meter
Price, $7.50

This Grade-Meter is the handsomest article of its kind on the market and is positively accurate.
No vibrating of the indicating hand.



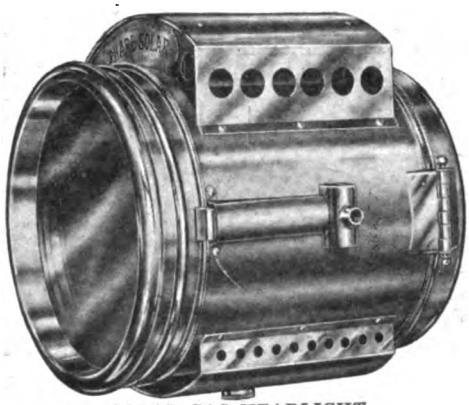
Yankee Mica Spark Plug
Closed End, $1.50 Open End, $1.00

Both guaranteed 90 days.
Thousands in use and no complaints.

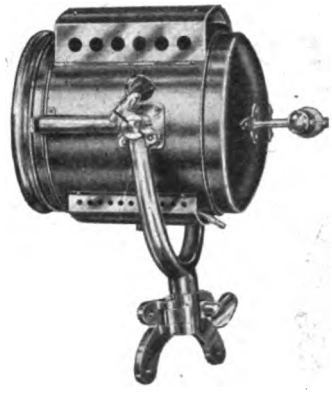
Yankee Silent Muffler
Price, $6.00

Composed of 24 opposed disks enclosing escapement holes in exhaust pipe. Gas escapes through the thin outer edge of all the disks simultaneously.
The point of escapement is so many times larger than the bore of the exhaust pipe that there is no back pressure.
Equal distribution of the escaping gas over so long a line solves the muffler question.
Positively noiseless.

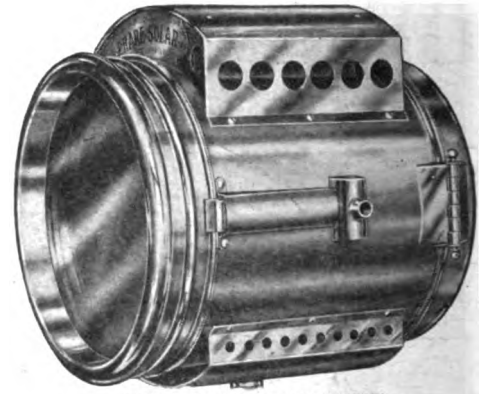
Yankee Cut-out Switch
Price, $1.50



Switch blade instantly detachable which locks your car in your absence. Cannot be short circuited.
May use two sets of batteries, separately or alternately, or you may double your amperage at will.



WE ALSO MANUFACTURE



Quick Chain Repairers (sells for 50c.), Foot Bellows for Horn (sells for $3.00), Wind Shield, Price $7.50 (keeps dust out of back of tonneau), Battery Connections (sells for 36c. doz.), Repair Plasters, $1.00 each.
We manufacture 33 other Auto Specialties. Cuts furnished free to jobbers and dealers.
BIG FREE CATALOG. Discount to Manufacturers, Jobbers and Dealers.

NORTHERN AUTOMOBILES

Good in all Climes

SILENT AS THE SNOW

is the operation of the Northern Touring Car. The plans of this superb vehicle called for the elimination of all noise and vibration, and every part has been carefully worked out with this end in view.

That the result aimed at is fully attained, the car itself proves.

THE NORTHERN TOURING CAR IS THE QUIETEST, EASIEST RUNNING CAR IN THE WORLD.

The motor is a 5¼x5¼ two-cylinder of the opposed type, developing ample power to take the car anywhere an automobile can go. Wheel base is 100 inches, with wheels fitted with 30x4 detachable tires. Choice of four different bodies. **Two-passenger** body, a powerful, speedy machine, **$1,500. Four or five passenger,** rear entrance, **$1,600,** and **four or five passenger,** side entrance, $1,700; and, lastly, a superb Limousine body, **$2,500.** All styles interchangeable.

WRITE FOR CATALOG 16.

THE "STURDY NORTHERN" RUNABOUT

long ago justified its name. With ample reserve power, strongly built and with body hung on swivel entirely independent of the frame, rough roads and smooth roads are alike, so far as riding qualities go. Its record in the hands of thousands of users all over the country proves its durability and efficiency under all conditions.

THE 1905 NORTHERN RUNABOUT, grown in everything except price, embodies all the features suggested by experience and the advancement of the art of automobile construction. Among the improvements are new body design, larger fenders, larger oil cups, full back moulded seats and numerous detailed refinements of working parts.

Largely increased facilities make it possible to now offer this sturdy, ideal **"Runabout" at $650.**

It will pay you to get in touch with NORTHERN Automobiles.

FIFTY DOLLARS LESS.

BUCKBOARD, $375.

SURREY, $450.

RUNABOUT, $475

TONNEAU, $525.

The price of the Orient Buckboard, Model, A, is $50 less this year than it was last.

Our dealers sold thousands of these cars last year, at $425. This year the price is only $375, and the car is better and faster than ever. There is no doubt that thousands of dollars can be added to your gross sales if you carry the Buckboards.

The thing to consider is that there is nothing else like them, and that there is a big demand for them.

They are as simple as a bicycle, dependable as steel beams, speedy as a 40-Horsepower Touring Car, and cost so little to buy and maintain as to put them within everybody's reach.

Get our superb color catalogue—the handsomest ever issued and by a new process.

VIBRATOR	4-coil.	4-coil.	4-coil.	4-coil.

NOTE.—The de Luxe differs from the Model G in finish and upholstery. It is magnificently upholstered in hand-buffed leather, and the body finish is the finest that can be found in America or Europe. No car built is richer than the Orient de Luxe.

As you will observe, both our 16 Horsepower models are built on exactly the same lines as the more powerful cars, embodying the same superior engineering features.

They are the only motor-cars of 16 Horsepower (or less) which have 4-cylinder vertical tandem engines, direct drive, and sliding gear transmission.

The swinging seat on the $1650 car is not one of the cheaply-built, hinged, tipping affairs. It is a regular Darracq type, swinging forward on a metal track—one of the fine features of this exceptional car. Both 16 Horsepower cars have three forward speeds and reverse.

that the American trade and the American public would not pay the price of a truly high grade tire.

OUR ANSWER

was the

FISK HEAVY CAR TYPE TIRE,

which was made first and priced afterward.

It costs more than any other because it is worth more It represents the finest workmanship and the very best materials money can purchase Its success proves that just such a tire was wanted, particularly with such a fastening as goes with The Fisk.

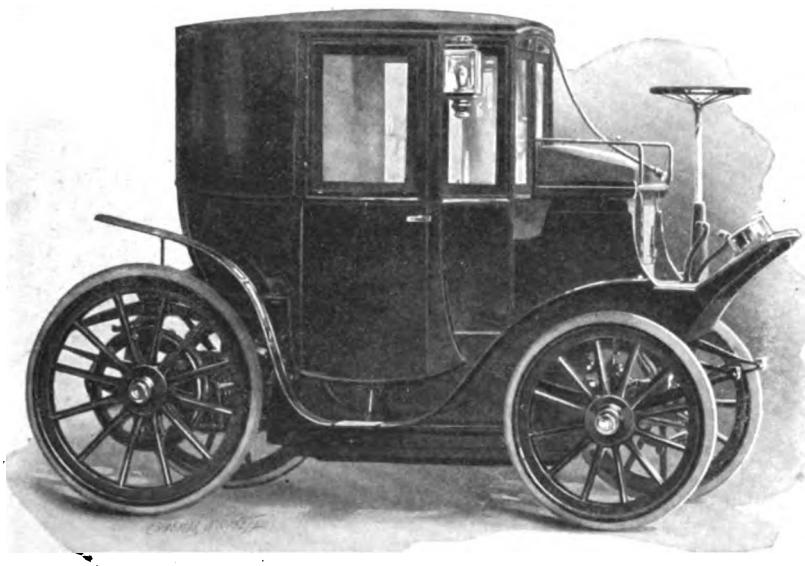
Columbia ELECTRIC

Mark XLI is an entirely new electric light, fast, of wide radius of action, luxurious in comforts, artistic in design and elegant in appointments and finish. It is the most resourceful light electric carriage yet built. Leading constructive features are steel chassis, single motor, chain drive, side lever steer, new and simple controller, with three speeds forward and two reverse, and equal division of battery weight over both axles.



The body follows the most approved Victoria lines with swing panels, and allows for ample seat room and harmonious battery disposition. The hand-buffed leather hood is perfectly fitted and lined with the finest broadcloth.

Mark LXI realizes an ideal vehicle for town and suburban use where a 15-mile speed is sufficient, and is high in favor with physicians, ladies, and others who find electric power best for their requirements.

Supplied standard in green and royal blue, with upholstering to match.

Mark LXI. Victoria-Phaeton, $1,850.

The new electric light runabout, mark LX, is the fastest, most efficient, and widest in range of single battery charge of any electric carriage of similar weight. Exclusive of the body it is the same car as the Victoria phaeton, and a season's popularity and successful use attests its many qualities of automobile worth.

Price, $900.

Columbia Town Carriages

Columbia supremacy in the building of Electric Town Carriages for private service—Broughams, Landaus, Landaulets, Hansoms and Rear Boot Victorias—is universally conceded. Perfect in design and equipped with every possible device that can add to the comfort of the occupants, these vehicles are the vogue with New York society people and are extensively used in other large cities. They have many important electric and mechanical features, found in carriages of no other make, which are the result of our years of experience in providing for the requirements of purchasers who demand the very best of everything that pertains to vehicles or their use.

The leading position of Columbia electric commercial vehicles—light and heavy electric delivery wagons and trucks—is equally well established.

Separate Catalogue of Columbia Electric Carriages and Columbia Electric Commercial Vehicles will be sent on request.

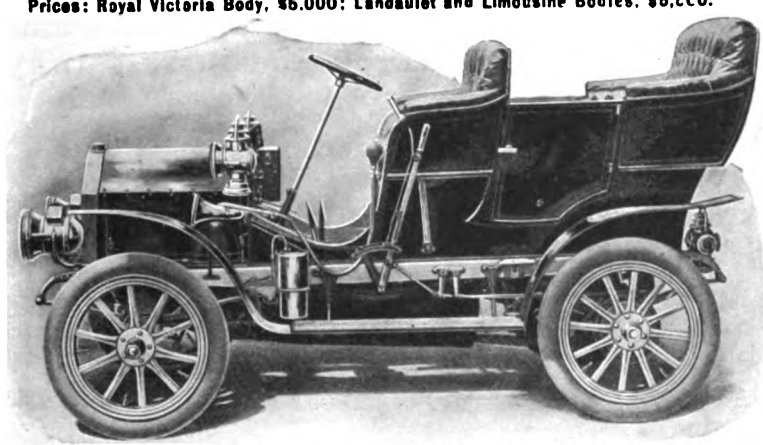
Columbia GASOLENE

The new four-cylinder 35-40 h. p. Columbia, Mark XLV, perpetuates the main features which placed its predecessor, Mark XLII, first among American cars, and incorporates such changes in details as have been suggested by a year's use. Most important among these is a new carburetter of the aspirating type, which represents the very latest and best practice and gives material increase of power. Another new and important feature is the spark and throttle control, by means of two levers so mounted on a revolving head within the steering wheel as to insure great delicacy of adjustment. The new pedals operating the clutch and foot brake are much larger than formerly, while the hand brake and speed changing levers are of new and greatly improved design. Added convenience in operation is secured by a dash-mounted mixture changing lever; compression releasing rod extending through both the cooler and the dash, so that it can be worked from either end; oiler driven by flexible shaft, replacing belts; and folding side-opening bonnet, arranged to open from either side and also bodily removable, and fenders which can be instantly taken off for close motor inspection.



Mark XLV., 4 Cylinder, 35-40 h. p. Price, $4,000.

The standard side-entrance tonneau body with 108-inch wheel base is of an entirely new design, which we believe to be the best that can be devised for an open car with full width cross seat at the rear. The lower rearward curves harmonize perfectly with the general design, and have a tendency to deflect dust. The upholstering is of the richest and most enduring character. The body is painted dark green and the running gear yellow. Canopy or cape tops are supplied to order.

With the Mark XLV chassis, with the wheel base extended to 112 inches, we supply Royal Victoria, Landaulet and Limousine bodies. The Royal Victoria is ideally suited to park and boulevard driving, where speed is desired and a considerable distance is to be traveled. It is also a delightful touring car. The Landaulet and Limousine bodies meet every requirement for winter use and inclement weather touring. On these cars the style and color of the painting and trimming are at the purchaser's option.

Prices: Royal Victoria Body, $5,000; Landaulet and Limousine Bodies, $5,ECO.

SPECIAL BODIES

2 Opposed Cylinder 18 h.p.

Mark XLIV. made its first public appearance as a class winner in the Eagle Rock Climbing Contest Thanksgiving Day. It has a double horizontal opposed 18 h. p. engine under forward bonnet, sliding gear transmission, propeller shaft drive, three forward and one reverse speeds operated by a single lever, automatic cylinder lubrication, standard spark plugs, foot-operated throttle, expanding metal to metal foot-operated clutch, hand and foot brakes, and spark advance lever in the steering wheel. The wheel base is 81½ inches. The luxurious side-entrance tonneau body is beautifully upholstered in dark green morocco. The entrances are broad and easy of access, and the car comfortably seats four persons. The body is painted dark green with gold striping, and the gear in long-wearing straw color. The long running boards have rubber, brass-bound treads. Equipment includes gas headlights, oil side and tail lights, horn and tools.

$1,750

THE ORIGINAL FACTORY BUILDING, AND THE OFFICES.

ACHIEVEMENT, rather than explanation, will best serve as an introduction to this announcement. The thousands of RAMBLERS in daily use by satisfied owners speak far more eloquently of RAMBLER merits than is possible for words. A brief retrospect will perhaps not be out of place, inasmuch as it will best serve to accentuate the extreme practicability of the typical American motor carriage, the RAMBLER.

The RAMBLER automobile of to-day is the result of an evolution of many years, the head of Thomas B. Jeffery & Co. being he, who, with Mr. R. Philip Gormully (deceased) designed and long built the bicycle of the same name, so deservedly popular among those who were boys a generation ago.

Commencing in 1891 with experiments on a small scale, the succeeding years have seen ideas tried, abandoned and tried again, until in 1901 they had taken a sufficiently practical form to warrant the acquisition of a large factory for the purpose of producing the results in a marketable form. But even then, with the results of ten years' experimenting in mind, the type of construction formulated was found if not unfit, at least inadvisable, for use on American roads. Further experimenting followed, and in January, 1902, the RAMBLER as now known made its initial appearance. The knowledge gained in the years of experimenting was valuable in developing the new idea, and the immediate recognition by the public of the RAMBLER'S suitability for use on average roads furnishes the most conclusive evidence of its worth. Commencing with vertical cylinders, sliding gear transmitting mechanism, direct drive with bevel gear connections, all were discarded for the more direct type of horizontal engines, planetary type of transmission and chain drive, as being more simple, having far fewer parts and capable of transmitting the engine power to the wheel rim with practically no friction loss. The earmark of American ingenuity is simplicity, and that earmark is in evidence in every part of the RAMBLER. Not a part but has some use, every part a means to an end. Refinement followed experience, and to-day the RAMBLER stands without a peer for touring on these roads of ours.

THE MAIN AISLE OF ONE OF THE MACHINE SHOPS.

The enormous demand and consequent increase in facilities for production (the latter probably without precedent in any branch of the mechanical arts) have enabled us to offer the best value on the market in automobiles.

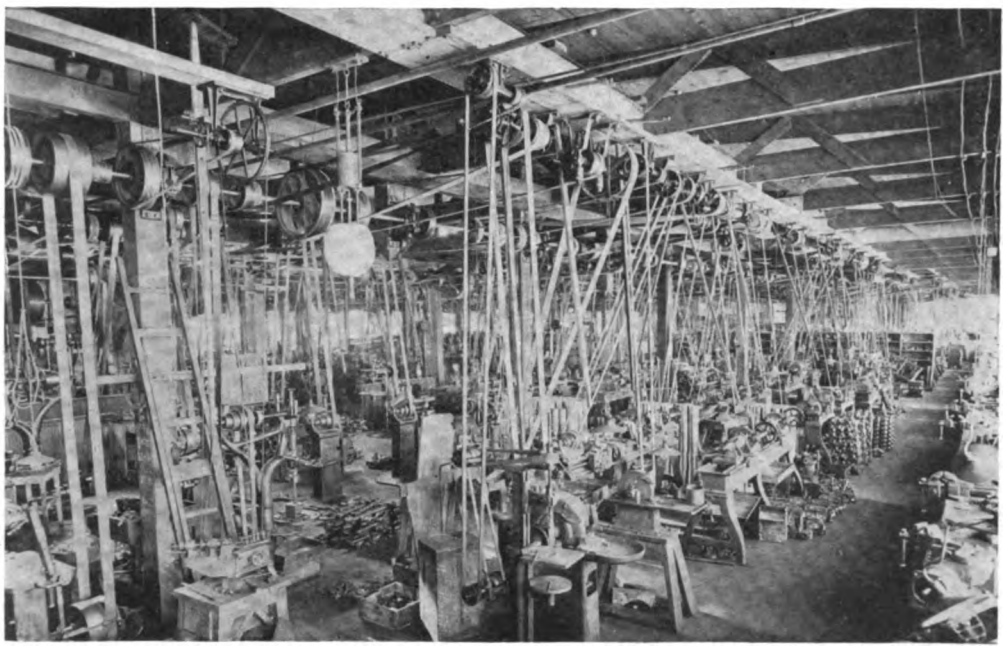
The factory, originally but seventy thousand square feet in area, exclusive of outbuildings, now covers nearly twelve acres, and, with the testing track, loading platforms and adjacent grounds, thirty-three and one-half acres.

Machinery has been added almost daily, until to-day the RAMBLER factory is admittedly not only the largest individual automobile factory of modern construction in the United States of America, but the finest equipped for its purpose.

But few parts go into the RAMBLER that are not made in our own factory, and those few consist of the woodwork (the bodies and wheels), the tires and the induction coils. Save for two of the largest steel forgings, the RAMBLER drop forge shop provides all those used in the carriage. The gray iron castings, such as cylinders, pistons, etc., are all made in the RAMBLER foundry, under expert and careful supervision.

Digitized by Google

THE RAMBLER IN 1905.



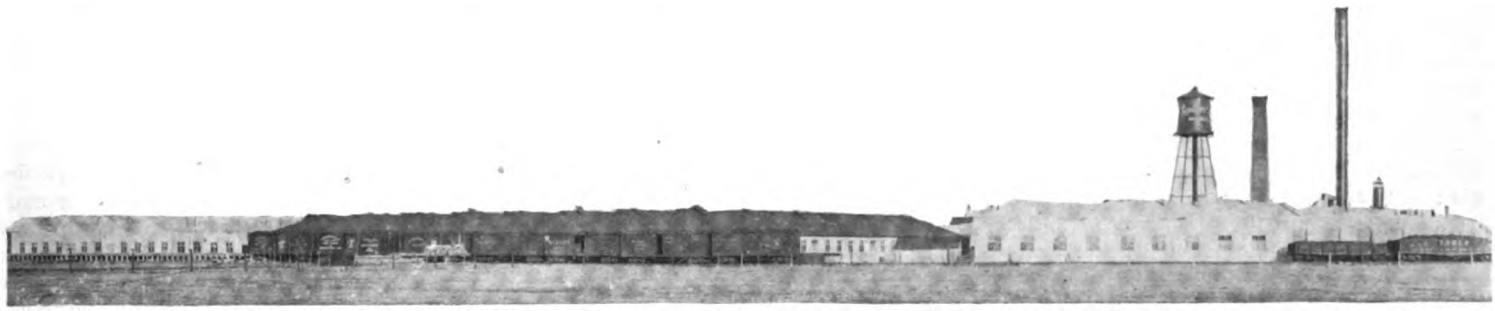
THE TESTING INCLINE AND THE LAST BUILDING ERECTED.

The pressed steel frames, unique in their design, are made in the forging plant; in fact, to further explain would be but to read through the list of component parts of the RAMBLER.

The essentials for a practical touring car are, briefly, simplicity of design, perfectness of construction, ease of control, spring suspension, road clearance and immunity from trouble, the latter being dependent upon almost all the former. In the RAMBLER the simplicity is unquestioned, there existing not a superfluous part; the thousands in continued daily use speak decisively for the thoroughness of construction; the control is by one lever and the throttle, the former convenient to the operator on the right side and the latter immediately beneath the steering wheel and operable with the left hand, so that it is never necessary to remove both hands from the steering wheel. The four full elliptic springs of the RAMBLER have but to be tried to be appreciated, their adoption on the RAMBLER marking an era in motor construction and an introduction of comfort that was soon copied by other manufacturers. Especial attention has been given to the road clearance, the RAMBLER being pre-eminently a touring car, fitted for use on any rideable roads.

Upon the transmission of the engine power to the wheels without undue loss by friction depends the success of the carriage, and while there are at least three known methods, each perhaps with some advantage of its own, we believe that the planetary system as adopted and used in the RAMBLER has so many points of superiority that it far outweighs those possessed by the other types. The RAMBLER engine is admittedly so powerful in comparison with the weight of the car that it is seldom necessary to use the slow speed; when running on the high speed the power is conveyed direct to the wheels without the mediation of gears, and with absolutely no frictional loss. Both the high, low and the reverse gears are put into operation by one lever, and without jerk; there are no gears to mesh suddenly, no teeth to strip and the mechanism adds its weight centrifugally to the fly wheel.

MOTOR DEPARTMENT.



Ordinary care only in the way of lubrication is necessary for the RAMBLER type, with which it will last indefinitely. The operator has none of the delicate adjustments absolutely requisite in other types to annoy him, and there is no fixed dead weight to add to the engine load, the whole mechanism being locked solid with the fly wheel when running on the high speed, and, as previously stated, adding its weight to the centrifugal force of the fly wheel.

ENGINE.—The RAMBLER engine is now probably so well known that it is perhaps unnecessary to describe it. In brief, there are but few alterations, which alterations may be better classed as refinements. It is of the two-cylinder, horizontal, opposed type, each cylinder being 5x6 inches, with mechanically actuated valves, both sets being worked from one cam shaft. This design is preferred for the reason that long connecting rods can be used; that the pistons can be thoroughly lubricated all around and that the weight of the rapidly reciprocating parts balance each other. All bearings are of large surface and composed of what is known as "non-friction" material. The pistons each have six rings, another RAMBLER feature, and are fitted to the cylinder with a variation of not more than one-thousandth of an inch. The piston rings are ground on their faces and sides to insure a close and accurate fit. Practically all the bearings in the engine and cam shaft are self-lubricating. The number of moving parts is ridiculously small as compared with those necessary to operate other types of engines, while the vibration, reduced to a minimum by careful balancing, is communicated longitudinally to the frame and almost entirely absorbed before reaching the operator.

TRANSMISSION.—The power transmitting gearing on the RAMBLER is greatly simplified by the longitudinal location of the engine in the centre of the car, inasmuch as only a single chain is

Digitized by Google

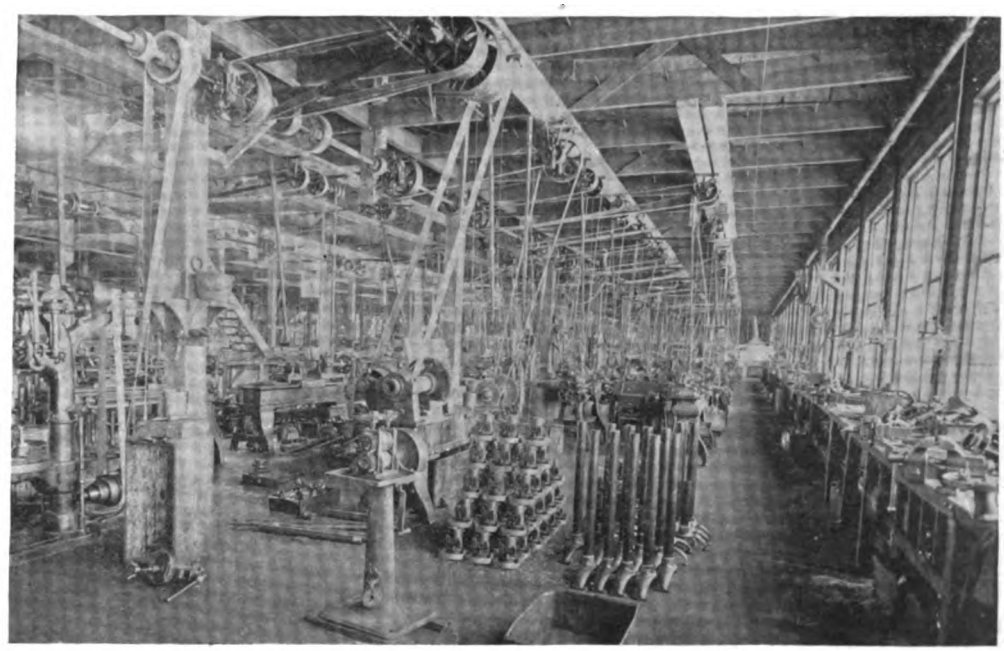
THE RAMBLER IN 1905.

THE ADDITION SINCE 1903—SEVEN CARS BEING LOADED AT THE PLATFORM.

necessary to transmit the power to the point at which it is to be applied. It is of the planetary type, with two speeds forward and reverse, and is somewhat different in detail to that hitherto used on RAMBLERS, and is greatly improved.

The RAMBLER engine is sufficiently powerful to drive the car almost entirely upon the high speed, at which time the engine drives direct to the rear axle without the mediation of gears. Occasionally, however, deep sand or heavy grades are encountered, when greater power is necessary, and for that purpose the secondary speed in the transmission is provided.

For reversing, the same lever is used as for the secondary speed, but in a more forward position, and is then engaged with the mechanism by applying the foot to a pedal on the foot board.



The engagements are effected through frictional leather covered clutches that avoid all noise, do not jar, and which are all adjustable and easily replaceable when worn.

These clutch bands are unused when the car is running on the high speed, and the entire gearing and transmitting mechanism rotates on the crank shaft with and becomes practically a part of the fly wheel.

The transmission is entirely disengaged from the engine when the car is at rest, and the ordinary unpleasant noise of idly revolving gears is not in evidence on 1905 RAMBLERS.

IGNITION.—Ignition is produced by means of a jump spark and the now standard type of plug. Two sets of dry batteries are provided—obtainable at most automobile garages and stores, or from any electrical supply house—only one set being in use at a time. A two-point switch is attached to the coil box, so that either set can be used, avoiding the possibility of the operator being left without electrical energy. Each set is connected to induction coils—made by the best known maker of such coils in the United States—and from the coils to the ignition plugs located in the head of the engines. The location of these plugs is so well chosen that many instances are known of operators using a RAMBLER an entire season without the necessity having arisen for examination of the plugs. Both sets of batteries and the coils are located on the dashboard, where connections and adjustments can be readily made.

The time of the explosion of the mixture is controlled by an automatic governor rotating in time relation with the crank shaft, and so constructed that the charge is ignited later when the engine is running slow than when running fast. When the engine is at rest the governor is in its most contracted position, thus giving electric contact and ignition at the extreme end of the piston stroke and rendering a reversal of the starting crank impossible. Briefly, the RAMBLER governor provides ignition at exactly the proper moment at all speeds of the engine at which to obtain the best results, and is far superior to any method of hand timing yet practised.

AXLE DEPARTMENT.

CARBURETTER.—With simplicity again as the keynote, the RAMBLER carburetter was evolved some two years ago with the idea of dispensing with one lever, previously considered absolutely necessary. The automatic feature was first used in America on RAMBLERS, and it has been so developed that we believe it the best of its type in existence. It relieves the operator of the annoyance of obtaining an exact mixture, the proportions being determined and the adjustments made at the factory in testing the carriage. An easy adjustment is provided, however, so that the proportions can be varied for the different altitudes at which the carriage may be used. In addition to the automatic feature a lever connected with additional air spaces is provided and attached immediately beneath the throttle, which can be used when running on level roads for the purpose of admitting more air and consequently reducing the consumption of gasoline.

RADIATION.—The RAMBLER engine expends no part of its power in keeping its cylinders cool. The thermo-syphon system, which has become a part of the RAMBLER, has beyond all questpart of the RAMBLER, has beyond all question or doubt proved its efficiency. It has

Digitized by Google

THE RAMBLER IN 1905.

been tested in every climate of the world, and with the benefit derived from past experiences it is believed that the radiator on 1905 RAMBLERS will leave nothing to be desired.

It is situated in the front of the bonnet, meeting the air unobstructedly, is of large area and radiating surface, containing, as it does, eight hundred and twenty-four thin brass tubes. The water, as heated by the engine, flows naturally from the upper part of the radiator, is cooled passing around the tubes and returns naturally, without the expenditure of power, from the lower part of the radiator, to resume its duties in the engine.

Gauges are supplied in the front of the radiator that the quantity of water may be determined, but so little is consumed by evaporation that practically no waste occurs, and very little attention to this detail suffices.

FUEL.—The fuel tank is carried under the hood of the carriage, far removed from the heated engine and the ignition circuit. The tank is of brass, considerably larger than ordinarily used, and has a capacity of about 12½ gallons of gasoline.

BRAKES.—Two brakes are provided, one on the transmission and the other acting directly on the rear wheels. The former is that generally used, and it is extremely powerful. The latter is the emergency or secondary brake, and is sufficiently powerful to lock both rear wheels. Both are put into operation by means of a pedal immediately in front of the operator on the foot board, and when necessary can be operated together.

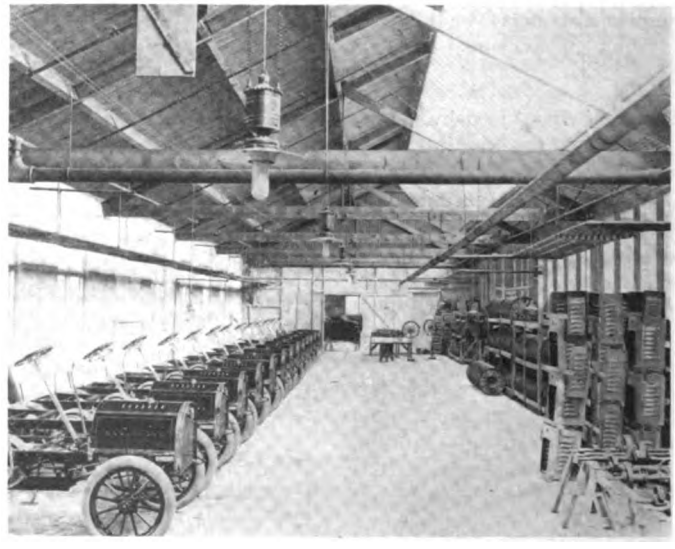
A novel combination is provided on the 1905 Surrey type cars by which the application of the brake also releases the clutch from the fly wheel; where the traffic necessitates many and sudden stops, this is a great convenience.

STEERING.—This is of the screw and nut variety, and is of RAMBLER origin. There is little possibility of wear, all parts being thoroughly covered, protected from dirt and well lubricated. Two seasons' use have proved its strength and freedom from complication. The connections to the steering knuckles are made with RAMBLER universal joints, each one adjustable to one-thousandth of an inch.

LUBRICATION.—This is of the simplest possible character and provided direct for the cylinders by two large glass oil cups immediately over them and easily accessible for refilling. Other moving parts are taken care of in a like simple manner, and no revolving or moving part of the RAMBLER is left without the necessary lubrication. No power pump is used, owing to its fallibility in cold weather, the location of the oil cups in the RAMBLER rendering it absolutely certain that the oil will flow even in the coldest weather, the heat from the engine keeping it liquid.

CHASSIS.—This part marks to the uninitiated the greatest change in RAMBLER construction. The angle steel hitherto used for frames has proved its reliability beyond question, but the necessity of lightening the carriage without sacrificing its strength made a change desirable and the pressed steel frame appropriate. To overcome the objections to this type in having so many cross members that should be rigid and integral with the side frame, but ordinarily riveted or bolted, ingenuity was again exercised, and the long steel channel, by an enormously heavy machine built especially for the purpose, was bent to the shape desired. This is a feature possessed by no other carriage, and is of no mean merit. The depth of the channel steel, combined with the one piece construction, provides the RAMBLER with a frame that for stiffness and lightness is unexcelled. The remaining cross members, to which are suspended the engines, levers, etc., are formed of U-shaped steel, with the ends bent and doubled to form the greatest riveting surface to the side frames. Factory tests have revealed the fact that this type of frame will sustain far more than twice the dead weight of the angle steel, and yet with a considerable saving in weight.

The whole of the mechanism is protected on the underside by a waterproof cover fastened to the chassis frame by spring clamps, but which can be readily removed when necessity requires it.



HORSEPOWER.—Believing it advisable to under rather than overestimate the horsepower, the RAMBLER has until this year been classed as sixteen horsepower. The refinements in the engine warrant the increase of from sixteen to eighteen in 1905, and upon the Type Two from eighteen to twenty, and it is confidently believed that with this increase they will still be able to tour with machines of double their nominal power. The public performances of the RAMBLER in touring and in some cases, racing, have revealed to an astonishing degree the elasticity of the term "horsepower," and while all RAMBLERS are rated modestly, their operators need never fear competition with other cars of considerably higher rating. Its various public performances are probably sufficient evidence on this point without further explanation.

SPRINGS.—The RAMBLER habit of using four full elliptic springs has added so much comfort to the carriage that the style will be continued, and, with the lengthened wheel base, the 1905 RAMBLERS should as far excel their competitors in comfort as they have in the past.

AXLES.—Included under this heading is the differential mechanism, which is located on the rotating inclosed rear axle. This is of the spur gear type and entirely inclosed, being practically oil and dust-proof.

The two portions of this axle are held together with large steel drop forgings on heavy tubes, whose outer ends carry roller bearings of large diameter and whose inner ends are fitted with ball bearings, insuring a free movement of the axle, and of such construction that it will require but little care and attention.

The front axle is of an extremely strong design of tubular construction, with walls one-quarter of an inch in thickness, to the ends of which are attached heavy forged yokes for the steering knuckles. The latter are also heavy drop forgings.

PAINT SHOP—PART OF A DAY'S OUTPUT.

Digitized by Google

THE RAMBLER IN 1905.

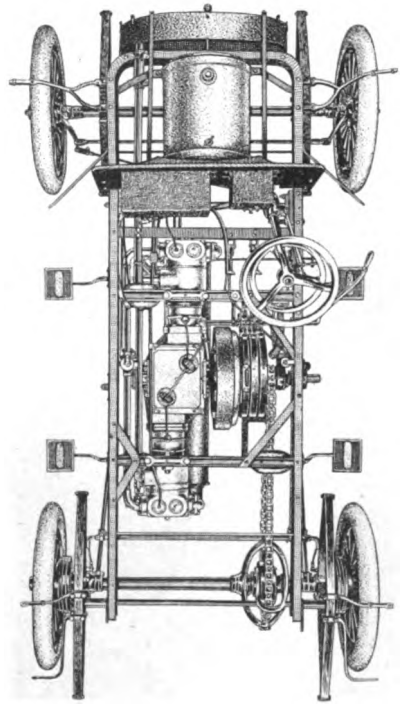
CHAINS.—These are of an especially heavy and durable pattern, made by the foremost manufacturer of chains in the country, and are practically immune from trouble.

WHEELS.—The wheels are of the wood artillery type, 28 inches in diameter for the Models "G" and "H" and the Delivery Wagon, 30 inches for the Surrey Type One, 32 inches for the Surrey Type Two and 34 inches for the Limousine. These need no extended description, inasmuch as they are now practically standard, the difference in value being governed only by the quality of the material.

The rear wheels (excepting on the Surrey Type Two and the Limousine) are fastened on the axle by means of keys and accurately tapered fittings and, when squarely seated, are then made fast by a lock nut at the outer end.

In the Surrey Type Two and the Limousine, however, the rear wheels revolve on ball bearings, the rear axle in that model being rigidly attached to the springs, the wheels being independently driven by a chain wheel on each hub, with power from a chain wheel on a counter shaft, containing the differential mechanism, located in the centre of the truss rod about midway between the engine and rear axle.

The front wheels of all models revolve on ball bearings of large diameter, are adjustable by cone movement and fastened with lock nuts.



TIRES.—On Models G and H and the Delivery Type One these are twenty-eight inches by three inches, on Surrey Type One they are thirty inches by three and one-half inches, on Surrey Type Two thirty-two inches by four inches and on the Limousine they are thirty-four inches by four and one-half inches, and an option is offered in Goodrich, G & J., Diamond, Hartford and Dunlop.

BODY.—The now well known RAMBLER French front will be continued for Models G and H, the latter being the former model with the addition of a tonneau. In Surrey Type One the wheel base is ninety inches, and the body known as the Surrey Type, with side entrances. These are one-piece bodies, and the rear part cannot be removed as in the old style tonneau bodies. In Surrey Type Two the body is of the same variety, but larger, longer and more luxuriously finished, while the wheel base of the carriage is increased to one hundred inches. The Limousine is naturally a closed body, with room for at least five persons, and has been designed with the idea of its use as a theatre or station 'bus.

GENERALLY.—It will be seen that the designer of the RAMBLER has succeeded in making every part perform its duties thoroughly, and has simplified them by multiplying their duties. There are no power consuming devices, such as the water circulating pump or air circulating fan, no power-driven lubricators, no air compressor or magneto. While it may be

true these devices do not consume a great amount of power, it is indisputable that they do not run of their own volition, and that they add unnecessary mechanism. No essential of any description is omitted from the

CHASSIS, SURREY, TYPE ONE.

RAMBLER, but every component part has its work to do, and accomplishes it.

The materials used in every part of the RAMBLER car are of the best that can be obtained. Experience has shown what is best suited for each purpose, and in the RAMBLER there are no misfits, every part being made of that material best suited for the work it has to do.

Their size, power and beauty put them in a class by themselves, it being beyond the power of any other manufacturer to offer such value as the RAMBLER for its price. It is only possible with the RAMBLER because of the immense and exceptionally equipped factory. The RAMBLER factory has no board of directors, no multiplicity of high priced officials, wastes no money in racing or useless advertising, the whole aim and effort being to give to the people exceptional and unapproachable value for their money.

WARRANTY. — We WARRANT all goods furnished by us for sixty days following the date of their shipment, based upon the date of invoice covering the goods, this warranty being limited to the replacement in our factory of all parts giving out under normal service in consequence of defect of material or of workmanship.

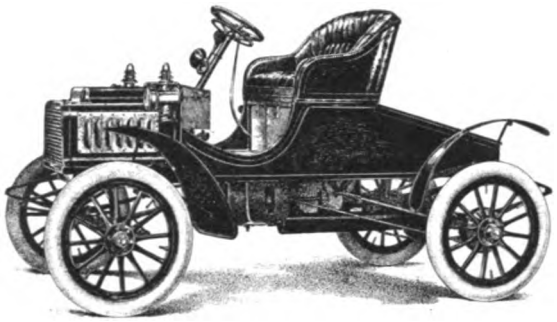
If the circumstances do not permit that the work shall be executed in our factory, this warranty is limited to the shipment, without charge, of the parts intended to replace those acknowledged to be defective.

It is, however, understood that we make no warranty whatever regarding pneumatic tires, coils or the batteries, complaints regarding which must be taken up with their respective makers.

We cannot accept any responsibility in connection with any of our motor cars when they have been altered or repaired outside of our factory.

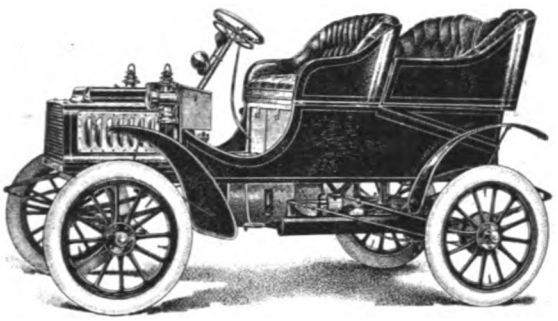
We are not responsible to the purchaser of our goods for any undertakings, promises or warranties made by our representatives beyond those expressed above.

TERMS.—All carriages are free on board cars at Kenosha, Wisconsin. When delivered to the railroad company they are ready for immediate use. Twenty-five per cent of the purchase price in current funds is required with an order and the balance at the time of shipment.



Carriages will be crated for an additional charge if desired, but under the prevailing tariff there are but very few points where this would effect any saving in the freight charges, and to all Eastern points the charge would be higher for a machine crated than if set up.

Our responsibility ceases when we deliver carriages to a railroad company and have its receipts for them in good order.



BRANCHES AND AGENCIES. — The branches are at No. 145 Columbus avenue, Boston; Nos. 302-304 Wabash avenue, Chicago, and No. 242 North Broad street, Philadelphia. The New York agency is at No. 134 West Thirty-eighth street, while representatives are to be found in substantially every other city in the United States.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, January 19, 1905. No. 17

GETS THE GARDEN

License Association Secures the Lease and Controls Show Situation in New York—Dates in January are Selected.

January 13-20 will be the dates of the 1906 automobile show in Madison Square Garden, New York. It will be confined to members of the Association of Licensed Automobile Manufacturers, and of makers of steam and electric vehicles, and doubtless of parts and accessories.

This is in the nature of confirming what the Motor World exclusively stated last week, i. e., that the A. L. A. M. had quietly negotiated for and had obtained an option on a lease of the Garden for a term of years. This lease, it is understood, was signed on Tuesday. It certainly was ratified at the general meeting of the Association of Licensed Automobile Manufacturers on that day. It covers a period of two years, with privilege of renewal for two years more. The lease is of an exclusive nature. It forbids any other display of automobiles of any kind by any one during the life of the contract. It is known that dates specified fall next year on the dates as here given.

While it is yet too early to talk of plans, it is certain that the license association aims to make the show a source, if not of profit, then of no expense to its members. The receipts will be equitably distributed.

It develops that the decision to secure an option on the lease of the Garden was definitely reached at a quiet meeting of the A. L. A. M. executive committee held in Buffalo last month. It was known that the meeting occurred, but that anything of such momentous importance had been discussed was not even suspected, although but a short time previous an officer of the organization, in discussing show matters, let fall a remark that, in the light of to-day, is seen to have been fraught with significance.

What move the N. A. A. M. or the independent trade will make in the direction of holding a show is problematical. It is said that in view of the termination of the "triple alliance" some members of the N. A. A. M came to New York with a new show plan well outlined—in fact, President White in his annual address plainly said so—but apparently the result of the annual election on Wednesday, at which it was shown that members of the A. L. A. M. were in such strength as to hold the whip hand, was sufficient to subdue any inclination that may have existed to consider such plans.

Pope to Return to Hartford.

The Pope Mfg. Co.'s headquarters are going back to Hartford. For several months the step has been under consideration, but the definite decision was reached only this week. The offices will, of course, be attached to the Hartford factory, and it is believed that again being in immediate touch with the manufacturing end of the business will facilitate matters in many respects. Hartford, as is well known, was the birthplace of the original Pope Mfg. Co., the New York offices being taken over at the time the new corporation of the same name purchased the effects of the late American Bicycle Co.

Fisk Promotes Two Managers.

At a meeting of the Fisk Rubber Co. on Thursday last, at Chicopee Falls, Mass., the following directors were elected: A. N. Mayo, H. T. Dunn, H. G. Fisk, Edward Pynchon, W. T. Baird, P. T. Jackson, Jr., and E. H. Broadwell.

At this meeting E. H. Broadwell, manager of the Detroit branch, was elected first vice-president, and Frank C. Riggs, manager of the Chicago depot, second vice-president. The other officers remain as heretofore, viz.: H. T. Dunn, president; H. G. Fisk, clerk, and A. N. Mayo, treasurer.

Miller to Invade Cleveland.

Charles E. Miller, the well known New York supply man, is about to invade Cleveland. He has made all necessary arrangements to establish a depot there. It will be the fourth in the Miller chain.

M. & W. Gets a Dunlop License.

Morgan & Wright have added a mechanically fastened tire to their line. It is of the perfected Dunlop type, being made under cover of that patent.

MET TO ADJOURN

Independent Makers Confer, but Fail to Take Definite Action—Reo Threatens to Sue A. L. A. M. for $500,000.

That the Motor World's great scoop of last week, reporting the pendency of the since consumated deal of the Association of Licensed Automobile Manufacturers for the lease of Madison Square Garden for show purposes, provided a sensation of the first magnitude is beyond doubt.

It was the first intimation that those outside of the ranks of the license association had that anything of the sort had even been dreamed possible. Several of them acknowledged being fairly stunned by the news. So sensational was the report that few of those who were in evidence at the show on Saturday were able to bring themselves to believe it. As the day wore on, however, the truth of it was confirmed; and on Monday evening it brought results in the form of a quiet meeting of some fifteen independent manufacturers at the Fifth Avenue Hotel. They had no particularly definite plan in view, but seemed of a mind that the conference might evolve something of mutual interest. The discussion developed that a general dissemination of the independent propaganda would be of value, and the talk was along that line. As most of those in attendance at the meeting did not, however, feel authorized to commit their companies to any policy, or to the expenditure of funds without consulting their directors, the meeting really availed nothing. T. B. Jeffery & Co., it is said, were not represented.

Probably the most interesting feature of the meeting was the appearance of R. M. Owens, sales manager of the Reo Motor Car Co., with his lawyer, who announced that he would this week institute proceedings against the Licensed Association of Automobile Manufacturers, or the responsible parties in the association, for $500,000 alleged damages. Owen has figured that the the Reo business has been damaged to that extent; but there are those—even among his friends—who con-

Digitized by Google

sider that he is taking the wrong tack. As one of them expressed it: "The Reo Motor Car Co. has little more than started, and, perforce, can have little or no business to have sustained damage." The man who held this opinion thought that a suit of this sort could have but one outcome, and that that would not be favorable to the independents' cause. If almost any one else took action of the sort, he said, it would have far more weight.

The Week's Incorporations.

Bath, N. Y.—The Kirkham Motor Co., under New York laws; capital, $25,000. Directors—C. B. Kirkham, C. A. Elias, W. L. Dolson, Bath.

Middleton, Conn.—Hubbard Motor Car Co., under Connecticut laws, with $100,000 capital, to manufacture engines for marine and stationary use.

Troy, N. Y.—Hudson River Motor Vehicle Co., under New York laws, with $3,000 capital. Incorporators—Sarah Leschau, William Cothell, Jessie Cothell.

New York, N. Y.—United Motor Car and Supply Co., under New York laws; capital, $25,000. Directors—E. D. York, Flushing; H. S. Byrne, F. N. Whitney, New York.

New York, N. Y.—Acme Motor Car Co., under New York laws, with $12,000 capital, to make automobiles. Incorporators—J. D. Maguire, R. L. Julian and G. H. Strout.

New York, N. Y.—Gotham Automobile Co., under New York laws, with $10,000 capital, to sell automobiles. Incorporators—H. A. Trimm, A. C. Thompson, S. W. Mathewson.

New York, N. Y.—International Observation Motor Car Co., under New York laws, with $200,000 capital. Directors—S. M. Fisher, E. G. Laureau and Charles S. Sinsheimer.

Middletown, Conn.—Simplicity Auto Co., under Connecticut laws, to manufacture motor vehicles. Incorporators—W. H. Kitto, A. S. Pollard, W. H. Chapman and Perry & T. W. Hale.

Will Cease Sunday Work.

The Cushman Motor Company, of Lincoln, Neb., has at last decided to do away with Sunday labor, and hereafter its employes will only be compelled to work six days a week. This change was decided upon at the annual business meeting of the company last week. The officials and directorate elected at the time are as follows: President, L. H. Cushman; vice-president, Everett B. Cushman; treasurer, S. H. Burnham; directors, L. S. Cushman, E. B. Cushman, L. W. Cushman, H. E. Cushman, J. W. Cushman, S. H. Burnham, George W. Bonnell and F. A. Mapes. W. E. Jackway succeeds A O. Taylor as manager.

Andrews is a Miss.

Few who see the name of A. M. Andrews, which appears on the letter heads of the new Reo Automobile Co., of Chicago, are aware that the Andrews concerned is a Miss Andrews. She figures as vice-president and secretary of the company, and is taking an active part in its management.

BENNETT THREW A BOMB

But They Wouldn't Let it Burst at the N. A. A. M. Meeting—Selden Men in Control.

What was expected to prove an animated gathering of the National Association of Automobile Manufacturers was held at the Victoria Hotel, New York, on Wednesday morning, the 18th. It was the occasion of the annual meeting, and the previous knowledge that two tickets were in the field, one practically representing the Association of Licensed Automobile Manufacturers, the other the independent manufacturers, led to the assumption that there would be "something doing" in the way of excitement.

As a matter of fact, the election itself was very one-sided, and what little there was done was dispatched in less than an hour. The only trace of excitement was apparent when George W. Bennett, of T. B. Jeffery & Co., boldly sought to introduce this caustic resolution bearing on the show situation:

"Resolved, That in view of the fact that a majority of the show committee of the national association have shown themselves to be unmindful of the best interests of this association, and unfaithful to the trust imposed in them, that they be and are hereby discharged."

In leading up to this resolution Mr. Bennett asked if the members of the N. A. A. M. show committee, two of whom are members of the A. L. A. M., had been cognizant of the purpose of the license association to secure a lease of Madison Square Garden for show purposes. President Windsor T. White, a manufacturer of steam vehicles, and hence in a position to view both charmers with equanimity, is a member of the N. A. A. M. show committee. He replied that he himself knew nothing of the movement leading up to the lease, and then promptly ruled Mr. Bennett's resolution out of order.

After this slight flurry the election of directors was proceeded to. The result, as stated, was one sided, the adherents of the Selden patent being elected by an overwhelming majority as follows: R. D. Chapin, Olds Motor Works, 28; S. T. Davis, jr., Locomobile Co., 27; Charles Clifton, George N. Pierce Co., 27; S. D. Waldron, Packard Motor Car Co., 27; L. H. Kittridge, Peerless Motor Car Co., 26.

The "independent" candidates polled the following votes: J. S. Bretz, Corbin Motor Vehicle Co., 12; Charles E. Duryea, Duryea Power Co., 10; J. E. Couzens, Ford Motor Co., 11; Thomas Hay, National Motor Vehicle Co., 11; E. R. Shurmer, Royal Motor Car Co., 11.

It was also announced that the executive committee had appropriated the sum of $500 to the good roads committee, of which R. D. Chapin is chairman. This money is to be used in furthering the Brownlow bill.

G. W. Bennett offered a resolution extending a vote of thanks to Percy Owen for the excellent entertainment afforded the association and its guests at the smoker given at the Waldorf-Astoria on Tuesday night.

The treasurer reported a balance on hand of $10,500.

The directors will meet on Saturday to choose officers for the 1905 term. In this connection it may be interesting to note that the directors of the National Association of Automobile Manufacturers now comprise twelve members of the Licensed Association of Automobile Manufacturers, two independents, one electric, and Windsor T. White, representing the steam interests.

President White's report was an interesting document. It, of course, reviewed the work of the year. During that time were held eleven meetings of the executive committee and one general meeting. The average attendance was fourteen. Nine active members were admitted, five left the ranks and eight associate members resigned, the latter to cast their lot with the Motor and Accessory Manufacturers, which, Mr. White stated, had been "formed with the approval and encouragement of your executive committee."

No new associate members have been admitted to the N. A. A. M. since August last, because it was believed to be to the best interests of the association that the parts and accessory people should flock by themselves.

During the year the membership committee continued the policy previously approved—that is, of declining to admit new applicants until they had been in business at least one year and were known to be reliable.

As the result of the formation of the Motor and Accessory Manufacturers, a joint conference committee had been appointed, resulting in some substantial advantages in the form of deferentials.

Mr. White remarked the failure to obtain a modification of freight rates, and reported that there was threatening an increase of Western classification, efforts to avoid which were being made.

He explained the action of the N. A. A. M. in deciding to test the legality of the license laws in the following language:

"The legality of requiring the automobile to be licensed by every State, county or township has been thoroughly considered. Your committee first discussed a plan to test the legality of such laws as require an automobilist who has secured a license in one State to take out another when he enters another State; in other words, your committee believes that one license which would cover all States would not be particularly oppressive. We were advised by counsel, however, that any law, if valid in one State, would be valid in another, and that there is no way of forcing one State to accept a license issued in another. Our counsel has prepared an opinion to the effect that it is not legal to require an automobilist to take out any license at all, and a committee has been appointed to prepare a test case, or, if necessary, as many as three test cases, in an endeavor to secure such a decision as will be binding upon the legislatures of all States.

Digitized by Google

Your executive committee, in deference to public opinion, has acted in this matter with great caution, but now that every State, county and township has taken it upon itself to demand a license, and in some cases to go so far as to prohibit the use of automobiles entirely, we feel that the interests of manufacturers demand aggressive action.

"Opponents of the automobile insist that licenses are necessary because of the accidents which occur upon the public highways. It is true that accidents are too common, but we maintain that they are due in no small measure to the condition of our roads, and that the proportion is steadily decreasing. The daily press, unfortunately, devotes three or four lines to an accident to a horse-drawn vehicle which results in the death of two or three persons, and gives a column to an automobile upset resulting in trifling bruises. One of our leading papers recently devoted eight inches of space to a record of the railroad accidents in 1903, yet this record, as officially reported by the Interstate Commerce Commission, showed that 11,006 people were likely and 80,673 were injured in one year. Here is a record of thirty deaths and 246 injuries every day in the year."

The result of the association's work in connection with the St. Louis Exposition, Mr. White reported, was one of its "greatest accomplishments."

That Mr. White himself had no previous knowledge of the intention of the Association of Licensed Automobile Manufacturers to secure a lease of Madison Square Garden was made evident by a reference to the show subject in his report.

"Your committee has under consideration," he said, "plans for the future which, it is hoped, will relieve the pressure and give to the members of this association a good deal more space than they have at present."

Body Builders Meet Tire Man's Offer.

With the idea, apparently of carrying the war into the enemies' camp, the Associated Body Builders of the Automobile Trade in France have met M. Michelin's offer of a cup to be given for the lightest touring body by offering a cup of their own. This cup will be given to the company for designing pneumatic tires which proved to be the best capable of sustaining the weight of a thoroughly reliable and satisfactory touring car.

The Michelin cup will be competed for every year, and will be decided by a committee appointed from committees of the A. C. F., the T. C. F., the Association Generale Automobile, the Chambre Syndicate de l'Automobile, and the Chambre Syndicate de Cycle et de l'Automobile. The regulations adopted and the style of vehicle selected will vary each year and will be announced by the first of March in each year. For the first competition, which will be held next spring, a 24 H. P. Chassis, with a body capable of providing commodious accommodation for six passengers, has been selected. The weight of the chassis and fittings will be deducted from the total weight of the car, thus giving the weight of the body.

M. & A. M. IN SHOW MATTERS

Retiring President Drops Hints and Makes Some Recommendations—New Officers Chosen.

To add to the much compounded interest that attends the existing show situation, it is not impossible that an exhibit wholly of parts and accessories may come to pass. The intimation was let fall by President D. J. Post, of the Motor and Accessory Manufacturers, at their annual meeting in the Hotel Astor on Friday evening last, 13th inst. It was contained in his annual report. After suggesting the desirability of permanent headquarters in New York, in charge of a salaried assistant secretary, Mr. Post said:

"I personally favor, first, a show alliance with manufacturers of complete vehicles, but, failing in that, I believe creditable, profitable and exclusive parts and accessories shows can be held by this organization."

He said that he conceded to manufacturers of automobiles a premier position, and the right to lead in show, as well as in all other matters of general interest to the industry; but he contended that, as representing the parts and accessories trade, the M. & A. M. was of next importance and should be so recognized.

President Post's report also seemed to intimate that in the event of again participating in national shows, it might be the intention of the M. & A. M. to do so in the role of a "partner." In fact, he used this exact term, adding that the partnership would provide the necessary funds for maintaining suitable permanent offices and render an increase in dues, which he was "tempted to recommend," unnecessary.

In connection with the suggested New York office, he thought that a credit bureau could be conducted to good advantage. The establishment of the office, he said, would relieve the officers of all detail work and result in much good to the organization generally.

Mr. Post also recommended the question of an associate membership, to be composed of jobbers, or those who were termed "combination jobbers and manufacturers," and also trade journals.

He recounted the effective work of the association in securing for its members a fair and equitable division of show space. "Nothing," he said, "better showed the effect of organized effort."

Although the meeting was held at an inopportune time, very many of the members being at Madison Square Garden putting the finishing touches to their exhibits, a representative number was in attendance. Probably the most important work of the meeting was the decision to accept the report of the committee on incorporation, of which W. S. Gorton was chairman. The committee recommended that the organization be incorporated under the laws of Connecticut, which recommendation was adopted.

Mr. Gorton moved also that hereafter the annual meeting be held in the City of New York, during the third week in January of each year, and that an additional meeting be held at such time and place as may be determined by the directors. This also was agreed upon.

Two new members were elected—C. T. Ham Mfg. Co., Rochester, N. Y., and the Chicago Battery Co., Chicago, Ill.

The nominating committee presented twelve names for selection as directors. Of the number the following seven were elected: H. T. Dunn, Fisk Rubber Co., Chicopee Falls, Mass.; P. S. Steenstrus, Hyatt Roller Bearing Co., Harrison, N. J.; Clarence E. Whitney, Whitney Mfg Co., Hartford, Conn.; George L. Weiss, Cleveland Car Specialty Co., Cleveland, O.; William Gray, Gray & Davis, Amesbury, Mass.; H. S. White, Shelby Steel Tube Co., Pittsfield, Mass.; J. W. Gilson, Hartford Rubber Works, Hartford, Conn.; D. J. Post, Veeder Mfg. Co., Hartford; M. H. Moffett, National Carbon Co., Cleveland, and C. S. Mott, Weston-Mott Co., Utica, N. Y.

Later, at the meeting of the new directors, the following officers were chosen for the ensuing year: President, H. W. Chapin, Syracuse, N. Y.; first vice-president, H. E. Raymond, Akron, O.; second vice-president, George L. Weiss, Cleveland, O.; third vice-president, C. E. Whitney, Hartford, Conn.; treasurer, W. H. Gorton, Cleveland, O.; secretary, J. W. Gilson, Hartford, Conn.

Fire Came Near to Columbias.

What might have developed into a disastrous conflagration in the Electric Vehicle Co.'s plant at Hartford, Conn., one afternon last week was quickly put out by the firemen employed in the building. The workmen on the third floor were hurrying some work, when one of the men ran around the room with a lighted plumber's torch, and as the place was filled with paint and varnish the gasolene in the blower started a blaze. The damage amounted to about $300.

Will Make Electrics Later.

For the present the Tritt Electrical Co., of South Bend, which was incorporated last week with a capital of $100,000, will confine itself to the manufacture of electrical specialties. Later it is its purpose to include in its productions electric vehicles and electrical automobile supplies generally. The officers of the company are B. E. Tritt, president; D. M. Calvert, vice-president; W. B. Pershing, secretary, and C. M. Kreighbaum, treasurer.

Maxwell Seeks Foreign Trade.

The Maxwell-Briscoe Co., through Richard Irvin & Co., New York, are making an active bid for foreign trade. One of their representatives, I. C. Kirkham, is now in London planning the first stage of the campaign.

To Sell Yales in Chicago.

The Yale Automobile Co. is the style of a new concern just formed in Chicago. It will handle the Yale car exclusively. W. W. Tarr is its chief sponsor. A salesroom is now being sought.

Baker Doubles Capital.

The Baker Motor Vehicle Co., of Cleveland, has doubled its capital stock, from $200,000 to $400,000.

A POINTER TO AGENTS.

THE

PIERCE-RACINE

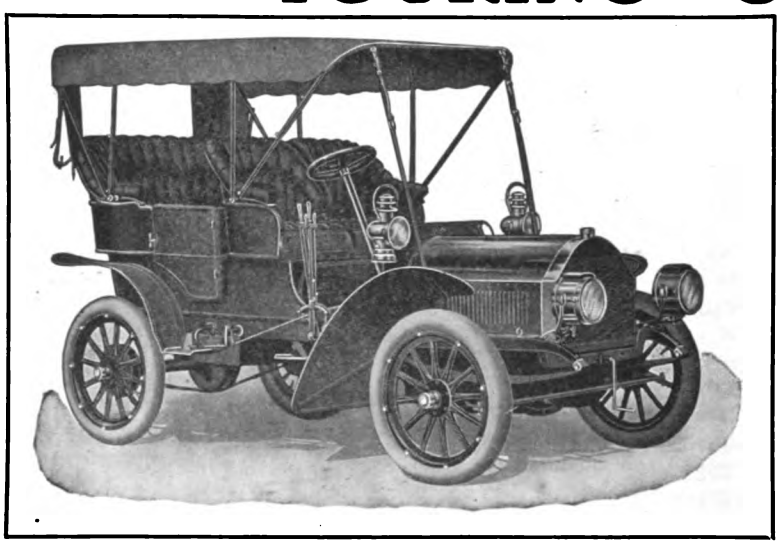
Embodying, as it does, all that 19 years' experience as gas engine builders suggests, coupled with an intelligent study of present-day demands, has proved a mighty attractive proposition.

Model B-2.
Price, $1250.

Looks Good, and is as Good as it Looks.

Here are a Few Features:

Vertical motors with mechanically-operated valves. Single-lever control. Three-speed transmission, with flexible connection to motor. Carburetter absolutely automatic and reliable under all conditions. Perfect cooling and lubrication systems. Long wheel base and full elliptic springs. Side-door entrance.



These constitute a hint of the wealth of goodness found in the **Pierce-Racine.** We invite correspondence from reliable agents, to whom we'll gladly furnish detailed description.

PIERCE ENGINE CO., 1161 Clark Street, Racine, Wis.

STEVENS-DURYEA

New 20-Horse Power, 4-Cylinder **TOURING CAR** *Model R.*

It is universally conceded that the STEVENS-DURYEA Runabout (Model L) is in a class by itself. Therefore, be sure to investigate the claims we make for our latest notable offering. ASK YOUR AGENT.

Great Strength.
High Power.
Light Weight.
Eminently suitable to the requirements of the tourist,
Send for detailed descriptive matter, illustrating Models L and R.

Leading Features: Aluminum Body—Side Entrance Tonneau—Capacity, 5 Persons. Pressed Steel Frame—Three Speeds and Reverse—Three Brakes—Four Individual Cylinders—Bevel Gear Drive—Water Cooling—Standard Equipment—Weight, 1650 Pounds.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, JANUARY 19, 1905.

Beware of the Boom!

Undoubtedly they mean well, but the men who have begun to talk and write of "the arrival of the automobile boom" are unintentionally doing the industry more harm than good. "Boom" suggests inflation, and "inflation" carries with it suggestions of future collapse. A boom would be about the worst thing that could visit the industry, and the men who can head it off when it comes in sight will be the trade's best friends. What is wanted is a slow, strong, steady growth that will endure and be well and deeply rooted. Booms and talk of booms simply create false impressions, and cause fools to rush in where angels fear to tread; disaster always follows in their train.

Now in the Front Rank.

If the show demonstrates anything, it demonstrates effectively that the American car no longer requires odds of the cars of foreign build. There still remain those inclined to assume that the foreign cars are superior, but close questioning does not evoke a single sound reason. Nor can the skeptic who is questioned, as a rule, specify in what particular points the foreign car excels the American article.

It looks as though there were no question about it; it seems clear and well defined that the domestic car fills the wants of this country, with its climatic conditions and bad roads, better than the imported car. There is a long list of American cars that run just as smoothly, just as noiselessly and endure as well as any foreign car. Moreover, it is a fact that the American car is simpler, easier to operate, easier to care for and easier to repair. In fact, as far as one can find out, the foreign car is in the repair department more often than the American car. All admit that it is exceedingly speedy and runs wonderfully while it is running.

There is one feature where the foreigner is probably in advance. That is in the selection of materials which enter the car. He has been willing to take the time to do it. His customer has been willing to pay the price that is necessary to get the best material, and the careful and painstaking French mechanic has made good use of the special alloys now in the market and of the special methods of heat treating familiar to those skilled in the art.

There is a long list, as stated, of American cars that have no startling features about the way their motors are arranged and assembled; but their motors, their transmission and the whole make-up of the chassis show careful consideration, and have resulted in a well balanced, thoroughly practical car.

Of course, these remarks apply to the class of cars having four cylinders as a rule, which is about all that can be compared with the foreign cars, as the foreigners exhibit nothing else. Some of this class of American cars follow closely the lines of the foreign built car, except that in nearly every instance they are simpler. For example, the Haynes, the Pierce, the Cleveland, the Royal Tourist, the Locomobile, the National, the Apperson, the Peerless, the Packard, the Autocar, the Pope-Toledo, the Columbia, the Lozier and the Thomas. There is no question but that these cars behave as well under our conditions as any car in the world. When price is considered, there is two and three times the value in the American car that there is in the imported car; indeed, it is fair to say that the domestic industry has reached that point when the purchase of a foreign car may be said to be merely an indulgence—the indulgence of wealth.

It gives the very wealthy a chance to have something that his neighbors cannot possess—that vicious spirit of rivalry which exists in the society of our big cities to a marked extent.

The show demonstrates that there is actually no sound reason why any American should purchase a foreign built car, unless he wants a special one, and then, it may be added, if he would pay the American manufacturer as much as he pays the foreign one it could be obtained right here. It would be odd indeed if the American designers and mechanics, who evolved and produced so much of the machinery that has made the foreign car possible, could not, when they apply themselves to the task, best produce the wares the machinery was designed to produce.

There is a class of cars at the show which cannot be compared with foreign cars because Europe holds nothing with which they may be compared. These cars fill a want in the United States that is tremendous. The numerical sales of the medium and low priced car are away in excess of the high priced. The volume of business in dollars and cents is even greater. The relatively small American car offers greater value for the money than is offered in any other country on the globe, and in this class are such wonderfully successful cars as the Olds, the Rambler, the Cadillac, the Ford, the Knox and the Buick.

These machines are seen everywhere—they are reaching into all the markets of the world. They are understood by every repair man. The care of them is reduced to a minimum. Their mechanism has been simplified to the extreme limit. They can be operated by any one with average intelligence.

If too much is not required of them and an attempt is not made to get them to do what a high powered, high priced car will do, they will meet all expectations and every call of the man of moderate means.

Stability of the Industry.

For an infant industry, born and brought up in less than a decade, nurtured by bigoted prejudice on the part of those blind to its importance and world-revolutionizing mission, and struggling and kicking against its own

Digitized by Google

numerous shortcomings as well as active outside opposition, the automobile youngster, as shown in the full strength of its early youth at Madison Square Garden this week, is entitled to crow long and loud. It has taken its place among the industrial powers—not like those others of the same appellation, deriving its life from water and wind and fostered by silver lubricated channels of legislation, but upon a solid foundation of its own erection, laid through experience and based upon healthy competition. Millions of capital and thousands of operatives but inadequately describe the tremendous interests now depending solely on the automobile as their raison d'etre, and, were such a thing possible, its sudden fall would bring about an economic disturbance but little short of a widespread panic.

As yet in the very first flush of its young days, it has assumed proportions which but presage its growth in years to come, and to predict the extent of this would be to attempt the impossible. And it is a matter for great congratulation on the part of all concerned that its advance to the present stage has not been of the mushroom order, liable to be swept away overnight, but on a basis regulated more by the economic safety valve of popular demand than the average industry which has been made, put on its feet and climbed skyward on a rocket in a few years.

Overcapitalization was greatly feared two years ago, and the number of concerns rushing into the business of building cars threatened to flood the market with cheap and worthless automobiles and involve themselves and others in bankruptcy. At the time this loomed on the horizon as an evil of no mean proportions, and while it did not disturb prominent interests to any noticeable extent, there was a natural feeling of unrest, coupled with a desire not to have the industry come in for any unwelcome publicity, such as would be brought about by the failure of a number of such concerns at one time. But the "survival of the fittest" has taken care of this influx, and there are many sadder and wiser people to-day who have come to a realization of the fact that a serviceable car cannot be built for a song, and that a cheap and flimsy affair is not saleable to a paying extent at any price.

There are others, in addition, who started in to do large things in the shape of $3,000 and $5,000 cars that were going to make their builders' fortunes, such was the attraction the industry held for capital, but they have come and gone, and none the wiser but themselves. Five thousand dollars seems a great sum of money to the average man to put into an automobile, and the popular impression is that a very large slice of the price stands for profit pure and simple; but the gentlemen in question found it was not so, to their cost.

The industry still holds out a powerful magnet to capital looking for paying as well as conservative investment, but the get-rich-quick investors are bound to be disappointed in more ways than one. There is still plenty of room for legitimate expansion, but not for the boomer, whose only object is to squeeze out all there is in it during the short time he thinks things will last, and then stands from under, letting the other fellow pay the freight. But the automobile industry, although only an infant of five shows, is in it to stay.

The Ignition Problem.

Seemingly too little attention is being paid to the matter of improvement where the application of electricity to the gasolene car is concerned. True enough, it forms a very small part of the motive power, and is usually the last item to be applied; probably this is the moving cause of its being also at the tail end of consideration by many, but the part it plays is so large as to overshadow almost everything else but the carburetter problem, and in the matter of vexatious mysteries both may be classed together.

It is safe to say that of all the problems confronting the builder of motor cars, this has in the past few years probably come in for less serious consideration at his hands than any one other; due no doubt, to the fact that a reasonable measure of success had been attained, and as anything better involved a greater expenditure, a halt has been called at this intermediate step and many have gone no further. It has proved itself "good enough," at any rate, and certainly "sufficient unto the day," etc., "so what's the use of bothering about it further." Hence the matter of improvement along this line has been left entirely in the hands of those who live by it—the makers of batteries, generators and similar apparatus, and the car builder is now usually only too willing to let his customer take his choice. Both the high tension magneto with synchronous distribution, and the low tension type for make and break spark—forming as close an approach to self-contained simplicity as has yet been evolved—have been old stories abroad for some time past, but the instances in which they have been taken up here could be enumerated on the fingers of one hand last year, and probably the two would yet suffice to cover all.

COMING EVENTS.

Jan. 11-24—New York, Importers' Show, Macy's Dry Goods Store, top floor.

Jan. 14-21—New York, National Show, Madison Square Garden.

Jan. 19—New York, Superintendents' and Engineers' Branch of the Association of Licensed Automobile Manufacturers, meeting.

Jan. 23-28—Ormond-Daytona, Fla., third annual speed carnival.

Jan. 23-28—Philadelphia, Automobile Show.

Feb. 4-11—Chicago, National Show, Coliseum.

Feb. 13-18—Detroit, Automobile Show.

Feb. 20-25—Cleveland, Automobile Show, Gray's Armory.

Feb. 27-March 4—Toronto, Automobile Show.

March 6-11—Buffalo, Automobile Show, Convention Hall.

March 13-18—Boston, Automobile Show, Mechanics' Hall.

March 13-18—Boston, Importers' Show, Symphony Hall.

March 27-April 5—Washington, Automobile Show.

One very good reason for this lies in the fact that until quite recently there was not a magneto produced in this country that merited the name, and the imported ones not only had the disadvantage of being very high-priced, but, in the opinion of many who saw them, the distributing apparatus too closely resembled the interior of a watch—"too much jewelry in the box," was the usual verdict, and consequently they did not find favor except in isolated instances.

There is every reason to believe that had this exceedingly important part of the motive power received the amount of attention that has been devoted to the problems of transmission, carburretion and similar knotty ones by the leading lights of the industry during the past few years, it would be in a much more advanced state to-day. The fact that these authorities are, in the majority of instances, better versed in things mechanical than electrical, and that the intricacies of alternating current generation have not been gone into very deeply by them, may account for this in part, while the further fact that no surplus of highly skilled talent of this order is in evidence among the manufacturers of accessories is doubtless responsible for the remainder. But all things will come in time, and trips of several thousand miles without ignition troubles show that much may be accomplished with the imperfect apparatus now available.

A. C. A. AT THE WALDORF

The Mayor and Sir Thomas Dewar the Guests of Honor—Both Speak in Happy Vein.

"One touch of automobiliousness makes the whole world kin." This was the opening flash of that Chauncey Depew of the automobile world, Winthrop E. Scarritt, as he took the chair at the annual banquet of the Automobile Club of America at the Waldorf-Astoria on Tuesday evening last.

The sally tickled the risibilities of the two hundred prosperous and well groomed men who fringed the tables, and, as one of them afterward laughingly said, "That one witticism was sufficient to obtain for Mr. Scarritt forgiveness for the setpiece which he has so often delivered, that one beginning: 'The curiosities of to-day are the commonplaces of to-morrow,' and so forth."

As toastmaster Mr. Scarritt was in good form, and performed the offices in his usual graceful fashion. The two guests of honor, Mayor George B. McClellan and Sir Thomas Dewar, the latter in particular, shared laurels with the toastmaster.

Sir Thomas is a witty speaker, and adept at turning deft compliments, and is no "slouch" as a gentle satirist. In the course of a bristling speech he said that he looked to America for a tire that would not burst, a carburetter that will be reliable and a chauffeur that will work when his master is not looking. He admitted that he had been surprised at the progress shown in automobile construction in this country, and turned a pretty compliment by stating that he trusted the industry would continue to flourish, if for no other than the selfish reason that England expects to eventually find here the best to be had in automobile manufacture.

Mayor McClellan informed his hearers that he was present in a dual capacity, one to enforce the law and one to obey the law.

"The motor car," he added, "has surely come to stay, and no longer is the once familiar cry of 'get a horse' heard when one travels in the eastern part of the city. Indeed, it is possible to go almost anywhere now, and only be stoned occasionally. You still have your oppressors, and as a bit of interesting information, let me say right here that a few days ago I received a petition from a very respectable body of taxpayers, begging that they might have better police service as a protection against burglars and motor cars."

This pointed reference to the agitation against motor vehicles by the West End Association evoked sallies of laughter.

"What the motor car industry really needs," continued the Mayor, 'is an engine that is cheap, simple and strong. By hard experience I know the difficulty of securing all of these attributes, but I know that American ingenuity will eventually succeed in giving us the ideal motor car."

Referring to the speed laws, Mayor McClellan said that if changes were desirable [illegible] nobile members were the men to obtain proper concessions, but that as long as the present law was on the statute books he would do all in his power to enforce it.

The banquet, which took place in the Astor Gallery, was presided over by Harlan W. Whipple, president of the organization, and among others at the speakers' table were Winthrop E. Scarritt, first president of the Automobile Association of America; Dave H. Morris, president of the Automobile Club of America; Sir Thomas Dewar, John Farson, president of the Chicago Automobile Club; Judge W. H. Hotchkiss, president of the Buffalo Automobile Club; Elliot C. Lee, president of the Massachusetts Automobile Club; Dr. W. E. Milbank, president of the Albany Automobile Club; W. C. Temple, president of the Pittsburg Automobile Club; Asa Goddard, president of the Worcester Automobile Club; E. Schriver Reese, president of the Cleveland Automobile Club; Dr. Julian A. Chase, president of the Rhode Island Automobile Club; W. L. Brown, president of the Syracuse Automobile Club; Alfred Wilmarth, president of the Long Island Automobile Club; H. S. Woodward, president of the Rochester Automobile Club; F. E. Constans, president of the Brockton, Mass., Automobile Club; G. F. Farrington, president of the Automobile Club of New Jersey, and Windsor T. White, president of the National Association of Automobile Manufacturers.

Addresses also were made by Messrs. Morris, Temple, Hotchkiss and others.

When Show Business Was Forgot.

Among the minor functions attendant on the New York show was the E. Schwartzkopf breakfast on Sunday and the dinner of the New York Motor Club at the Hotel Astor on the same evening. Sir Thomas Dewar was the most conspicuous guest and speaker on both occasions.

Schwartzkopf publishes an alleged automobile daily during the week of the show, and, it is said, gave the breakfast in order to ease his conscience. Chief among those invited to attend were those who have advertising or influence to dispense, but a number of newspaper men and a few club officials were included in the gathering to leaven the mass.

The dinner of the New York Motor Club was in the nature of a reception to Sir Thomas Dewar, who was induced to present a cup and to come to this country by a fellow countryman, who originated the club in question and who seems to be acting as a sort of trustee and press agent for Sir Thomas.

The N. A. A. M. smoker on Tuesday night was a huge, well attended and well ordered affair. The talent provided was good, ditto the tobacco, ditto the edibles, ditto the management, of which Percy Owen was the life.

Law to Confine Cars to Cities.

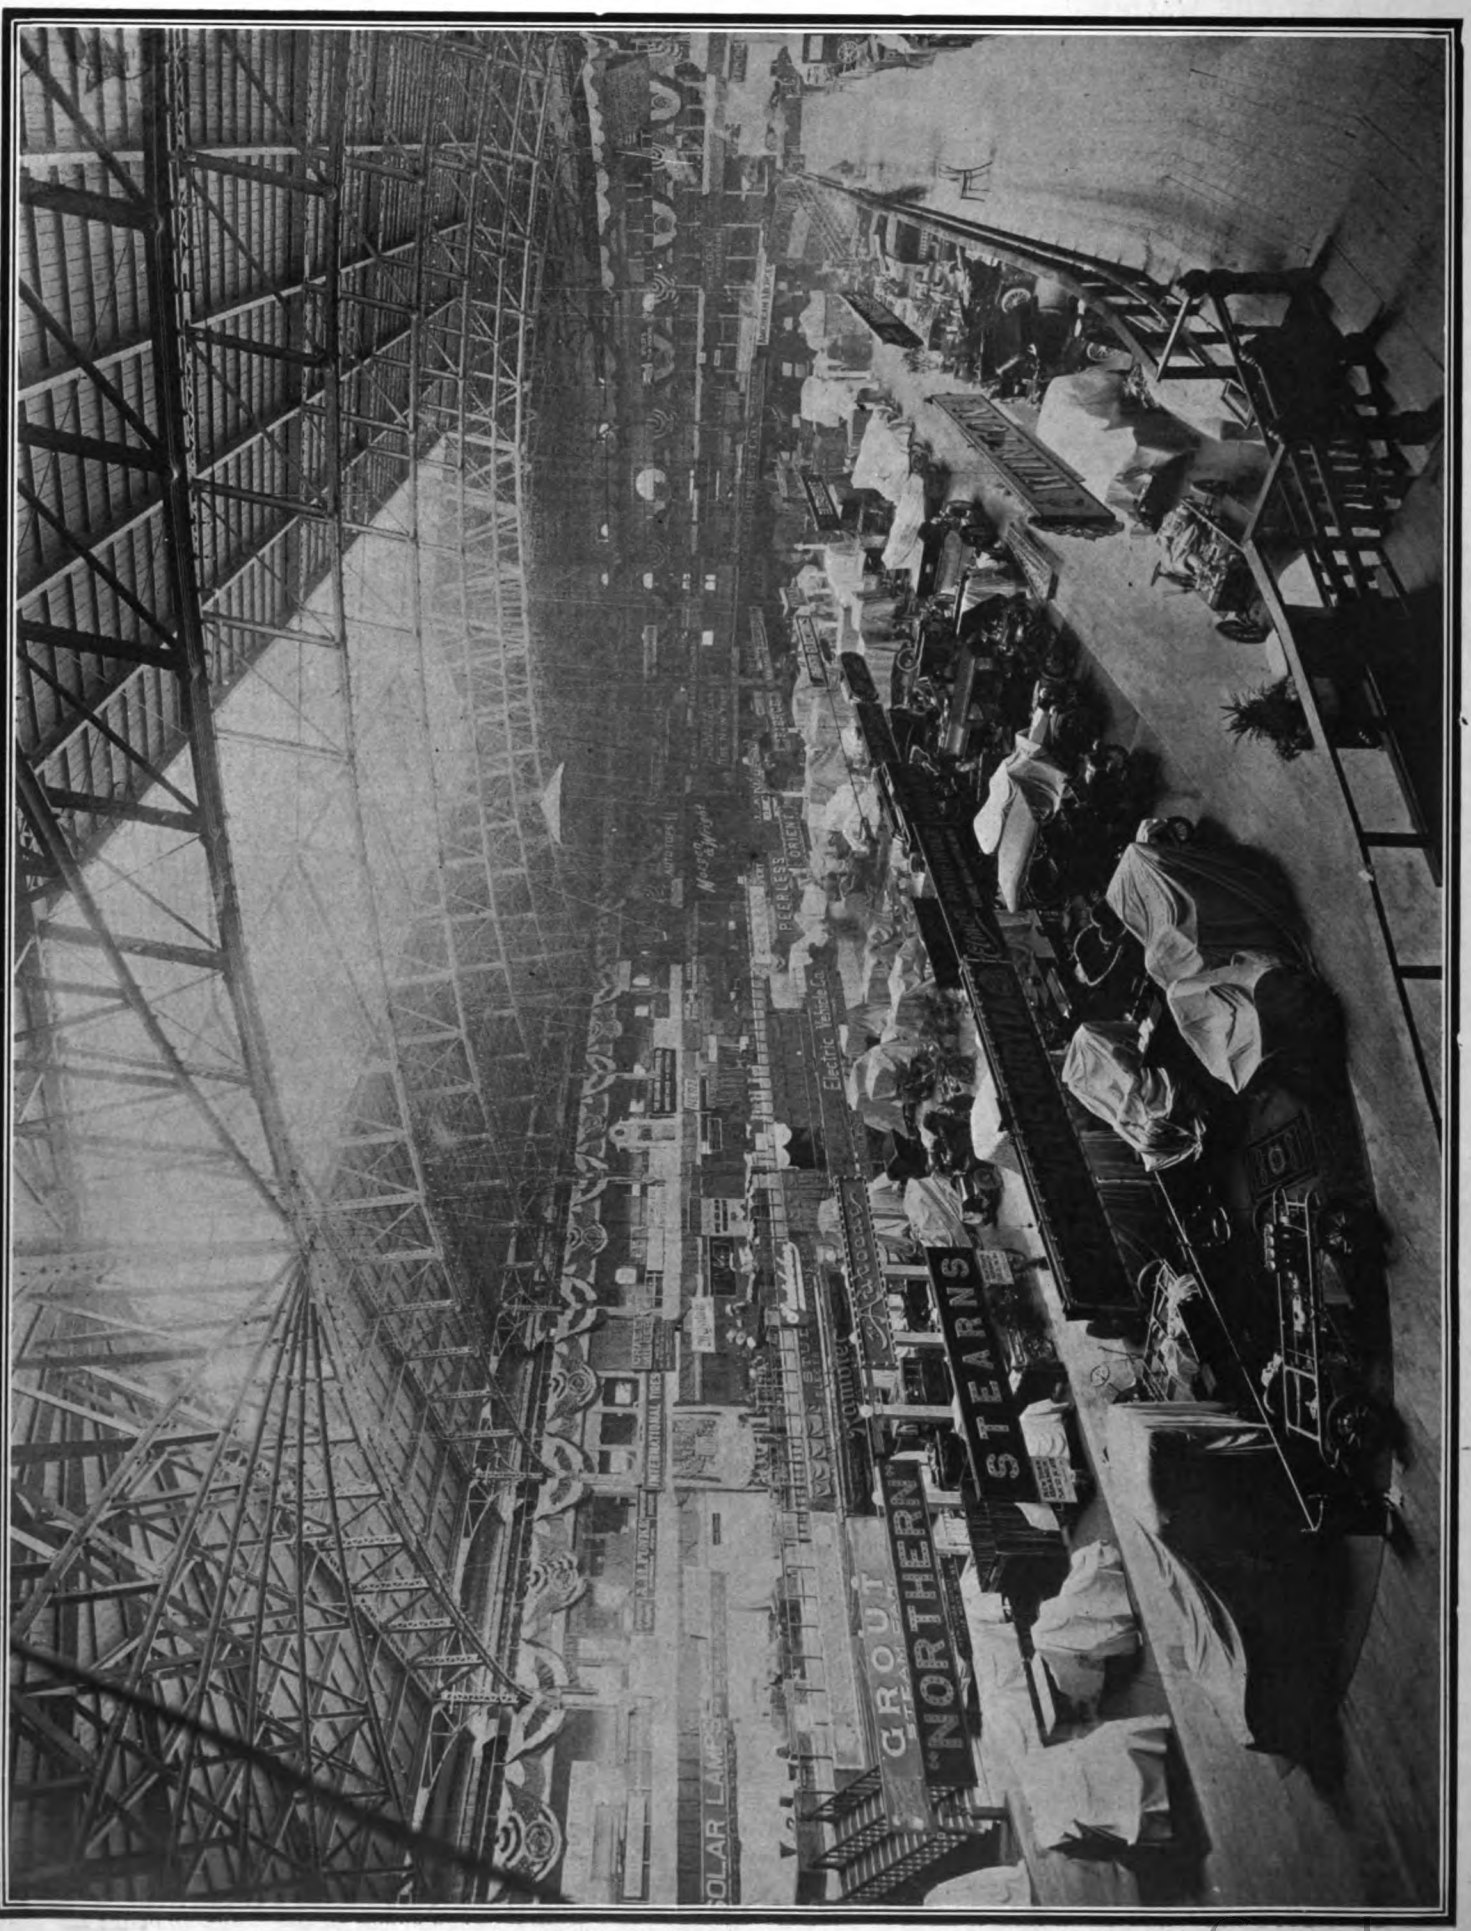
Senator Jetton, of the Tennessee Legislature, has made his bid for fame. Among several fool bills that have been introduced into that body is one, of which he is the proud sponsor, limiting the use of automobiles to cities of nine thousand inhabitants and over.

A. A. A. IN BUSY SESSION

Officers Elected and Much Good Work Performed —Temple Now Head of Racing Committee.

Harlan W. Whipple's re-election as president, the appointment of W. C. Temple, of Pittsburg, as chairman of the racing committee in place of A. R. Pardington, who because of not being in sympathy with the president declined re-nomination, and the rejection of all intermediate mile records made during 1904 were the important actions at the annual meeting of the American Automobile Association and its directors, held on Tuesday last, 16th inst., in New York.

There was no opposition to the regular ticket, and all the officers that will serve in 1905 held the same positions last year. It was reported at the meeting that forty-one clubs now belong to the A. A. A., with a total membership of 4,000. There are also 200 individual members.



The old racing board reported that they had decided to reject the intermediate miles made by Oldfield, Kiser and others last year, and that the accepted mile figure is 5[illegible] seconds, made by Oldfield at Los Angeles December 21. They recommended to the new board that no intermediate mile times be accepted in the future. Oldfield's records of three miles in 2 min. 39 4-5 sec., of nine miles in 8 min. 4 sec. and fifty miles in 1 hour, 12 min. 40 3-5 sec. were accepted. The 100-mile record made by E. H. R. Green's chauffeur, Oliver Savin, at Dallas, Tex. was recommended for acceptance by the old board.

Mr. Temple's associates on the racing committee for 1905 will be W. K. Vanderbilt, Jr., T. M. Hillyard and George Isham Scott of New York; H. L. Bowden and William Wallace, of Boston; George L. Weiss, of Cleveland; F. C. Donald, of Chicago; R. L. Lippitt, of Providence; E. H. R. Green, of Dallas, Tex. Technical advisers, A. L. Riker, E. T. Birdsall and Roland White.

The officers elected were: President, Harlan W. Whipple, Automobile Club of America and Automobile Club of New Jersey; first vice-president, John Farson, Chicago Automobile Club; second vice-president, Judge William H. Hotchkiss, president of the New York State Association of Automobile Clubs; third vice-president, Dr. Millbank Johnson, Los Angeles, Cal., Automobile Club; secretary, C. H. Gillette, Automobile Club of America; treasurer, George E. Farrington, president of the Automobile Club of New Jersey; directors, Elliott C. Lee, Massachusetts Automobile Club; William C. Temple, Pittsburg Automobile Club; Dave H. Morris, Automobile Club of America; A. R. Pardington, Long Island Automobile Club; R. L. Lippett, Rhode Island Automobile Club; Windsor T. White, Cleveland Automobile Club; E. M. Steck, Florida East Coast Automobile Association.

Albert R. Shattuck was appointed chairman of the good roads committee, Augustus R. Post chairman of the touring committee and James B. Dill chairman of the law committeee.

GENERAL VIEW OF THE SHOW IN MADISON SQUARE GARDEN.

Digitized by Google

Show Marks Start of a New Era.

Giant Strides the American Industry Has Made Clearly Shown and its Product Proved the Peer of Any in the World—Success of Show Unbounded from the Beginning—All Attendance Records Broken.

Although they may never meet again—that is, in the promotion of a show, they, that is, the "triple alliance," are certainly going out in a blaze of glory.

It is the third show under the auspices of the "triple alliance"—the National Association of Automobile Manufacturers, the Automobile Club of America and the Madison Square Garden Co.—and the force of the whirligigs of time, men and patents requires that it be "three times and out," and that it is a case of "It may be for years, and it may be forever," so far as very many of the exhibitors at the present show being again gathered under the roof of Madison Square Garden, the sensationally altered show situation strongly suggests.

That the show which opened on Saturday night is by far and in every way superior to all those that have gone before admits of no possible argument. It is not only the best show and the largest one, but the brightest and busiest. The demand for space forecasted a bustling state of affairs, but it is safe to say that comparatively few conceived that the exhibition would attain such dimensions or arouse such intense interest—for intense interest is the word that best describes the situation.

The attendance on the part of both trade and public has been astonishingly large—all previous records have been knocked to smithereens. At night, so crowded are the aisles that progress is almost impossible. There is nothing left for the spectator to do but float with the human tide that surges up one aisle, down the other and back again. In the morning hours, given over to the trade people only, the crowd is almost as dense, although not a few of the manufacturers who are exhibiting have very largely or wholly disposed of their outputs, and many of the dealers who are in evidence have fully arranged their lines for the season about to open. It appears almost that every mother's son of them felt it a bounden duty to attend the show. If a roll of the trade, both manufacturers and retailers, could be called, it would probably be found easier to enumerate those who are absent than those who are present.

The volume of business transacted is in keeping with the attendance. It is quite the busiest public function of the kind that can be conceived.

Summary of Vehicles on Exhibition.

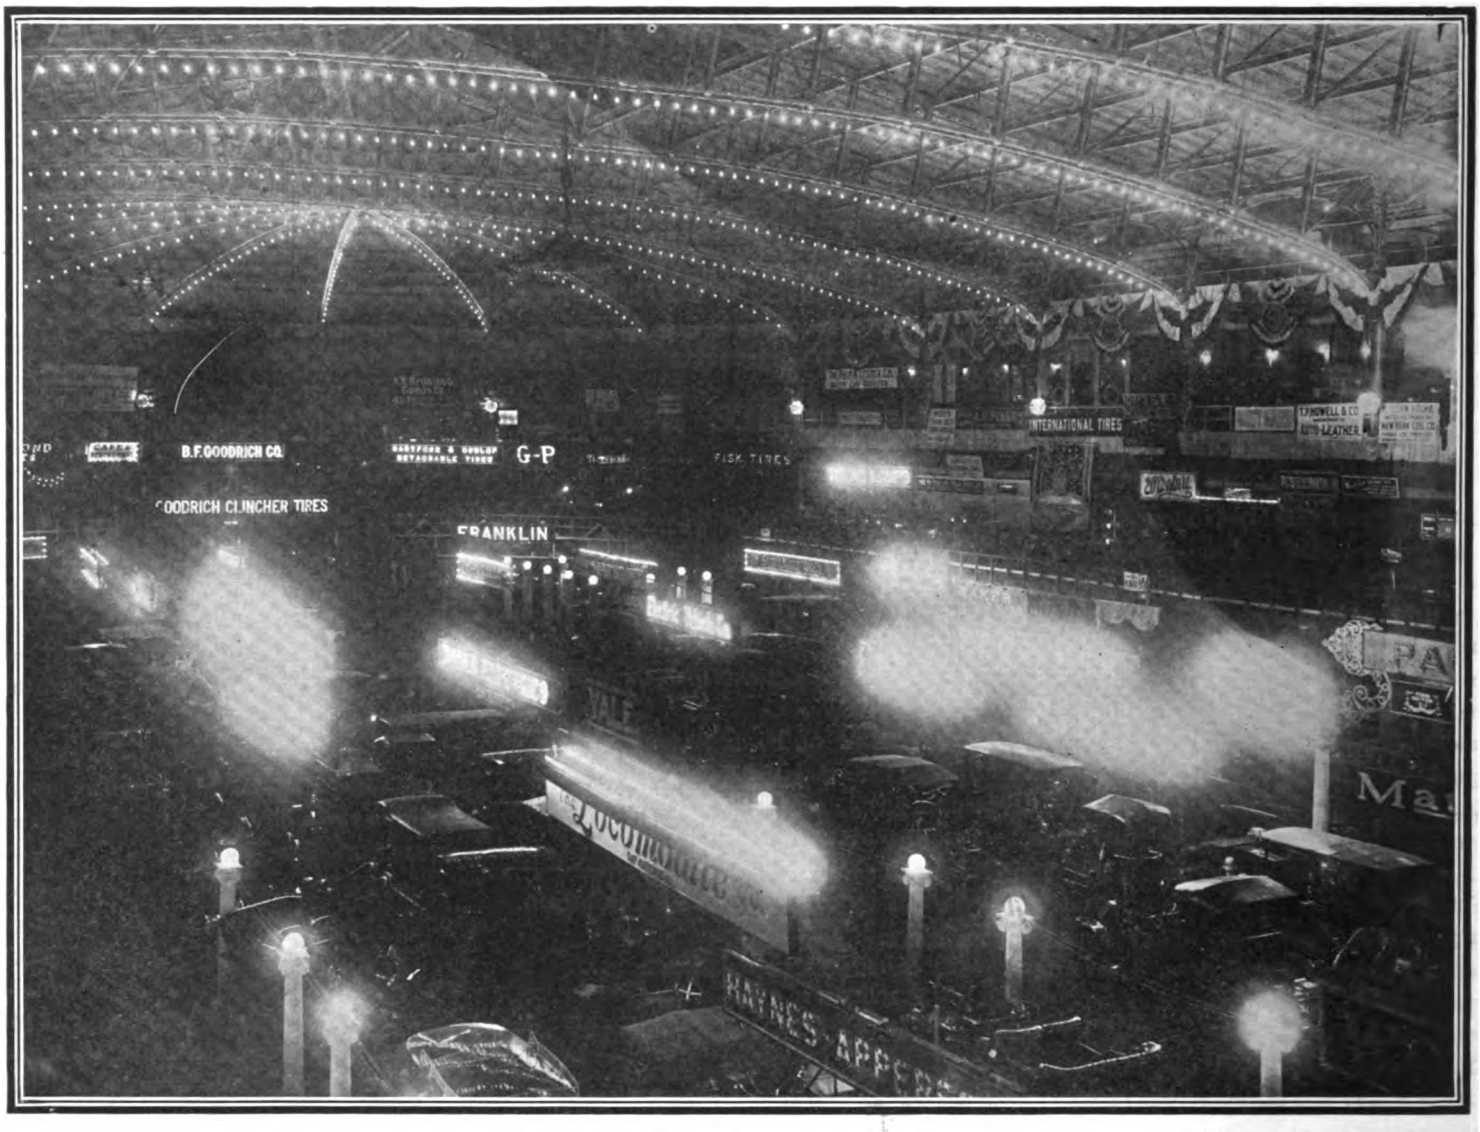
Four cylinders	96
Three cylinders	5
Two cylinders	50
One cylinder	125
Total	177
Steam	4
Electric	31
Total cars	212
Chassis	40
Motor bicycles	21

In general appearance this show does not differ radically from its predecessors. The demand for space required that individual exhibits be smaller than in the past, and for this reason the booths are unduly congested. The manner in which some of the exhibitors were able to find room for the number of cars they display must have necessitated much study of angles and much use of tape measures.

Due to the rule forbidding the use of platforms or railings, the shows in Madison Square Garden have never been rightly termed picturesque. That wealth of decoration and elaboration of signs which make the foreign shows so pleasing to the eye have been absent. This year, however, a few of the exhibitors stretched the letter of the regulation and "defied the lightning," and a touch of the ornate is the result.

T. B. Jeffery & Co. are showing their Ramblers in a space which stands out like a "house afire," because of the white and gold pillars surmounted by opaque globes that mark it.

The Packard display also is marked by pillars, shorter and of more generous proportions that those of Jeffrey & Co., and these, too, are surmounted by globes.



At the Ford booth, the ends of golden scroll work rest on tall pillars, and the top of the sign is surmounted by a silvered eagle, perched in quiet rather than defiant attitude.

The beauty or picturesqueness that the show holds is apparent at night. It is then at its best. For the first time the exhibitors generally have had recourse to electric signs, and the effect is such that the light studded dome of the Garden itself is hardly necessary. The signs are of every size, shape and hue.

At one end of the Garden the Edison people have spelled out, in lights of red and gold, the virtue of electric vehicles, and the fact that they themselves supply current for such conveyances. At the other end the B. F. Goodrich Co. fling their name to the public in blazing letters of heroic size. In its well known script, the Electric Vehicle Co., in red lights, spells "Columbia." Pierce spells his name in white globes, the familiar arrow which pierces the name being fashioned in red lights.

Around the title "Orient," lights, which are alternately flashing red and green, revolve unceasingly. The name "Mitchell," in flaming green script, is suspended in midair. The Pope and Winton signs are bordered with electric embroidery of white globes. Olds, Royal, Northern, Peerless, Packard, Corbin, Baker, in fact nearly all of the ex-

Digitized by Google

NIGHT VIEW OF THE SHOW AT THE GARDEN.

hibitors on the main floor, employ electric signs.

On the elevated platform, whereon all of the better known tire and accessory manufacturers are neighborly located, there is also a wealth of electric light. "Diamond tires" are spelled in green globes. The "G. & J. Tire Co.," in the style of lettering made familiar by this concern, spell their name in white. The same is true of Hartford and Dunlops, while the "Fisk tires" is fashioned in red lights. Morgan & Wright, apart from their neighbors at one corner of the platform, have arranged their name in italic letters of distinctiveness and of heroic size. The name rests on a background of dark maroon, and no eye can escape it.

By comparison with the exhibits of cars and other wares, these tire booths are distinctly restful. None is congested with the wares made by the respective manufacturers. There are simply a few tires for demonstration purposes, a few pieces of office furniture, a carpeted floor, a velvet background, and they are all sufficient. There is plenty of agreeable elbow room and breathing space.

Such familiar names as "Solar" and "Veeder" likewise blaze out, and up aloft, where the many and sundry are gathered in the galleries, there also are electric signs, not so large nor so handsome as those which shine below them, but they are electric signs just the same.

In the restaurant there is another blaze of light, and in the rather forbidding and low ceilinged basement, called for politeness sake exhibition hall, such brightness is also to be found; indeed, as has been suggested, it is easily and literally the brightest automobile show that has ever been held, on this side of the water at least. Here and there is a potted palm, but these are not numerous.

Crowds and color, however, are merely the frames of the picture. The cars, of course, constitute "the thing," and the promise of them given by advance information amply is borne out.

The show is, as the Motor World styled it last week, a show of American achievement. The fact is evident to all. It marks the beginning of the end of the imported car. The American manufacturers who conceived and designed much, if not most, of the machinery that enabled the foreigners to produce the cars that have been the world's standard of excellence have proven that, as they made the machinery, so also they can turn it to the same advantage in producing the wares they are fashioned to produce. Evidence of this is on every side. The improving hands have been strong, and as skilful as they are strong. It is not contended, of course, that those American cars which sell for $1,000 or $2,000 are the peers of the foreign cars which sell for three, four or five times as much (a mistaken idea that is possessed by all too many), and that is flung back to the hurt of the industry, but at equal prices, or even for less money, no American need be ashamed of the product of his country or hesitate to make a selection from the diversity that is offered him.

This remark or opinion is so general that it no longer excites argument, and the truth of it is admitted even by some of those who have been inculcated with the germ of foreign superiority. Even the snob whom the Motor World quoted last week, who defended his purchase of a foreign car on the ground that he "did not purchase his clothes in Bax-

Digitized by Google

ter street," has placed his order for an American vehicle.

One of these small, but not unexpected instances, that show how great is the advance that has been made occurred at the exhibit of the Manufacturers' Foundry Co., of Waterbury, Conn.

Displayed on the stand are two specimens of American cylinders cut sectionally. Among the many who stopped to inspect them was a Teutonic appearing individual, who evinced more than ordinary interest. This interest finally induced him to bring out a pair of calipers, with which both cylinder sections were carefully measured.

"A clever idea, that of displaying a German Mercedes cylinder alongside the American article," remarked the Teuton, whose accent betrayed his origin, as he put away his calipers, and hastened to add that he had been once connected with the Mercedes factory in Germany.

"But neither of them is a German cylinder," said Manager Beach of the Foundry company, to whom the German's remark was addressed. "They were both made in our foundry in Waterbury."

"Remarkable! Remarkable!" was the Teuton's response. But he quickly sought to cover his tracks. "They look like the Mercedes product, but, of course, Americans never will be able to make cylinders equal to ours," he retorted. "You will always have to import them, the same as the makers of the American Mercedes have done in attempting to reproduce the German car. The cylinders in the American Mercedes show that they are the imported article."

"But they are nothing of the sort," responded Beach. "They were made in our foundry in Waterbury."

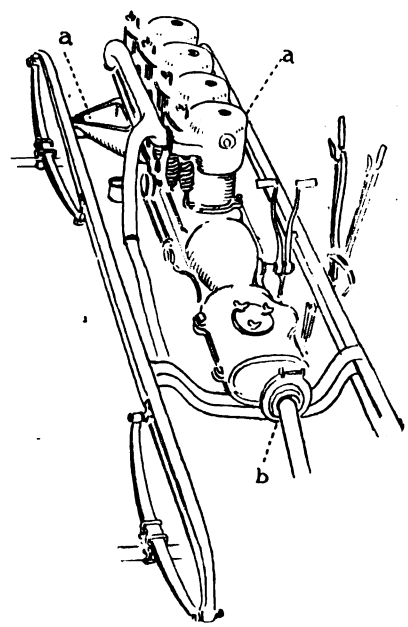
"W-hat!" ejaculated the astonished German. "It is remarkable—remarkable!" was all he could say.

This is but one little instance of many that serve to show how great is the extent of American achievement and how thoroughly the American industry is coming into its own.

Up to Wednesday night it is estimated that the attendance has been fully 40 per cent. greater than last year.

The Show from the Viewpoint of the Engineer.

By HENRY SOUTHER.



To the observer familiar with mechanical matters relating to automobile construction the New York show of 1905 furnishes much food for thought.

It shows the wonderful power of the American mechanic to evolve a piece of machinery from a crude, ill-proportioned machine to a finished and well-proportioned one.

By proportions, the general external appearance of the car is not referred to. It is the proportioning of the mechanical details in relation to each other; the size of the axles as compared with the loads they must carry; the proportions of the steering gear, the rods, the pivots, the steering arms and all that. Wonderful advances have been made, and well balanced machines in this respect are almost universal. Tremendous advances ever since the New York-Pittsburg endurance run of last summer are evident.

There are one or two instances in which it looks as though the designer had crowded all the metal he possibly could into some parts of the mechanism, many of them being extremely large for the work they must perform and the complication of arrangement being something wonderful to look at. However, these one or two cars are the exception, and may almost be classed as freaks.

The American mechanic has not been slow in following the Frenchman with his beautifully polished exhibition chassis. The idea of the American in years past has been to show what he has to sell, and not what he can do in the way of polishing and finishing a machine for show purposes only. The public has forced the American, however, to build just such uncommercial machines, because the public is easily deceived by fine finish, and believes that a company which can make the most handsome exhibit along these lines is necessarily the company which will make the best finished stock product. Consequently the number of exhibition chassis shown is very large, their quality very high and the cleverness used in showing the construction is of a very high order. Sections of carburetters, clutches, transmission, engine

Stevens-Duryea Transmission.

valves showing operations are in evidence. If the ordinary observer uses his time to advantage he will learn much from such sectional exhibits about how an automobile really operates, while the motorist himself may even learn so much that he will understand his car better the coming season and get better results out of it because he does know more. In other words, the show is of great educational value, and its value because of this should not be underestimated.

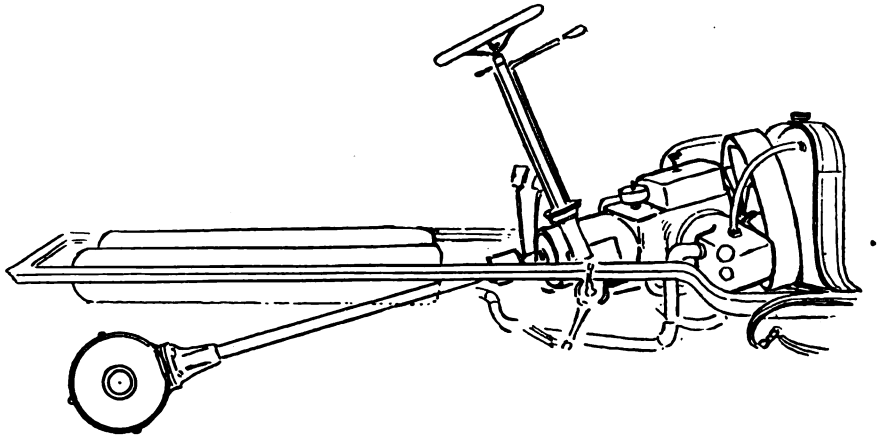
Another thing evident to the skilled observer is the potency of what may be termed fashion—that certain fashionable design that seems to be acceptable to the buying public at this time in the way of motors, arrangement of engine, transmission and other vital parts.

In a way this prevailing fashion is a bad thing. An engineer may have the best reason in the world for departing from this design. He might be able to increase the efficiency of his motor, cut down fuel consumption and get many other advantages if the commercial end would allow him to. But commercial end says, "We cannot allow you to do this; we could not sell the cars. The public has got its mind set on certain prevailing designs, and would not buy any piece of mechanism that did not have, approximately, the recognized exterior form and dimensions."

Marked examples of departure from the accepted arrangement are seen in the four cylinder Stevens-Duryea. Its flywheel is at the front end of its engine, consequently the clutch arrangement, transmission and whole train of mechanical parts from engine to bevel gears are absolutely different.

The Peerless, in the shape of its cylinders, position of inlet and exhaust valves, also has departed from what may be termed the "fashionable."

In these instances their designers have real reasons for these changes. It remains to be seen whether the public will accept radical departures and buy as readily as it will buy the old accepted forms.



ENGINE LOCATION.

Engines are found in nearly every available place on the chassis, a single cylinder and a double cylinder opposed under the body, or two cylinder opposed under the hood at right angles to the body, the four cylinder vertical

Digitized by Google

across the body under the hood and in line with the body under the hood, and the two cylinder vertical under the bood, across and in line with the body.

In the Northern two cylinder opposed car high up, because the entire engine is above the frame, under the hood is found the most marked example of bringing the crank shaft into such a position that it points directly at

Arrangement of Northern Motor and Driving Mechanism.

the rear axle, requiring no motion in the universal joint in the propeller shaft at all. The fly-wheel on this engine is at its front end, quite above the frame. The flywheel is very large in diameter, and the spokes are in the shape of a fan. The crank shaft carries at its rear end, and in contact with its engine case, the transmission gearing, which is of a modified planetary type. This system gives only two speeds ahead and one reverse, but it is exceedingly simple and strong. The Northern engine is supported at its two cylinders on top of the frame and at its third point of suspension at the rear of the transmission case.

In the Stevens-Duryea four cylinder car is a most striking departure from ordinary practice in the location and form of the engine, the clutch and transmission gears. In the first place, the flywheel is at the front end of the crank shaft. The engine is supported by a frame engaging with the side members of the chassis. It stands in a vertical position quite like others, but its crank case, its clutch case and its transmission gearing case are continuous, supported at one point only, at the rear end of the whole system. This gives the three point suspension, a most desirable feature, and a neat appearance to the whole arrangement.

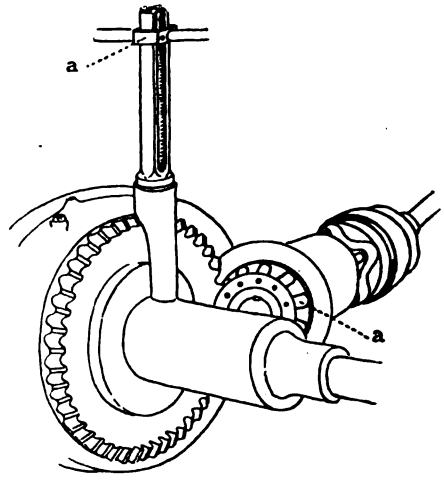
GOVERNORS.

Discussion with the engineers of the various manufacturers shows widely varying difference of opinion in the matter of governors for large cars. Some are perfectly confident that a governor that will prevent the car from "racing" when suddenly released from its load is an absolute necessity. Others are of the opposite opinion, that a governor is an unnecessary complication, and that there is no trouble going to arise from the absence of a governor of any kind, that when the clutch is opened and the engine released from its load the throttle lever may be returned to the desirable point so that the engine may run slow. Such prominent makers as the Pope-Toledo people and the Pierce-Arrow are radically opposed in this respect, the Pope-Toledo having abandoned the governor, believing it to be of no use, while the Pierce-Arrow retains it and depends upon it.

The types of governors are many where they exist. There is the mechanical ball governor, flying out under spring tension, some of them adjusted at the factory once and for all at a certain speed, others having variable springs, so that the operator may vary the spring tension from the seat and set his car at a slow or rapid speed. This seems to be a most desirable feature. The Winton car depends upon its air governor. When the machine begins to race the air pressure in the system prevents the valves from opening and slows the engine. The Cadillac circulates oil, working against a piston controlling the throttle in the carburettter. When the engine begins to run fast the oil cannot bypass fast enough, pressing on the pistons and closing the throttle. If the car is running along with the governor set and meets an obstruction or hill the oil pressure is diminished, the throttle opens and the car maintains its even speed.

Several builders show cars without governors, but with a device which prevents "racing" of the engine when the clutch is released. This safeguard is brought about by a lever working from the clutch lever to the throttle. When the clutch is opened it automatically closes the throttle to a certain desirable point. This does away with all danger of "racing" as a result of the opening of the clutch.

There is no doubt but that a skilled operator can run a car without a governor, but it is also certain that there is one more thing for the operator to think about when he is busy thinking about other things. There are times when an operator's hands and feet are rather busy meeting an emergency. At such a time if he has his clutch open for only the smallest part of a minute the engine increases its speed without the governor to a dangerous extent, whereas if there were one, a governor would prevent it.



TRANSMISSION.

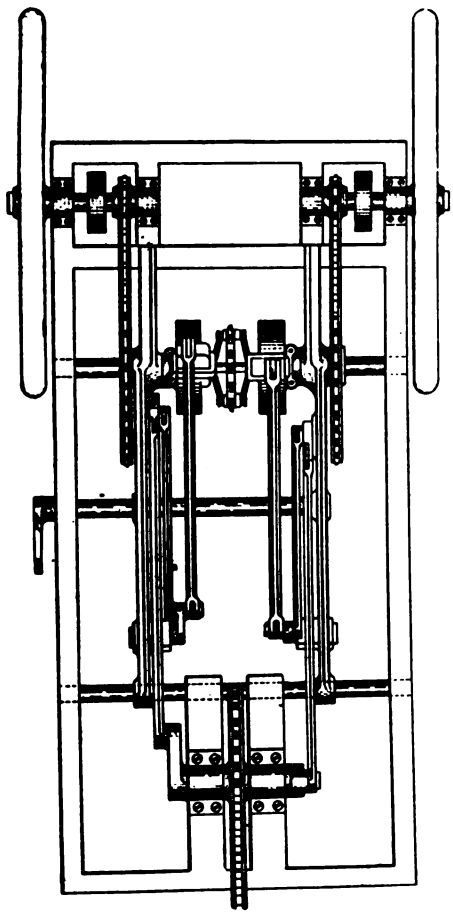
On the large cars by all means the greater proportion of them drive at high speed direct, without any gears in the driving train working, except the bevel gears. The counter shaft in the transmission case may be idle or may not, either system giving perfect satisfaction. About the only exception to the sliding gear transmission is the Winton and the Cadillac—that is, in the large cars. The Winton uses its old type of cone clutches, individual clutches being used for all speed changes; it is to be added that it is very cleverly worked out.

The Cadillac people have done a daring thing in using the planetary system for their four cylinder 25—30 horsepower car, with three speeds forward and a reverse. They have certainly gone in the right direction in using tremendously large dimensions. This will lead to success, if anything will, in this system and in transmitting so much power.

The Knox people on their large cars also still retain the planetary system. It runs in heavy grease, and all noise is thus eliminated.

There seem to be no radical changes in the sliding gear transmission. Generous gears and dimensions are the rule. Carefully hardened gears are universal, and the result will undoubtedly be even more satisfactory than in the past. Perfectly operating clutches have made the sliding gear a very satisfactory mechanism.

Haynes Roller Drive.



In the four cylinder Haynes is found a transmission which is apparently a sliding gear, but which differs from all others in that all the gears are absolutely idle when the car is on high speed and driving direct. Not only are they idle, but they are without motion. This is accomplished by a patented device and by means of ratchets, which work automatically and the pawls of which engage only when called upon to do so by the shifting of the gears.

A novelty in the way of drives is shown in the Haynes-Apperson exhibit. To all external appearances it is a bevel gear, but, in fact, it is one of the oldest forms of gearing in history, or rather a modern adaptation of it. The large gear resembles a sprocket with the teeth turned over sidewise, so that they en-

Digitized by Google

gage with a pinion which consists of two flanges carrying hardened rollers between them. The action is very much like that of a roller chain, except that the chain is wrapped tightly around the pinion and bears upon the sprocket teeth direct. This set of gears transmits the power from the 35—40 horsepower four cylinder Haynes-Apperson engine successfully, quietly and with good endurance. It goes without saying that it runs in a bath of oil.

Up in the gallery, in an obscure corner, is found a working model of the Custead transmission, which is something distinctly new. By means of connecting rods from a main engine shaft motion is transmitted to regular locomotive links. By means of a lever

Custead Variable Transmission.

these links are thrown into long or short strokes. On these links are grips which engage with pulleys, not by means of a ratchet, but by a form of ratchet clutch. These pulleys are on the same shaft with a sprocket or sprockets, which transmit the power to the wheels in the ordinary way. The speed may be from the slowest possible visible motion to anything within the limits of the strength of the mechanism. Reversing is simple and instantaneous. It looks as though, with proper handling and careful development as to dimensions and materials, this new system might be worked up into something valuable. It is well worth the inspection from all skilled mechanics; the layman would not understand it.

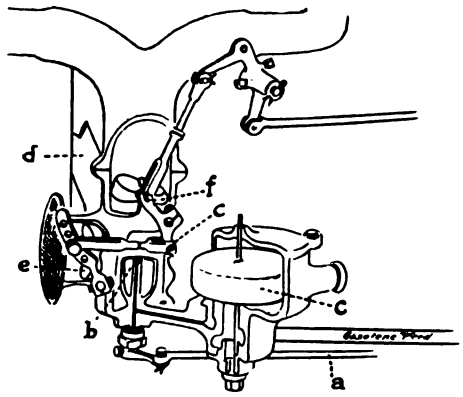
Outside the specifications there is nothing startling in the way of the main drive for the car.

The two chain type is probably most evident for heavy cars. The bevel gear is a great favorite with medium weight cars, and finds some users among the heavy weights. The simple single chain drive is on all the runabouts, almost without exception. It naturally finds a place here because of low cost and simplicity. The roller chain is in almost universal use, and the block type is difficult to find and is in use on few cars, if any.

While it may not be startling, it is of no small importance and worthy of remark that some of the prominent makers have been clever enough to introduce the highest class of heat treated nickel steel into the shafts of their transmission gears. They have realized the fearful strains that come upon the parts, and know that even with the best of dimensions and design failures can take place. It is usually through the ignorance of carelessness of a driver, and at such a time, with the full power on, the engine running at full speed and a quickly engaged clutch puts the whole strain suddenly onto the shafts.

CARBURETTERS.

It looks as though the automatic carburetter that takes care of itself at high speeds, low speeds, under heavy hill climbing conditions and under every other condition, has about reached its limit. The carburetter may be found that will operate fairly well under all these conditions, but no carburetter can be at its best under all of them. A driver of a car ought to be in a position to be able to adjust his carburetter so as to meet extreme conditions and variations.



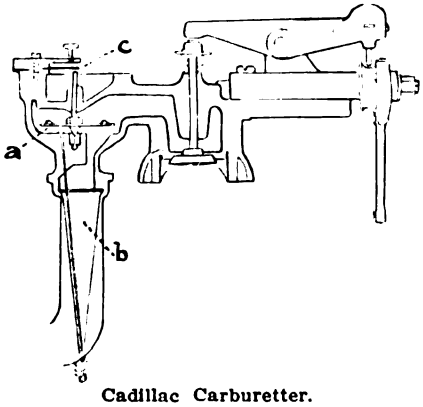
The water circulation about the carburetter is not very much in evidence, which shows good sense on the part of the designers in not adding a complication, which is of very questionable benefit. Instead, hot air is being conducted to the jet of many of the cars, and it is right in principle.

The Columbia carburetter of the Electric Vehicle Co., here illustrated, is a direct departure from the automatic principle. A lever on the dash, A, permits the variation of the size of the jet, B, admitting gasolene to the carburetter from the float chamber, C. This puts it in the power of the operator to give a rich mixture at comparatively low engine speeds and a weaker mixture at high speeds. With intelligent use, the gasolene consumption can be minimized. It also had an additional advantage in that when the motor is being allowed to stop a rich mixture can be left in the cylinders, so that the self-starting properties of the motor are greatly improved.

All the engineers appear to realize the tremendous importance of the carburetter as related to the performance of their cars, and the questions of size of the air inlets, the amount of vacuum produced about the gasolene jet, so that the suction will be correct at all times, is plainly receiving its meed of attention.

All realize the necessity of getting more air into the mixture at high speeds than at low speeds, and do it by various mechanisms. Some allow increased suction at the time the engine is at high speed to draw from an extra inlet against spring tension. Some accomplish the same object by a rubber diapraghm. Another class gives additional air by connecting an auxiliary air inlet with the throttle lever.

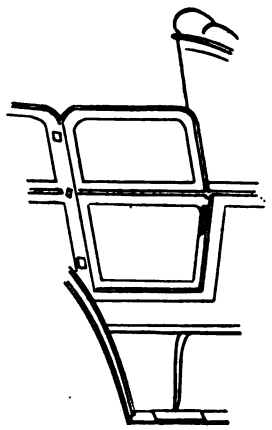
The makers do not hesitate to exhibit and explain their carburetters, because they realize perfectly that mere inspection of this important part will not reveal the secret of its success. It would be a clever man, indeed, that by mere observation could appreciate



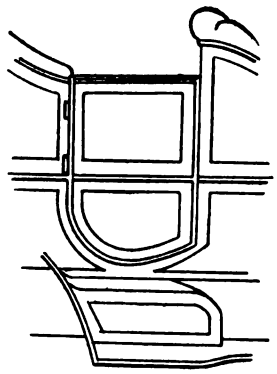
Columbia Carburetter.

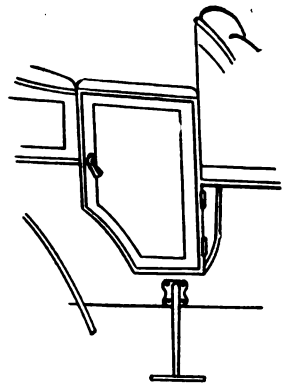
the essential points underlying the secret of success in any given carburetter. It must be tried, used on an engine under all conditions and carefully studied.

The carburetter presents the great problem of the day to the automobile engineer.

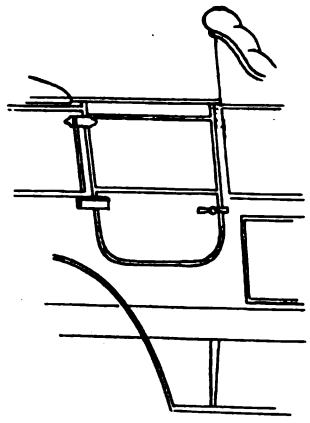


This Columbia carburetter is cut away so that the operation of it may be very easily studied. It takes its hot air in starting from the exhaust pipes through the tube, D, but the moment the governor comes into operation it opens an additional air supply, E, which is not hot. The amount of the mixture entering the engine is under the full control of the operator on the wheel, and the throttle valve, F, and air valve, E, bear a fixed relation to each other, and are adjustable, so that the best mixture may be arrived at.





Cadillac Carburetter.



Probably the simplest carburetter in evidence is that shown on the single cylinder Cadillac. It consists merely of a very light copper disc, A, which is lifted by the suction of the engine, allowing gasolene to drop. If the engine is running slowly, it drops onto a wire gauze cone, B, and is picked up slowly by the inrush of air. If the car is running fast, there is more suction, the copper

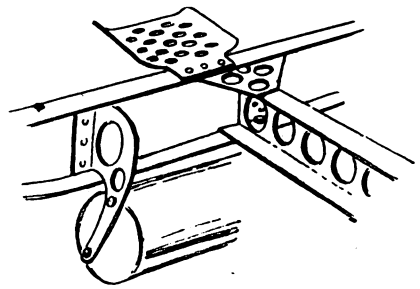
disc is lifted up higher, admits more gasolene, and the air picks it up as it drops. Under extreme conditions of speed, the disc, B, or, rather the stem on it, comes up and in contact with the spring C, the tension of which can be varied. On the four cylinder model the same carburetter is employed, but with the auiliary inlet shown by the accompanying illustration. The well known power of the Cadillac car with this carburetter is a sure proof that, even as simple as it is, it is effective.

The Haynes carburettter is rather different from the others in the fact that the gasolene flows from the float chamber, and, instead of rising through a jet and coming in contact with the air, as most of them do, it passes downward, over a cone, the air meeting it, mixing with it in the mixing chamber and passing into the engine. It is also notable because of its regulation. With an increased amount of air admitted by the air valve, which is controlled by the hand on the wheel, comes an increase in the amount of gasolene—that is, the size of the jet is increased simultaneously with the admission of a greater amount of air. The proportions of increase have been very carefully worked out through a term of years, and with great success.

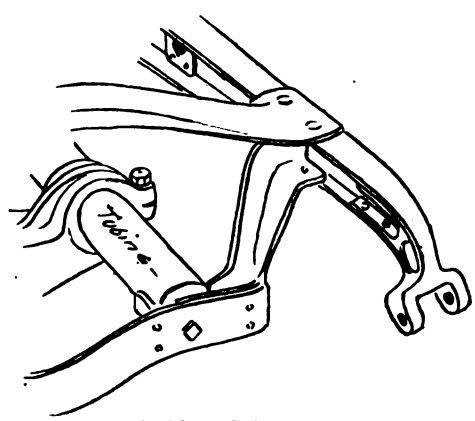


The construction of all steel frame predominates throughout the exhibition. It has been worked down to a fine science, and beautiful proportions are in evidence as far as is possible with an all steel frame of the type now in vogue. Some, notably the Packard, have gone so far as to lighten their cross members and gusset plates by cutting holes in them. This is a step in the right direction, as useless metal is removed.

A great many of the frames are drawn in opposite the engine, so that there need be no sub-frame, short cast members supporting the engine base and engaging directly with the side member of the frame. At this same portion of the frame several prominent makers have adhered to the sheet steel pan, which supports the engine and attaches it to the frame. This is successful construction when enough intelligence has been put into the study of the proper weight of metal to do the work and, also, to make the engine itself self-sustaining so that it depends upon the supporting structure for none of its strength.

As usual, striking innovations appear in the Cadillac, the construction of which is something original and departs almost entirely from old methods. This is seen in the polished chassis, in the tubular sub-frame supported at the front end by an elliptical truss, which is unquestionably very stiff and strong. From this truss, toward the rear, run very large seamless tubes, which carry the engine and transmission. Their whole frame is of generous proportions and shows intelligent thought.

One or two fairly good examples of the composite frame are in evidence, the best one being that of the Autocar. This is going along the right lines, the pressed steel side members taking the form of a channel to which all cross members of the frame of light sheet steel are attached. The side bars are nicely reinforced on the outside by rectangular wooden side members. The construction is neat and, without doubt, very strong, stiff and resilient. With this frame there certainly need be no fear of permanent bending; the side members of wood would insure against that.



There is one instance of composite structure for part of the length of the side members, where the wood extends throughout the part of the frame upon which come the greatest strains. This is another step in the right

Packard Frame Members Showing Cutaway.

direction, and if intelligently used may prove to be the best solution of the problem. It is apparent that much care has been used in having close contact between the wood and the steel at all points. This is essential to get the best results from composite structure.

The truss frame has disappeared from one prominent make of car. Inquiry reveals the fact that it proved to be too stiff, and, consequently, caused failure in some other parts of the frame where the strains centred. This might not have been easy to foresee, but it is very interesting. It is not at all certain that a truss cannot be applied, however, that will properly distribute the load and strains, but without any danger to any other part of the structure and without being too stiff. This points again to the fact that wood is the natural stiffener for frames.

Cadillac Sub-Frame.

The inverted "U" frame is seen in its highest development in the Pope-Toledo. It is tied together at frequent intervals, making practically what is a box girder, except that the lower side is open. This type is fine from a structural engineering standpoint, but has some disadvantages in the attachment of the cross members and parts.

The angle iron frame is still in evidence, almost exclusively on the small cars. Of course, the frame in these cars is of minor importance, because it is comparatively short; many are composite.

One car has practically no frame at all, the front and rear axle being connected by a cylindrical structure containing all the transmission, and propeller shaft. The body rests upon springs fore and aft. The main side timbers of the body are strong and do all the work ordinarily done by the frame.

The materials composing the all-steel frame are still of a most ordinary grade. No attempt has been made yet to furnish high-class sheet steel for this purpose. It must be made, and undoubtedly will be made during the coming season. Nickel steel frames, heat treated, will give something double the stiffness of the present material, and yet be tough enough at that. Judging from the hardness of some of the French racing car frames, it is apparent that they have done something along these lines, just what has not been investigated. The time has arrived for our manufacturers to take up some of these finer details, which will go to make up a perfect car—light and strong.

TORSION STRUTS.

Few ordinary observers at the show realize the problem presented to the engineer in taking care of the violent twisting strain that comes upon the car in connection with bevel gear drive. When the power is applied the rear axle tries to rotate. Something must be interposed to prevent it.

A large variety of these devices are in use, and in one or two cars, in the Autocar and the Northern, for example, they are transmitted through the springs, which are made heavy and of special design for the purpose. Struts, where they exist, take many different forms. One that seems to be increasing in favor is a tube inclosing the propeller shaft. It serves as a casing for the shaft and its moving parts, and also as a torsion rod. These rods usually engage somewhere in the neighborhood of the transmission box, attached to the frame in that locality, or even to the box itself, and cushioned by springs or buffers.

One exception to this form is that shown by the Haynes people, where the torsion rod passes vertically to a part of the frame and telescoping in it. This makes a very short, very rigid rod.

BEARINGS.

The so-called "anti-friction" bearing is creeping to the front slowly and surely. There was a time when it was sidetracked in favor of plain journals. Now it is found in the shape of plain rollers, tapered rollers and balls, and with bearings consisting of a combination of balls and rollers.

Increased knowledge has brought with it increase of diameter in both balls and rollers, and the success of anti-friction bearings is assured just as long as reasonable diameters for the loads to be carried are adopted.

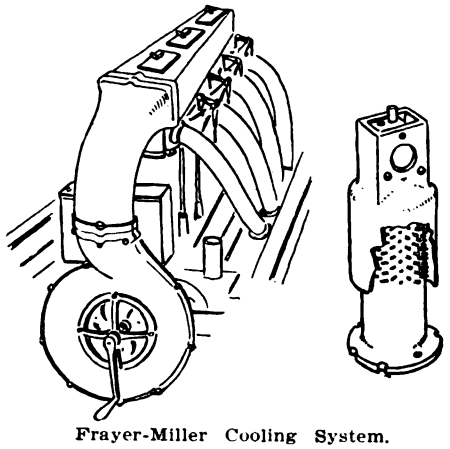
On the Cadillac there is a fine example of large balls for wheel bearings, on the rear axle 1⅛-inch balls being used. The hub looks large, but at the same time inspires the mechanical observer with confidence because of

Digitized by Google

its size. Ball bearings are found throughout the transmission gears and bevel gear drive of several first class cars.

BRAKES.

Every variety of brake is to be found in the show. The exceedingly safe and proper scheme of having all the brakes directly on the rear wheels is creeping into general use. The Pierce-Arrow on its large car has two sets of brakes, one internal and one external, all bearing on the same drum on its rear wheels, that deserve study. They are strong, well built and of very generous dimensions, the drum being fourteen inches in diameter. A glance at these brakes inspires absolute confidence in their good proportions and safety.



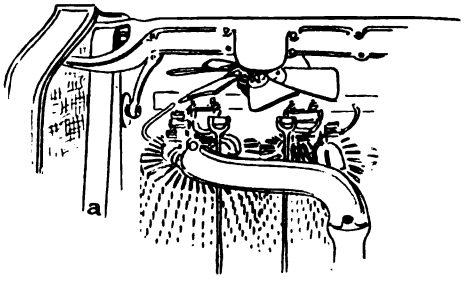
Wire rope is used rather more than formerly in transmitting motion from the body of the car to the brakes. This is a thing that is found in a great many foreign cars. It is cheap construction, but there is always the chance that the wire rope will wear without being observed and fail at the time most needed. This is an accident that is out of the question with properly constructed brake rods.

On the long Pierce the observer will notice an extremely large intake pipe to the carburetter. It is 2¼-inch outside diameter, 16 gauge and leads around the rear end of the engine so as to take warm air from the exhaust pipe. This makes the pipe somewhere about twenty-five or thirty inches long. A large intake is well recognized and desirable, so that the air may go to the engine freely without friction and without wire drawing. The long pipe also plays another beneficial function. The air within it has considerable inertia and helps fill the cylinder quickly. This would not be so with a small pipe, where the friction would overcome and offset the inertia, but with the dimensions given it must have a marked effect. This is one fine point of engine building, and a good one.

AIR-COOLED MOTORS AND CARS.

Judging from the exhibitions at the show, the successful performances of the air-cooled motors of the past, and the tremendous amount of intelligent thought that is being put into the problem, the air-cooled motors have come to stay in some form or other, even in large powers.

One apparently very promising type, and a new one this season, as far as the public is concerned, is the Frayer-Miller. At the forward end of its crank shaft, in front of its engine, is a good, substantial fan of the Sturtevant blower type, some twelve or fifteen inches in diameter, possibly more. Leading from this directly up in front of and along the top of the four cylinders is a generously proportioned and well finished air blast pipe. Each cylinder has an aluminum jacket, very much like a water cooled cylinder jacket, only that it is open at the bottom to allow free exit of air. Under these jackets are a comparatively few spines, which assist in distributing the air rather more than in forming a function of giving additional cooling surface. A powerful blast is transmitted by the fan down around each cylinder, it being distributed very carefully by careful proportioning of air passages. There is little doubt but what this means of air-cooling actually keeps the cylinders cool. It is quite possible that so much air might be forced through as to overcool the engine. The only questionable point in the proposition is as

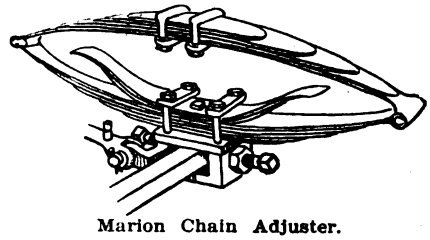


Frayer-Miller Cooling System.

to the amount of power necessary to drive this fan and force so much air through constricted passages. The machine as seen running on the street is smooth and noiseless.

The air-cooled motor developed by the Orient people for their motor-cycles and buckboard has been evolved into a very neat four-cylinder engine for a moderate sized touring car. It is simple, compact and evidently well thought out. The claim is made that the cooling is perfect.

In the Corbin car, which really makes its debut at this show, a new and simple type of air cooling spines is used, the rapid current of air being induced by a fan over each pair



Corbin Cooling Spines.

of cylinders blowing downward. The car, as a whole, is well considered and shipshape in all respects.

The good old stand-by, the Knox car, returns again with comparatively little change in the motive parts. Little refinements have been added to quiet the car, to cool it a little more thoroughly by using the fly wheel for a fan and taking the hot air away from the centre portion of the motor. The wheel steer is also used. Their lubrication has been somewhat improved by force feed pumps, but, as before stated, the refinements are along the lines of perfecting, rather than changing. This motor lends itself beautifully to their commercial trucks. It is undoubtedly extremely successful in the hands of the class of men who operate such cars.

An interesting air-cooled car is the Marion, seen in the basement. The motor is a four cylinder, with the four cylinders set across the top in front of the hood. The most startling part of the air-cooled motor is the tremendous size of the exhaust valves and their location, directly at the end of the cylinder. This allows the exhaust of gases to pass quickly and relieves the cylinders in the quickest possible time of the old gases. The clutch and transmission mechanism are interesting by the very generous dimensions and rather peculiar arrangement. The arrangement also has a lot of good points in it.

The means of changing the chain adjustment are, perhaps, the most radical points on the car. To adjust the front chain leading from the sprocket shaft to the engine shaft, the whole countershaft may be removed rearward. This naturally slackens the rear chains under ordinary construction. Provision is made for this in the fact that the rear springs are hung on very large

Marion Chain Adjuster.

pivots, and the whole rear axle swings backward by lengthening the strut rods. In addition to this, and to take up the rear chain elongation, the rear axle rests in a slot on the under side of the spring and may be pushed rearward by set screws two inches more or less. This latter point is exactly similar to the adjustment of the rear chain of the bicycle.

In the Maxwell-Briscoe car is found the type of motor that is fast growing into favor for medium weights; that is, the two cylinder opposed, under the hood. These people have a very nice arrangement, something well worth careful observation. Their fly-wheel is in front, another instance of previously questioned construction which has been adopted by some very good engineers this year. It will be very interesting to see how this works out. There is nothing wood about the whole car or its body except the footboard and the wooden strip holding the apron on the front seat. All the rest of the car is of metal.

LUBRICATION.

The lubrication of the vital parts of the cars seem to be tending all in one direction, and that is the force feed pump, operated by the engine and driving oil by piston pump and positive pressure to the parts lubricated. Of course, the small cars still have the gravity feed, assisted by pressure from crank case or muffler.

The 18 horsepower Columbia, Mark XLIV, shows a very ingenious and effective lubri-

Digitized by Google

cation from a box directly over the engine and with feed pressure in the crank case. This is their second year of this type, which is pretty good proof that it has been a success.

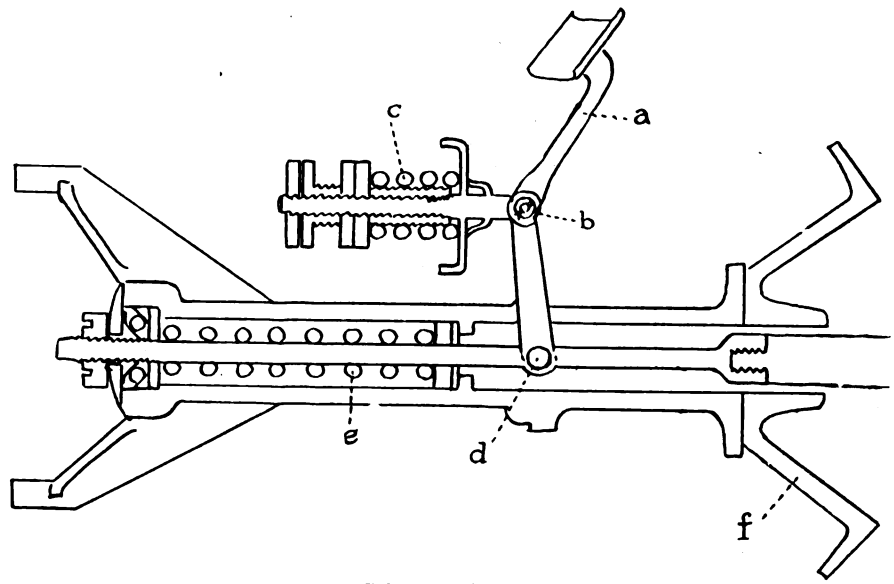
The most notable system of lubrication for the engine is shown in the Pierce-Arrow. It results in wonderfully small consumption of oil for the engine, and at the same time gives most efficient service. A geared oil pump operated by the cam shaft drives oil from a pit at the bottom of the crank case and forces it into a reservoir at the top of the engine. From this reservoir pipes lead to the crank shaft bearings and the crank pin bearings. By proper channels the oil finds its way through the centre of the pins and is thrown by centrifugal force outward on to the cam shaft and upward, so that the piston is lubricated only by oil from the crank pins.

A continuous flow of oil from the reservoir down through these vital parts into the small pocket at the bottom of the crank case is assured. The flow can be copious and more than enough, because no oil is wasted, it being pumped right back again up into the tank, where it is cleansed by a little cotton waste filter and returned as good as new. The Pierce people have used this now for several seasons, and have no idea of departing from it, so successful has it been.

Grease is used by most builders at some part or another of the car where the bearing must be left to take care of itself for some little time. Of course, the transmission gears and bevel gears run in oil, and are thus most efficiently lubricated. The wear of transmission gears is not a serious menace to the life of the machine. Those in use several years give no serious indication of wear when lubricated in this manner by proper grades of oil.

The greatest problem of lubrication is in the crank pins and main engine bearings.

A good deal of difference exists as to the thickness of oil that ought to be used in an engine, but it resolves itself to about this—that the single or double cylinder engines with big bore and stroke are best handled by heavy oils, and that other engines of high speed are best taken care of by a light or medium oil.



In the air cooled engine the question of cylinder lubrication is of much importance, and is met by them by proper grades of oil flashing at high temperatures.

A constant level splash lubrication is maintained in the Haynes four cylinder car by means of a tank which feeds by gravity and a float which opens and admits oil when the level falls below a given point and closes when it reaches a correct level. In addition to this, oil is fed to the four pistons by the regular oil pump. It is worthy of notice that the Packard engine is oiled entirely at one point. A pump feed enters the crank case at the top, near the centre, and all parts of the engine mechanism, such as crank pins, bearings and pistons, are oiled from this one supply.

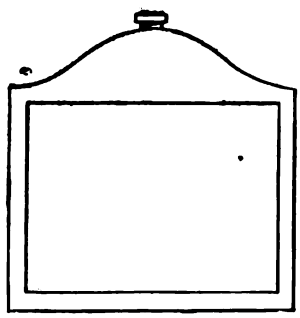
As far as the lubrication of bearings is concerned, the question sinks into insignificance in connection with roller and ball bearings. Just enough oil should be applied to keep them from rusting.

CLUTCHES.

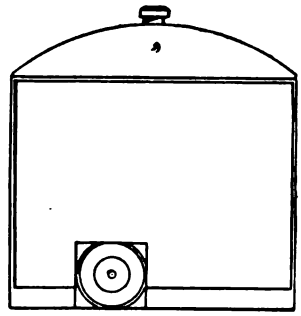
A feature in clutches that will be overlooked is the compensating springs of the clutch of the big Columbia car. The peculiarities of it are this: The ordinary spiral spring E, holding the cone clutch, F, in which plays the foot pedal, B, are supplemented by an auxiliary and compensating spring, C. There is a slight difference in the strength of these two springs, and one operates against the other in such a way that at the instant the clutch comes in contact with its seat the operator is dealing only with the difference in tension between the two springs, instead of the whole tension of one of them. This means that he can move his foot almost two inches without allowing the clutch to seat suddenly, whereas with the ordinary single spring the clutch is liable to seat suddenly the minute it comes in contact with the flywheel. This is brought about by putting the fulcrum, B, on the foot pedal, A, against the compensating spring, C. The device is exceedingly simple, but the advantage of it is not easy to see nor easy to explain.

Columbia Clutch.

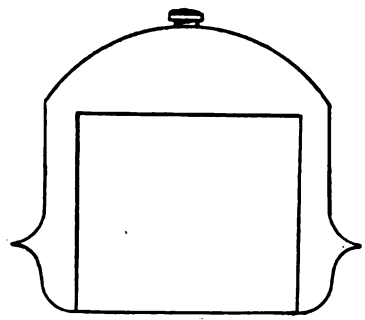
In the Stevens-Duryea, four cylinder, is found a clutch which stands alone in the show. It is a series of leather-faced discs bearing on steel, brought in play by a spring ratchet drive in a compartment by itself. It is built up along right lines; it must be examined and it must be recognized by the engineer as a coming proposition. The principle is not new by any means, and it has been accepted in many places in the mechanical world as good for a clutch which will take hold gently but positively.



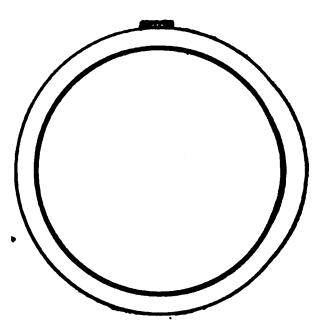
SOME GENERALITIES.



The only two cycle motor in the exhibition is shown in the Elmore, both single and double cylinder type, horizontal under the body. In the two cylinder car both the cylinders are on one side of the crank shaft. The Elmore people have faithfully clung to the two cycle type, and have done well with it without doubt. As to its actual efficiency as compared with the four cycle, there is really no good information. If the old charge is thoroughly swept out by the incoming new charge, then it ought to be equally efficient. The Elmore Mfg. Co. have experimented very greatly with a flange on the top of their piston, which is for the purpose of deflecting the incoming charge in such a maner that it will drive every bit of the old exhausted charge out of the exhaust port without mixing the two. It certainly is interesting to remark that with the two cylinder, two cycle the explosions are just the same per revolution as with the four cylinder, four cycle engine.



The Rambler car shows the same type of motor as last year, two cylinder opposed, under the body, with the cylinder diameters of 5x6. There has been substituted a pressed steel frame for the one of angle iron previously used, and a very strong and stiff one it is, too. In the Rambler the ignition is advanced and retarded by the governor, so that the operator does not have that to think of at all. This is an exceedingly good scheme, and is likely to be adopted to a considerable extent in the near future. It meets nearly every condition of all those possible to arise. As the engine speeds up the spark advances, due to the action of the governor, and this is exactly what should be done by the hand to operate the spark intelligently.



Probably the most startling thing about the Rambler motor is the fact that it operates perfectly without a circulating pump, on the principle of the thermo-siphon. Notwithstanding the fact that it is something over six feet from the extreme end of the motor to the radiator, and that the pipes are necessarily level, or nearly so, for the greater part of that six feet, the water circulates perfectly. Careful inspection reveals the secret. It is that the pipes are very large in diameter and very smooth, and without unnecessary or sharp bends. The tubing is all brass, 1¼-inch diameter. The Rambler radiator is of

Digitized by Google

OLDS

CADILLAC

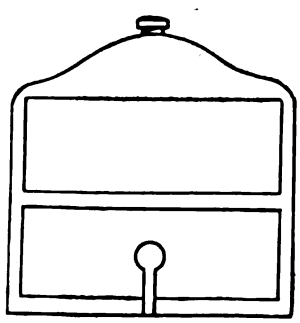
LOGAN

NATIONAL

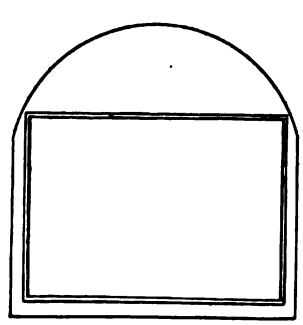
the accepted steam engine condenser type, a most reliable and well established form. The spaces between the tubes are not as much constricted as in some of the cellular radiators, and it is probable that this type would be necessary with any thermo-siphon. The water must have free passage to operate successfully on this system.

The Rambler also uses a wiper ring on the end of their piston near the cranks, to insure against too much oil finding its way up into the motor from the splash in the crank chamber. This is a precaution that ought to yield good results in any horizontal engine. There have been some decided changes made in the material entering into their planetary transmission, bronze wheels being substituted for fibre and steel. It is absolutely dust tight, and retains all the oil that is put into it. This, of course, adds greatly to the smooth running and wearing qualities. The reverse and slow speed bands of the transmission are steel straps lined with fibre, in place of the leather formerly used. It is believed that the fibre gives better service.

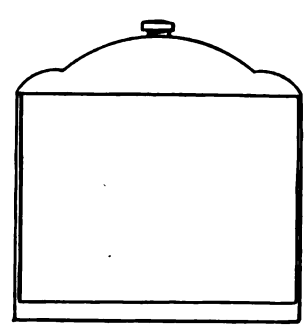
The bearings of the machine are one-half-inch balls of the two point type, running on curved cones and cases, which insures long life and easy adjustment.



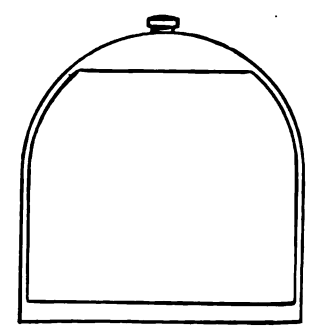
One of the most remarkable small cars is the Buffum, weighing 930 pounds, for two people, at a cost of $1,200. This departs very decidedly from the regular outward appearance for this type of car. There are four cylinders, 4 x 4, located under the hood in front. Everything about the car is compact, light and strong. It should be one of the most powerful runabouts in the trade; by all means examine it carefully.



There is one newcomer which must command the attention of the public, the Buick, already famous for the claims of wonderful development of horsepower from a relatively small engine.



Mr. Buick realizes that his claims are apt to be questioned, and very generally and in a very nice way explains why he certainly is getting more horsepower than engines of similar size. Twenty-two guaranteed horse power from two 4½ x 5 cylinders is equal to, if not in excess of, the best performances by a motor of any kind. There are these points which are good and unquestionably good about the Buick motor, all of them tending to give good results in burning the gasolene: In the first place his valves, 1⅞ inches in diameter, are at the end of the cylinder; the diameter given is generous. The gas as it enters, enters the piston clearance at the end of the piston immediately. His spark plug is on the side of the cylinder about midway between the pistons, at the top of the stroke and under the cylinder head. This puts his ignition point directly in the cylinder proper. Compare this with the fashionable type of valve chambers, sometimes two or three inches from the cylinder pipe, and it is easily seen that quick burning of the gases is arrived at, with the pressure exerted quickly and immediately upon the pistons, and that all these points tend to give better efficiency. The fashionable type is good for a lot of things, but it is perfectly sure that the quicker you burn the gas the quicker you fill your cylinders, the better the horsepower developed.



The well known Peerless comes back again this year with all its fine features and refinements. It brings with it, though, a motor that is new in design and, in one respect—in the Peerless—in principle. The new design is the fact that both inlet and exhaust valves are directly at the top of the cylinder, with the spark plug on the side of the cylinder about midway in the clearance. The thing new in particular is, however, that there is an arrangement which practically gives a double exhaust. It may be explained in this way: Assume the charge just exploded, the piston travels downward in this cylinder. At a point one-quarter inch about from the end of its stroke it opens a port one-quarter inch wide and about two inches long directly into the exhaust pipe. This relieves the high pressure exhaust. Then the piston starts back, pushing out the old exploded charge through the exhaust valve in the regulation manner. The claim for this is that the engine heats less and runs quieter. The device is a new one for the Peerless company, and most naturally excites a very great deal of attention and comment. The Peerless put on the magneto also this year, with the jump spark, doing away with the batteries. They have also changed the angle of their clutch, giving rather a milder engagement with just as strong final holding power.

The most notable feature in the Ford exhibit is their splendid, simple and compact four cylinder chassis. This is their new model. The engine is exceedingly simple, the pump being run directly from the end of the cam shaft at one end of it, and the commutator directly from the cam shaft at the opposite end. The fan has a pulley on the front end of the crank shaft. There is, therefore, no gear visible or used about the engine, except the one gear which runs the cam shaft. The simple planetary transmission is used with two speeds ahead and a reverse. It is small and compact. The power is transmitted from the transmission to the rear axle by one universal joint only. This

GROUT

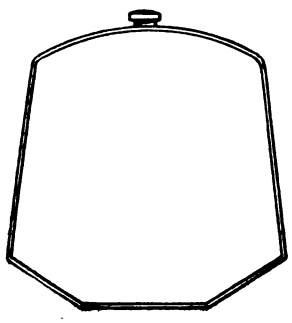
PACKARD

WHITE

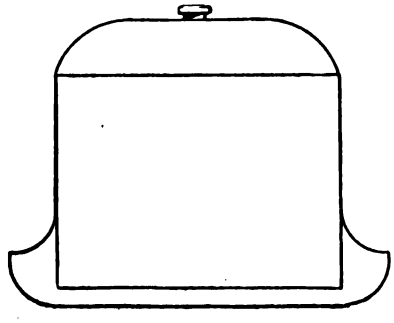
ORIENT

is so arranged by a large ball socket that no strain on the rear axle reaches the forward part of the car at all. The impression given by the chassis is of extreme simplicity and lightness. Altogether it is a fine piece of work. Their old Ford is practically the same as before, except that the 12 horsepower engine is rather more powerful.

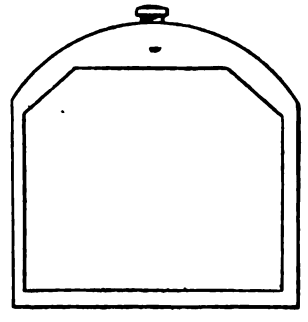
The Buffum exhibit should not be overlooked, for two reasons: First, because there is a $4,000 car, the finish of which is perfect, the mechanical points along the best-accepted lines and carried out in every detail to the utmost nicety. The motor carries two systems of sparking, the jump and the make and break. Either may be used separately or both together. This machine is mounted upon ball bearings and rolls on the floor at the slightest touch. The ball bearings are coming, there is no question about that, where the price of the car will allow it. H. S.



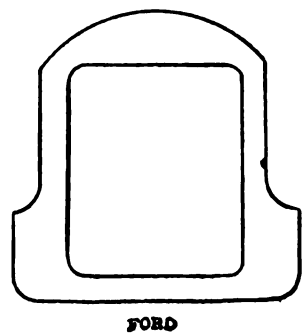
IGNITION.



First impressions of tabulated statistics showing the methods of ignition obtaining with all the makers represented at this year's show would lead one to the conclusion that the latter have left this very important problem entirely to the manufacturers of ignition apparatus during the last year. Out of some seventy-odd cars of different makes to be seen in the Garden, no less than thirty-eight, or more than 50 per cent, have retained the dry battery, some in connection with accumulators, others with a generator, and still others with a magneto, but all these exceptions taken together will be found to constitute a pitiful minority of the thirty-eight, the majority of whom stick to the dry cell and coil in its original form of application.



The next largest group comprises those employing accumulators in various combinations and figures a total of twenty makers, or somewhat less than a third of the whole number. Of these the majority have simply substituted the storage battery for the dry cell; others have used the accumulator for ordinary running with a set of dry cells as a reserve, as in the case of the Pope-Toledo cars, while some, as in the Packard and Pierce cars, provide a reserve set of accumulators, and the Pierce car is, in addition, provided with an extra coil, readily substituted for one failing to operate, owing to the adoption of the unit system of dashboard coils used in this make. Unit or sectional vibrator coils may be said to be practically universal this year, but this probably is the only car to be seen at the show that has made such provision against accident. A very small subdivision of the accumulator class uses the latter in connection with a small direct current generator of the "Apple" type, in shunt with the storage cells, and this should prove an ideal outfit, as even in case of accident to the source of current supply the accumulator should be more than sufficient to get home with. Two cars, the National and the Studebaker gasolene, have this sub-head entirely to themselves.



The drop to the next class, or those employing high tension magnetos, is a long one, as it is represented by but eleven cars in all, three of which are foreign. The domestic makers included under this head are the Stearns, Walter, Winton, S. & M., Acme, Lozier, Upton and Peerless, and in the case of the last it is left to the purchaser of the car; he may have whatever his preference dictates, either batteries and coils or the magneto, and by selecting the form with which he is most familiar have the advantage of knowledge gained by experience, or at least have no one else to cuss but himself when it goes wrong. Several other makers, among them the Wolverine, Buffum, Duryea and S. & M., accord the buyer the privilege of choosing his own medicine, and are willing to apply what he may fancy, whether the latter be high or low tension magneto, direct current generator or batteries, dry or storage, though some of those mentioned specify exactly which of these forms they will supply, while others include all. The three foreign cars in the above cited class are the Panhard and Renault, using the Eisemann system, and the Leon Bollée (Worthington). On the latter car are provided two entirely independent systems of ignition, separate even to the extent of operating through different spark plugs. These are in the form of a high tension magneto and distributor and a set of accumulators, with the usual four part dashboard vibrator coil, so that both are at least similar in supplying a jump spark. Either may be called upon at any time or both used simultaneously, though their object is naturally to provide an infallible reserve—infallible, at least, to the extent that no part of either system is at all dependent on the other, and that one may be totally destroyed, if that were possible, without affecting the reserve set.

Several makers have thought it worth while to provide two entirely independent sets of ignition apparatus, as outlined, protecting to as great an extent as possible the relay apparatus from being rendered inefficient through accident to its working mate, by isolation, though only two others have gone to the same extent, the Phelps and Buffum, in which both make and break and jump spark ignition are provided. The others, such as the Walter, only stop short of this point and provide everything in duplicate except the

"SHOW-FURS."

Digitized by Google

firing device in the cylinder itself. The interchangeable combination of make and break and jump spark on the same car, as represented by the Phelps and Buffum systems, is probably one of the most radical departures to be found in this year's attempt at the solution of the ignition problem. Both of these cars employ a low tension magneto simply to supply the make and break spark, which in the former is not the familiar wipe or hammer and anvil movement, but a needle contact, spring controlled and moved upward by the cam shaft in its revolutions and merely touching against a similar point inside the cylinder. The needle remains at rest except when making contact, and is retained in place by a spiral spring. The systems of ignition are readily interchangeable, and one may be substituted for the other without delay or the necessity of making any complicated adjustments. On the Buffum the purchaser is allowed either storage or dry cells for the jump spark side.

A further classification of the cars from the ignition point of view places those relying solely on the low tension magneto in another subdivision, comprising nine makers in all, of which one is foreign, the De Dietrich, and two are adaptations of a foreign system, the American Mercedes and the Locomobile. Where the latter car is concerned, this marks a jump from heights of complication to the lowliness of simplicity, as their product of only two years back was marked, and, in the opinion of some, marred, by the employment of an unusually large direct current generator, two sets of accumulators, provided with an automatic charging and cut-out switch, and sufficient wiring on first sight to fit out a small sized charging station. Now the jump spark has been discarded utterly—a low tension magneto provides the current for the make and break system provided with individual switches on each cylinder for ready inspection. Of the other makers in this class, both the Standard and Matheson cars are now in the make and break line, employing Remy low tension magnetos.

This partial return to a system that was abandoned by one and all at the inception of the building of four cylinder high powered cars in this country, as something totally unsuited to the use of the motors in question, though it was at the time in successful use on the other side, is a development that will doubtless be closely watched by makers in general here, and in all probability will lead to its extension to other cars before the end of the year. It is indicative of the general feeling of dissatisfaction on the ignition question, and is more in the nature of a retrying out of a system that was cast aside previously without being accorded a very thorough test.

Coming to the next class, there are three lonesome representatives who are pinning their faith to the small direct current generator, the Duryea, using it with dry cells, although the customer is allowed an option on other forms of ignition, and two, the Studebaker gasolene and the National, using it in connection with a set of accumulators placed in shunt with it and always charging, and, on the whole, forming a simple and economical source of current supply and reserve at the same time. Of those which may be listed to a certain extent in a classification of their own are the De Dietrich, using the Simms-Bosch low tension magneto, and the Speedway, with a high tension magneto and a set of dry cells as a relay. The Eisemann high tension system is present upon but two cars, the Panhard and Renault, the former concern having fostered it originally and giving it the official seal of approval some time back. The Remy magnetos are in evidence to a much greater extent, though but in a few instances in the high tension type.

Coming from the source of current supply to the feature of distribution on the multi-cylindered engines, it is noticeable that there has been very little effort to centre this on the dashboard, as previously, and probably not more than one or two cars in all, such as the Napier and the Autocar, show this. On the other hand, the distributor has been moved about in many instances, and is no longer to be universally found lying horizontally and pointing forward or aft at the front or rear of the engine, as was formerly the case, but has in several, of which the Ford, Packard, Autocar, National, Haynes-Apperson, Covert, Royal and Pungs-Finch are examples, been placed on a vertical shaft rising slightly above the level of the engine, and is driven by bevel gearing from the cam shaft, as usual. In the case of the Autocar, this shaft comes inside of the dashboard, rendering the working visible. On the Napier what appears to be an ordinary four part dashboard coil box, except that it is provided with plate glass lights, houses the single coil commutator and distributor in a central and instantly accessible location.

The Eisenhuth Compound—the only car of its kind at the show—provides a duplicate arrangement of jump spark plugs, one in the inlet passage and one in the centre of the head of each active cylinder. These plugs spark simultaneously, and should not only be the means of providing more complete and rapid combustion, but, as they are wired in multiple from the distributor, double the chances of firing the charge.

While frequently not in evidence when most wanted, the vital spark is sometimes present when and where it is not at all desirable—at starting. This is the result of absent mindedness on the part of the operator, and failure to return the lever to the starting point often results in a vicious back kick on cranking the engine. This is provided against on the Acme car, using the Remy high tension magneto by connecting the spark advance with the starting crank. Should the former be left at advance on leaving the car, grasping the starting crank causes it to fly back to the beginning of the quadrant before the engine can be turned over.

"New Dur Exploder" is the name of a magnetic plug being placed on the market by the Duryea Power Co. This consists of a solenoid equipped with both a plunger and an armature, though the former does not act magnetically. Normally it rests by gravity on the contact located on the under side of a bridge spanning the plug and completing the circuit. On the opposite end of the magnet which is inclosed in a metal casing is a hinged circular armature through which the plunger passes, and engaging the latter by means of a washer forced on it. Upon the current passing the armature is attracted, and with its release the plunger is jerked upward, rupturing the circuit and producing, not a spark, but a somewhat blinding flash. The principle involved is not new, by any means, but has seemingly never met with any favor at the hands of the manufacturers of cars, though several attempts have been made within the past few years looking to this end.

Folding Bicycles for Emergencies!

Most people hold that the automobile has had an adverse influence on the use of the bicycle. From Paris, however, comes the story of a portable bicycle that owes its "invention" to the vogue of the motor vehicle. In this case the cycle is a tail to the automobile kite, designed to be carried in the car so that in case the latter becomes en panne from any cause the bicycle can be utilized to carry the driver to his destination.

M. Prudor is the name of this distrustful motorist, and he has been granted a patent on his invention. According to the patent specification, the latter is "an emergency bicycle, to be carried by and used in connection with motor cars, so that if the car should break down or meet with an accident the chauffeur can leave it on the roadside and proceed to the nearest village where he can get assistance or telegraph or take any necessary steps. The bicycle is such that it can be collapsed or folded, and will then occupy by a very small space, under the seat or in the mud guard baskets. Four of these bicycles can be carried in the mud guard baskets of an ordinary car" (presumably to allow all the crew of the car to escape). "Notwithstanding its small dimensions, the bicycle has the power" (?) "of a bicycle of current pattern, and the cyclist rides it in the usual position."

Two illustrations are given, one showing the machine in its collapsed position and the other expanded ready for a bold man to ride. The frame consists of four tubes, crossed and joined about the centre, so that they are free to be collapsed. The extremities of these tubes are connected by wires. Those in the forward end of the bicycle are connected at one end of two projecting pins on the steering fork, and at the other to each side of the handle bar. Thus when the handle bar is moved, the wheel will move with it—perhaps. The inventor suggests that these steering cords add lateral rigidity to the machine.

According to the police records, there are 1,143 automobiles in use in Detroit, an increase of nearly 100 per cent during the year.

ELECTRIC VEHICLES

Barring the advent of some revolutionary improvement in the shape of an accumulator, visitors to the show did not anticipate finding any great difference in the types of electric vehicles for either pleasure or commercial purposes, but both have come to be such a necessity in many ways for city use that these exhibits, though lacking in the drawing power of the high speed gasolene cars, have come in for their share of attention. Edison's new battery, which at the time of its initial exploitation was confidently predicted to be the immeasurable superior of any other form of accumulator in the market, has fallen so far short of this that, like the boy who cried wolf too soon and too often, it does not now receive the attention it merits. It has been adopted by several large users, and has considerable to recommend it, but as these features have long been a matter of common knowledge it is unnecessary to detail them here.

The Baker line of pleasure vehicles presents a full complement of this type for the intending purchaser, and as this firm has been the only one to adopt and successfully carry out in practice a system of low voltage, a smaller number of cells, with consequent gain in charging expense as well as weight, is a feature of their carriages. The depot carriage, with motor under a bonnet in the front of the car and bevel gear shaft drive, shows the marked effect on public taste of the prevalent form of motor carriage as exemplified by the gasolene vehicles. This type is very convenient for stormy weather use, and has become quite popular. No attempt has been made to increase the speed of any of these types, the maximum of which remains at fifteen miles an hour. In the Baker line of vehicles only twelve cells are used on the light runabout, and but twenty-four on their heavier types, their ¾ horsepower motor on the former, operating at 24 volts and 22 to 28 amperes, consuming only 500 to 600 watts. Any battery the customer prefers will be installed.

The Electric Vehicle Co.'s engineers have devoted their attention to further improvements in the already very effective Exide cells, and have reduced the bulk somewhat by omitting some of the corrugated wood and rubber separators which were found to be unnecessary. Improvements have also been made in the manner of connecting the plates in the various types of cells; in that intended for pleasure vehicles this takes the form of a new pillar post connection, to prevent the plates breaking away, and the top strap of which is simply forced on so as to be readily removable. On the heavy express wagon type these top straps are made unusually substantial, and are burned on; the L form of connection previously in use has been retained on the medium heavy cells. New records have been added to the laurels of the Exide cell during the last year, and they have been adopted by a number of large users for commercial work.

The Pope Waverly line of "always ready" electrics comprises a dozen or more different styles of pleasure vehicles, and this firm is making a strong bid for delivery wagon and heavy truck orders. Their "herringbone" gearing for transmitting the power to the axle is made of gun metal, and hardened steel in the case of the small pinion, and is conducive to absolutely quiet operation—an advantage to be dwelt upon.

The Studebaker Mfg. Co. is devoting most of its attention to the production of heavy business vehicles, which are being turned out in numbers, although pleasure vehicles are also included in its line. On the latter the equipment consists of a battery of twenty-eight Exide cells, with a special Westinghouse plain bearing motor and double reduction gear. Speaking of heavy commercial vehicles, the Rainier exhibit should prove a factor of educational value in demonstrating to what a phenomenal extent electricity is being harnessed to the heavy delivery wagon. Huge trucks for carting every imaginable kind of materials from drygoods or condensed milk to beer in kegs confront the visitor, and they are but samples of the extensive number supplied to large concerns all over the country, particularly for use under crowded traffic conditions.

The universal adoption of alternating current supply in new installations has made it increasingly difficult for the owner of an electric to obtain charging current without going to the expense of a rotary converter or motor-generator set, either of them calling for quite an investment and skilled supervision. To obviate this the General Electric Co. has recently placed on the market a mercury arc rectifier, an extremely simple device for charging storage batteries from an alternating current, and unique in the fact that it is without any moving parts. Compared with the common motor-generator set, it shows a higher efficiency and power factor, and has a lower first as well as a lower operating cost, while its simplicity makes its use possible for persons not familiar with electrical apparatus to charge their own vehicles. It consists, in brief, of a panel, tube and holder and a compensating reactance.

The panel is of the usual slate construction, and on it are mounted the tube and all necessary switches and terminals. The tube itself is an exhausted glass vessel of peculiar shape, containing two anodes and a cathode, provided with metal caps for the terminals which protect the electrodes, reducing to a minimum the liability of breakage and burning out. The leads from the anodes are connected to the compensating reactance, while the lead from the cathode forms the positive side of the direct current circuit. The holder consists of a moving member mounted on the face of the panel and provided with spring clips for holding the tube.

The compensating reactance is connected directly across the alternating current supply mains, and is mounted either on the back of the panel or may stand on the floor beneath it. Leads are brought out from the reactance to a dial switch mounted on the front of the panel, and by means of which the voltage and amount of current may be varied within the limits of the rectifier. A tap is brought out from the reactance, and forms the negative side of the direct current circuit. The complete outfit occupies very little floor space, and is made in capacities of 10, 20 and 30 amperes, and will be furnished for any commercial frequency.

STEAM CARS.

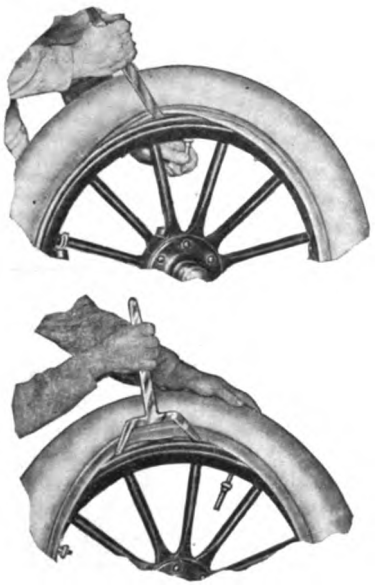
The White presents new models which are irresistibly attractive to the passer-by. Those who have ridden in the White and used it need not be told what a delightfully smooth running car it is. The Frenchmen who examined it at the World's Fair in St. Louis pronounced it to be undoubtedly the smoothest thing on wheels, although they did not exactly care for steam. White has added some very valuable functions to his motor. Perhaps the most important is the fact that he has got a change of gears, one of them being three to one and the other seven to one. This gives tremendous power on hills and allows the engine to run at high speed; consequently keeps the generator full of water, even on the most severe hills. It also allows the operating of the motor while standing still for purposes of pumping up the boiler without the use of a hand pump. A large fan back of his steam radiator brings about the condensation of a very much larger proportion of the steam, which, of course, allows the car to travel further on one tankful of water. There is a larger generator in the car, so that more horsepower may be developed. The air pump for the gasolene tank is thrown into operation by the mere closing of a valve. In short, it seemed as though the operating of the motor had been reduced to perfection.

The Grout steamer is one that has made immense advances this last year. Its generator is in front of the dash, the engine under the footboard and the gasolene under the seat. The chassis, which is exposed, shows a good, commonsense arrangement and proportioning of parts, and it would seem, from the description of its mechanism, that every emergency had been guarded against.

To Build the Mors in St. Louis.

It came out this week that the automobile which the St. Louis Car Co. will manufacture will be none other than the Mors. M. Mors is now in this country, and on Saturday last made definite announcement of the fact.

The St. Louis Car Co. is one of the largest producers of streetcars and railway coaches in the country, and with such facilities as they command should cut no small figure in the automobile industry of this country.



A Sharon (Minn.) farmer is alleged to possess an automobile which is propelled by vapor produced by the slacking of lime. Unfortunately, however, the agriculturist has not come out in the limelight sufficiently to be identified.

TIRES.

In tires, those "feet of the automobile," in which interest both trade and public is hardly less keen than in the complete themselves, the year has brought forth notable developments.

The most noticeable tendency, of course, is in the extension and expansion of the mechanically fastened principle, though the very great advance of this type has been stubbornly contested by the already strongly intrenched "clincher," which has been improved past belief, hard bends, asbestos fabric to prevent rim-cutting, open heat curing, giving largely increased external strength and tougher vitality to the tread and walls, and, lastly, but not least, the introduction of simple and handy tools, greatly facilitating removal and replacement, have marked long steps forward in clincher tire development. This "battle of the tires," however, has been and is a royal one, with honors easy, for though, as indicated, the first named has gained much ground and

M. & W. Tire Tool.

favor, there is little reason to suppose that there is any real danger of its materially displacing the older form of construction—for the next year, at least.

Conspicuous in the mechanically fastened type the well known Fisk tire shows marked advance. The number of fastening parts have been reduced 25 per cent., a three-piece threaded bolt being now employed in place of the four-piece hexagon bolt with clip inside, this, of course, tending to greater ease in manipulation. All bolts and nuts, too, have been galvanized, rendering them impervious to rust. The clamping rings also show some alteration, this section being now made in a special shape that insures the tire against any undue wear in the event of its being run when punctured.

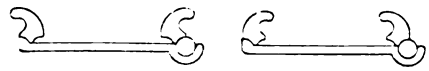
In the Fisk heavy car tire, which is enjoying much favor, an extra heavy outside tread is employed, thus materially protecting the envelope and making it possible to renew the tread when required. Samples exhibited which have given the creditable performance of over 17,000 miles without replacement show comparatively little wear and indicate the real progress made in the line of tires carrying great weights. This success is in no small measure due to the high quality of rubber employed, the tire as now made being of practically pure rubber, the erroneous idea that a pure rubber tire punctured easier and was not stiff enough to enjoy long life having been effectually dissipated. The reverse has proved true, and this conclusion carries with it the conviction that first cost of tires is not likely to be reduced in the near future, though the item of tire up-keep will show a big reduction.

The new perfected Dunlop tire, the advent of which gave a decided impetus to the mechanically fastened type, shows, so far as outward appearance goes, no change whatever. The reason is simply that none was required, the tire which enjoyed such marked favor the past season and which looms very big on the 1905 horizon showing no reason for change or chance of improvement, so far as mechanical construction is concerned. But the Hartford Rubber Works Co., its original makers, have been far from idle, busying themselves in the perfection of "open heat" curing, claiming for this process a marked superiority, and contending that the old style of curing in moulds overheated and weakened the side walls of the tire in the process of subjecting it to the great heat necessary to cure the largely increased thickness of the tread. This process, of which they claim to be the originators, is extended to all their product, including the Hartford clincher, the only changes in which is the employment of a hard "bead" and asbestos fabric to prevent rim-cutting.

A full line of the time tried Turner endless solid tires, that "once put on never come off," are also shown with proof of their worth.

The Diamond Rubber Co., that enterprising, aggressive organization, which has made such a marked impress in the automobile world, show forth with a complete line in variety enough to satisfy the most exacting. In the mechanically fastened field they are there with a tire of the "turn-buckle" variety, which is adaptable to any regular clincher rim, and which seems to afford the acme of simplicity with the maximum of worth. In the regular Diamond clincher tires they blossom forth with what they term a "wrapped tread" construction, showing remarkable external strength and tough vitality to the tread and walls, while actually giving increased resiliency. This wrapped tread process is a long, slow cure in open heat, and its value is attested by the decided favor with which these tires have been received. Inner tubes, of which the Diamond Rubber Co. make a specialty, are made endless, are thicker and of heavier gauge, and have their full share of the improvements suggested by experience.

Nor in tire protectors or non-slip devices has the Diamond Rubber Co. been behind. In the former they show a protector of the most approved foreign type, which examination reveals to be every whit as good, if not superior, to anything shown by foreign makers, which in a non-slip tire they have a tread formed of a succession of "studs," which seems to do much toward accomplishing the purpose for which they are designed.



The B. F. Goodrich Co., standing as they always have for everything conservative and respectable in the rubber line, "stand pat" on Goodrich tires, so far as changes of construction are concerned. "None whatever were made, for none were needed," is their simple statement. And yet they have been far from idle, though it would take the eye of the expert to detect the change. Improvement there has been, and much of it in the employment of an even better compound, insuring the upholding of the Goodrich reputation for goodness. The only addition is a "thread fabric" tire, a fast, extra resilient construction, designed for electric carriages where long mileage is the great desideratum, or wherever fast work is required.

The Goodyear Tire & Rubber Co.'s chief

Goodyear Detachable Tire.

novelty is the new Goodyear universal rim, adaptable to all of the ordinary type of clincher tires. This rim consists of a single flat steel band, rolled to shape, and adapted to fit any wheel with a wood felloe carrying

Goodyear Universal Rim.

standard clincher tires. Two removable endless steel flange rings, adapted in contour on the one side for engaging the ordinary clincher type of tire, and on the reverse side for the Goodyear tire itself, where it has a steel locking ring, which locks the flanges in position. The whole is claimed to be rendered rust proof by galvanization.

This concern shows, in addition, a complete line of endless solid tires and much interesting matter regarding them.

The G. & J. Tire Co., makers of the original "clincher," and under whose patents all American clincher tires are made, return to first principles in the abandonment of all lugs, asserting with emphasis that a lugless construction makes the tire less liable to self-destruction and is the improvement in every way. Aside from this departure, the only change observable is a slight lengthening of the bead on toe of the outer casing. The G. & J. Tire Co. have been fully alive to the lessons experience has taught and have profited by them.

Morgan & Wright, with the reputation of "doing things," have one of the most interesting tire exhibits in the show. In their demonstration of the M. & W. clincher, the goodness of which they back up with a large bunch of testimonials, they employ what is really an invaluable little tool, cut and description of which appear elsewhere in this issue. By its use a clincher tire may be detached and attached in a minute and a half, a feat they perform countless times for the enlightenment of the skeptical. Through their courtesy the G. & J. Tire Co. are permitted the use of this time and trouble saver and will furnish it regularly.

Morgan & Wright show also another useful and handy article in a crotch stick, for use on the front wheels, preventing them from revolving when working on them. The end of the stick resting on the ground or floor is shod with a blunt iron point, and while simplicity itself, this little article is of much practical value.

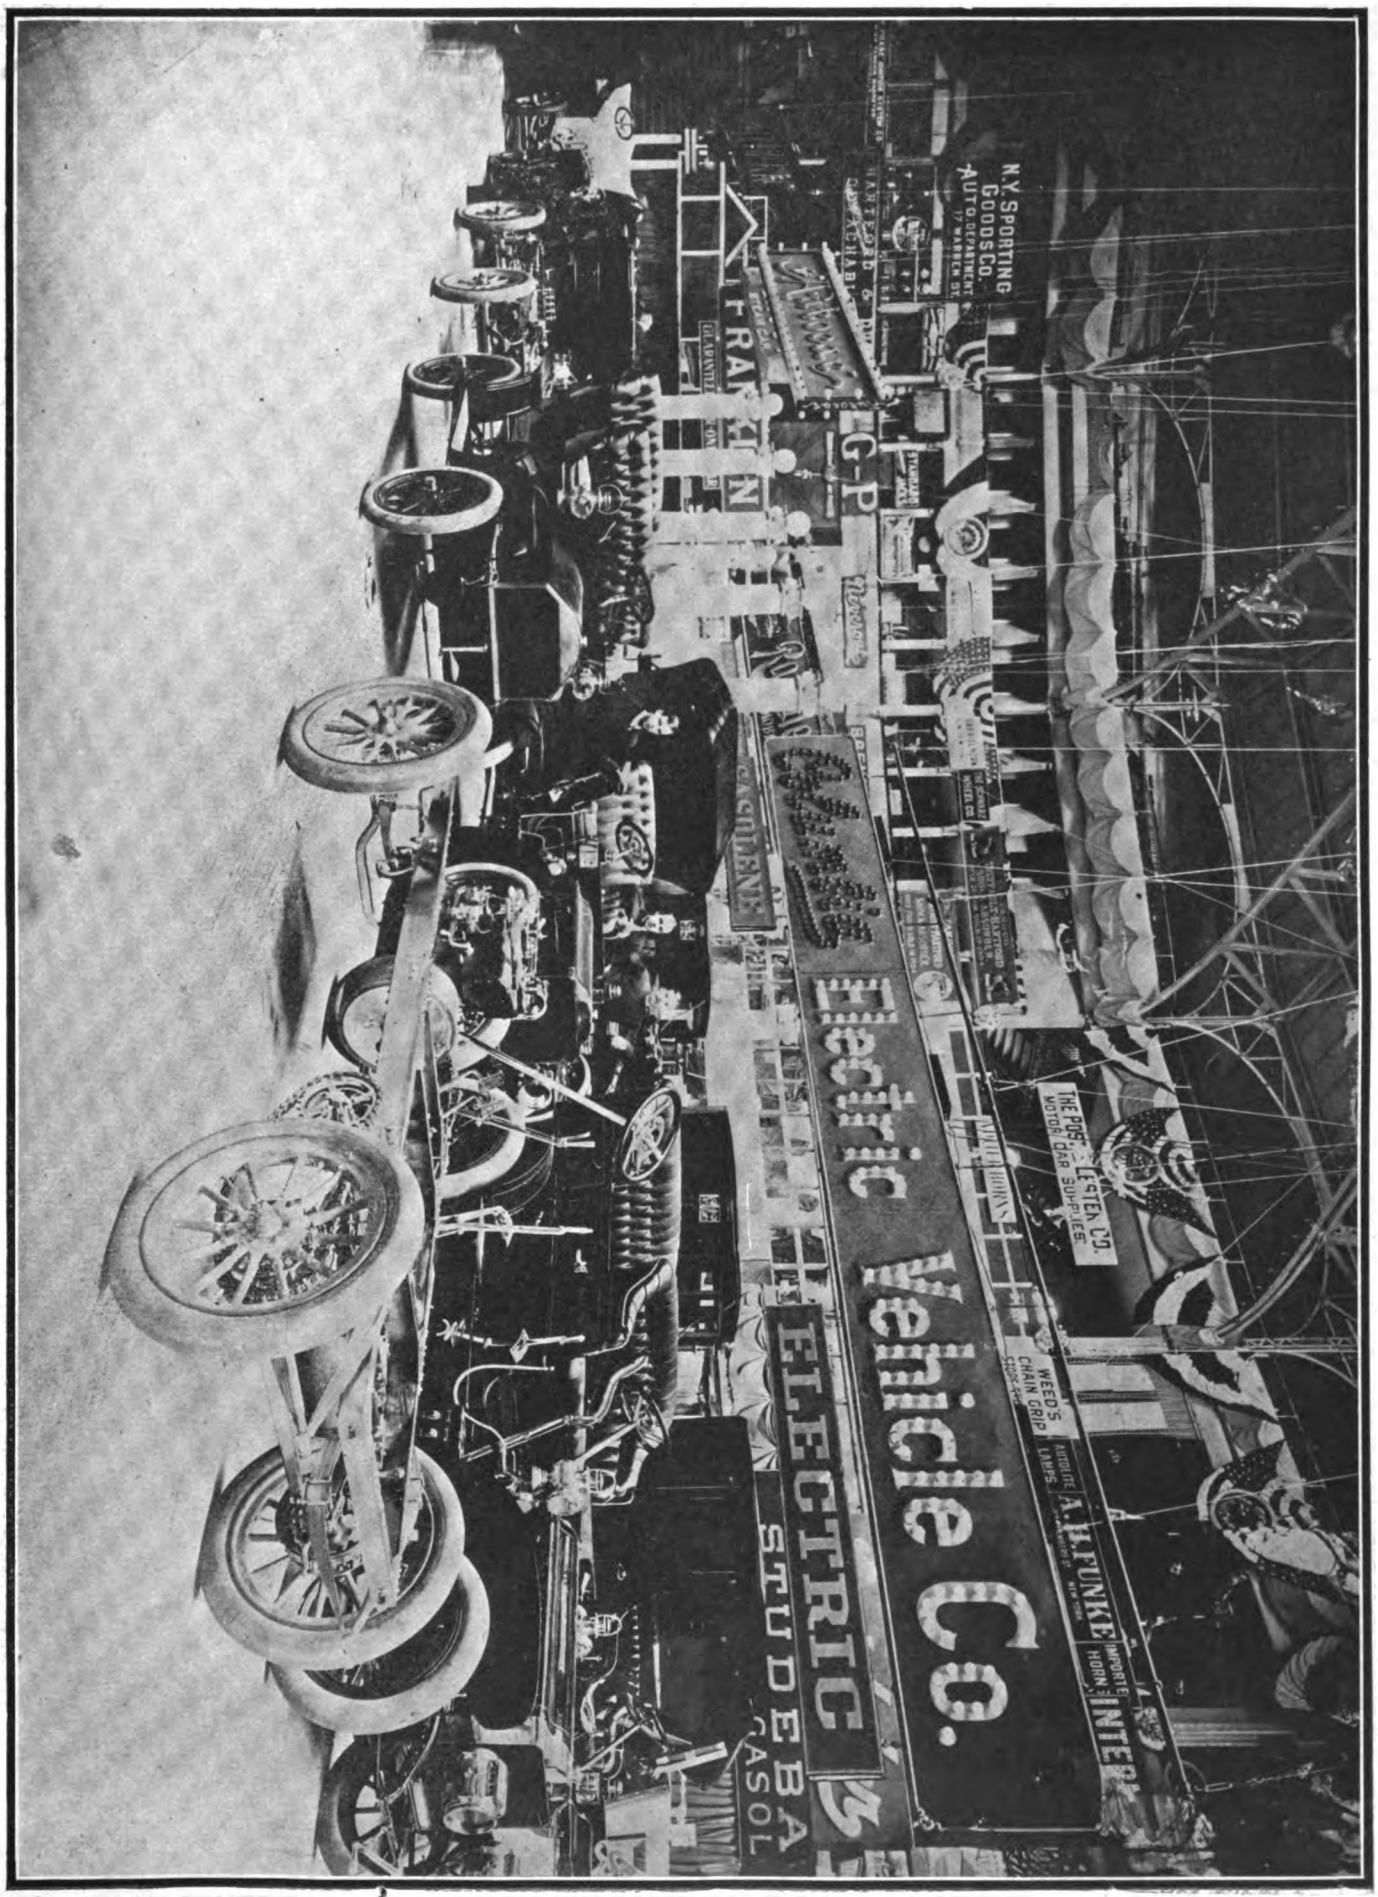
A recently consummated arrangement has been the taking out of a license to manufacture and market the new Perfected Dunlop Tire, so that Morgan & Wright will now be in a position to supply this tire, in addition to their own M. & W. clincher.

In solid tires the Firestone Tire & Rubber Co., of Akron, O., have a most instructive and interesting display.

Proudly exhibiting data showing that every rubber tire in service at the World's Fair was a Firestone, and that every commercial wagon (except one) operating in St. Louis during the same period was fitted with Firestone Tidewater Tires, they also show the performances of the tire under various conditions, all with excellent results.

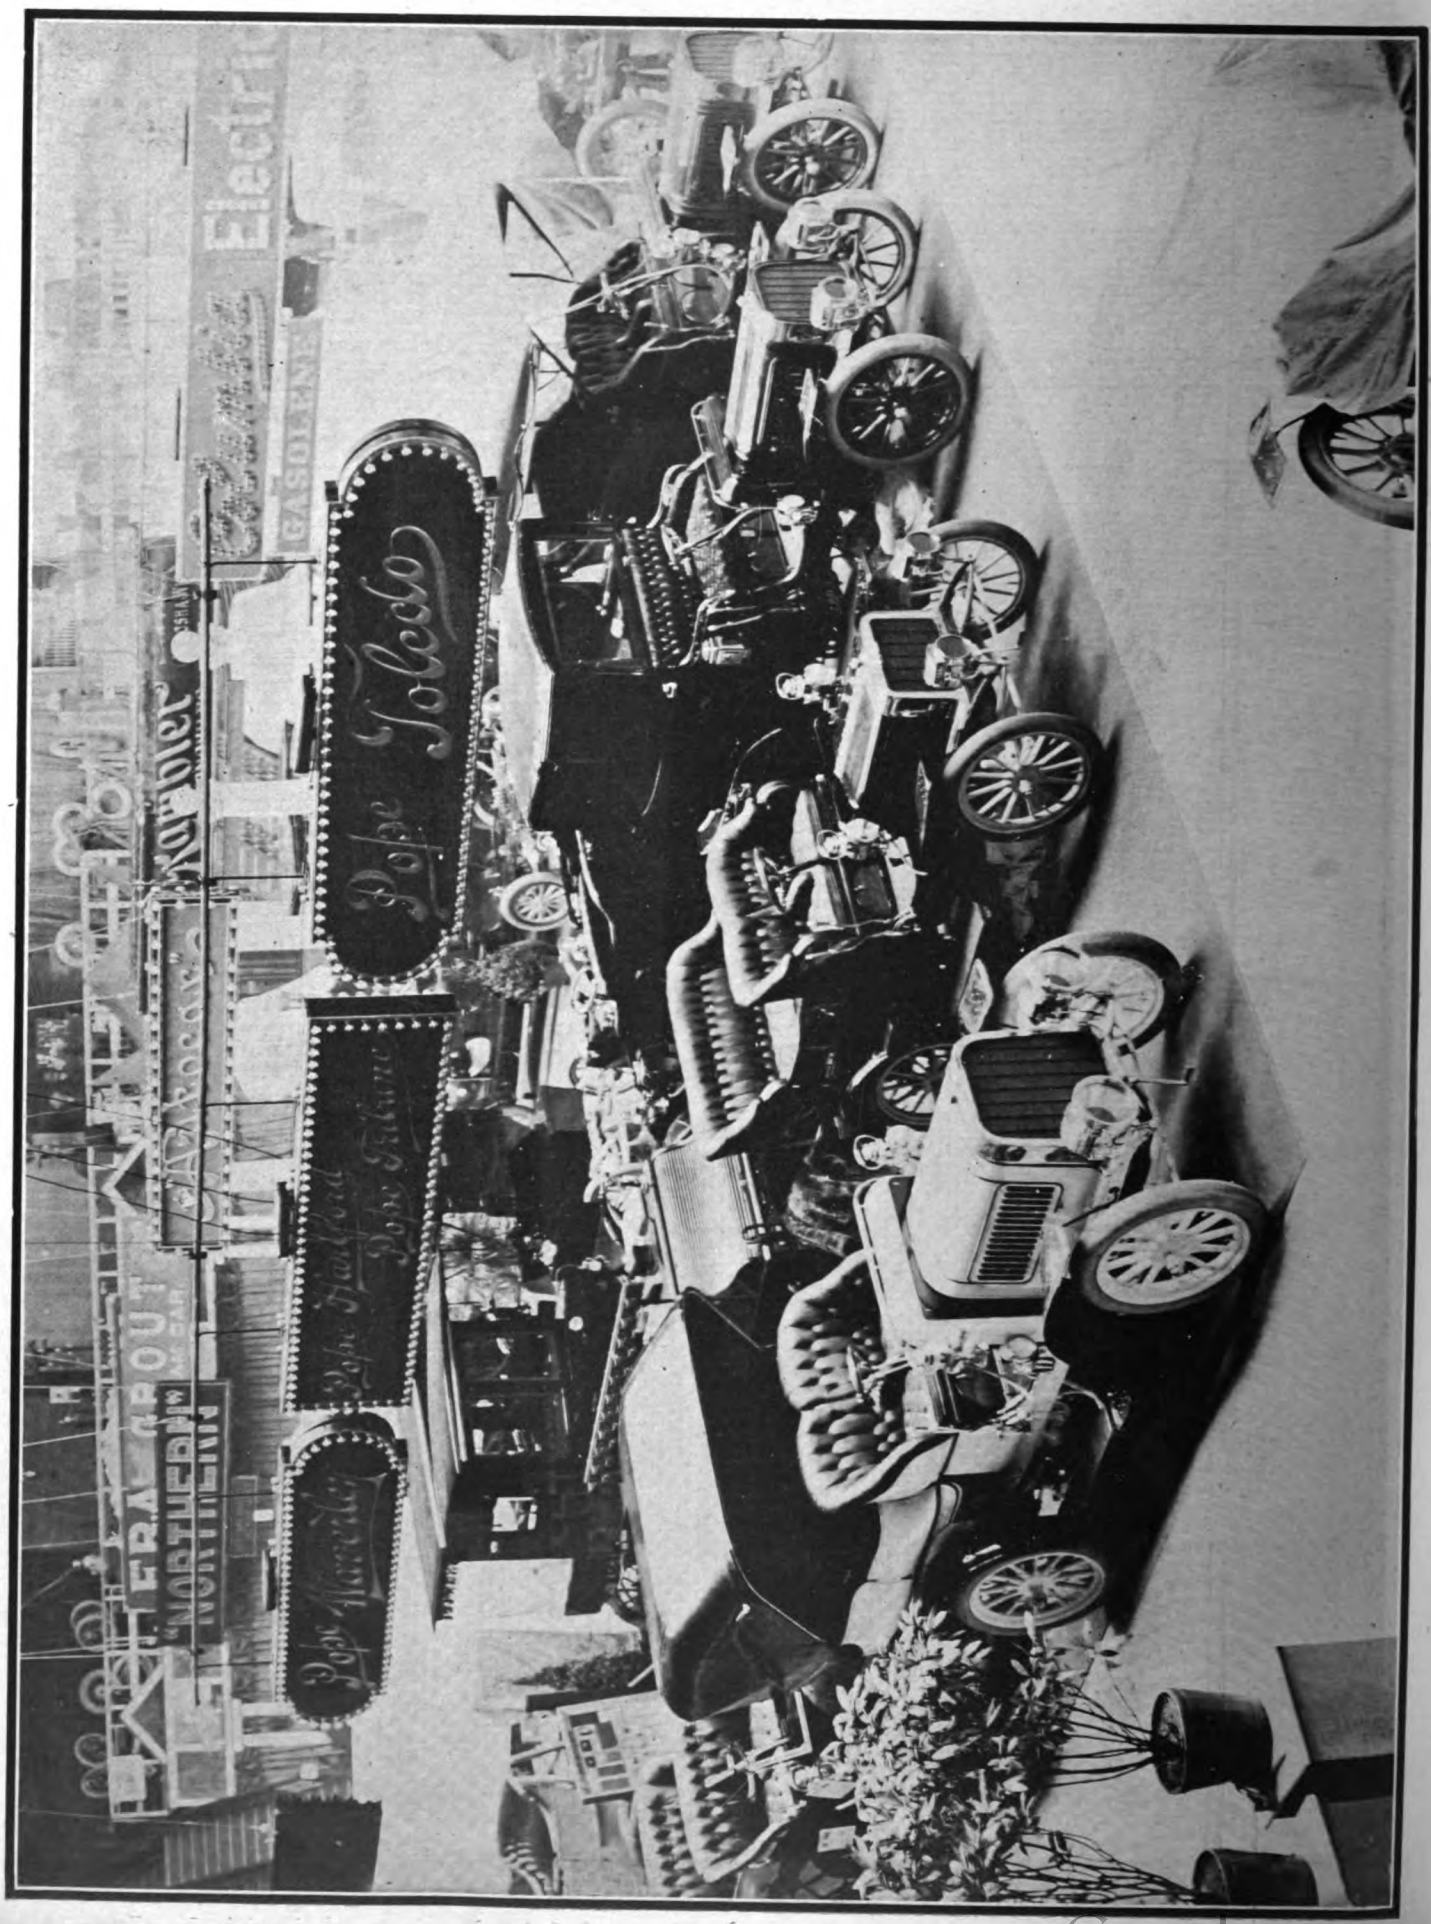
In construction the Firestone Tire has steel cross bars inserted laterally at regular intervals near the base, vulcanized in the rubber and becoming an integral part of it. The tire is retained in the channel by two cold-drawn steel wires, made into hoops, which rest on the shoulder formed by the cross-bars and hold the tire perfectly solid with an even compression throughout. The fact that there are no internal cavities to cut out or to wear the rubber, that a new section of any size may be quickly inserted, are a few strong Firestone features.

ACCESSORIES.



Of accessories and sundries or specialties there has been an amazing multiplication. They are of all sorts, sizes, shapes and conditions, and perform all sorts of functions in all sorts of ways. The greatest influx is of speed indicating instruments and of non-puncturing and non-skidding devices and of automatic tire inflators. All of them are ingenious; some of them will prove useful. Most of the standard accessories—lamps, for instance—have been splendidly improved, the better known wares now comparing favorably with the best foreign product, which, is, in fact, rapidly disappearing from the American market.

IGNITION ACCESSORIES.



Induction coil making has reached a stage where it is a matter of improving upon improvement to such an extent that radical changes of any nature in this field are hardly to be looked for. Not that the apparatus of the present day exemplifies the last word in the direction of betterment by any means, but, short of the unexpected, the induction coil may be relied upon to retain its now-a-day familiar features unchanged for some time to come. And unexpected changes are not made by the manufacturers on the first of each passing year, they come as a bolt out of the clear sky; existing things are revolutionized, and every one hustles to get in line with the fortunate inventor. Nothing of this order has appeared on the horizon during the last 365 days, nor is anything radical foreshadowed by what may be gleaned from a sifting of the aggregate showing of the coil makers at this year's exhibition.

The "tilting bridge," or hinged vibrator, permitting of the instantaneous examination of the contact points without any disturbance of the adjustment, as shown on the Pittsfield and American coils, is an innovation that will not only be appreciated by all users, but will tend to lighten the makers' troubles, for many a good coil has received its quietus at the hands of an amateur adjuster when in reality the battery was at fault. The makers of the Pittsfield coils have come to recognize the merits of the French article, and their product is now in

PIERCE

The Pierce Car was awarded the Grand Prize at the St. Louis Exposition as the best expression of an American car built for American conditions and American temperaments.

The Grand Prize thus awarded is but a recognition of a standard toward which we have been working for five years, and which we believe we have attained.

The six cars which we have built for 1905 comprise the best we know of successful motor car building.

Catalog and technical descriptive matter sent on request.

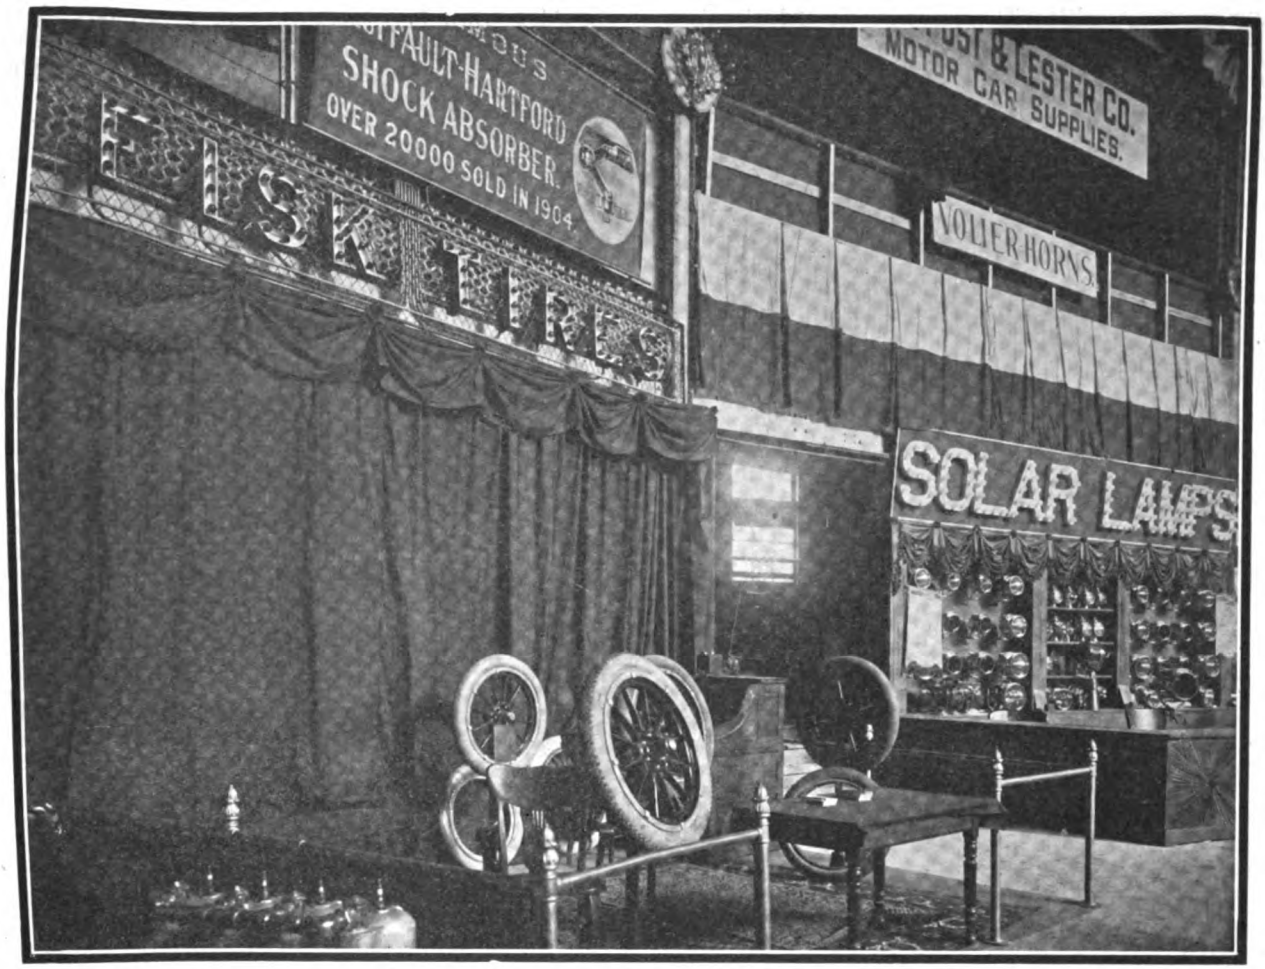
its essential features, as well as in detail, such as the adoption of spring screw binding posts and sectionalizing the units for convenient replacement, patterned after the latter.

That weak point of the majority of early attempts at high tension coil making—insulation—has been practically overcome entirely, so that it is a poorly made coil indeed that should suffer nowadays from punctures in the secondary itself or between the latter and the primary or the condenser. One of the most effective methods of accomplishing this part of coil construction has been brought about by the use of a moulded receptacle of insulating composition. Spaces to exactly accommodate the primary, both sections of the secondary, which are separated by a substantial insulating wall between them, and an independent pocket at the side for the condenser, are provided, the mould being made in two pieces. The windings and condenser being inserted, the other half is placed over them and both are sealed by melting the composition together at the joints. This is a feature of the American coils.

Another early trouble was the more or less frequent puncturing of the sparking leads where high tension was employed, either from inherent defects in the insulating covering itself—this in many instances being totally inadequate for the purpose—or after it had been attacked by waste acid or oil or a combination of all three. First attempts to remedy this resulted in wires which were little short of cables, so many were the layers superimposed over one another and over that important little piece of wire. Great advances have been made in this direction, and the present day wire, which the makers one and all assure the intending buyer is absolute proof against the ravages of the three destroyers above mentioned, will doubtless fulfil to a very large extent all the good things predicted for it.

Digitized by Google

Improvements in distributing and commutating devices are confined almost entirely to the detailed make-up of the apparatus, which in some instances has been brought to a state of simplicity consistent with efficient working and rapid investigation of its "innards" when trouble is met with. This is exemplified to a great degree in the distributers and commutators shown by the Pittsfield Coil Co. Screws have been entirely eliminated, and each of the contact elements is not only self-contained, but is so placed that it may be instantly lifted from its seat with a pair of pliers and without disturbing any other parts or adjustments. The burning and consequent rapid deterioration of contact surfaces subjected to the high tension current has been overcome by the employment of hardened steel, and in one instance by the use of steel balls similar to those employed in bearings—in fact, a ball bearing contact. Trouble from this source is further guarded against by filling the commutator or distributer with heavy oil or grease, which serves the double purpose of preventing the sparking and oils the bearing of the mechanism, as well as illustrating the fact that grease and the high tension current are on speaking terms, and the former has nothing to fear from a little lubricant. This is the Leavitt Ball Contact Timer, made by the Brooklyn Automobile Co. and handled by Charles E. Miller.



Speaking of this, the makers of small direct current generators have followed the lead of fan motor designers and adopted the oilless bearing, as oil, grease and their accompanying load of dirt when distributed over the commutator of the small dynamo—invariably the case under road working conditions—always proved a detriment to the latter. This is one of the improvements noticeable on the "Apple" dynamos, made by the Dayton Electrical Mfg. Co., which concern has brought its product to a much higher state of efficiency by increasing the output of their machine to 10 volts and 5 amperes, and the use of wide and heavy brushes of copper gauze embedded in carbon, with regulating devices similar to those in vogue on larger generators. Form wound fields complete the resemblance, so that these dynamos are now practical replicas in miniature of those employed for lighting purposes. Motor generator sets of the same capacity for use in conjunction with a 110 volt supply are provided for those who do not wish to install a generator on their cars. Further improvements have been effected by the addition of rawhide pinions for direct drive from a shaft or periphery of the flywheel, for which purpose they also supply a toothed shell to fit any of the standard flywheels. The latter may be attached by merely drilling and tapping for a few machine screws, and in conjunction with the rawhide gearing on the dynamo make a very smooth running machine. This is a variation of the leather bevel gear flywheel drive, and overcomes any lost motion due in the latter case to a worn bevel wheel or insufficient friction from any cause. An innovation that will be appreciated is the use of a storage battery in shunt with the machine and always charging, so that the ignition current taken from the dynamo is boosted by the battery and an adequate supply at constant potential is maintained. The accumulator is in the shape of convenient units, four of which are used in series to give the same voltage as the generator, and as they are of 30 ampere hours' capacity, the current is further utilized for two six-candlepower headlights and a four-candle tail light. Control is through a three way snap switch on the dashboard, making any desired combination but a matter of one or two turns. This firm is also showing a line of coils with a two piece, spiral spring controlled vibrator, for which advantages over the ordinary type are claimed.

Plugs have doubtless come in for their share of attention during the last twelvemonth, but, aside from a few novelties, there is not a great deal of either advance or radical improvement over previous existing types to place on record. Built up insulation of transverse layers of mica put together under powerful compression—a foreign idea, originally hailing from Germany and scoffed at to greater or less degree by most of the domestic makers a few years back—has come to be quite a general favorite. The "Constant"—a double ended plug with a double gap at each end—is one of the few new things noticeable, and has some features that merit attention. It is, in brief, two plugs placed end to end, though made practically in one piece, heavily mica insulated and having, instead of the familiar platinum points, a bridging point of iron with a gap from each end of it to the rim of the plug. Either end of this plug may be inserted in the cylinder, the exposed portion being protected by a cap and mica cover, rendering the working of the plug visible. In case of accident it may be instantly reversed, and, if desired, either end may be cut out by short circuiting it. This should in a measure at least obviate the necessity of carrying extra plugs.

Mosler, of "Spit Fire" plug fame, shows a plug of his make designed for a thousand horsepower engine, and while it is not likely to be in universal demand, makes an interesting exhibit. An innovation in plug making is to be found in an ingenious attempt to do away with the inevitable sooting, so common to many, by providing two small air inlets on each side of the core of the plug and through which the suction of the engine will draw air into the cylinder between the walls of the plug, thus preventing a deposit of this objectionable carbon. To avoid an escape of compression via the same passages they are automatically closed by ball checks on the compression stroke.

Switches have been brought to a stage of improvement where compactness and convenience are prominent features, those shown by the Pittsfield makers exhibiting the same absence of screws with consequent simplicity and the placing of all parts behind the hard rubber base, thus protecting them from moisture. A novelty in the shape of a switch is provided either with a lock or a combination, and no one not possessing one or the other of these essentials can start the car. Its object is to assist the absent minded man who is forever mislaying or losing the ordinary plug cut out, by providing something that cannot get away from him. It is termed the Parker lock switch, and is manufactured by a firm of the same name in Newburg, N. Y.

C. F. Splitdorf, the "man who makes coils" and has been making them for a good many years, has, in addition to bringing his product right up to date, turned his attention to the magneto problem, and has evolved a machine which should add to his fame. This is a high tension alternator, with permanent fields of circular form placed end to end—it is, in short, the result of experiments on the inventor's part in revolving a complete induction coil before a magnetic field. Both the primary and secondary windings are on the arms of a laminated H armature of well designed proportions, the condenser being located at the side and the collector and distributer just above it so that it forms in itself a complete self-contained ignition outfit that has many good points to recommend it. The same maker has delved into the effect of hysteresis on the magnetic core, and to reduce the latter to a minimum has brought out a coil with ventilated core, this being accomplished by drilling holes longitudinally through the latter. Beyond a certain temperature both iron and steel are not affected by magnetism, but rapid pulsations of magnetic force, such as are set up in the core of a coil when working, are productive of heat, and it is to minimize the effect of the latter that these air passages have been made. As the coil is used in vertical position, the ascending warm air causes them to act much the same as a chimney on a miniature scale. This is a refinement in coil building hitherto unsought for.

The principles of the inductor alternator are such as to render its application to an engine both simple and economical, and it is strange that this system has not come in for more serious consideration on the part of engine builders. The Polyphase Ignition Co. have adapted this principle to the sparking problem in a manner that presents many and obvious advantages to one familiar with its workings, and the lack of attention accorded it is due in numerous instances to the fact that it is so far above the calibre of the many who are still wedded to the dry cell that it is regarded with more or less suspicion and deemed a matter of endless complications, as is likewise the high tension magneto and synchronous distribution. As applied by this concern, a circular permanent magnetic field is mounted directly on the main shaft of the engine, and the flywheel is cast integral with segments so as to form the inductor. Either single or double phase may be used, and the machine has been designed to produce a flattened current curve on the magnetizing impulse, dropping sharply to a peak on the demagnetizing side, so that in the latter case one curve follows the other so closely that they almost coincide, with a consequent elongation and increased duration at the sparking terminals. The distributor used in connection with this generator is patterned after the "comb" collectors used on static machines, and, as in the latter, the teeth do not come in contact with anything, but are passed close to what in the ordinary distributor would be the bearing surfaces, thus producing an additional intensifying gap. The field being mounted on the engine shaft, this permits of a very wide range of advancement or retardation in the time of ignition. This system merits close attention on the part of designers desirous of bringing this feature of their motive power to an advanced state of efficiency, and while it may not have been solved to a certainty by the concrete example of its application cited above, more study will be given it in the fulness of time, and then many will wonder why it was not taken up sooner. But as it marks a step in advance of the high tension magneto with synchronous distribution—and not many have come to the latter as yet—it is too much to expect that this step in the process of evolution toward a higher standard should be passed over.

The ignition problem has proved a boon to the dry cell industry, and doubtless enough are now turned out annually for this purpose alone to reach across the continent. The makers of the "Ever Ready" cells have almost doubled the capacity of their batteries, which now test to 30 amperes in the case of the standard, or 6-inch, size, and 35 amperes in that of the 7-inch, as compared with an average of 15 to 18 amperes, which represents the maximum heretofore obtainable. Sparking apparatus is being wound almost universally for 8—10 volt current, so that no attempt is being made to increase the voltage of dry cells, particularly as the latter would

Digitized by Google

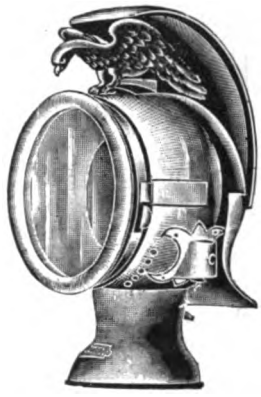
tend to greatly shorten the life. The automatic battery case is an innovation provided for the benefit of dry cell users by the American Coil Co. With its aid it is only necessary to insert the cells and put the connecting strip in place. Two thumb nuts are provided which render the latter "fool proof" and prevent its insertion in anything but the correct way. This strip has spring brass wires which, when in place, engage all the binding posts of a four or six cell set and make automatic connections.

To sum up the results of careful observation of everything in the shape of ignition accessories, little can be said except that improvement has in the main been confined to detail, and that on the whole matters are in very much the same condition as they were a twelvemonth back, where this end is concerned.

TIRE APPLIANCES.

Throughout the show it was obvious that if any particular line had been omitted, it was certainly not tire protectors and non-skidding devices. The Republic non-skid bands, manufactured by the Republic Rubber Tire & Shoe Co., New York, showed a leather non-skidding cover. This cover can be applied to solid, cushion, or pneumatic tires, and is fitted with large brass studs. H. & F. Messenger Mfg. Co., New York, displayed their detachable leather tire protector, which is merely strapped on the rim of the wheel. Le Marquis is another tire cover made of leather with metal studs. The Detroit Motor Supply Co., Detroit, Mich., have a heavy puncture proof leather case or cover, which is rather more thickly coated with steel studs than the others. It certainly has a solid appearance, and is also strapped to the rim of the wheel. The Pneumatic Tire Protector Co., New York, exhibited a rubber cover which is far lighter than the other protectors, though perhaps less effective. It only covers that part of the wheel which comes immediately in contact with the ground.

There are a number of "next-door neighbors" to these puncture preventers—one is an adhesive repair patch shown by the Charles O. Pingley Co., Rahway, N. J. No cement is necessary to make it stick. It incorporates the porous-plaster idea, the heat generated by the road friction softening the rubber and causing the patch to adhere fast to the inner tube. By far the most amusing exhibit of this kind is what maybe termed a puncture alarm, made by the Worcester Auto Co., Worcester, Mass. Through the use of a contact arm bearing on the tire and two concave discs a clicking noise is produced on the alarm immediately the tire is deflated badly enough to cause any detriment to it. The Garlick Auto Prop Co., Paterson, N. J., contend that tires suffer as much from the car resting on them while not in use as they do from actual traveling. As an aid to this trouble they showed a wooden tripod stand about thirty inches high for the purpose of placing under the axles and elevating the machine when in the garage. Four of these tripods are needed to keep the tires from the ground.



Efforts to automatically inflate tires are unexpectedly numerous. The Hibbard Automatic Tire Pump, marketed by McCord & Co., of Chicago, presents an ingenious device of the sort. The pump is fastened to the spokes with spoke clamps. The hose of the pump is then attached to the valve of the tire in the ordinary manner. The pump is operated by means of an eccentric arrangement which surrounds the wheel hub, and one part of the device is held against rotation by a cord, which may be fastened to the mud guard or some other fixed portion of the car above the wheel. The apparatus is equipped with a cut out appliance, through which it ceases to act after a pressure of 110 pounds is reached. In the event of a leak the pump will maintain the pressure, though, of course, it would necessitate continued action. Anyhow, with this pump the tire will always remain at a uniform point without attention. For inflating the rear wheels the device may be applied, and the rear part of the vehicle being jacked up, the tires may be filled by starting the engine. The Brown-Lipe Gear Co., Syracuse, N. Y., also have a pump which is supposed to eliminate much of the trouble caused by deflating tires. This pump is worked by the engine only, the spark plug must be unscrewed, and the air valve is screwed into the cylinder, while a long rubber tube connects with the tire. It is claimed to do the work in three minutes, and is the invention of Arthur G. Bolster. The Auto Supply Co. have the P. T. C. Power Pump, which must be attached to the vehicle in such a manner as to allow the friction pulley to be brought in contact with the fly wheel of the engine, when the pump is moved along the sliding base by the thumb screw. One end of the hose is attached to the valve in the tire, and the other end to the pump, which is started by turning a screw to the right. The pressure is registered on the gauge, and when the necessary pressure is obtained, the screw must be turned to the left. A multiple gear pump has been launched by the Wray Pump & Register Co., which is said to require less than half the ordinary power to drive it. The same company has also a pressure register for the purpose of ascertaining whether the tires are evenly inflated. The Gleason-Peters Co. pump is not a bad idea. When in use the handle is horizontal, but when it is folded it is vertical, and the foot rest closes with a spring on the cylinder of the pump, making it very portable. The Ultra Compound Pump is being shown by the Post & Lester Co. This pump has an indicator on top for the purpose of knowing exactly the air pressure upon the tires.

The Champion automobile repair kit is displayed by Patterson, Gottfried & Hunter, New York. The Calculograph Co., of New York, demonstrated a time register, to be used principally by garage people who rent cars by the hour. It marks on a card the exact time of departure, and on another space will naturally mark the incoming time. The Sprague Umbrella Co. show a sixteen rib extension top, the ribs being of tempered steel and the covering of mohair. The Wheeler Mfg. Co. had some new light canopy tops on view. The one for touring cars weighs 40 pounds, and an extension top of the folding type weighing about 35 pounds.

Covers of every conceivable type are made by the Gilbert Mfg. Co., New Haven, Conn. They have some good waterproof covers of combination rubber and cloth for lamps, and one new feature in the way of a similar cover for automobiles, which clothes every part of the vehicle except the wheels. The Poughkeepsie Art Pulp Co. have a new touring car side hamper, through which the dust cannot penetrate. Saks & Co., New York, have a new kind of automobile hat made of leather, but shaped something like a Panama, which it is supposed to represent. They also showed some novelties in the way of women's headgear, made of red leather, with a black brim.

NEWNESS IN LAMPS.

Lamps are of an infinite variety, but for downright novelty, L. Angiulli, New York, easily takes the palm. He seeks to make his lamps not only useful, but unusually or-

One of Anguilli's Lamps.

namental. There is on his stand, among others, a revolving searchlight in the shape of a bell. When not in use it hangs down exactly like a bell; it is made of brass, with a straight, wooden handle. Another ostentatious light was one in the shape of a helmet, with two visors, which may be regulated to obscure, or partially obscure, the light. Another helmet lamp is shown with a white eagle on top and without the visors. The Twentieth Century Mfg. Co., New York, displayed some handsome lamps. They have just launched a new generator in which the conditions of water and carbide are reversed, by the carbide dropping in grains in the water and thus causing the gas. The C. P. Ham Mfg. Co., Rochester, N. Y., have some handsome oil burners. What is termed the cold blast principle has been introduced. The idea is that a fresh supply of cold air gives a brighter light. They have a double body, through which the warm air is forced out at the bottom, leaving only fresh, cold air in contact with

Digitized by Google

the flame. A new tail lamp is also exhibited, which is made with a solid brass handle, and also serves the purpose of ascertaining the cause of trouble in the machinery. It has a white light on the side and the usual red light in front. The N. Y. Coach and Auto. Lamp Co., New York, have a lamp called the latest French creation. It is round in shape and is fitted with a foreign lens, and throws a powerful light, and, like a camera, has a focussing arrangement in front. Of course the Badger Brass Mfg. Co., Kenosha, Wis., show their famous Solars to advantage, their parabolens generator head lamp being the most recent creation. The innovation consists of the combination mirror reflector and a polished magnifying plano convex lens in front. The Autolyte projectile type is another powerful light, and is fitted with Bausch & Lomb lenses. The Motor Car Equipment Co. have a unique lamp, shaped like a ball and termed the Fire Ball. The claims made for this shape are the absence of seams and ease of cleaning. It goes without saying that Gray & Davis, with their Bullet lamp, were conspicuous, the lamp being made more conspicuous, perhaps, by one or two crude efforts at imitation of the Bullet's shape, that were thinly disguised under other titles. A new oil tail lamp was included in the exhibit. The Atwood lamp is shown on Chas. E. Miller's stand and is quite equal to the Atwood reputation.

A new low-priced gasolene pump is exhibited by the S. F. Bowser Co., Fort Wayne, Ind. It works well and costs only $12. The company had their usual stock of gasolene tanks and equipments. The Ironclad Mfg. Co., Brooklyn, N. Y., showed the model of a new steel-hooped metal barrel, hermetically closed, and opening from the top by means of springs.

DELUGE OF SPEED INDICATORS.

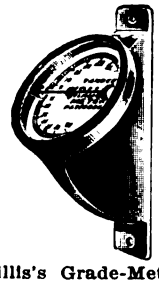
Numerous speed indicators have recently been placed on the market and quite a number were shown in different exhibits. Among the newest ideas of this kind is the Auto-Meter, manufactured by the Warner Instrument Co., Beloit, Wis. It is a combination distance and speed indicator, showing the rate at which the car is travelling and the distance covered on one particular trip, also the entire distance covered from the time the register has been in use. A magnet is its power, and as it works independently of weights, liquids or air, the makers are of the opinion that it is not subject to the law of centrifugal force, and they contend that the scale is absolutelv even. The magnet revolves freely on ball bearings and is not connected with the indicating dial. The latter is suspended in front of the magnet, and a partition separates them, which is said to preclude the possibility of air affecting it. The dial is mounted on a pivot, of which the ends ride in sapphire bearings. A hair spring holds the dial to zero point, and the magnet, when revolving, has a tendency to draw the dial in the direction of its revolution, while the hair spring opposes its tendency. The greater rapidity of the magnet's revolution, the greater the displacement of the dial, and when the speed of the magnet doubles, the displacement is doubled. The length of the dial is practically six inches, which is large for the size of the instrument. The worm driven by the same shaft that drives the magnet operates the worm gear, which is connected directly to the odometer. Mounted on the dashboard, it can be tilted to any angle to accommodate the vision of the motorist, and thus it is possible for him to determine the distance covered at any stage of the journey.

Another speed indicator not wholly new is the one manufactured by the Webb Co., who have their factory in Newark, N. J. It is constructed with a taper bore and a long, thin aluminum wire called a "flyer." There is also a blower, which is a combination of two gear wheels, and is similar in principle to the water circulation pump which feeds the radiator of the water cooled automobile. As the speed of the car becomes greater or less, the size of an opening and the height of the flyer vary accordingly. The diameter of the flyer is exactly .500 inch. Its weight is five and one-quarter grains. There are three different types, varying from 40 to 100 miles.

The McGlehan dashboard odometers, made by the McGlehan Odometer & Mfg. Co., New York, had an interesting exhibit of their Models A and B. For speed indicating, the company suggests timing the passing miles by watch. The Veeder Tachometer, or speed indicator, manufactured by Veeder Mfg. Co., Hartford, Conn., attracted attention. It registers somewhat on the order of a thermometer, a red fluid marking on the glass the speed of the car. The Jones Speedodometer is actuated by a flexible shaft and gear drive on the front wheel. There are two sizes of this instrument made with indicating dials, three and four inches in diameter.

The Chicago Pneumatic Tool Co. showed an interesting speed-odometer of the dashboard type. Like the weather chart, the speed indicator records on paper the different speeds of the journey by means of a needle and a reel of paper inside the indicator, thereby creating a permanent record of the entire trip.

The R. & C. Indicator Co., Bridgeport, Conn., are exhibiting their gasolene gauge applied to the filling opening of the gasolene tank, and by which the quantity of gasolene in the tank is marked. The indicating point is actuated by a permanent magnet, which is incased in a brass tube depending from the indicator top to the bottom of the tank.



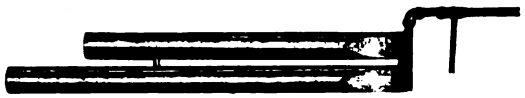
Many of the jacks shown were similar in type and mention is hardly necessary, as it would only mean a general repetition with the name of a different manufacturer. The Wray Pump & Register Co. exhibited a good automobile jack, which works by means of a pump, very much the same idea as used in inflating tires. The car is lowered by opening a small valve. This is undoubtedly one of the foremost jacks on the market. The Duff Mfg. Co., of Pittsburg, Pa., demonstrated what they term a Barrett jack. It raises on the downward movement of the lever only, supposedly an improvement over the double acting jack.

The improved equalizing gear shown by the Brown-Lipe Gear Co. is interesting. By an addition of six pinions, making twelve in all, the capacity is doubled without increasing the size and making it very little heavier.

Charles E. Miller, New York, shows an almost endless variety of supplies for the needs of an automobilist, and among his latest novelties is the Manometer, which is a pressure gauge for indicating the pressure of the cooling water on gasolene cars. It is intended to be connected to the return pipe from the cylinder jacket to the radiator coil. The necessity of maintaining good circulation is important. This Manometer has a flange with screw holes on the back of the case, permitting it to be screwed to the dashboard, and the rigid method of fastening secures correct registering.

WILLIS'S THREE NOVELTIES.

There were three distinct novelties displayed on the stand of E. J. Willis & Co., New York. The first and perhaps the most recent of these innovations is the Grade-Meter, which is placed on the dashboard in



Willis's Grade-Meter.

full view of the driver, who can immediately discern the grade of the hill the car is climbing. It is an ingenious employment of gears, glycerine and a balance weight, and is so simply, yet perfectly, constructed that it indicates the grade exactly without any vibration of the indicating hand while the automobile is in motion. The dial is at an angle and the figures are large enough to be read from the seat. Willis also shows a new muffler, called the Automatic Yankee Silent Muffler, composed of 24 opposed spring discs on the end of the exhaust pipe. At 12 regular intervals the exhaust pipe is bored with several small holes opening into the chamber. The gas passes into the 12 radiators at the same time and escapes from around the outer edges of these discs in a thin stream. This form of muffler has been found to be noiseless, and as the outlet point of escape is so much larger than the bore of the exhaust pipe, there is no back pressure. The discs free themselves of all soot and foreign matter by the force of gravitation accelerated by the force of exploding gases. The Yankee Non-Vibrating Steering Wheel is another Willis novelty. It has a flexible rubber disc in the centre, and the spokes are much shorter than in the ordinary run of wheels. The fact of having a rubber diaphragm lessens the jar on the wrists and does not detract from the power or strength of the steering gear.

Digitized by Google

HORNS OF ALL SORTS.

What looks extremely like an organ pipe is the new Gabriel Horn, the invention of C. H. Foster, and manufactured by the Gabriel Horn Manufacturing Co., of Cleveland, O. The feature of the new invention is the musical note it makes, and the fact of it being operated from the exhaust, blowing a full blast with less than one pound pressure. The horn can be placed on the bonnet of the car or underneath the body. On gasolene engines that have a specially light exhaust a valve is placed on the exhaust pipe, which is manipulated by the cord that blows the horn, opening the pipe to the horn and closing the end leading out, causing all the exhaust required to pass through the horn. It has no reed and is said to be unaffected by water or oil. More of these horns are in course of construction with three pipes, instead of

Gabriel's Horn.

two. Another idea of musical horn is shown in the exhibit of A. H. Funke, New York. His specialty is a double horn, operated by the usual bulb, which gives out a double note, probably not the perfection of harmony, yet it should be very effective in its purpose. Funke has also on exhibition a triple auxiliary horn, with stops on it similar to a cornet and blown after the same manner. It is supposed to be used in the event of an emergency, and a bugle call could easily be blown on it to warn pedestrians. Not altogether a new design is the Dragon horn, exhibited by both Charles E. Miller and the Post & Lester Co. It has a large mouth, but for the purpose of avoiding the wind and dust, a wire shield is provided which lessens the size of the opening, but does not diminish the sound. The double turn in this horn gives a deep bass stentorian sound and should be appreciated by those enjoying the pleasure of a long tour, as it can be heard from afar. In connection with the exhibition of horns, a foot blower is shown, made by the Pneumatic Tire Protector Co., Dayton, O. It is attached to the side of the machine, where it does not interfere with the other pedals, and a slight pressure of the foot will blow the horn.

R. E. Hardy & Co., New York, are showing the Dome gasolene outfits. One feature of their pump is worthy of notice. On top of the gasolene pump is a glass dome shaped device, and all the gasolene going into the tank first passes through the glass, and the quantity and impurities can be immediately detected. One movement of the pump handle empties the gasolene, and it remains in the glass bowl on the pump. A downward movement of the handle returns the gasolene to the storage tank. For filling the automobile tank a faucet is placed on the pump, and the exact quantity can very easily be regulated.

Single glass goggles are becoming quite the rage, and to meet the fastidious tastes of many E. B. Meyrowitz, New York, is exhibiting curved glass goggles, which are made in one piece, permitting thus to look in any direction without actually bending the head. They are comfortable, and a plush lining prevents them chafing the skin. The fact of there being no dark space in the middle keeps the view much clearer, and also they do not depend on the nose for support. The Motor Car Equipment Co., New York, have some collapsible goggles and the new feature is having them folding as well as collapsible, so that they can be placed in a small pocket.

EXHIBIT OF AMERICAN BALL BEARING CO.

Summary of Cars Exhibited.

Duryea Power Co., Reading, Pa.—Duryea cars; one three seated family phaeton, gasolene, three cylinders.

Phelps Motor Vehicle Co., Stoneham, Mass.—Phelps gasolene cars; one three cylinder car; one chassis.

Apperson Bros.' Automobile Co., Kokomo, Ind.—Apperson gasolene cars; one four cylinder car; one chassis.

Winton Motor Carriage Co., Cleveland, Ohio—Winton gasolene cars; two touring cars and one limousine, four cylinders; one chassis.

Knox Automobile Co., Springfield, Mass.—Knox gasolene cars, four; three two cylinder cars, one single cylinder car; one chassis.

Thomas Motor Co., E. R., Buffalo, N. Y.—Thomas gasolene cars; three four cylinder cars; one chassis.

Royal Motor Car Co., Cleveland, Ohio—Royal Tourist gasolene cars; two four cylinder cars.

American Motor Co., Brockton, Mass.—Marsh gasolene car; one two cylinder runabout.

Springer Motor Vehicle Co., New York City—Springer gasolene cars; one four cylinder touring car and one two cylinder delivery wagon.

Daimler Mfg. Co., Long Island City, N. Y.—American Mercedes gasolene cars; one chassis, four cylinders; one body.

Vehicle Equipment Co., New York City—Nine cars, all electric; four heavy trucks, three delivery wagons, one Victoria and one cab.

Lane Motor Vehicle Co., Poughkeepsie, N. Y.—Lane steam cars; one car and one chassis.

Covert Motor Vehicle Co., Lockport, N. Y.—Covert gasolene cars; one four cylinder car, one single cylinder car.

Packard Motor Car Co., Detroit, Mich.—Packard gasolene cars, two four cylinder cars; one chassis.

National Motor Vehicle Co., Indianapolis,

Digitized by Google

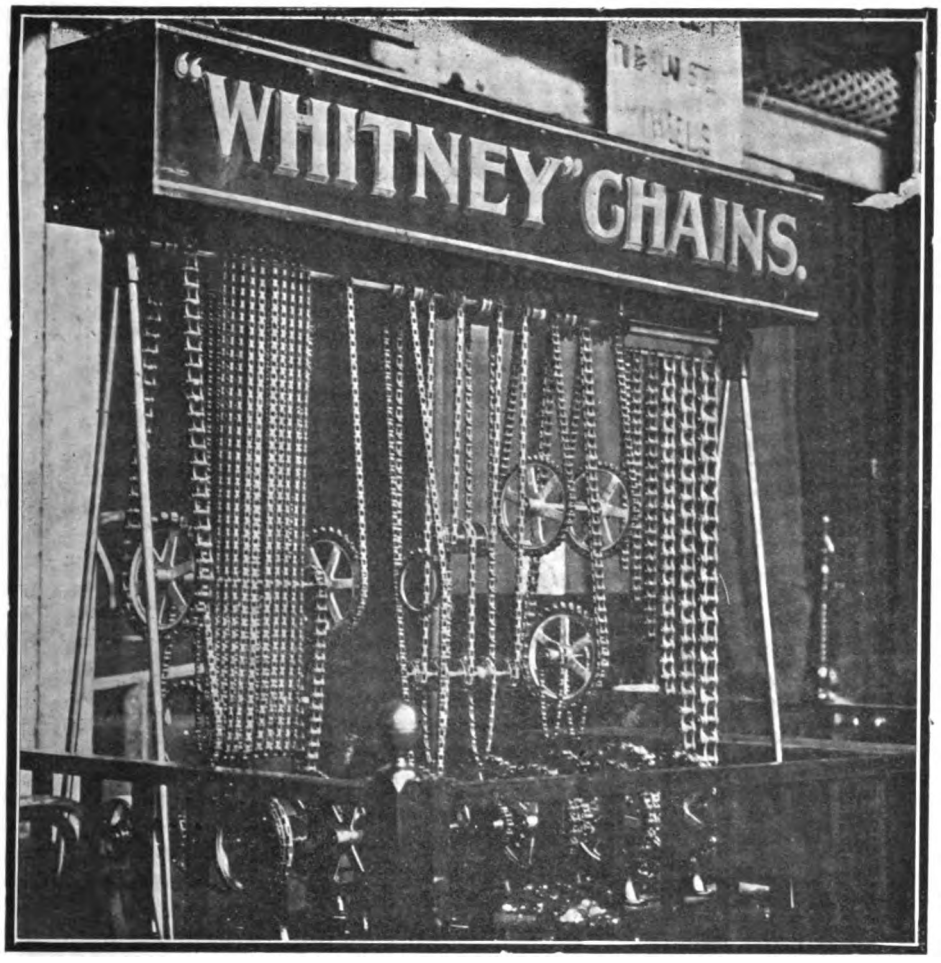


EXHIBIT OF WHITNEY MFG CO.

Ind.—National cars, gasolene and electric; three cars, one gasolene, four cylinders; two electrics; one chassis.

Studebaker Automobile Co., South Bend, Ind.—Studebaker cars, gasolene and electric; seven cars, two gasolene, one four cylinder and one two cylinder; five electrics; one chassis.

Smith and Mabley Mfg. Co., New York City—Simplex gasolene cars; two four cylinder cars; one chassis.

Prescott Automobile Mfg. Co., New York City—Prescott steam cars; one steam car.

Stevens Arms & Tools Co., Chicopee Falls, Mass.—Stevens-Duryea gasolene cars; two cars, one four cylinders, one two cylinders; one chassis.

Elmore Mfg. Co., Clyde, Ohio—Elmore Pathfinder cars, gasolene; two cars, one single cylinder, one two cylinder.

Standard Motor Construction Co., Jersey City—Standard Gasolene cars; two four cylinder cars.

Pope Mfg. Co., New York City—Pope-Toledo, Pope-Hartford, Pope-Tribune gasolene cars and Pope-Waverly electric cars; two single cylinder cars, two two cylinder cars, four four cylinder cars and four electrics.

Olds Motor Works, Detroit, Mich.—Olds cars, gasolene; four single cylinder cars and two two cylinder cars.

Locomobile Co. of America, Bridgeport, Conn.—Locomobile gasolene and steam cars; six four cylinder cars; one chassis.

Haynes-Apperson Co., Kokomo, Ind.—Haynes gasolene cars; one four cylinder car and two two cylinder cars.

Mitchell Motor Car Co., Racine, Wis.—Mitchell cars, gasolene; one two cylinder car, one four cylinder car.

Worthington Automobile Co., New York City—Meteor gasolene cars; six four cylinder cars.

Kirk Mfg. Co., Toledo, Ohio—Yale gasolene cars; one two cylinder car and one four cylinder car.

Baker Motor Vehicle Co., Cleveland, Ohio—Baker electric cars; one 'bus, two Stanhopes, one delivery wagon and one two seat carriage.

White Sewing Machine Co., Cleveland, Ohio—White steam cars; two cars.

Stearns Co., Cleveland, Ohio—Stearns gasolene car; one four cylinder car; one chassis.

Northern Mfg. Co., Detroit, Mich.—Northern gasolene car; one single cylinder car, one two cylinder car, one chassis.

Autocar Co., Ardmore, Pa.—Autocars, gasolene; one four cylinder car, two two cylinder cars, one chassis.

Electric Vehicle Co., Hartford, Conn.—Columbia electric and gasolene cars; four four cylinder cars, one two cylinder car, six electric cars, two chasses.

Waltham Mfg. Co., Waltham, Mass.—Orient gasolene cars; two single cylinder cars, two four cylinder cars, one chassis.

Pierce Co., The Geo. N., Buffalo, N. Y.—Pierce Great Arrow and Pierce Stanhope, gasolene; three four cylinder cars, one single cylinder car, one chassis.

Matheson Motor Car Co., Holyoke, Mass.—Gasolene cars; one four cylinder car, one chassis.

Cadillac Automobile Co., Detroit, Mich.—Cadillac gasolene cars; one four cylinder car, three single cylinder cars, one chassis.

Lozier Motor Co., New York City—Lozier gasolene car; one four cylinder car.

Corbin Motor Vehicle Corporation, New Britain, Conn.—Corbin gasolene cars; two four cylinder cars.

Ford Motor Co., Detroit, Mich.—Ford gasolene cars; two two cylinder cars, one four cylinder car, one chassis.

Reliance Motor Car Co., Detroit, Mich.—Reliance gasolene cars; one two cylinder car.

Peerless Motor Car Co., Cleveland, Ohio—Peerless gasolene cars; three four cylinder cars.

Jeffrey & Co., Thos. B., Kenosha, Wis.—Rambler gasolene cars; three two cylinder cars.

Grout Bros.' Automobile Co., Orange, Mass.—Grout steam car; one car, one chassis.

Commercial Motor Co., New York City—Walter gasolene cars; one four cylinder car, one chassis.

Buick Motor Car Co., Jackson, Mich.—Buick gasolene car; one two cylinder car.

Reo Motor Car Co., Lansing, Mich.—Reo gasolene cars; one single cylinder car, one two cylinder car, one chassis.

Blonstrom Motor Car Co., C. H., Detroit, Mich.—Queen gasolene cars; two two cylinder cars, one chassis.

Buffum Co., H. H., Abington, Mass.—Gasolene cars; two four cylinder cars.

Maxwell-Briscoe Co., Tarrytown, N. Y.—Maxwell gasolene cars; three two cylinder cars, one chassis.

Wayne Automobile Co., Detroit, Mich.—Wayne gasolene cars; one two cylinder car, one four cylinder car.

Worthington Automobile Co., New York City—Three four cylinder Reo-Bollee gasolene cars (imported).

Premier Motor Mfg. Co., Indianapolis, Ind.—Premier gasolene cars; three four cylinder cars.

Panhard & LeVassor Automobile Co., New York City—Panhard gasolene cars; four four cylinder cars.

De Dietrich & Co., New York City—Four four cylinder cars, De Dietrich gasolene cars.

Palais de l'Automobile, New York City—Gasolene cars; two four cylinder Renault cars, three four cylinder Panhard cars.

Welch Motor Car Co., Detroit and Pontiac, Mich.—Welch gasolene cars; one four cylinder car, one chassis.

St. Louis Motor Carriage Co., St. Louis, Mo.—St. Louis gasolene cars; two single cylinder cars.

Gas Engine & Power Co. & Chas. L. Seabury Co., Consolidated, Morris Heights, N. Y.—Speedway gasolene cars; one four cylinder chassis.

Michigan Automobile Co., Kalamazoo,

Digitized by Google

Mich.—Michigan gasolene cars; two two cylinder cars, one chassis.

Marion Motor Car Co., Indianapolis, Ind.—Marion gasolene cars; one four cylinder car.

Cleveland Motor Car Co., Cleveland, Ohio—Cleveland gasolene car; one four cylinder car, one chassis.

Acme Motor Car Co., Reading, Pa.—Acme gasolene cars; one two cylinder runabout, one four cylinder touring car, one two cylinder opera 'bus.

Bartholemew Co., Peoria, Ill.—The Glide gasolene cars; two single cylinder cars.

Ardsley Motor Car Co., Yonkers, N. Y.—Ardsley gasolene cars; one four cylinder gasolene car, one chassis.

Mack Bros.' Motor Car Co., Brooklyn, N. Y.—Manhattan transportation gasolene cars; one four cylinder passenger car.

Jackson Automobile Co., Jackson, Mich.—Jackson gasolene car; one two cylinder car, one chassis.

Austin Automobile Co., Grand Rapids, Mich.—Austin gasolene cars; one four cylinder car, one chassis.

Pierce Engine Co., Racine, Wis.—Pierce Racine gasolene cars; one single cylinder car, one two cylinder car.

Oscar Lear Automobile Co., Columbus, Ohio—The Frayer-Miller gasolene car; one four cylinder gasolene car, one chassis.

Knox Automobile Co., Springfield, Mass.—Knox Waterless cars; one single cylinder car, two two cylinder cars.

Napier Motor Co., of America, Boston, Mass.—Napier gasolene cars; two six cylinder cars, one chassis.

Coldwell Lawn Mower Co., Newburgh, N. Y.—One gasolene lawn mower.

American Motor Sleigh Co., Boston, Mass.—One motor sleigh.

Reid Mfg. Co., Detroit, Mich.—Wolverine gasolene car; one two cylinder car, one chassis.

Logan Construction Co., Chillicothe, Ohio—Logan gasolene cars; one two cylinder car.

Black Diamond Automobile Co., Utica, N. Y.—Buckmobile gasolene cars; two two cylinder cars, one chassis.

Dolson & Sons, John L., Charlotte, Mich.—Dolson gasolene cars; one two cylinder car.

Buick Motor Co., Jackson, Mich.—Buick gasolene cars; one two cylinder car, one chassis.

Upton Motor Co., Lebanon, Pa.—Upton gasolene cars; one four cylinder car.

Union Automobile Co., Oakdale, Mass.—Union gasolene cars; one two cylinder car, one chassis.

E. H. V. Co., Middletown, Conn.—Compound gasolene cars; one three cylinder car, one chassis.

Crest Mfg. Co., Cambridge, Mass.—Crestmobile gasolene cars; one single cylinder car.

Browne Machine Co., James, Pawtucket, R. I.—Cameron gasolene cars; one single cylinder car, one three cylinder car.

Pungs-Finch Automobile & Gas Engine Co., Detroit, Mich.—Pungs-Finch gasolene cars; one four-cylinder car; one chassis.

Franklin Mfg. Co., Syracuse, N. Y.—Franklin gasolene cars; three four-cylinder cars.

Model Gas Engine Works, Auburn, Ind.—Model gasolene cars; one two cylinder car; one four cylinder car.

Summary of Accessory Exhibits.

American Roller Bearing Co., South Framingham, Mass.—American roller bearings.

American Barr Bearing Co., The, Cleveland, Ohio—Ball bearing axles, wheels, etc.

American Coil Co., West Somerville, Mass.—Coils.

Auto Supply Co., New York City—Supplies.

America Co., Inc., Rockford, Ill.—Specialties.

Autocoil Co., Jersey City, N. J.—Coils.

Aurora Automatic Machinery Co., Aurora, Ill.—Thor motorcycles and fittings.

Allers & Co., H. A., New York City—Specialties.

American Lubricator Co., Detroit, Mich.—Century lubricators.

Angiulli, Luigi, New York City—Lamps.

American Electrical Novelty & Mfg. Co., New York City—Electrical goods.

Baldwin Chain & Mfg. Co., Worcester, Mass.—Baldwin detachable and riveted chains.

Brown-Lipe Gear Co., Syracuse, N. Y.—Gears.

Briscoe Mfg. Co., Detroit, Mich.—Radiators and fenders.

Brennan Motor Co., Syracuse, N. Y.—Brennan gasolene motors.

Badger Brass Mfg. Co., Kenosha, Wis.—Solar acetylene gas lamps.

Baker & Thatcher, Attleboro, Mass.—Puncture preventors.

Breeze Motor Co., Newark, N. J.—Motorcycles and carburetters.

Brown, Wm. H., Chicago, Ill.—Dust shield.

Byrne-Kingston & Co., Kokomo, Ind.—Carburetters.

Bowser & Co., Inc., S. F., Fort Wayne, Ind.—Gasolene outfits.

Brown & Sharpe Mfg. Co., Providence, R. I.—Gears.

Bridgeport Deoxidized Bronze & Metal Co., Bridgeport, Conn.—Castings.

Chicago Pneumatic Tool Co., Chicago, Ill.—Little Giant pneumatic drills.

Columbia Lubricant Co. of New York, New York City—Lubricants and polishes.

Cooper, Dr. T. J., Paterson, N. J.—Tires.

Continental Caoutchouc Co., The, New York City—Tires.

Cramp & Sons' Ship & Engine Bldg. Co., Wm., Philadelphia, Pa.—Castings.

Carbondale Chemical Co., New York City—Lubricants.

Coldwell Lawn Mower Co., The, Newburgh, N. Y.—Motor lawn mowers.

Central Automobile Exchange, Providence, R. I.—Specialties.

G. H. Curtis Mfg. Co., Hammondsport, N. Y.—Motorcycles.

Concentrated Acetylene Co., Indianapolis, Ind.—Acetylene gas and gas tanks.

Cleveland Car Specialty Co., Cleveland, Ohio—Pressed steel frames.

Consolidated Mfg. Co., Toledo, Ohio—Yale Motorcycles.

Carlyle-Johnson Machine Co., Hartford, Conn.—Gears and clutches.

Cook's Sons, Adam, New York City—Grease.

Custead, W. D., New York City—Specialties.

Calculograph Co., New York City—Time recorder.

Constant Dynamo Co., Boston, Mass.—Dynamos.

Dietz, Co., R. E., New York City—Lamps.

Diamond Rubber Co., Akron, Ohio—Diamond detachable clincher tires.

Dow Portable Electric Co., Braintree, Mass.—Spark coils.

Dayton Electrical Mfg. Co., Dayton, Ohio—Apple dynamos.

Demmerle & Co., New York City—Clothing.

Duane & Co., W. J., New York City—Specialties.

Detroit Steel Products Co., Detroit, Mich.—Automobile springs.

Duff Mfg. Co., Allegheny, Pa.—Auto jacks.

Electric Contract Co., New York City—Electrical goods.

English & Mersick Co., New Haven, Conn.—Locks, lamps and other metal specialties.

Edison Storage Battery Co., Glen Ridge, N.—Storage batteries.

Firestone Tire & Rubber Co., Akron, Ohio—Solid tires.

Fisk Rubber Co., Chicopee Falls, Mass.—Fisk mechanically fastened tires.

Funke, A. H., New York City—Lamps, horns, supplies, etc.

Federal Mfg. Co., Elyria, Ohio—Frames, axles, gears, etc.

Gilbert Mfg. Co., New York—Waterproof cases for cars and lamps.

Gray & Davis, Amesbury, Mass.—Headlight, side and tail oil and acetylene gas lamps.

Goodyear Tire & Rubber Co., The, Akron, Ohio—Goodyear detachable clincher tires.

Gunther's Sons, C. G., New York—Fur coats.

Gleason-Peters Air Pump Co., New York City—Pumps.

Goodrich Co., B. F., Akron, Ohio—Goodrich detachable clincher tires.

G & J Tire Co., Indianapolis, Ind.—G & J detachable clincher tires.

Ham Mfg. Co., C. T., Rochester, N. Y.—Oil lamps.

Hartford Rubber Works Co., Hartford, Conn.—Perfected Dunlop detachable and Hartford and Turner tires.

Hartford Suspension Co., The, New York City—Shock absorber.

Hardy Co., R. E., New York City—Starite spark plugs.

Hess-Bright Mfg. Co., The, Philadelphia, Pa.—Ball bearings.

Hine-Watt Mfg. Co., Chicago, Ill.—Lamps.

Hyatt Roller Bearing Co., Harrison, N. J.—Bearings.

Hussey Drop Forge & Mfg. Co., Cleveland, Ohio—Fittings and supplies.

Hjort & Co., Wm., Jamestown, N. Y.—Wrenches.

Hendee Mfg. Co., Springfield, Mass.—Indian motorcycles.

Herz & Co., New York City—Spark plugs, etc.

International Automobile & Vehicle Tire Co., New York City—Tires.

The Week's Patents.

778,821. Connecting Rod. James F. Duryea, Springfield, Mass. Filed March 27, 1900. Renewed May 12, 1904. Serial No. 207,695.

Claim.—1. A connecting rod having at its end a cup-shaped socket, interiorly threaded at its mouth and a longitudinal slot in the wall of the socket which extends to the mouth thereof, a threaded plug screwed in the socket and a lock-nut threaded to the plug and having a projecting rim which engages the mouth of the socket to secure it against spreading, in combination with a ball and supporting arm therefor, substantially as described.

778,894. Process of Making Spongy Lead for Secondary Battery Electrodes. Charles J. Reed, Philadelphia, Pa., assignor to Security Investment Company, a Corporation of Pennsylvania. Filed May 7, 1903. Serial No. 156,094.

Claim.—1. The process of forming spongy or finely-divided lead for second battery electrodes, which consists in mixing one or more compounds of lead with finely-divided metallic zinc, then subjecting such mixture to a liquid which will convert the lead compound into metallic lead and the zinc into a soluble zinc salt, and lastly washing out the zinc salt.

778,988. Carburetter. Francis L. Merritt, Shepherds Bush, England. Filed November 8, 1904. Serial No. 231,866.

Claim.—1. In a carburetter, the combination with a chamber having a valve-controlled air inlet, an oil admission inlet communicating with said chamber, a cone-shaped valve controlling the admission of oil into said chamber, and a deflector located in said chamber and surrounding said valve with its upper end open and terminating in a depending cone and effective to deflect the incoming air so as to assist in the atomizing of the oil.

779,034. Means for Fastening Tires to Wheel Rims. Charles G. Fawkes, Denver, Colo. Filed January 15, 1904. Serial No. 189,213.

Claim.—1. In means for fastening rims to tires, the combination of a shoe adapted to be inserted in the tire and engaging the inner surface of the inner periphery thereof, and suitable means connected with the said shoe for fastening the rim to the tire, comprising a part having a threaded connection with the shoe, said part being provided with a flange adapted to engage the outer surface of the inner periphery of the tire.

779,111. Brake. Frank H. Ball, Plainfield, N. J. Filed June 29, 1903. Serial No. 163,609.

Claim.—1. In a brake the combination of a friction wheel; a split band on said wheel; means for holding either end of said band against the action of the wheel, and for permitting a movement of the free end of the band, a lever connected to one end of the band, and a link connecting the lever with the opposite end of the band.

779,120. Motor-Vehicle. Louis S. Flatau, St. Louis, Mo. Filed December 23, 1903. Serial No. 186,318.

Claim.—1. In a motor-vehicle, a driven axle having independently movable spindles bearing wheels, with their bearings axially pivoted in position, arms fixed to said bearings, a pilot bar pivotally connected to said arms, a manually-actuated shaft having an arm controlling the movement of said pilot-bar, a second shaft, and reversing mechanism connected up with said second shaft.

779,207. Sparking Igniter for Internal-Combustion Engines. Henry Devlin, Philadelphia, Pa. Filed November 4, 1903. Serial No. 179,760.

Claim.—1. In an internal-combustion engine an igniter comprising a reciprocating rod; a slide-block running on the rod; a fixed electrode projecting within the combustion-chamber; a rock-shaft also projecting within the combustion-chamber; a moving electrode on the rock-shaft within the combustion-chamber; an arm pivoted to the slide-block and fast to the rock-shaft whereby movement of the slide-block along the rod rocks the shaft, and thereby makes and breaks the electric circuit; a trigger-arm pivoted to the reciprocating rod which, when moving in one direction, advances the slide-block until contact of the electrodes is effected; means for thereafter tripping said trigger so as to free the slide-block from it; and a spring whereby the slide-block is upon such release driven in the opposite direction and the electrodes separated, substantially as described.

779,216. Starting Mechanism for Engines

WANTS AND FOR SALE.

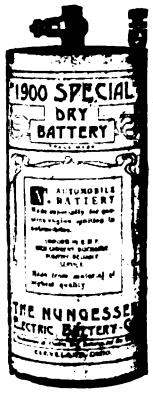
15 cents per line of seven words, cash with order

In capitals, 25 cents per line.

1902 Winton Touring Car, 5 passenger, 20 horse power, double sparking device: guaranteed to run 30 miles an hour. HOWARD CYCLE CO., Trenton, N. J.

FOR SALE—Delivery Top to fit A Model Cadillac, or will trade for Tonneau of same size. L. M. JOHNSTON, Dayton, O.

1904 Tonneau Auto Car, canopy top and headlights; run less than 500 miles; A1 condition; $1,100. ARTHUR McNALL, 67 South ave., Rochester N. Y.



A MORE UNIFORM MIXTURE can be obtained by the use of our automatic air governor when applied to the Oldsmobile mixer. This means more power and speed. Easily attached. Not necessary to remove mixer. Sent upon receipt of price, $2.50. Circular upon application.
MORE-POWER CO., Box 175, Lowell, Mass

FOR SALE—Winton quad. In best condition, with four hundred dollars worth of extras on it. Very best reason for selling. It will pay you to investigate, if you are comtemplating buying an automobile at a bargain. Address, Room 403, First National Bank Building, Danville, Ill.

FOR SALE—4 passenger side-entrance car bodies, in good condition at considerably reduced price. DETROIT CARRIAGE CO., Detroit, Mich.

WANTED—Fifteen to twenty traveling salesmen by a well-known and established tire manufacturing company, making standard goods. Only active men who know how to work effectively and all the time need apply. Exceptional opportunity for men of the right sort. Address, TIRES, P. O. Box 649, New York.

THE WISE MAN PROFITS BY THE EXPERIENCE OF OTHERS.

2½x6 in. high.

Experienced people say that the

"1900 SPECIAL" DRY BATTERY

Is unexcelled in all the qualities that characterize a strong, up to date Dry Battery for ignition.

MANUFACTURED BY

The Nungesser Electric Battery Co., Cleveland, Ohio.

General Sales Office, 128 Jackson Boulevard, - - Chicago.

Digitized by Google

or Motors. Wilhelm Hagspiel, Ludwigsburg, Germany. Filed November 6, 1903. Serial No. 180,076.

Claim.—1. In a starting mechanism for engines, the combination of a shaft, a starting element for said shaft normally ineffective, a hand lever having a sleeve for moving the starting element into its effective position, means for preventing relative motion of the said lever and shaft starting element when the former is manipulated, said shaft having means serving to automatically return the starting element to its normal ineffective position on the initial motion of the shaft, a clutch wheel surrounding the shaft and means carried by the starting element and engaging the said wheel for locking the starting element and hand lever to an ineffective position when the shaft rotates in a reverse direction.

779,231. Induction Coil. John G. Meyers, East Providence, R. I., assignor to Varley Duplex Magnet Company, Phillipsdale, R. I., a corporation of New Jersey. Filed August 4, 1904. Serial No. 219,542.

Claim.—1. An induction coil embodying a primary winding divided into sections connected in series, and an electrical controlling device connected in the primary circuit between said sections.

779,256. Speed Regulator for Explosive Engines. Alfred Bougault, Paris, France, assignor to The Societe Francaise de Constructions Mecaniques (Anciens Etablissements Cail), Paris, France. Filed September 21, 1903. Serial No. 174,122.

Claim.—1. A speed-regulator for explosive engines, having an inlet valve, a mixing chamber provided with ports for the entrance of gas and air in predetermined proportions, the discharge of the mixture from said chamber being caused by the opening of said inlet valve, a distributing valve arranged to simultaneously close said air and gas ports, mechanism for opening the two valves, the distributing valve, when opened, serving to simultaneously uncover said ports, and governor-controlled means for causing the closure by said distributing valve of said ports on each stroke of the engine, said distributing valve being operable independently of the inlet valve on its closing movement.

779,302. Vehicle. Lionel Norman, Brookline, Mass. Filed May 20, 1904. Serial No. 208,819.

Claim.—1. A sleigh, having, in combination, runners, power mechanism carried thereby, propelling means engaging the road surface and actuated by the power mechanism and means for reversing the operation of the propelling means so that the sleigh may be driven either forward or backward.

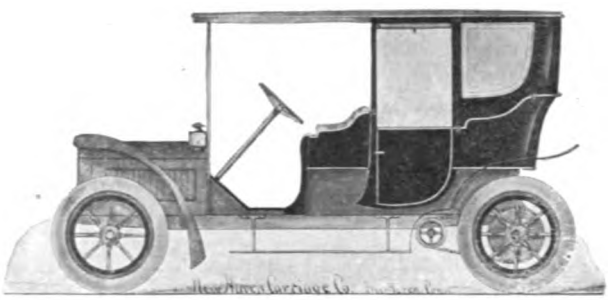
779,303. Sleigh. Lionel Norman, Brookline, Mass. Filed June 11, 1904. Serial No. 212,100.

Claim—1. A sleigh, having, in combination a pusher engaging the road surface, means for reciprocating the pusher, and means for raising the pusher during alternate strokes, acting to render either the backward strokes or the forward strokes of the pusher inoperative at the will of the operator, according as the sleigh is to be driven forward or backward.

779,335. Wheel Tire. Alfred J. White, Akron, Ohio. Filed May 10, 1904. Serial No. 207,288.

Claim—1. In a wheel the combination with the felly having a flat face, of a metallic rim fitted thereto and having an inwardly extending flange lying flush with the side of the felly, the tire having the flanged base portions, an annular plate secured to one side of the felly having an inturned end, or flange, engaging the flanged base of the tire, an annular plate secured to the flange of the rim, but capable of longitudinal movement thereon, and having an inturned flange engaging the flanged base of the tire, and means for fastening said movable plate, substantially as described.

779,351. Driving Gear for Motor Vehicles. William H. Douglas, Belleville, N. J., assignor to Healey & Co., New York, N. Y., a corporation of New York. Filed February 20, 1904. Serial No. 194,522.



Claim—1. In a motor vehicle, the combination with an axle having pivoted stub axles, and wheels journalled on the stub axles, of an internal gear wheel on each wheel, a pinion in mesh with the gear wheel, a motor mounted on the said axle, and a universal joint between the shaft of the motor and the shaft of the said pinion, as set forth.

779,418. Motor Vehicle. Charles E. Foster, Washington, D. C. Filed July 5, 1902. Serial No. 114,492.

Claim—1. The combination with the body, seat and platform of a motor vehicle, of a casing forward of the platform, a boiler arranged within the casing, a burner below the boiler, and devices for controlling the supply of burning mixture accessible from above the platform, substantially as set forth.

"Motorcycles: How to Manage Them." Price $1. The Goodman Company, 154 Nassau Street, New York.

Automobile Buyers

Desiring really luxurious Tonneaus, Limousines or Landaulets that will be very durable, ride easy, finely painted, having the same attention paid to details they received in their fine horse drawn Broughams and Victorias, can obtain same from the **first** firm in America to build **Automobile Bodies.**

United Electrical Mfg. Co., The, New York City, Space 12, U. B.—Electric goods.

Upton Motor Co., Lebanon, Pa., Block E, E. H.—Pumps.

Vacuum Oil Co., New York City, Space 29, U. B.—Lubricants.

Veeder Mfg. Co., The, Hartford, Conn., Block U, E. P.—Veeder Odometers, Tachometers, etc.

Valentine & Co., New York City, Spaces 23 and 25—Varnishes.

Weston-Mott Co., Utica, N. Y., Block U, E. P.—Wheels, axles and rims.

Whitney Mfg. Co., Hartford, Conn., Block U, E. P.—Whitney roller chains and standards.

Warner Gear Co., Muncie, Ind., Block X, E. P.—Gears.

Worcester Mfg. Co., Worcester, Mass.—Puncture alarms.

Wray Pump & Register Co., Rochester, N. Y., Space B, C. H.—Pumps and registers.

Warner Instrument Co., Beloit, Wis., Space B, C. H.—Specialties.

Willis Co., E. J., New York City, F. A., B.—Supplies, parts and sundries.

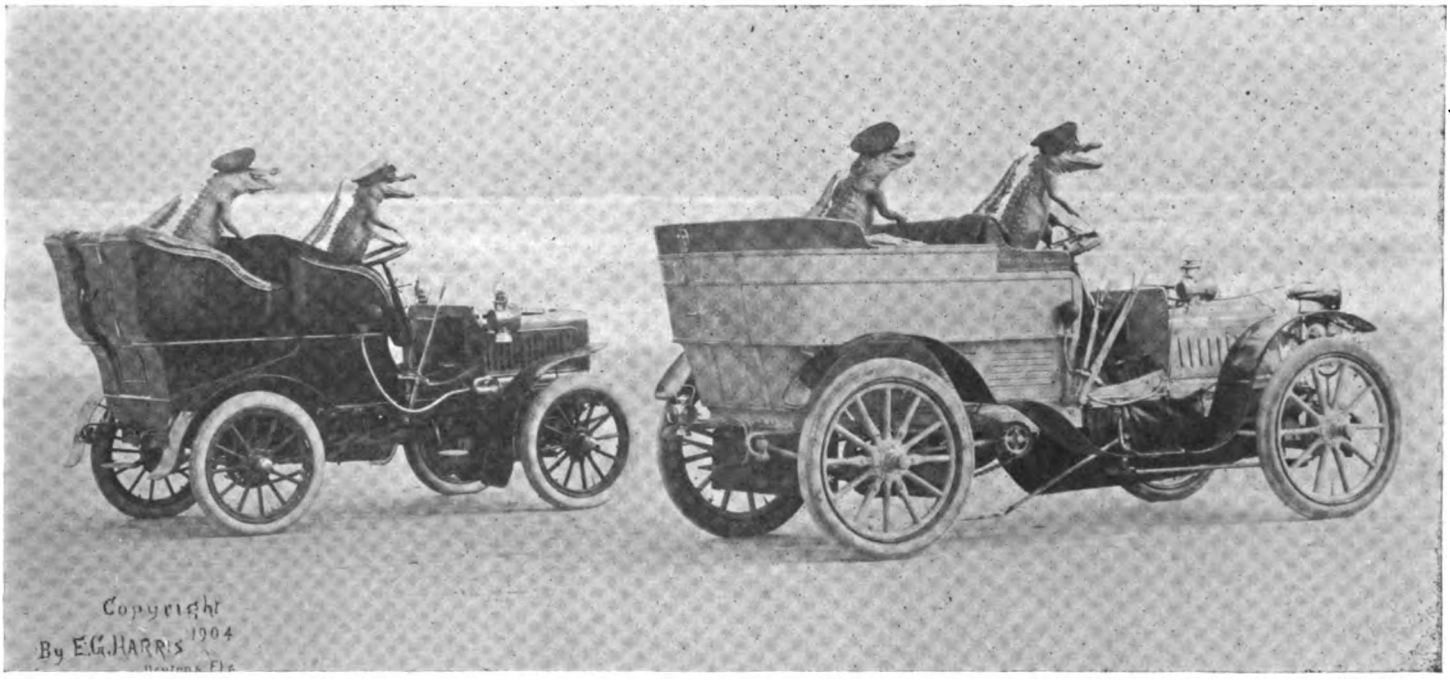
Whitlock Coil Pipe Co., Hartford, Conn., Spaces 42 and 44, F. T. B.—Whitlock coolers.

Webb Co., The, New York City, Space G, C. H.—Speed indicators.

Whitehouse & Co., Chas. F., New York City, Spaces 23 and 25—Specialties.

Wheeler Mfg. Co., Detroit, Mich.—Canopy tops and hampers.

Test of Heavy Oils.



There seems no end to the diversity of tests undertaken in France. The most recent was one designed to demonstrate practically the value of heavy oil as a combustible. For this purpose a number of vehicles—a veritable caravan—at the head of which was a steam automobile, was used. The course was from Paris to Rouen, a distance of 136 kilometres, which was covered at a cost of 4 francs 68 centimes; that is, 39 litres of heavy oil at 12 centimes per litre were used, the average speed being 41 kilometres per hour. The trial was controlled by two representatives of the Minister of War and conducted under the superintendence of a well-known automobile manufacturer.

Italy Encouraging Stage Routes.

With a view to increasing public interest, the Italian government is proposing to grant subsidies to local bodies that are prepared to establish automobile services. The only stipulation is that neither tramways nor railways exist in the chosen districts. These subsidies will probably amount to $100 a kilometre for a service for passengers and freight traffic; $80 where the line is confined to passengers, and $40 where only freight is conveyed.

All Ready for the Florida Speed Carnival.

For the first time interest in the Ormond-Daytona speed carnival, which will be inaugurated on Tuesday next, may be said to be general. The interest permeates all concerned with automobiles, both in and out of the trade, and the attendance is certain to be of record breaking proportions. There will almost be an exodus from the New York show on Saturday.

The entry list has filled well, being far larger and more representative than ever before, and including a number of new men and new cars. That records are likely to be shattered is indicated by the mile in 37 seconds by H. L. Bowden, the Waltham millionaire, who, with Oldfield, Christie and a few others, is already on the beach.

The entries are as follows: W. K. Vanderbilt, Jr., H. L. Bowden, Harry S. Houpt, Louis S. Ross, Arthur E. McDonald, Edward R. Thomas, F. A. La Roche and E. M. Steck, B. M. Shanley, Jr., F. A. La Roche, Isaac E. Emerson, Harry S. Houpt, Frank H. Croker, W. Gould Brokaw, Standard Automobile Co., R. R. Kimball, George H. Flinn, John Caswell, A. C. Webb, Charles Soules, Charles Soules, Alfred G. Vanderbilt, James L. Breese, James L. Breese, Olds Motor Works, William Wallace, Major C. S. Miller, Joseph H. Heller, S. B. Stevens, Chas. N. Wheeler, Walter Christie, Electric Vehicle Co., Electric Vehicle Co., Henry Ford, W. E. Evans, S. B. Stevens, Charles Canaut, W. J. Edmunds, Louis S. Ross, Rollin H. White, Webb Jay, H. W. Fletcher, Barney Oldfield and M. B. Aultman.

The thirty-six events to be decided are as follows:

1—One hundred miles, International, for the W. K. Vanderbilt, Jr., Trophy.
2—One mile, International Championship, for the Sir Thomas Dewar Challenge Trophy.
3—One mile, time trials, Classes A (1,432 to 2,204 pounds), B (851 to 1,432 pounds), and C (551 to 851 pounds).
4—One kilometre, time trials, Classes A, B and C (weights as in Event No. 3).
5—Ten miles, Ormond Derby, open, for the Major C. J. S. Miller Trophy.
6—Fifty miles, Daytona Handicap, open, for the F. E. C. A. A. Challenge Cup. Conditions as specified in deed of gift.
7—One kilometre, Record Race, open, for the H. L. Bowden Trophy.
8—One mile, steam cars, for the Colonel R. C. Clowry Trophy.
9—One mile, Corinthian, amateur owners only to drive, for the Colonel L. C. Weir Cup.
10—Fifty miles, open to American built cars only, for the Lozier Trophy.
11—Ten miles, Mercedes cars only, for the Allen-Halle Trophy.
12—Ten miles, F. I. A. T. cars only, for the Hollander and Tangeman Cup.
13—Twenty miles, open, for the Edward R. Thomas Championship Trophy.
14—Five miles, stock cars, $1,001 to $1,800, inclusive.
15—Five miles, stock cars, $1,801 to $2,750, inclusive.
16—Five miles, stock cars, $2,751 to $4,000, inclusive.
17—Five miles, handicap, open only to the first four cars in Events Nos. 14, 15 and 16. No entry or fee required.
18—Five miles, stock cars, $4,001 to $6,000, inclusive.
19—Five miles, stock cars, $6,001 to $8,000, inclusive.
20—Five miles, stock cars, $8,001 to $10,000, inclusive.
21—Five miles, open, for the W. Gould Brokaw Trophy.
22—Five miles, Great Ormond Handicap, open only to the first three cars in Events Nos. 18, 19, 20 and 21. Cars to compete in exactly the same condition as in Events 18 to 21, inclusive.
23—Five miles, gasolene stock cars, $650 and under.
24—Five miles, stock cars, $61 to $1,000, inclusive.
25—Ten miles, stock cars, 1,001 to $1,800, inclusive.
26—Ten miles, stock cars, $1,801 to $2,750, inclusive.
27—Ten miles, stock cars, $2,751 to $4,000, inclusive.
28—One mile, time trials, stock cars, price classification as in above events.
29—Ten miles, handicap, open.
30—One kilometre, Class A (1,432 to 2,204 pounds).
31—One kilometre, Class B (851 to 1,432 pounds).
32—One kilometre, Class C (551 to 851 pounds).
33—One mile, Class A, weights as above.
34—One mile, Class B, as above.
35—One mile, Class C, as above.
36—Gymkana race.

As, on the occasion of the Florida speed carnival, the headquarters of the Florida East Coast Automobile Association are this year to be established at Daytona, instead of Ormond, as formerly, Daytona is claiming that share of attention that has been its due. It is carrying with it attention to the spacious Clarendon Hotel, located directly on Daytona Beach and but two minutes from the association's clubhouse. The hotel is modern and high class in every particular; it is steam-heated and electrically lighted; has private baths and also hot and cold water in all rooms. The spacious garage, with competent mechanics, which is attached to the Clarendon, leave nothing to be desired from the motorist's standpoint.

To Handle Acmes in New York.

The Acme Motor Car Company of New York, which was incorporated under the laws of the State of New York, promises to prove a notable addition to the trade of the metropolis.

The president of the new company is R. Lewis Julian, of the real estate firm of Stockdale & Julian; the vice-president and general manager of the company is George H. Strout; the secretary and treasurer of the company is J. De Smet Maguire, president of the American Electric & Controller Co. The three above named gentlemen also compose the board of directors for the first year, and all are residents of the city of New York. Mr. Strout is well known among a large majority of those now engaged in the manufacture and sale of automobiles, owing to the fact that he was for six years identified with the bicycle business, and was for three years the sales manager in New York of the Eastern branch of the Monarch Cycle Manufacturing Co., of Chicago.

The new company will occupy on February 1 the salesroom at Nos. 941-943 Eighth avenue, formerly occupied by the Pope Manufacturing Company, and the new company has been made distributing agents for the eastern half of New York, the northern half of New Jersey and Fairfield County, Conn., for the Acme line of automobiles manufactured by the Acme Motor Car Co., of Reading, Pa.

Two Suits Against Stockholders.

Arvide C. Hester, receiver for the defunct Toledo Fire and Police Notification and Auto Parcel Delivery Company, has filed two suits in the Common Pleas oCurt of Toledo, Ohio. One is against Charles F. Nighwander, Maurice Weiss, Louis Litchie, Charles F. Tanner, Charles G. Wilson, George Harris, W. F. Edman, Douglass Long, F. M. Given and Warren B. Wyman, stockholders of the company. Hester avers that the defendants, while directors of the company, received moneys which rightfully belonged to the company, but of which they made no accounting. It is also charged that Harris, Nighwander and Wyman, at different times managers, disposed of property belonging to the concern, for which there was no accounting to the company. Another and separate suit is filed against Warren B. Wyman, and the claim is made that the defendant bought 938 shares of stock in the company at $10 a share, for which he never paid. Judgment is asked for the amount with interest.

How it Climbs Hills.

"It goes well on the flat and romps up-hill in a manner 'almost Japanese.'" This comes direct from England and illustrates the latest effect of the Eastern war upon English as she is written when applied to describing the performance of a late addition to the rapidly growing list of British motor cars—or the tri-car, which is half tricycle, half runabout.

Now for the Chicago Show!

As is already known, the Chicago Show, which opens February 4, is full to overflowing. The complete list of those who secured room and the spaces allotted them has not, however, before been made public. They are as follows:

MAIN FLOOR.

1 to	3	Winton Motor Carriage Co., Berea Road, Cleveland, Ohio.
4,	5	National Motor Vehicle Co., 22d & Belt R. R., Indianapolis, Ind.
6 to	8	Apperson Bros. Automobile Co., Kokomo, Ind.
9 to	12	Knox Automobile Co., Springfield, Mass.
13 to	15	Studebaker Automobile Co., South Bend, Ind.
	16	Chicago Motorcycle Co., 536 Wabash avenue, Chicago, Ill.
	16	Chicago Caloric Engine Co., No. 536 Wabash avenue, Chicago, Ill.
17 to	19	Packard Motor Car Co., Detroit, Mich.
20 to	23	Electric Vehicle Co., Hartford, Conn.
	24	Haynes-Apperson Co., Kokomo, Ind.
25 to	28	Jeffery, Thomas B., & Co., Kenosha, Wis.
	29	Duryea Power Co., Reading, Pa.
30 to	32	Woods Motor Vehicle Co., No. 110 East Twentieth street, Chicago, Ill.
33 to	35	Royal Motor Car Co., Lake street, Cleveland, Ohio.
36 to	39	Electric Vehicle Co., Hartford, Conn.
	40	Haynes-Apperson, Kokomo, Ind.
41,	42	Elmore Mfg. Co., Clyde, Ohio.
43 to	45	Thomas, E. R., Motor Co., 1,200 Niagara street, Buffalo, N. Y.
46 to	48	Woods Motor Vehicle Co., 110 East Twentieth street, Chicago, Ill.
49,	50	Pierce, George N., Co., 58 Main street, Buffalo, N. Y.
51 to	54	Pope Motor Car Co., 21 Park Row, New York City.
55,	56	Olds Motor Works, 50 Concord avenue, Detroit, Mich.
57,	58	Peerless Motor Car Co., Cleveland, Ohio.
59 to	62	Locomobile Co. of America, Bridgeport, Conn.
	63	Mitchell Motor Car Co., Racine, Wis.
	64	Maxwell-Briscoe Motor Co., Tarrytown, N. Y.
65,	66	Pierce, George N., Co., 58 Main street, Buffalo, N. Y.
67 to	70	Pope Mfg. Co., 21 Park Row, New York City.
71.	72	Olds Motor Works, 50 Concord avenue, Detroit, Mich.
73,	74	Peerless Motor Car Co., Cleveland, Ohio.
75 to	78	Locomobile Co. of America, Bridgeport, Conn.
	79	Mitchell Motor Car Co., Racine, Wis.
	80	Maxwell-Briscoe Motor Co., Tarrytown, N. Y.
81 to	83	White Sewing Machine Co., 300 Rose Building, Cleveland, Ohio.
84,	85	Kirk Mfg. Co., Toledo, Ohio.
85 to	86	Northern Mfg. Co., Detroit, Mich.
87,	88	Autocar Co., Ardmore, Pa.
89,	90	Cadillac Automobile Co., 1,343 Cass avenue, Detroit, Mich.
91,	92	Stevens, J., Arms & Tool Co., Chicopee Falls, Mass.
93 to	96	Franklin, H. H., Mfg. Co., Syracuse, N. Y.
97,	98	Blomstrom, C. H., Motor Co., Detroit, Mich.
	99	Union Automobile Co., Union City, Ind.
	100	Adams Co., Dubuque, Iowa.
101,	102	Columbus Motor Vehicle Co., Columbus, Ohio.
	103	Moline Automobile Co., Moline, Ill.
	104	Check Room, Public Stenographer, Photographer.
105,	106	Buick Motor Car Co., Jackson, Mich.
107,	108	Wayne Automobile Co., Dubois and Franklin streets, Detroit, Mich.
109,	110	St. Louis Motor Carriage Co., 1,212 North Vandeventer avenue, St. Louis.
111,	112	Cleveland Motor Car Co., Cleveland, Ohio.
	113	Monarch Auto Car Co., 218 La Salle street, Chicago, Ill.
	114	Marion Motor Car Co., 113 Monument Place, Indianapolis, Ind.
115 to	117	Banker, A. C., Co., 1,255 Michigan avenue, Chicago, Ill.
	118	Hagmann & Hammerly, Oakley avenue, Chicago, Ill.
	119	Holsman Automobile Co., Chicago, Ill.
120,	121	Premier Motor Car Mfg. Co., Indianapolis, Ind.
122 to	125	Waltham Mfg. Co., Waltham, Mass.
126,	127	Welch Motor Car Co., Detroit and Pontiac, Mich.
	128	Wayne Works.
129 to	131	Reo Car Co., Lansing, Mich.
132,	133	Model Gas Engine Works, Auburn, Ind.
134,	135	Austin Automobile Co., Grand Rapids, Mich.
136 to	140	Ford Motor Co., Detroit, Mich.
	141	Reliance Motor Car Co., 67 Fort street, Detroit, Mich.
	142	Auburn Automobile Co., Auburn, Ind.
	143	Tincher Automobile Co., 6,521 Wentworth avenue, Chicago, Ill.
	144	Kilfyre, 84 La Salle street, Chicago, Ill.
145,	146	Standard Wheel Co., Terre Haute, Ind.
147,	148	Mead Cycle Co., 1,235 Wabash avenue, Chicago, Ill.
	149	Dolson, John L., & Sons, Charlotte, Mich.

ANNEX (First Floor).

150,	151	Acme Motor Car Co., Reading, Pa.
	152	Hammer Motor Co., 573 Gratiot avenue, Detroit, Mich.
153 to	155	American De Dietrich Motor Car Co., 1½ W. Thirty-fourth street, New York.
	156	Michigan Automobile Co., Kalamazoo, Mich.
157,	158	Bartholomew Co., Peoria, Ill.
159,	160	Royal Automobile Co., Cleveland, Ohio.
	161	Stearns, F. B., Co., Cleveland, Ohio.

Co.; 328, Continental Engine Co.

Suits Follow Garage Failure.

Further litigation in the case of the bankrupt Plainfield (N. J.) Automobile Garage has resulted in non-suit being given by Justice Smalley in the case of Joseph Loughead against Andrew Wilson at Plainfield last week. The evidence brought out by the lawyer for the defence from Loughead himself, showing that the case was one which concerned the Plainfield Automobile Garage, was what lost the case for the plaintiff, who was suing for the recovering of money advanced in payment of the garage's debts.

When the garage closed up there was the sum of $56.55 owing to the employes, all of which was paid by Loughead on the verbal agreement with Andrew Wilson that the latter would pay half of the amount. The evidence was brought out in cross-examination showing that the debt was one in which the company was concerned and the result was, as stated, a non-suit.

Cannon Goes With Grout.

By what seems to be a natural transition George C. Cannon, well known as a close student of steam vehicle construction, has graduated into the automobile industry. It became known this week that he has become the consulting engineer of the Grout Bros. Automobile Co., of Orange, Mass. It is stated that some of his ideas have already been incorporated in the 1905 Grout models.

Cannon will be remembered as the Harvard student who made the steam automobile his hobby. As long ago as 1901 he changed over a Locomobile steam runabout, and with it made records on the Providence (R. I.) track. Afterward he built several cars of his own, embodying some pet theories in boiler construction, etc., and they proved very fast.

Pope's Garage Nearing Completion.

Work on the pretentious new Pope building, Broadway and Fifty-fifth street, this city, has now progressed sufficiently to permit a good idea of its appearance to be obtained. The outside work is practically completed, and the putting in of the plate glass front is now in progress; that of the ground floor has been finished. The entire front will be of glass, except the steel framework and two strips of light colored brick, which mark the finish of the ends.

The building has a frontage of 75 feet on Broadway, and is four stories high. The words, "Pope Garage," in bold lettering appears on the front just under the roof, worked in metal. It is probable that the building will be ready for occupancy in February.

Detroit Show Sold Up.

All the space in the Light Guard Armory, where the Detroit show is to be held from February 13 to 18 has been sold, including the entire gallery. Secretary Lewis has been overwhelmed with applications of late, but has been obliged to refuse them all. He says he could have disposed of nearly double the space at his disposal.

HAVE MEN PROGRESSED?

History Shows that Since Time of Chariots they Have Opposed All New Vehicles.

While each succeeding generation is given to prattling of its superior enlightenment and of the progress it has made, nothing so well proves that the nature of mankind has undergone no change than the reception accorded the several forms of improved locomotion. While the grandfathers of to-day laugh to scorn their parents' opposition to locomotives, they and their own sons were similarly fearful of bicycles and trolleys; and to-morrow their grandchildren will read or listen with wonderment to the history of opposition to automobiles now being made by their immediate forebears.

It is possible to go back to the time of the chariot to prove how empty is the boasted advancement of the present day. That clumsy two wheeled vehicle was of very ancient use in war, but the carriage for the purpose of private conveyance was known first to ancient Rome at a comparatively late period, and there the law restricted its use to persons of high rank, who sent messengers in advance warning the crowds in the street to make way for its coming. This was necessary because there were no sidewalks.

In mediæval and chivalrous Europe the use of carriages was prohibited because it was considered that they produced effeminacy. Feudal usages of the time required men of the upper class to be expert horsemen, and the suzerain would not permit his vassals any practice that rendered them unfit for military service. Monks and women rode she asses or palfreys. The women frequently mounted behind their armored lords on the warlike steeds they bestrode. The disdain of carriages at that time is not surprising when the crude contrivances called carriages in that day are considered.

Covered carriages were not known until the beginning of the sixteenth century, when their use was confined to women of high rank. They were forbidden by law to all others. A German authority on the subject says: "Covered carriages were for a long time forbidden even to women, but about the end of the fifteenth century they began to be employed by the Emperor, Kings and princes in journeys and afterward on state occasions." There is still in existence an ordinance issued by Philip the Fair in France, in which citizens' wives are prohibited the use of carriages. As late as 1550 there were only three carriages in Paris. One of these belonged to the Queen, the other to Diana of Poitiers and the other to Rene de Laval, a very corpulent nobleman who was unable to ride on horseback.

It was as late as the beginning of the seventeenth century before coaches were employed as a means of public conveyance, and it was in 1601 that a bill was introduced in Parliament "to restrict the excessive use of coaches," but it was rejected on second reading. This bill, which was much discussed and agitated, seems to have been urged largely on the same ideas that influence the introduction of anti-automobile bills. It was said the coaches were dangerous to pedestrians, and also that they frightened the horses that met them in the highway. The chief supporters of the bill in Parliament, however, were the friends of the Thames watermen, with whom the coaches competed in carrying passengers. A poet of the times, who was in sympathy with the watermen, wrote:

"Carroaches, coaches, jades and Flanders' mares
Do rob us of our shares, our areas and fares.
Against the ground we stand and knock our heels,
While all our profit runs away on wheels."

It is a historical fact, and a very curious one in the light of modern progress, that travel in carriages was prohibited by law all over Europe for several centuries, and that these vehicles gradually came into use over prejudice and adverse legislation which both ignorance and prejudice induced. The motor car, whether in its present form or of an improved and cheaper construction as merely traveling the route followed by all other improved forms of locomotion, and will win its way into popular favor as the others "won out."

Maine Club Joins With Farmers.

Owing to the inactivity of the Automobile Club of Maine, at Portland, Lewiston motorists have organized the Eastern Automobile Club, and contemplate undertaking a good roads propaganda in connection with the Maine State Grange.

There has been absolutely nothing done by the Automobile Club of Maine during the present season. Not a run has been attempted, and, as far as is known, no organized movement has been begun for the betterment of Maine roads. And this, too, when every owner of an automobile is complaining about the condition of the thoroughfares of Maine. After having had a two days' conference with members of the Maine State Grange, which sat in Lewiston, President C. V. Emerson of the Eastern Club outlined his plans thus:

"Our club has incorporated in its constitution and bylaws a clause relating to the improvement of roads in the State of Maine. I was very glad to read the admirable suggestions of the master of the Maine State Grange in regard to better roads in Maine.

"Our automobile club, and probably every other automobile club in Maine, will join hands with the grange in presenting this matter before the Maine legislature this winter. At the next meeting, which will be held soon, we shall combine with the latter in a proper presentation of this important feature of Maine's future prosperity before the legislature this winter.

"We are with the grange, heart and soul, in this matter."

INUNDATION IN INDIANA

Legislative Floodgates Opened and a Deluge of Proposed Laws Follows—The Text of Them.

Four State Senators have endeavored to answer what they believe to be the cry of the public for automobile legislation by introducing bills in the Indiana Senate. Farber, of Clinton and Carrol counties; Moore, of Putnam; Bell, of Lake and Porter, and Crumpacker, of Laporte and Starke, are the sponsors of measures introduced last week, and the methods of each differ from those of the others.

Senator Moore proposes that every owner of an automobile shall obtain a license from the State Auditor, and that a record of each license shall be kept, together with the consecutive numbers. These numbers must be displayed on the rear of all machines. Notice of any change of ownership in a machine must be filed with the auditor. For a violation of the section containing these provisions the penalty shall be a fine of not more than $500 or imprisonment in the county jail for not more than six months.

The speed limit shall be ten miles an hour inside city limits and twelve miles an hour outside. The penalty for a violation of the speed regulation shall be the same as for the first section.

It is provided that drivers of automobiles shall stop on the signal of any person in another vehicle. The penalty for a violation of this provision is fixed at a maximum of $1,000 fine or imprisonment, at the discretion of the court.

All automobiles shall be equipped with latest patterns of brakes, horns and lamps. At night a white light shall be displayed in front and a red light at the rear. For violating this section the penalty shall be not more than $100 or imprisonment, at the discretion of the court.

The bill offered by Senator Crumpacker limits the speed of automobiles in the business portion of a city to eight miles an hour, in the residence section to fifteen miles an hour and outside the city to twenty miles an hour. White lights shall be displayed on the front and red lights at the back of all machines.

The bill offered by Farber requires automobile drivers to keep to the right side of the road in passing vehicles, and to leave one-half the road free for other traffic. The speed limit is fixed at ten miles an hour in cities and twenty miles an hour outside cities. The penalty is fixed at a fine of not less than $20 or more than $100, to which may be added imprisonment in jail not to exceed thirty days for any violation of the law.

The measure proposed by Senator Bell has several features that are different from the others. One provision is that the speed of an automobile shall be slackened to four miles an hour when approaching or passing

Digitized by Google

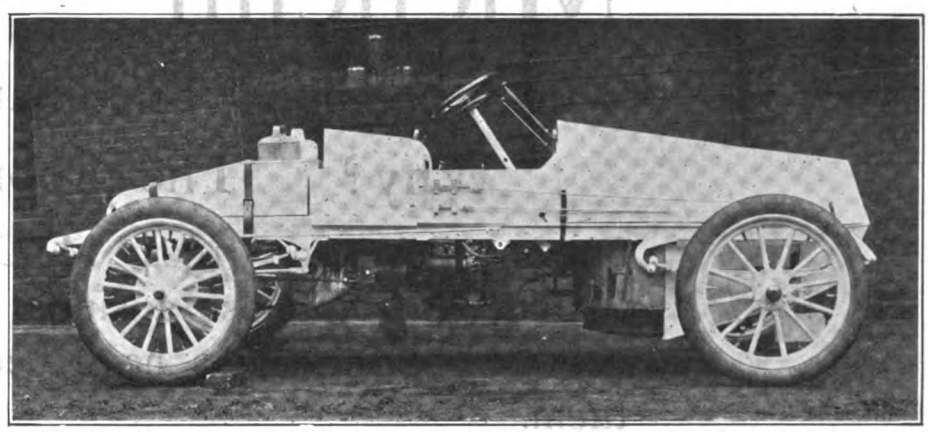
another vehicle, and to the same rate of speed when approaching a crossing or a turn in a road. In case of a horse becoming frightened, it is provided the driver of an automobile shall stop his machine and not proceed until the animal is pacified.

To road supervisors are given police powers to regulate the speed of automobiles, and they are to receive 50 per cent. of any fine that may be imposed. The penalty for any violation of the act is to be a fine of not less than $5 or more than $100, to which may be added imprisonment not to exceed thirty days.

In the House, Representative Martin W. Yencer, of Wayne county, has offered still another bill which seems the fairest of the lot. It provides that the speed limit outside cities shall be twenty miles an hour for automobiles and inside corporation lines shall be ten miles an hour. By the proposed law, motor cars would be required to lessen their speed at all street crossings, and always when approaching and passing any vehicle drawn by a horse. Should the horse appear frightened, the bill provides, the person driving the machine must bring it to a standstill.

It is provided by Yencer's bill that no city or town or borough shall have any power to make any ordinance respecting the speed of motor vehicles, and that no ordinance heretofore or hereafter drawn by any city or town shall have any force or effect.

One section of the bill sets out that the Mayor of any city or the Selectmen of any town may, upon special occasion, whenever in their judgment it may be deemed advisable, grant permits to any person or to the public to run such motor vehicles during a specified time, or until such permit is revoked, upon specified portions of public highways, at any rate of speed.



The penalty clause provides for a fine of not more than $200, which may be assessed for aviolation of the act. An emergency is declared to make the act take effect from the date of its passage.

Still another bill is fermenting in the brain of Representative McDowell, of Wells county. He has not been able to reduce it to writing, but he inclines to a measure similar to the threshing machine law. This requires such machines to halt when meeting other vehicles, and also that engine not only be stopped, but the man in charge is compelled to lead around it any horse that may show signs of fright.

Meanwhile Mr. McDowell has added to the gaiety of Indiana by preparing a bill aimed at circuses and the like. He would establish one price of admission to all—no reserved seats for him!

Though the Pike's Peak climb from Denver is still "in the air," three sanguine members of the Chicago Automobile Club have already sent in their entries. They are Dr. H. E. Thomas, H. Hulman, jr., and Jerome A. Ellis. If the climb occurs Dr. Thomas will drive the 90 horsepower Locomobile which he has entered in the International Cup race, and Ellis will use a special 75 horsepower Haynes-Apperson.

Rollin H. White's New Racer, Which Makes Its "Debut" at Ormond-Daytona.

Hunter Heads Dallas Club.

The Dallas (Tex.) Automobile Club has elected the following officers for the 1905 term: President, John G. Hunter; first vice-president, E. H. R. Green; second vice-president, Henry Garrett; third vice-president, E. J. Kiest; secretary, Eugene Corley; treasurer, Gross R. Scruggs; directors, S. H. Boren and Henry Garrett (three years), W. H. Haggard (one year), Jess Illingworth (two years), E. J. Kiest (three years), Sam Morgan (one year), S. D. Murray (two years), J. D. Scofield and George A. Titterington (one year).

The Colonel Accepts the Challenge.

Things are getting warm in Dallas, Tex. No sooner had Colonel E. H. R. Green's chauffeur set up the first American 100-mile record than Houston and Fort Worth were heard from. J. Howard Hughes (Columbia), of the former place, and A. B. Wharton (Peerless), of Fort Worth, both of whom had previously been beaten by Colonel Green's car, hurled challenges. The colonel lost no time in accepting them, and has set February 11 as the date for the race. It will occur on the Fair Grounds track at Dallas.

Anxious to Jail Automobilists.

The West End Improvement Association, a body of elderly, wealthy and very respectable New Yorkers, in which a few professional reformers are conspicuous, is very anxious that automobilists who infringe the speed law be placed behind the bars, without the usual option of a fine. Accordingly they have hired a lawyer and sent him to Albany, with a view of urging a measure of the sort. The association is so thorough in its respectability that they do not concern themselves with speeding horsemen or cyclists.

Pasadena's Acrobatic Bicycle Policemen.

The bicycle police of Pasadena, Cal., will take a lot of beating. Two of them recently arrested an automobilist, and when the case came up last week they asked the court and a jury to believe that they had, while at full speed, pulled out their stop watches and timed the car over a measured course. Computation brought out that they had performed this wonderful feat of timekeeping while going at the rate of 26.6 miles an hour. It is not surprising that the jury refused to take stock in such marvellous agility, even on the part of policemen, and acquitted the defendant.

Coyote Hunter Heard From.

L. E. Bartels, who is described as the pioneer coyote hunter of Colorado, has offered to pilot a party of Denver automobilists who are considering the practicability of a coyote hunt with automobiles. A number of mounted attendants with greyhounds will accompany the party; coyotes will be started in some of the eastern counties which are as level as floors, and many chauffeurs believe they will be able to keep pace with the dogs. Colorado Springs motorists are also interested in the proposed hunt, and it is probable a trial will be made soon.

Carousing Chauffeur Goes to Jail.

They do some things better in England. For taking his master's car without permission and driving furiously in London at 2 o'clock in the morning, an Englishman's servant was given two months' imprisonment. He dashed into an excavation, the vehicle jumping a hole 4 feet 6 inches wide. His only excuse was that it was dangerous to pull up because the roads were "skiddy." The magistrate declared that the case was not one for a fine, so gave the man two months' imprisonment.

Buffalo Club in New Quarters.

Quarters in the Teck Theatre Building are to be leased for the clubrooms of the Automobile Club of Buffalo. This was decided upon at a meeting of the board of governors held last Saturday, when a committee, consisting of Dai H. Lewis, W. H. Baker and H. A. Meldrum, was appointed to make the final arrangements. It is expected that the new home of the organization will be ready for occupancy by the middle of February.

Gasoline Automobiles and Selden Patent

United States Letters Patent No. 549.160, granted to George B. Selden, control broadly all gasoline automobiles which are accepted as commercially practical.

The Commissioner of Patents, in his annual report for 1895, said:

"Selden, in 1895, received a patent, Nov. 5, No. 549,160, which may be considered the pioneer invention in the application of the compression gas engine to road or horseless carriage use."

The following manufacturers and importers who deal in the leading gasoline cars of the United States and Europe, ranging from 4 to 100 h. p., are licensed under the Selden patent:

American Manufacturers.

APPERSON BROS. AUTOMOBILE CO. ..	Kokomo, Ind.
THE AUTOCAR CO.,	Ardmore, Pa.
BUICK MOTOR CO.,	Flint, Mich.
BUFFALO GASOLENE MOTOR CO.,	Buffalo, N. Y.
CADILLAC AUTOMOBILE CO.,	Detroit, Mich.
CREST MANUFACTURING CO.,	Dorchester, Mass.
THE COMMERCIAL MOTOR CO.,	Jersey City, N. J.
ELECTRIC VEHICLE CO.,	Hartford, Conn.
ELMORE MANUFACTURING CO.,	Clyde, O.
H. H. FRANKLIN MANUFACTURING CO.,	Syracuse, N. Y.
THE HAYNES-APPERSON CO.,	Kokomo, Ind.
THE KIRK MANUFACTURING CO.,	Toledo, O.
KNOX AUTOMOBILE CO.,	Springfield, Mass.
LOCOMOBILE CO. OF AMERICA,	Bridgeport, Conn.
NORTHERN MANUFACTURING CO.,	Detroit, Mich.
OLDS MOTOR WORKS,	Detroit, Mich.
PACKARD MOTOR CAR CO.,	Detroit, Mich.
THE PEERLESS MOTOR CAR CO.,	Cleveland, O.
THE GEORGE N. PIERCE CO.,	Buffalo, N. Y.
POPE MANUFACTURING CO.,	Hartford, Conn.
POPE MOTOR CAR CO.,	Toledo, O.
THE SANDUSKY AUTOMOBILE CO.,	Sandusky, O.
THE STANDARD MOTOR CONSTRUCTION CO.,	Jersey City, N. J.
THE J. STEVENS ARMS & TOOL CO.,	Chicopee Falls, Mass
SMITH & MABLEY, INC.,	513 7th Ave., N. Y.
THE F. B. STEARNS CO.,	Cleveland, O.
STUDEBAKER AUTOMOBILE CO.,	South Bend, Ind.
E. R. THOMAS MOTOR CO.,	Buffalo, N. Y.
WALTHAM MANUFACTURING CO.,	Waltham, Mass.
THE WINTON MOTOR CARRIAGE CO.,	Cleveland, O.
WORTHINGTON AUTOMOBILE CO.,	547 5th Ave., N. Y.

Importers.

AUTO IMPORT CO.,	1786 Broadway, N. Y.
SIDNEY B. BOWMAN AUTOMOBILE CO.,	52 W. 43d St., N. Y.
THE CENTRAL AUTOMOBILE CO.,	1684 Broadway, N. Y.
HOLLANDER & TANGEMAN,	5 W. 45th St., N. Y.
F. A. LA ROCHE CO.,	147 W. 38th St., N. Y.
STANDARD AUTOMOBILE CO. OF N. Y.,	136 W. 38th St., N. Y.
SMITH & MABLEY, INC.,	513 7th Ave, N. Y.
PANHARD & LEVASSOR,	232 W. 13th St., N. Y.
WORTHINGTON AUTOMOBILE CO.,	547 5th Ave., N. Y.

Suits for infringement are now pending against manufacturers, importers and users of and dealers in unlicensed cars, and the policy of the licensees hereafter will be aggressive.

Do Not Buy a Lawsuit with Your Automobile!

SEE THAT A SELDEN LICENSE PATENT PLATE IS ON THE CAR BEFORE YOU PURCHASE.

ALL PERSONS ARE NOW FINALLY WARNED

that suits will be brought against firms and individuals manufacturing, selling and using unlicensed gasoline automobiles.

William A. Redding, Esq., Attorney, of 38 Park Row, New York City, has been authorized to make adjustments with persons who have in the past unwittingly infringed the Selden Patent by the importation or purchase of unlicensed foreign made automobiles, and who choose now to guard themselves against prosecution.

Many individual infringers already have sought and effected settlements.

ASSOCIATION OF LICENSED AUTOMOBILE MANUFACTURERS,

7 EAST 42d ST., NEW YORK.

The Paint Shop in Cold Weather.

During the cold months of the year the carriage paint shop is probably the most unwholesome department connected with the carriage making or repairing business, says the Carriage Monthly. Unfortunately, what modern ingenuity and invention has done for many industries has as yet been denied the paint shop, and poor light, worse ventilation and equally bad heating arrangements have combined to expose the workman to conditions inimical to his health and to his earning capacity.

It would be difficult to prophesy the results which might accrue if paint shops were better lighted, better heated and better ventilated. A travelling salesman who sees the larger portion of the Northeastern States recently told the writer that, taking the average carriage paint shop as a basis for an estimate, it is the most poorly provided for shop in the country, and the facilities for handling and painting work are totally inadequate and notoriously ill proportioned to the importance of the industry in question.

This is a seemingly sweeping indictment, but there is no doubt that paint shop conditions and conveniences are far from being what they should be. Indeed, speaking from actual observation and experience, we may justly deplore the existing status of the paint shop in respect to all that assists to make it a better paying and healthier department of the carriage business.

The paint shop so situated that it must depend upon its own resources for heating power should be made as tight and weatherproof as possible, in order that every fraction of heat generated by the stove, furnace or other heating device may be utilized. The volume of lost heat is an item of large expense to a majority of shops, and in the paint shop the loss is more quickly and more extensively felt than elsewhere. While the dull season hangs heavy over painting affairs, it is a matter of finance, not to say of personal comfort, to look the shop carefully over and tighten up window casings, side walls, ceiling and floor. A nail here and there, driven at the right spot, and a piece of siding placed where it is needed, or a window tightened and made more secure, are the means to an end which the twentieth century carriage painter may well urgently desire. There is small danger of getting the paint shop too warm, and, if so, an excess of heat may very quickly be disposed of. Better at all times to have a surplus of heat at disposal.

Lumber placed where it will do the most good is cheaper than coal, and both are cheaper than labor that cannot be utilized in a room insufficiently heated.

Ventilation is the handmaid of heat, and no shop can be properly heated until it is adequately ventilated. It is important, therefore, that in making the shop weather proof and heat retaining provision be also made for some system that really ventilates without exposing the work to danger from stirring dust and dirt atoms. There are numerous ventilating devices which open into the shop from the roof, but the old style, inexpensive sort are, after all, about as effective as any.

Each individual room should be furnished with a ventilator leading directly out to the roof, and it should be arranged so that opening and closing of the device may be regulated by the workman in the room. Many of the so-called modern ventilators cannot be operated from the shop, which is a marked disadvantage.

Of course, ventilation secured through lowered and raised windows is better than no ventilation, but it is a crude system, and not reliable nor thorough enough to meet the needs of a shop carrying a vitiated and poison saturated air as does the paint shop.

Moreover, in cold weather the ventilation which the window offers brings with it so much of personal discomfort to the workman, and delay in shop operations, that it is highly objectionable on this score. At first reckoning the cost of a first class roof ventilation, in comparison with the seemingly inexpensive ventilation obtained through the opened window, may appear like an unnecessary expense, but the developments of time will show the economy of the former.

In connection with heat and ventilation must be considered the question of light. The real value of light is expressed in the Divine command, "Let there be light," etc. In the paint shop it is a paramount issue; the chief factor in the greatest trinity of shop necessities, deprived of which the paint shop is a derelict on the remorseless sea of business enterprise.

It is a great pity, and the cause of a large share of unprofitable business, that so many paint shops are dark and dismal, retarding shop operations and the drying of paint and varnish, handicapping, in fact, the whole line of paint shop activity.

Light is an active drying agent, a promoter of health and comfort, and a powerful aid in abstracting profits from the bottomless pit of present day competititon. Let there be more light!

Michigan Concerns in New Quarters

The three story brick block at the corner of Tilden street and Genesee avenue, Saginaw, Mich., has been purchased by the Norris Automobile Co., of that city. Two of the four stores on the ground floor are already occupied by the Norris Co., and they will fit up a repair shop and charging station in the rear and make other improvements.

Spacious new quarters in the Thum Building, Louis and Ottawa streets, Grand Rapids, Mich., have been leased for a term of years by the Michigan Automobile Co., of that place, and will be occupied at once. They have been fitted up to conduct a general sales and garage business in the most approved style. The garage will house 100 cars.

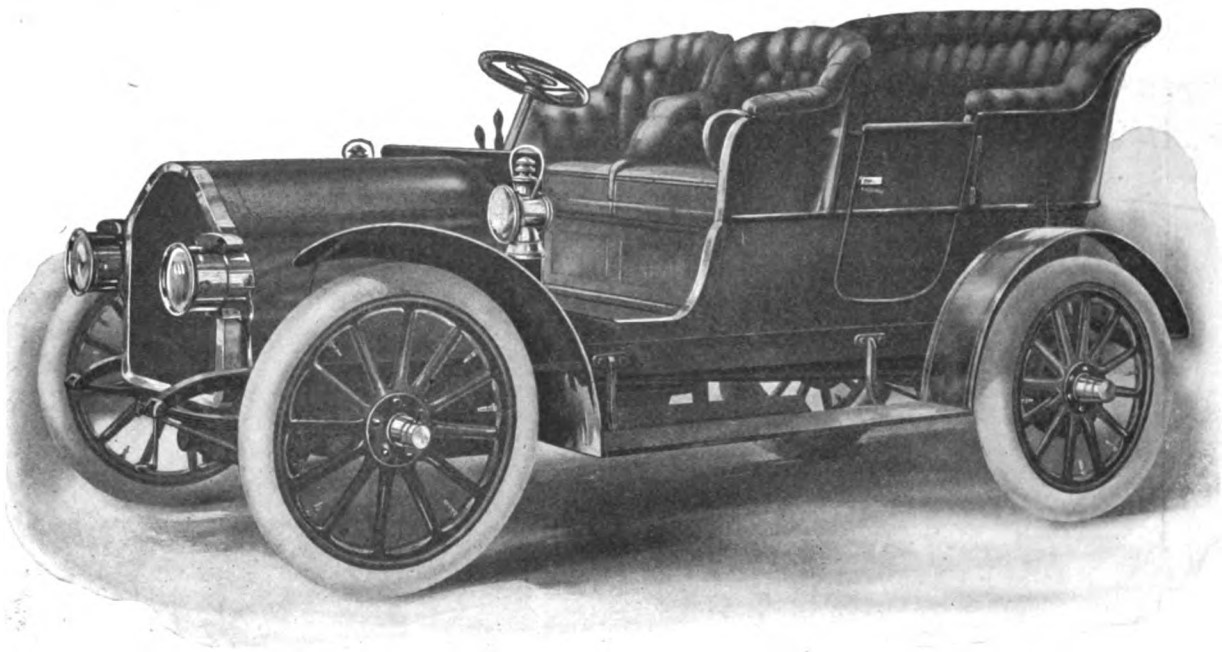
The Jeweler Spins a Yarn.

You "pays your money and you takes your choice"—providing you have bank notes in your purse and stocks and bonds in your strong box—between a $7,000 miniature automobile studded with jewels and one of the "really" kind that will carry you instead of you carrying it. This latest gee-gaw is described by a jeweller as having been "very popular this season among that class which has more money than it knows how to spend."

He took from a little satin-plush box a miniature automobile, about an inch and a half long, and sent it spinning across the show case. It struck two or three other articles of jewelry, and, in true automobile style, bowled them over.

The little automobile was perfection in manufacture. The frame, made of platinum, had not a part missing. The hubs of the little wheels (the wheels being not much larger in diameter than a pencil) were diamonds; diamonds ran along the sides of the seats, and the seats themselves were made of several rubies forming a radiant, though hard, cushion. The lamps were a ruby and an emerald on either side, and a diamond in the center of the dashboard. On the back of the automobile was a pin by which to attach it to the neck of the dress.

The price on the tag was $7,000.



How They Help Their Workmen.

To enable their workmen to live outside the city, the big chocolate making firm of Stollwerck's, Cologne, have hit upon a happy idea. Some time ago the firm erected a number of model dwellings in the country, but they nearly all stood empty, as the distances to and from the factories were too great in most cases for the men employed. The firm owns two heavy electric trucks, and these were fitted out with covers and canvas sides, which transformed them into large and convenient omnibuses, as seats were already provided. These two wagons are now sent down early every morning to the little colony, where they collect the men and convey them to the works, and take them home again at night. Punctuality is enforced, as the men who are not ready on time have to trudge the best part of the way on foot. As soon as the wagons reach the factory they are stripped of their accessories and perform their ordinary duties. Thanks to this idea, the colony is now fully occupied, and further buildings are being erected.

Here's the Circus Car.

An Englishman named Livet claims to be the inventor of an automobile that can turn somersaults without injuring the occupants of the car. An ordinary machine is fitted with a pair of steel rockers running parallel and in a curve overhead from the front to the rear wheels. The inventor says that upsetting in his car is impossible, and that the machine can run over any embankment and turn a complete somersault with ease.

ORIENT TOURING CAR.

Model de Luxe, 20 Horsepower. $2250.

This advertisement is written and published primarily for the benefit of those dealers who did not go to the New York Show.

Those who were there and saw the Orient cars know, better than we could tell them, the reasons why we have already closed with a large number of the very best dealers in the country.

If you did not go, we want you to know, as they know, just why the Orient Touring Cars stood out, head and shoulders, above any other cars in their class.

We want you to know that in beauty of design and finish, in perfection of engineering detail and in all around selling qualities, they ranked, in the opinion of experts, in a class with cars quoted at three thousand to five thousand dollars.

We want you to realize that the Orient de Luxe Touring Car looks every inch an imported, five thousand dollar machine—yet sells for $2250—that the Orient Model F, Light Touring Car with Tonneau ($1650) is the only car of 16 horsepower (or less) in America, having 4-cylinder, vertical tandem engine, Positive Air-Cooling, direct drive, sliding gear transmission, and three forward speeds and reverse.

Furthermore—we want you to realize that no line is complete this year without air-cooled cars—and that the Orient from every standpoint is *the* air-cooled car. It is made by the Waltham Company—and you know what "Waltham" means in fine machinery.

If we can get these facts before you clearly, you will sell Orients this year—unless the other man gets them first. And you will be helped by the biggest advertising and selling plan (combined) ever invented.

Write for details and illustrated catalogue.

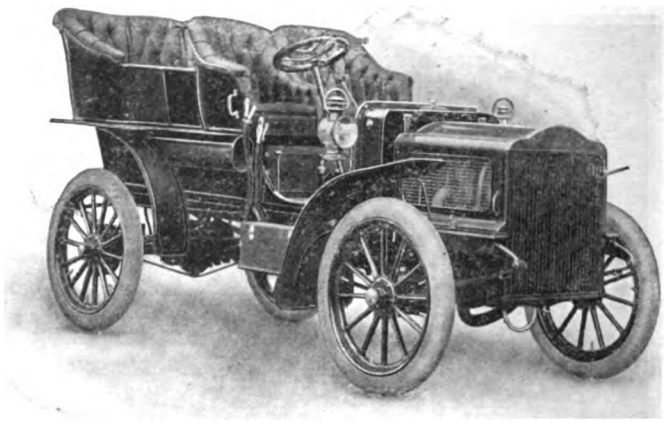
Are your eyes bothering you? Do they ache and pain you? Do they look red and feel hot? Are you troubled with headache and neuralgia? Does it hurt you to read or sew, or use the eyes steadily?

Then don't waste another hour, but get EYE-FIX, the only sure and painless cure for all eye troubles. It never fails to give instant relief, and as it contains neither cocaine, atropine, belladonna or other dangerous elements, EYE-FIX is used universally by physicians and opticians.

EYE-FIX is good to keep the eyes well and strong. And it's the one safe remedy for every eye trouble in both young and old.

If baby's eyes are weak or sore—use EYE-FIX.



If grandfather's eyes are weak and weary—use EYE-FIX.

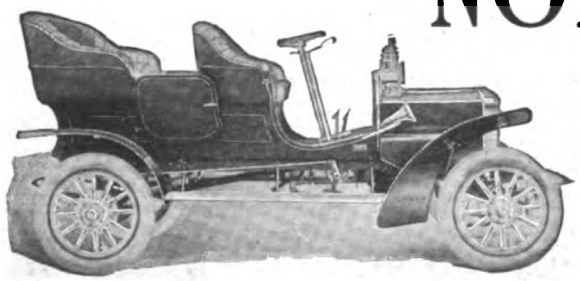
If your own eyes are bad from any cause—use EYE-FIX.

All druggists and opticians sell EYE-FIX at 50 cents. Ask for it and take no substitute. No other eye remedy in the world is like EYE-FIX, because no other remedy produces the same splendid results as EYE-FIX. A trial bottle for 10 cents will be sent you direct from our laboratory. Eye-Fix Remedy Co., Detroit, Mich. Dept. S.

The INCOMPARABLE WHITE

THE CAR FOR SERVICE

Concerning the 1905 White.



The conservative English authority, the *Automotor Journal*, in a recent issue said:

"The new car is, in our opinion, quite as far superior to the 10 H. P. model as that model was to its prototype." * * *

"Silent as have been the earlier models, yet this 15 H. P. car is even more completely so; small as has been their water consumption, yet the efficiency now attained in this respect is even more remarkable; and easy as they always have been to manage, yet the control of this larger model is easier than ever."

NORTHERN AUTOMOBILES

Good in all Climes

SILENT AS THE SNOW

is the operation of the Northern Touring Car. The plans of this superb vehicle called for the elimination of all noise and vibration, and every part has been carefully worked out with this end in view.

That the result aimed at is fully attained, the car itself proves.

THE NORTHERN TOURING CAR IS THE QUIETEST, EASIEST RUNNING CAR IN THE WORLD.

The motor is a 5¼x5¼ two-cylinder of the opposed type, developing ample power to take the car anywhere an automobile can go. Wheel base is 100 inches, with wheels fitted with 30x4 detachable tires. Choice of four different bodies. **Two-passenger** body, a powerful, speedy machine, **$1,500. Four or five passenger,** rear entrance, **$1,600,** and **four or five passenger,** side entrance, $1,700; and, lastly, a superb Limousine body, **$2,500.** All styles interchangeable.

WRITE FOR CATALOG 16.

THE "STURDY NORTHERN" RUNABOUT

long ago justified its name. With ample reserve power, strongly built and with body hung on swivel entirely independent of the frame, rough roads and smooth roads are alike, so far as riding qualities go. Its record in the hands of thousands of users all over the country proves its durability and efficiency under all conditions.

THE 1905 NORTHERN RUNABOUT, grown in everything except price, embodies all the features suggested by experience and the advancement of the art of automobile construction. Among the improvements are new body design, larger fenders, larger oil cups, full back moulded seats and numerous detailed refinements of working parts.

Largely increased facilities make it possible to now offer this sturdy, ideal **"Runabout" at $650.**

It will pay you to get in touch with NORTHERN Automobiles.

Reliance DETROIT

16 h. P. (and lots to spare); weight, 1,750 lbs.; speed, 45 miles (if you want it); price, complete, ... $1,250

EASY SELLERS, because people who know Automobiles can see at first glance that the Reliance is a good car, while novices pick the Reliance because it "looks good to them" for the money; in fact, with purchasers of any class it's "the car too good for the price."

"No Noise About It but the Horn."

Reliance Transmission is the sliding-gear type, "too costly" for other manufacturers. Works the same over all kinds of roads, requiring no attention to keep it adjusted and thoroughly lubricated, something you cannot say of any other car at anything like the money.

Simple pedal control, both hands free; all speeds without touching gear levers, giving absolute control on the direct drive in tight places; saving on the nerves. Easy for women to operate; no strength required. Easiest riding car now built at any price. Finest finish and upholstery that can be produced. Smart body with luxurious tonneau for three persons, and COMFORTABLE side entrances. Wonderful hill climber.

We build it all ourselves; we KNOW it's right.

One hundred cars ready Feb. 1. We have a system of guaranteeing deliveries. Write now for our special terms.

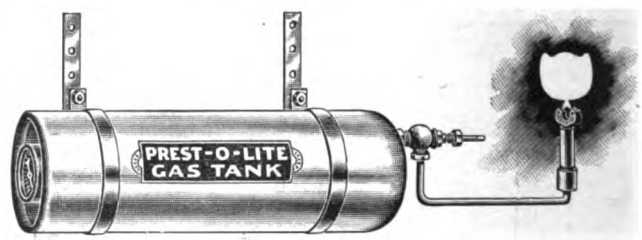
Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about Feb. 1st, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.



The 1904 edition is now out of print.

Sent upon receipt of 6 cents in stamps for postage.

Association of Licensed Automobile Manufacturers,

Room 1009. No. 7 EAST 42nd STREET, NEW YORK.

The Prest-o-Lite Gas Tank

The new system of acetylene lighting for automobiles and launches. More than 1,000 Prest-o-Lite Tanks sold since September 1st. More than 100 of the best agents in America have placed orders for Prestolite Tanks.

TEN THOUSAND Tanks will be sold in 1905. The wide-awake dealers are signing up agencies now. Write us for catalogue and full information.

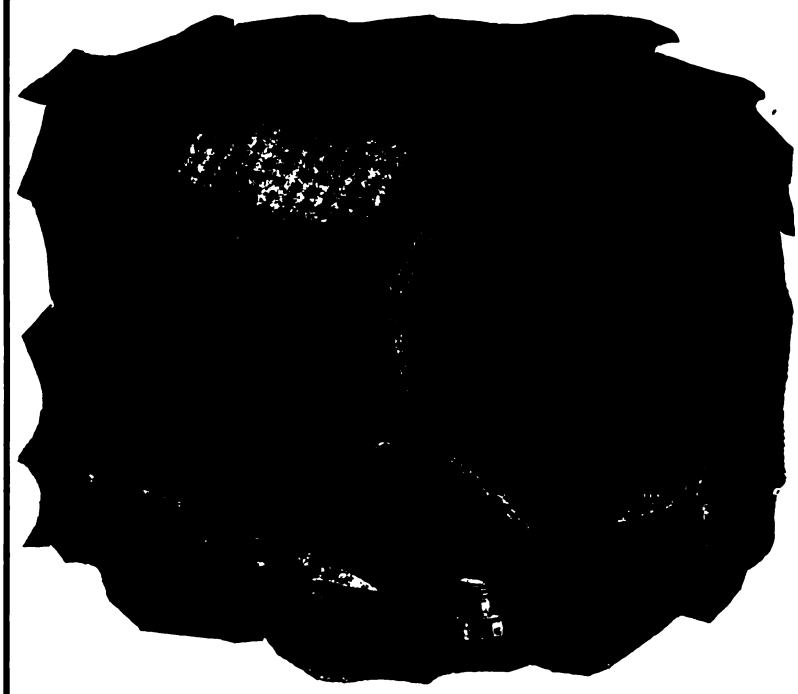
— THAT ETERNAL QUESTION —



— Tire Maintenance —

— Solved at Last —

and by the

Kokomo Mechanically-attached Tire

"Creeping," "Crimping," "Rolling" and "Blow Outs" Impossible

The lugs form part of the metal band, which is moulded into the tire itself, and are rigidly held in place by slots in the rim itself.

Attached and Detached in a Jiffy with a Small Wrench

No Bothersome and Unsightly Lugs Projecting through rim to damage the inner tube and no metal valve used

Side Walls as Strong and Substantial as the Tread

☞ More cushioning or air space to sectional diameter than any other tire of same diameter, permitting the use of a smaller tire—a saving to purchasers.

Prices and other particulars on application

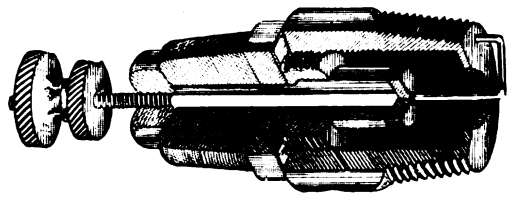
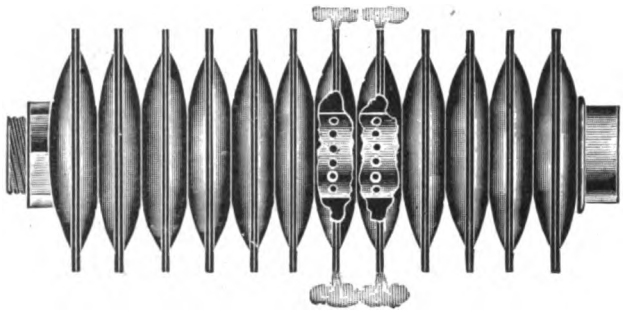
WHOLESALE RETAIL

Largest Manufacturer of Auto Specialties in the World



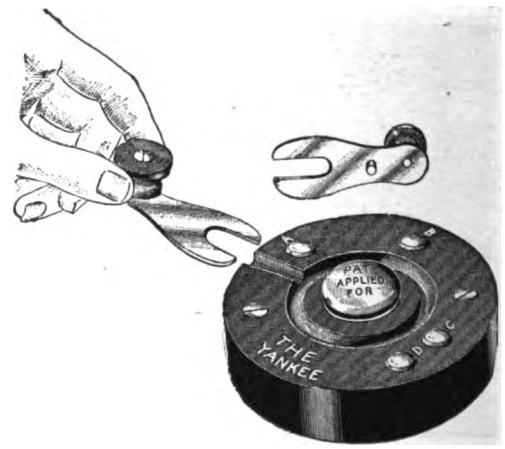
1905 Yankee Non-Vibrating Steering Wheel
Price, $10.00

Takes up all the vibration and at the same time has greater tensile strength for steering purposes than the old-fashioned wheel. Very ingeniously constructed. Write for descriptive circular.



1905 Yankee Grade-Meter
Price, $7.50

This Grade-Meter is the handsomest article of its kind on the market and is positively accurate.
No vibrating of the indicating hand.



Yankee Mica Spark Plug
Closed End, $1.50 Open End, $1.00

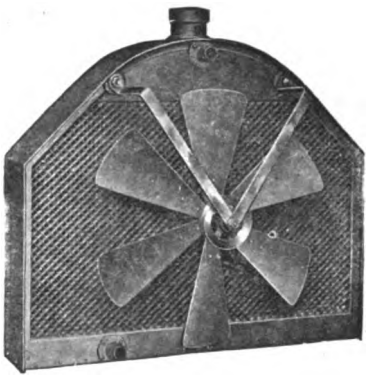
Both guaranteed 90 days.
Thousands in use and no complaints.

Yankee Silent Muffler
Price, $6.00

Composed of 24 opposed disks enc'osing escapement hole in exhaust pipe. Gas escapes through the thin outer edge of all the disks simultaneously.
The point of escapement is so many times larger than the bore of the exhaust pipe that there is no back pressure.
Equal distribution of the escaping gas over so long a line solves the muffler question.
Positively noiseless.

Yankee Cut-out Switch
Price, $1.50

Switch blade instantly detachable which locks your car in your absence. Cannot be short circuited.
May use two sets of batteries, separately or alternately, or you may double your amperage at will.



WE ALSO MANUFACTURE

Quick Chain Repairers (sells for 50c.), Foot Bellows for Horn (sells for $3.00), Wind Shield, Price $7.50 (keeps dust out of back of tonneau), Battery Connections (sells for 36c. doz.), Repair Plasters, $1.00 each.
We manufacture 33 other Auto Specialties. Cuts furnished free to jobbers and dealers.
BIG FREE CATALOG. Discount to Manufacturers, Jobbers and Dealers.

The FOUR POINTS OF REAL MERIT

RELIABILITY

DURABILITY

BEAUTY

UTILITY

OF

Solar Lamps

As clearly observed by all visiting "trade wise" dealers at our booth at the New York Show.

They do not need the verdict of the International Jury at the St. Louis World's Fair, by which **Solars were awarded the Gold Medal,** to convince them that the automobile drivers will insist upon Solar equipment on all 1905 cars. Be wise and meet this demand. Solar lamp equipment means "no lamp troubles" and that is what you want.

Don't fail to see our 1905 line if you visit the Show. If not, write us for samples, electros and prices.

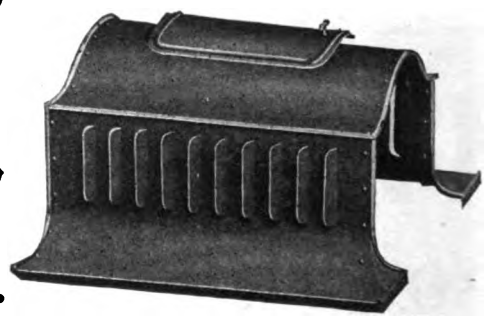
OUR EASTERN BRANCH, NEWARK, N. J.

Briscoe Radiators

need no introduction to the automobile trade. They are known everywhere as the most efficient, modern, tasty and economical radiators that can be used.



During the past season the demands on our factory were so great that we have been compelled to open a new plant at Newark, N. J., to handle our eastern trade. At the same time our Detroit factory has been materially enlarged and improved, so that in 1905, as in past years, we shall continue to make more radiators than all other manufacturers combined. This year our specialties are:

FLAT-TUBE RADIATORS,

"STAGGERED GANG FIN" RADIATORS,

HONEYCOMB RADIATORS.

All old types refined and improved. With our increased facilities and the large stock of materials which we carry on hand at all times, we are prepared to make prompt deliveries.

BRISCOE HOODS, FENDERS, TANKS, ETC., ARE STANDARD.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

OLDSMOBILE

THE success of our demonstrations, the enthusiasm of our visitors, the magnitude of our sales, testify to the leading part played by the Oldsmobile in the New York Show.

Our sales were unprecedented and indicate a prosperous year in store for our agents.

Our 20 H. P. Touring Car fully met every expectation. In demonstration it easily took 12 and 15 per cent. grades on high speed.

Our commercial vehicles and Ten Passenger Coach attracted favorable attention, particularly on the streets in demonstrations.

We did it with this line:

Oldsmobile Standard Runabout,	**$650**
Oldsmobile Touring Runabout,	**$750**
Oldsmobile Light Tonneau Car,	**$950**
Oldsmobile Touring Car, 2 Cylinder,	**$1400**
Oldsmobile Light Delivery Car,	**$1000**
Oldsmobile Heavy Delivery Car,	**$2000**

Did you get copies of "Good Talk" and George Ades "The Rolling Peanut"? If not, write for a free copy.

WINTON

Twin Springs—An Exclusive Winton Feature.

Automobile springs generally have one of two radical faults.

First.—Some springs are *so stiff* that they do not absorb the shocks of travel, but transmit them to the motor, greatly to its damage, and jar the passengers in a most uncomfortable manner.

Second.—Other springs are *so elastic* that the car bounds up and down, like a ship at sea, distressing the motor and the passengers alike.

The ideal spring, consequently, is one that combines *resistance* (stiffness) with *resilience* (elasticity), in such proportion that the motor sustains no shocks and the passengers travel in complete comfort.

WINTON *Twin Springs* alone possess this combination of merit.

Two four-leaf springs (200 and 201) are united in the centre and shackled at either end (198). They support the frame (2) by means of shackle (199), which is attached to spring horn, and spring plate (202).

Because of the *freedom of action* allowed by the shackles (198), the result, when car is used, is a *light spring* for light loads and good roads, and a *heavy spring* for heavy loads and rough roads.

The efficiency of these *Twin Springs* has been absolutely proved, not only by mechanical tests, but also by use on WINTON cars for *more than a year*.

Individual owners who have used them could not be persuaded to use any other kind. The comfort these *Twin Springs* provide adds a new delight to motoring.

Twin Springs are but one of *many exclusive features* to be enjoyed by Winton owners in 1905. Booklet No. 8 tells about the others.

"From my experience, I would certainly recommend a Locomobile to any one considering the purchase of a touring car."—J. H. M., New Haven, Conn.

"As you know, I had in N. Y. City the celebrated —— ($6,700 foreign car), but it is not in the same class with the LOCO to my mind."—D. M. B., Amherst, Mass.

"We have had a letter from his chauffeur, saying Mr. B.—— is highly pleased with his Locomobile, it having gone 700 miles and no delays or difficulties."—J. H. M., Boston, Mass.

"I wish to say the Locomobile fulfills my expectations in every respect; it runs magnificently, does its work easily, quietly and without vibration."—A. S. P., Wichita, Kan.

"I must say the Locomobile has given me entire satisfaction in every way; the more I drive it the more I think of it."—C. L., New York.

"The Locomobile has now run about ten thousand miles, and is in as good condition as ever."—A. A. M., San Francisco, Cal.

"My Locomobile has made since the 22nd of January, 1903, 13,950 miles."—R. L. M., New York, March 31, 1904.

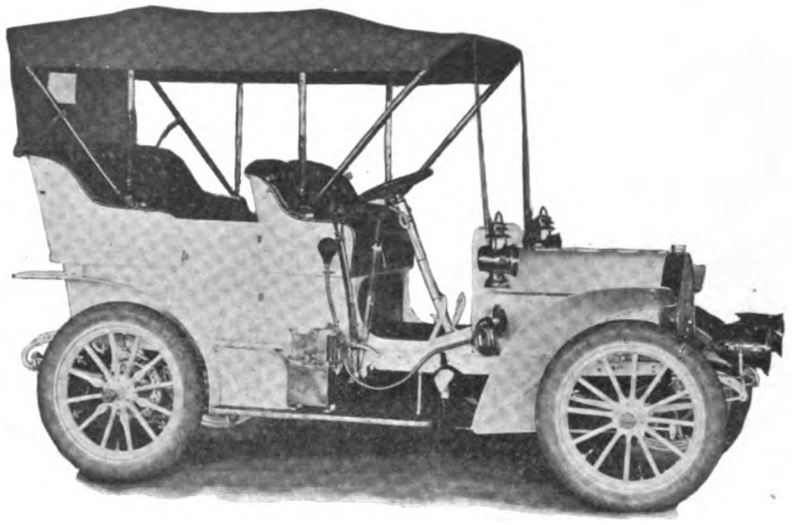
"The Locomobile is running beautifully and giving entire satisfaction."—W. A. R., Woonsocket, Mass.

"Met on this trip three parties who were running 4-cyl. Locomobiles, and they seemed to be very much pleased with them. One man, in fact, said he would not exchange his LOCO for the best foreign car built."—F. G. T., Springfield, Mass.

Locomobile

Gasolene Touring Cars.

"Easily the Best Built Car in America."



"This is the fifth automobile that I have had, but of all the cars I have seen or used, there is none that will compare with the Locomobile in any manner."—S. T. M., Lafayette, Ind.

"The Locomobile is delightful in every respect, and there has been no trouble whatsoever so far."—H. S. E., New York.

"It gives me much pleasure to say a good word for the Locomobile Gasolene Touring Car—I regard it as the most reliable and generally satisfactory of any of the twelve automobiles I have owned."—G. F. C., New York, N. Y.

"In every way the Locomobile has been entirely satisfactory; never has failed to do what was required of it. Refer any to me you care to."—A. G. M., Norwich, Conn.

"I have now run my Locomobile for about 6,000 miles, and it has never refused to come home under its own power."—F. W., Fitchburg, Mass.

"I am very much pleased with the behavior of the Locomobile, and consider it way ahead of last year's car, although that gave good satisfaction."—F. W. B., Bridgeport.

"Came up to Boston yesterday. The Locomobile went like a bird. Have been over 500 miles, and have not missed an explosion."—F. H. T., New Bedford, Mass.

"I think the Locomobile Company's claim of "Easily the Best Built Car in America" is a perfectly just one. I can readily claim it to be superior to any American and equal in the same horse power to any French car, and at the same time perfectly adapted to American roads."—J. C. S., Boston, Mass.

"I think the construction (of the Locomobile) is absolutely perfect, for never was a more rigid test given a machine than our trip from Bridgeport to Providence."—A. L. P., Providence, R. I.

"I have used it now three months in my business, which is constant. We are averaging sixty miles per day, up hill and down. The Locomobile is certainly all you have recommended."—Dr. R. W. L., Ridgefield, Conn.

"Have run the 4-cyl. Locomobile purchased from you last November about 5,000 miles. About 4,000 miles of this was through the mountains of California. I do not think any machine could give better satisfaction."—D. H. G., N. Y.

Write for full information regarding our 1905 product. All models are of the four-cylinder type, with side entrance tonneau. Prices, $2800 to $8000.

"My Locomobile delivered to me in November, 1902, is running satisfactorily, and with the exception of such adjustments as are necessary on all cars is always in commission."—M. M. R., New York City.

"I am frank to say I am delighted with the Locomobile. Believe there is no better machine made—in fact, do not believe there is another machine in the country that would have gone where I did last Sunday."—C. B. M., Minetto, N. Y.

The *Locomobile* Company of America,

CHICAGO—No. 1345 Michigan Avenue

Member Association Licensed Automobile Manufacturers.

"Have run my Locomobile easily 8,000 miles. She has always gone and returned from every place I have started for without any trouble."—D. N. A., Bridgeport, Conn.

"Cannot say too much in praise of the Locomobile. Have several friends who own cars, and they say it is equal to, if not better, than the foreign cars."—C. L. H., Norwich, Conn.

"I have now operated the Locomobile for about five months. During that time I have never wanted the car when it was not ready to go out."—W. A. W., Jr., Hoosic Falls, N. Y.

"I can offer no suggestions which would be of value as to the improvement of the Locomobile. It has far surpassed my expectations."—W. B., Boston, Mass.

"Every time I drive the Locomobile I am more than pleased with it. Saturday evening last I drove 20 miles in 42 minutes, including three long hills, and the car ran like a watch."—F. W. M., Jr., La Salle, Ill.

"I have yet to see a car which I think is better than my Locomobile, or will stand up as well over all kinds of country roads with the ordinary usage which a car gets."—P. W. W., Boston, Mass.

"I fail to see how you could improve in any way upon the Locomobile, as its details seem perfect, and it is without doubt "easily the best built car in America."—A. L. P., Providence, R. I.

"Where my Locomobile was this summer for a month it was the only car out of two dozen, including high-priced foreign cars, that was always in good shape and running every day."—C. W. L., New York, N. Y.

Speaking of Motor Cars

What factor most influences your purchase—is it fine finish and smart exterior appearance of a car, or the dependability of its motor and working parts—or both? You have in THE LOZIER MOTOR CAR a correct combination of both.

Fine appearance is a large item, and is as essential to the Motor Car as is correct dress to the human family—it must be in keeping.

But the MOTOR—that is the important factor, and in that is where we excel. Better not have a Motor Car if its motive power and controlling mechanism are not absolutely dependable.

Our many years experience in the manufacture of High Grade Gasoline Motors and our very large output, have given us a practical knowledge of the subject that few manufacturers possess. Our facilities and equipment for the building of this product are the best in the country, and as it has ever been the LOZIER policy to build the best that money and brains could produce, a Lozier Motor is a guarantee of excellence in itself. Its correct installation and control, and consequent quiet running, are assured.

LOZIER

The body and finish throughout are in keeping with the high grade motor and controlling mechanism—in short, the entire combination is correct.

The motor is of the four-cylinder, vertical type—Ignition by high tension magneto—Tonneau, double side entrance—Seating capacity, 5 to 7—Wheels, 36 inches—Wheel base, 115½ inches (one of the largest American cars)—Price, $5,000 and upward, according to style of body.

Send for a copy of our catalogue.

Motor Boat Agents are requested to write us for our motor boat discounts.

1905 ANNOUNCEMENT

The Autocar

A NEW TYPE.

We believe that the Autocar in all its types represents the highest excellence in automobile design, workmanship and material. Every Autocar is built on honor. We feel, therefore, that our new type will meet with a cordial reception.

This car, **Type XI.**, larger and more powerful than the other types, has a four-cylinder vertical engine of 16-20 horsepower. The body is built on the newest and most approved French lines. The front seat is divided and both front and rear seats are large and comfortable.

While this car is built upon the tried Autocar principles which have been so splendidly proven, it shows a number of very important improvements making for increased simplicity, ease of operation, safety and comfort.

In fact, though Autocars have always been noted for absence of bewildering intricacy of mechanism, yet no one can but be impressed with the extreme simplicity of this new car. It is a triumph in scientific construction and arrangement.

This car has more than met our highest expectations in the road test. In fact, its performance has been a surprise to experienced automobile men. The power of the car carries it, fully equipped and loaded with five passengers up, tested 12 per cent. grades, for instance, at 20 to 25 miles per hour on the direct drive, while on the level the car attains a speed of 40 to 45 miles. The car is a superior climber on any hill.

Altogether our eight years' experience has enabled us to produce in this type, a four cylinder car we are assured cannot be surpassed by any similar car at any price.

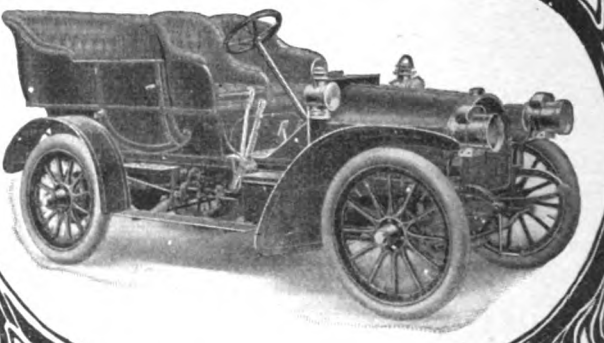
The price of Type XI is $2000. Ready for delivery January 16.

Type VIII.—Four-Passenger at ($1400.) and

Type X.—Runabout at ($900,)

have made *Autocar Reputation.* Each stands at the head of its class for value and efficiency.

Catalogue descriptive of the 1904-05 types will be sent free upon request. This catalogue contains also addresses of our dealers throughout the country who will be glad to give demonstrations to prospective automobile purchasers and explain in detail the merits of our cars.



THE AUTOCAR COMPANY,

Ardmore, Pa.

ORIENT TOURING CAR.

Model de Luxe, 20 Horsepower. $2250.

If you can think of any surer way to make money than by selling the Orient Touring Cars this season, please tell us about it.

We have been eleven years in business, building first bicycles, then motorcycles, then water-cooled automobiles, then air-cooled automobiles.

During the last seven years we have been continuously engaged in motor work—so we ought to know something about motor building.

We have more than three thousand air-cooled motors in successful operation—so we ought to know something about air-cooling.

And we state positively that there are no cars in America that equal this year's Orients, at anything like the same prices or power ratings.

The Orient Positive Air-Cooled 4-cylinder, vertical tandem engine is a triumph in motor construction. It runs coolly and quietly, developing its full rating power, and combines all the best features of up-to-date motor designing.

The same type of engine is used in the 16 H. P. as in the 20 H. P. cars. The lighter cars also have direct drive, sliding gear transmission, and three forward speeds and reverse.

The Orients are superbly designed. They have all the snap and style—the massive, powerful lines, gracefully treated—of the high-priced foreign cars.

NORTHERN AUTOMOBILES

Good in all Climes

SILENT AS THE SNOW

is the operation of the Northern Touring Car. The plans of this superb vehicle called for the elimination of all noise and vibration, and every part has been carefully worked out with this end in view.

That the result aimed at is fully attained, the car itself proves.

THE NORTHERN TOURING CAR IS THE QUIETEST, EASIEST RUNNING CAR IN THE WORLD.

The motor is a 5¼x5¼ two-cylinder of the opposed type, developing ample power to take the car anywhere an automobile can go. Wheel base is 100 inches, with wheels fitted with 30x4 detachable tires. Choice of four different bodies. **Two-passenger** body, a powerful, speedy machine, **$1,500. Four or five passenger,** rear entrance, **$1,600,** and **four or five passenger,** side entrance, $1,700; and, lastly, a superb Limousine body, **$2,500.** All styles interchangeable.

WRITE FOR CATALOG 16.

THE "STURDY NORTHERN" RUNABOUT

long ago justified its name. With ample reserve power, strongly built and with body hung on swivel entirely independent of the frame, rough roads and smooth roads are alike, so far as riding qualities go. Its record in the hands of thousands of users all over the country proves its durability and efficiency under all conditions.

THE 1905 NORTHERN RUNABOUT, grown in everything except price, embodies all the features suggested by experience and the advancement of the art of automobile construction. Among the improvements are new body design, larger fenders, larger oil cups, full back moulded seats and numerous detailed refinements of working parts.

Largely increased facilities make it possible to now offer this sturdy, ideal **"Runabout" at $650.**

It will pay you to get in touch with NORTHERN Automobiles.

DO YOU WANT A GOOD CAR—

a car that will go anywhere you want, up hill and down, over good roads and bad?

We know you do. Now, our new four cylinder car is such a one. Vertical engine, in front. Individual cylinders, with ***copper*** water jackets—you know what that means. Thirty ***actual*** horse power—with us, that means more. Duplex disc clutch, with springs between the friction surfaces—no shocks on starting—no unnecessary strains on motor. Three speeds and reverse; planetary transmission handled by ***one lever.*** And the gears don't clatter or grind when going into engagement—some gears do.

Shaft drive, running on ball bearings. ***Positive*** and ***sufficient lubrication.*** Brakes you can depend on. A ***proper*** muffler which silences the exhaust as it should be silenced. This and our usual excellence of design and workmanship makes the car unusually free from noise and vibration—and don't ***you*** want

A QUIET CAR?

Our "big" car for 1905 is that kind.

Our smaller cars of the detachable tonneau-type will continue to be made. They will be equipped with the same engine and transmission as last year—there are no better of their kind.

Volume IX. New York, U. S. A., Thursday, January 26, 1905. No. 18

TORONTO SHOW IS OFF

Promoters Had Secured a Sanction, but Overlooked one Detail of Some Importance.

There will be no automobile show in Toronto, after all.

Although Toronto is a British possession, the National Association of (American) Automobile Manufacturers had duly issued a sanction for the show, and even the dates—February 27 to March 4—had been duly promulgated and the manager designated by the secretary of the N. A. A. M., Mr. S. Arthur Miles, formerly of England. The manager named was William J. Morgan, one of Miles's old pals, who makes his living in America and hurrahs for the British flag. He used to race on a bicycle for a living, but of late he has been wearing a white vest, and seems to be a sort of boomer of hotels and wealthy foreigners who need booming. Automobile races, speedways, shows and almost "any old thing" are the favorite mediums employed by Morgan to "deliver the goods."

Morgan has been very much occupied with his boomings of late, and, whether the fact was in any way responsible for the Toronto fiasco has not yet developed. At any rate, it appears that such a trifling detail as obtaining a hall in which to hold the show had been overlooked. It was supposed that one of the Toronto armories could be secured for the purpose, but it is now given out that the Canadian government has refused to rent the buildings for show purposes. But, whatever the cause, the show is off. That much is certain.

Ground for White Garage.

The estate, No. 230 Newbury street, Boston, owned by F. B. Riedell, has been sold to the White Sewing Machine Co., but the price has not been given out yet. The White company will erect a large garage, salesroom and repair shop on the property. The property consists of a lot containing 7,260 square feet and a three story brick stable, and is assessed at $49,000.

Kitto Heads Simplicities.

W. H. Kitto has been elected president of the recently organized Simplicities Automobile Co., of Middletown, Conn. The new company will occupy the old Worcester cycle factory in William street. This week Kitto issued to the company a bill of sale of all parts, pieces, cars complete or in the course of construction at the factory of the company, and conveyed all the patents owned by him, granted or pending, and also the goodwill of the business.

Monnier Changes His Title.

On February 1 the Monnier Cycle Supply Co., the Detroit jobbing house, will become the Monnier Auto & Cycle Supply Co. The change is of name only. The management of the concern and the business will be conducted as it has been for the last seven years, by Charles S. Monnier, who is sole proprietor. With an eye to expansion, Monnier has leased the entire building at No. 68 Congress street, East, and the upper portion of No. 66 Congress street, East.

Smith Goes to Cleveland.

George H. Smith, formerly with the Packard branch in New York, has become manager of the Automobile Storage & Repair Co., Cleveland. W. C. Anderson, former sales manager of the Columbus Motor Vehicle Co., will be his right hand man. The concern will continue to handle Cadillacs, Autocars and Packards.

Iowa Jobbers Enter Trade.

The Iowa Automobile & Supply Co., which was organized a short time ago, has leased all of the old Western Newspaper Union building, in West Fourth street, Des Moines, Iowa, and will enter the jobbing trade. This means, of course, that a full stock of accessories will be carried.

Trout Goes With Reliance.

George Trout has been appointed sales manager of the Reliance Motor Car Co. He brings to the office ripe experience, gained in the service of the Ford, Kirk and Sandusky concerns.

ENGINEERS ORGANIZED

Licensed Association's Factory Heads Finally Choose Leaders and Outline Plan of Action.

By the election of Charles Clifton, treasurer of the George N. Pierce Co., as temporary chairman, and Karl Almquist, chief engineer of the Worthington Automobile Co., as permanent secretary, the mechanical branch of the Association of Licensed Automobile Manufacturers finally assumed definite shape on Thursday last, 19th inst. The meeting for the purpose was held at the association's offices in New York on that date.

At the same time a committee of four, consisting of A. L. Riker, H. G. McComb, H. P. Maxim and John Wilkinson, was appointed to select subjects for discussion and the men to handle them; for it is the purpose of the branch to carry forward the work in a manner corresponding closely to the work of the Society of Mechanical Engineers, for example—the writing of papers on the vital problems of the day, as far as motors and automobile construction is concerned. The discussion of these papers and addresses by prominent engineers and experts on the theoretical principles underlying the problems to be worked out practically are included in the scope.

It is also not out of the range of possibilities that certain principles may be worked out experimentally under the auspices of this section of the association, and that knowledge may be acquired by them which will become of vital importance to the members of the association. Frequent meetings are to be held, and as the section has the hearty support of the commercial end of the business nothing seems necessary to insure its usefulness.

Wayne Gets More Room.

The Wayne Automobile Co., Detroit, Mich., has secured an addition to its factory in the building at No. 121 to 129 Champlain street, that city. The company will continue the manufacture of cars at its Franklin street factory, and the new place will be used as a storeroom.

PHILADELPHIA SHOW OPEN

"Full House" of Exhibitors, but Blizzard Weather Has Affected the Attendance.

Monday evening, following closely on the heels of the New York exhibit at the Garden, the first of the succession of local shows, which will extend well into spring, opened in Philadelphia under the auspices of the Automobile Trades Association of that city. A large number of the prominent makers were well represented by fitting and effectively decorated displays made, in the majority of instances, by their local representatives, and the First Regiment Armory, in which the show was held, was crowded.

Demonstrating cars were greatly in evidence from the start, and though activities in this direction were brought to a sudden halt during the middle of the week by the advent of the storm and snow-blockaded streets, operations were resumed immediately after, despite the high wind and biting weather, which made riding anything but a pleasure—in an open car this partook more of the nature of torture than otherwise, and short demonstrations were the rule, for not even the most enthusiastic would-be buyer was anxious to insist upon a long ride.

Well over a score of different makers exhibited from one to three or more cars, with here and there an exhibition chassis, which, as usual, formed the nucleus of the inevitable admiring crowd in every instance. The motor bicycle is in evidence in several exhibits, and the sundry dealers, with their assorted collections of anything and everything in the way of specialties for the automobile and the automobilist, flourished like the proverbial green bay tree. It is matter for remark that, in spite of the overwhelming attraction offered by the large cars and the highly polished chassis, clearly showing the modus operandi of the internals which the spectators never seem to tire gazing at, the booths of the sundry dealers always manage to have an interested assembly before them, and it must be admitted that these enterprising members of the fraternity always have something new and novel that is worth seeing.

Practically every automobile dealer in the Quaker City put in appearance at his exhibit, some of them having no necessity to draw on their agency cars for display purposes, as some of the New York exhibits were transferred in toto. While the main floor of the armory provided excellent facilities for showing cars, so far as it went, the exhibits were somewhat crowded for space, and many of the smaller exhibitors were compelled to show in the company and officers' rooms. This is the fourth annual show, and, judging from the attendance on the first evening, it will greatly surpass all previous attempts in this direction, both from the exhibition point of view and the amount of business done.

Cars of various types, with here and there an exhibition chassis, were exhibited by the agents of the following makers:

Winton Motor Carriage Co., Knox Automobile Co., E. R. Thomas Motor Co., Packard Motor Car Co., Elmore Mfg. Co., Pope Mfg. Co., Olds Motor Works, The Locomobile Co. of America, Haynes-Apperson Co., White Sewing Machine Co., The Autocar Co., Waltham Mfg. Co., Cadillac Automobile Co., Ford Motor Co., Buick Motor Co., Maxwell-Briscoe Co., Eastern Automobile Co., Black Diamond Automobile Co., Quaker City Automobile Co., Keystone Motor Car Co., Reo Automobile Co., Rose Automobile Co., John Wanamaker, Penn Electric Vehicle Co., Chadwick Automobile Co., Crawford Automobile Co., Simplex Automobile Co., Premier Motor Mfg. Co., Darracq Automobile Co.

The sundry makers and dealers, tire manufacturers, etc., many of whom were forced to fit up booths in the company and officers' rooms, were as follows:

C. E. Miller, supplies; Atlantic Refining Co., oils; E. J. Willis, supplies; Cushman Motor Co., Cushman motors; Twentieth Century Mfg. Co., lamps; Rose Mfg. Co., lamps; Gray & Davis, lamps; S. F. Bowser Co., gasolene outfits; Raffex Flash Light Co., of Passaic, N. J.; Mobiloil Co., oil.

The motorbicycles exhibited were the Indian, Racycle, Light, Mayo and Thoroughbred.

The latest advances in tiremaking were shown by the Hartford Rubber Works Co., Diamond Rubber Co., B. F. Goodrich Co., Fisk Mfg. Co., Firestone Tire & Rubber Co.

Suits and More of Them.

Clyde P. Warner has brought a suit for replevin in the Superior Court at Chicago to recover an automobile which was seized by Constable Louis Greenberg. The action is the outgrowth of an injunction suit filed several months ago by Everett G. Eberhart, who owns the machine, asserting that Greenberg had seized the machine upon executions obtained against C. H. Hurlburt, the former owner. Eberhart asserts he purchased the automobile from Hurlburt, and afterward gave it to Warner for the latter to sell. It was while the machine was in Warner's possession that Greenberg is alleged to have seized it.

Seneca Falls has Hopes.

If present plans do not miscarry and sufficient stock is subscribed for to warrant its moving there, Seneca Falls, N. Y., will have a new enterprise in an automobile factory. The Syracuse Automobile Co. is given as the title of the concern that is anxious to locate at Seneca Falls.

Jacob Pfleigel, of Brooklyn, N. Y., will erect a garage on Stewart street, that city. The building will be a one story brick, with a fireproof gravel roof.

NAMES THE DELINQUENTS

Many Automobile Concerns Included in New Jersey's Lengthy Annual "Blacklist."

Former Governor of New Jersey Franklin Murphy made his annual housecleaning among the corporations chartered under the New Jersey laws before his term expired, and as a result 1,300 of these concerns are without a "legal" right to continue business.

The list of corporations that failed or neglected to pay the State corporation tax has just been published, and the following, connected with the automobile trade, are mentioned in the list: Automobile & Marine Power Co., Automobile Patents Exploitation Co., Automobile Transit Co., Church Automobile & Specialty Co., Du Bois Automobile Agency, F. L. C. Martin Automobile Co., Forest Automobile Co., Gasper Motor Co., Henrietta Motor Vehicle Co., Hercules Motor Co., Hird Cushion Tire Co., Hogan Motor Co., of West Haven, Conn.; Motormobile Co., New Jersey Automobile Co. Branch, New Jersey Motor Carriage Co., New York Motor Vehicle Co., Oldfelt Automobile & Steam Launch Co., Remington Automobile & Motor Co., Rutenber Automobile & Mfg. Co., Sneckner Motor Co., Standard Automobile Co. of New York, Standard Rotary Motor Co., Thompson Automobile Co., Thornycroft Steam Wagon Co. of America, Traction Truck Co., Union Tire Co., United States Tire Inflater Co., Wheel Within Wheel Co., Woods Motor Cab Co. of Detroit, Woods Motor Cab Co. of Washington and Woods Vehicle Co.

Replacing the Speaking Tube.

Paris coachbuilders are at present making a feature of the various systems of communication between a passenger in a closed vehicle and the driver. The best of these, if the ordinary speaking tube be placed momentarily aside, are those worked by a small electric battery. Inside the automobile is a keyboard with a number of knobs, under each one of which is written some command, such as "home," "left," "right" and "turn." These correspond with an indicator on the dashboard immediately in front of the driver. When a knob is pushed a bell rings, and the order in question is seen on the glass of the indicator in illuminated letters. Thus the device is equally practical either by day or night. One of them recently was shown in this country on a Mercedes car brought over by Mr. Theo. Kearney, of Fresno, Cal.

Columbus Sues the Railroad.

The Columbus Motor Vehicle Co., Columbus, Ohio, has sued the Pittsburg, Cincinnati, Chicago & St. Louis Railroad Co. for $1,200 for alleged improper delivery of a Dumont car.

TALE OF TWO DOCTORS

Told in Court it Wins Verdict and Brings Out Some Interesting Evidence.

That a balky automobile and a refractory horse are much the same in the eyes of the law was the substance of a decision rendered by Judge Williams, in Milwaukee, Wis., in an interesting damage suit against the B. & P. Co., from whom the Drs. P. H. and J. J. McGovern purchased an automobile two years ago.

The McGovern doctors bought the car from the B. & P. Co. two years ago, and because, as they claimed, the machine balked, suit was instituted against the automobile company for $750, the price of the machine, and $1,000 damages. The suit was a long drawn out one, in which much "expert" testimony concerning automobiles was brought out by both sides. Dr. P. H. McGovern, in giving his experience, said that a machine of a make especially consistent with physicians' demands had been contracted for, but on steep grades with this particular car there would result "patient and patience losing trouble." He detailed some of his woes.

But the principal witness for the plaintiffs was Dr. Ralph Elmergreen, former president of the Milwaukee Automobile Club. Dr. Elmergreen qualified as an expert after stating that he had been "soaked" several times and spent $7,000 to learn what he knew about the things he was called to talk about. His testimony was interesting, to say the least.

"It has done me good," said Dr. Elmergreen, "to see the doctors working, swearing and sweating. A 4 horsepower engine on a 1,250 pound machine will have about the same results to the machine as a 50 pound man doing eighteen hours' work a day will have on the man. The machine in question was worth about $150 to a man of my experience to-day. I did not always have it. To a 'sucker' the machine might be worth from $750 to $1,500. A horseless carriage is one in which the body is built to suit the engine; in an automobile the engine is suited to the body of the machine. The McGoverns' automobile does not come under either classification." Dr. Elmergreen then told the court what he "thought" about the McGovern automobile.

"We don't want 'thinks'; we want 'facts,'" thundered the court.

"Well," was the answer, "we have to think a whole lot about automobiles."

E. E. Warner, of the defendant company, then took the stand. He said: "I do not consider that the Drs. McGovern have sense enough to run any machine. They would not follow my directions, and several times applied the high speed clutch when I told them not to do so. I have gained my knowledge of automobiles by actual experience in the shop." Pressed by the attorney for the plaintiffs to give the horsepower of an engine with a 6½x9-inch cylinder, he said he could not do so, and added by way of explanation that no man could do such a task. When he first went into the manufacture of automobiles he had no designer, he said, but had copied his designs from those of other manufacturers.

After carefully listening to the testimony on each side Judge Williams rendered this interesting verdict:

"I consider a balky automobile the same as a balky horse—neither is worth very much. An automobile is an article which is ordinarily desirable only on account of its commercial value or its mechanical fitness for the uses for which it is made and sold. I have no power to unmake the contract, but judgment should be entered for the difference between the real value of the machine when it was sold, $200, and the value as it had been warranted, $750."

By the decision the Drs. McGovern recover $550 of the purchase price and retain possession of the automobile, at an exceedingly low cost of $200, and after two years' usage.

The Week's Incorporations.

New-Haven, Conn.—Ochsner & Sons' Company, under Connecticut laws, with $15,000 capital; to manufacture automobile appliances.

New York, N. Y.—United Motor Car & Supply Co., under New York laws, with $25,000 capital. Incorporators—E. D. York, F. N. Whitney and H. F. Wells.

Elmira, N. Y.—The Watrous Automobile Co., under New York laws, with $10,000 capital; to manufacture automobiles. Incorporators—T. S. Watrous, H. R. Brate and S. B. Clarke.

Baltimore, Md—The Auto & Moto Co., under Maryland laws, with $7,000 capital; to rent automobiles, launches and motor machines. Incorporators—N. Tip Slee, Bonio H. Bittle, Julius H. Wyman, Otto Kubitz, Milton C. Davis, E. Clay Timanus, and W. Bernard Duke.

Bridgeport, Conn.—The Miller Motor Car & Supply Co., under Connecticut laws, with $2,000 capital paid in; to deal in motor vehicles and supplies. Incorporators—Willard R. Miller, Alma E. Miller and Edward M. Wells.

Garage for Electrics Only.

Trenton, N. J., is to have a new garage for electric machines only, to be conducted by Wilbur Dorsett and W. G. Osborne. The proprietors will protect their patrons by carrying insurance policies on all automobiles stored with them.

Leaving Detroit for Lansing.

The Wilson-Hayes Co., manufacturing automobile supplies, will move its factory from Detroit to Lansing, Mich. They will occupy the factory just vacated by the Reo Motor Car Co.

ST. LOUIS HAS A SECRET

Million Dollar Factory Being Erected, but Deep, Dark Mystery Surrounds it.

St. Louis County, Mo., is to have a million-dollar automobile factory near Kirkwood, and work has already been started upon the buildings, but for some unaccountable reason the greatest secrecy has been observed in all the transactions. The enterprise is being promoted by A. L. Steinmeyer, of the Peyton Investment Co., who declares the enterprise is being financed by twenty New York and Boston capitalists.

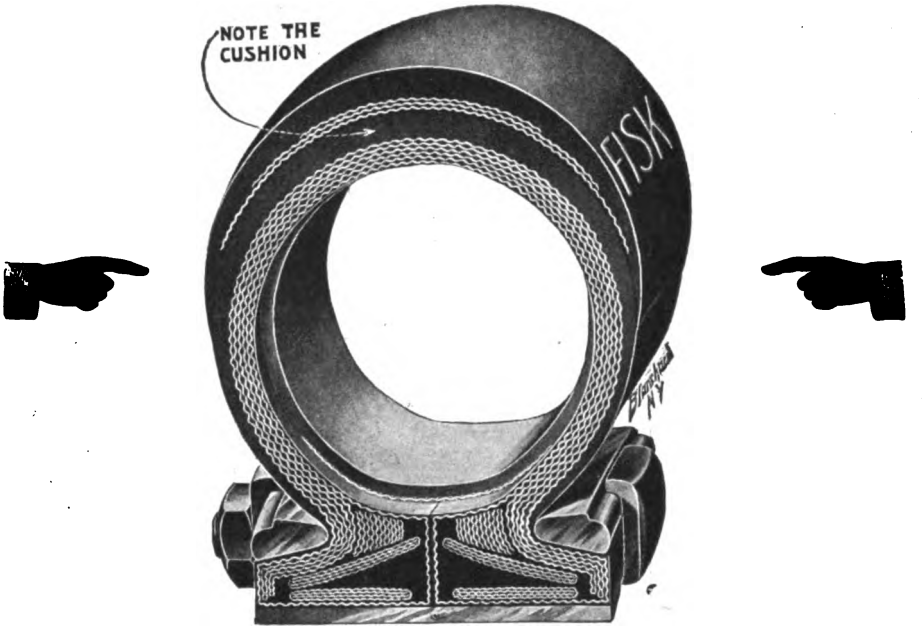
A tract of twelve acres, one and one-half miles south of Kirkwood, includes the purchase, and to keep the purchase of the land a secret the deeds to the property were made out in the names of young women stenographers in Steinmeyer's office. The main factory building, which is now in the course of construction, occupies a ground area of 300x300 feet, and will be three stories high. An office building will also be erected on a plot of ground, 50x90 feet. Contracts have been let for the construction of 140 cottages, and from this it seems that the workmen will be expected to live on the premises. Steinmeyer refuses to give out any particulars, except that the car the company proposes to manufacture will be of the gasolene type.

Lorain to Branch Out.

The Lorain Automobile Co., of Lorain, Ohio, composed of Frank Floding, F. S. Rathwell and H. Fredericks, will branch out in the spring and make a bid for business in four counties instead of one. The firm has the agency in Cuyahoga, Lorain, Erie and Huron counties for the Elmore Mfg. Co.'s Pathfinder car, and will open a permanent store in Cleveland in March.

Kaestner Elects Officers.

The Charles Kaestner Mfg. Co., South Bend, Ind., making automobile engines and supplies, has elected these officers: President, John G. Libstein, jr.; vice-president, Adolph Kaestner; treasurer, Edward B. Reynolds; secretary and general manager, Charles D. Cutting; directors, J. G. Libstein, jr., E. B. Reynolds, C. D. Cutting and Otto Knoblock.



Hartford Chooses Directors.

The Hartford Motor Machine Co., of Hartford, Conn., has elected the following directors: James M. Thompson, Samuel E. Elmore, Henry Farnham, R. Ballerstein, Arthur D. Coffin, John W. Hatstat, John S. Hunter, John T. Collins and Gilbert W. Chapin.

Will Move in March.

The Wilmington Automobile Co. has secured the agency in that city for the Winton and Autocar. The firm will move from its present location, in Orange street, to Tenth street, in March, when they will stock up with the new cars.

How Values Govern Price.

The many who are confidently predicting a great lowering of prices in the automobile field with each passing year and awaiting the time when a good machine will be within the reach of all who would buy, will be sorely disappointed to note that, despite an increasing demand, prices are climbing higher.

This apparent anomaly is readily explainable by the fact that it is not merely an increased demand, but a call for a higher powered and at the same time a more luxuriously fitted type of car, that accounts for the rising figures. Up to the opening of last year 16 to 24 horsepower was deemed to be the limit in this direction for heavy touring cars; now the question of power has been reversed to the extent that last year's maximum, 24 to 30 horsepower, is practically this year's minimum and 40 to 60 horsepower cars for touring purposes form an item of the lines of several prominent makers.

Great advances in body making, more luxurious fittings and a much more general demand for weather protection such as is afforded by the various styles of tops or entirely inclosed bodies further account for advances.

Two years ago $5,000 and $6,000 were considered top notch figures for the product of the American maker, and it was confidently predicted by many that these would go down at least 50 per cent before strenuous efforts at cheapening. Quite the reverse has come to be the established fact, however, and no astonishment is now manifested at $10,000 for a stock car. For those who aim to be unique in the matter of price paying—and there are enough included in this category to make it profitable for a few manufacturers to cater to their whims—there is no longer any necessity to look abroad for something over this figure; anything can now be had of the American maker, who need acknowledge no superior, and 45 per cent of the price won't be Dingley tariff, a costly part of the imported machine, that aids neither its looks nor its speed, and doubles the expense of replacements, which likewise have to be imported.

So far as this applies to the heavy touring cars of increased power, there can be no gainsaying the fact that prices are way up, but they have not been increased. More expensive cars have been turned out, and from a perusal of the above standing alone it would seem that the automobile was to all intents and purposes solely within the purchasing power of the wealthy.

But when the great range of prices at which serviceable cars can now be had is considered little reason is apparent for waiting indefinitely for prices to be lowered before purchasing. On the standard types of runabouts, light and heavy touring cars of the classes put forward very largely last year, numerous improvements have been made in all directions, without any increase in price, and this applies equally to practically all machines listing between $450 and $2,500; above the latter figure, such as $3,000, $3,700 and $5,000, many radical innovations involving great expenditures on the part of the manufacturer to bring them about are in evidence, though the figures remain the same. It is in the creation of new types to sell at the last three mentioned figures, as well as above the $5,000 mark, that larger prices are apparent. The touring car which sold at $2,500 last year can still be had in improved form at the same figure, and, with greater power and added refinements in the way of more luxurious fittings, it is priced $1,000 or $1,500 higher. The man who is looking for a car this year as an entrant into the fold will find that he can suit his taste and purse without any great difficulty, and if he buys a standard make he will receive in return a machine that not only in appearance but service and comfort will amply repay him for the investment. As to the man who has already been the owner of a car for a year or more, he needs no advice.

French Sportsmanship!

It certainly would be interesting to discover the process by which the promoters of that French "consolation race," styled the Grand Prix, arrived at the "relative importance" of the automobile industry of this country.

France, Germany and England are placed in the front rank, while the United States are placed in the same class with those little splashes on the map of Europe—Italy, Belgium, Austria and Switzerland. It suggests that the Frenchmen are either handing out a left handed insult or are unconscious jokers or monumental ignoramuses, at least so far as concerns the volume and extent of the American industry.

But, then, the whole race is something of a joke, if not a studied attempt to tear down the importance of the Bennett Cup contest. The idea of giving a lot of "also rans" what practically is a surreptitious chance to defeat those who had already defeated them may be a French idea of patriotic commercialism, but it violates the rule and spirit of real sportsmanship. When the Frenchmen display such false colors it is time for the rest of the world to protest and to hold aloof and for Mr. Bennett to withdraw his cup. It looks as if France is determined to win or to have the hog's chance of winning, regardless of price and decency.

Alcohol and Gasolene.

In Great Britain they are beginning to seriously advocate the necessity of a "home supply" of fuel, and to suggest that every car owner should be possessed of sufficient patriotism to throw off the yoke of Rockefeller by looking into the advantages of alcohol as a motor fuel and discarding the present odoriferous explosive medium. It constitutes a significant state of affairs.

Alcohol has many advantages over gasolene, from almost every point of view, and

Digitized by Google

about the only reason why it has received so little attention in this country is that it would be just about as practical to advocate the use of cologne in the cylinder; one could be had about as cheaply as the other. Chief among the points in which it rises superior to present day fuel are its far greater safety, its property of being miscible with water, which presents great advantages, and its greater heat value, not to mention its lack of objectionable odor.

Germany took the subject in hand officially almost a decade since, and the extent to which it has progressed in the empire is startling to those who have not had an opportunity to investigate, as the figures presented in another column serve to show.

France also has investigated the matter somewhat thoroughly, and has produced alcohol motors for the automobile which have given satisfaction; a number of them were shown in a special exhibit in Paris two or three years ago. A general impression prevails, however, that, nothing further of note resulting as the outcome of the exhibit, the subject has been dropped owing to the failure of this fuel to fulfil expectations; but this is not the case. The impression is probably due to the fact that a very large percentage of the cars manufactured in France being marketed in foreign countries would have necessitated the production of two separate types of cars, one for home use and one for export, as alcohol as a fuel is obtainable only in Germany and France. The former country now produces more denaturized alcohol for commercial purposes annually than the United States does of wood alcohol in a quarter of a century, taking the present rate of production in each case as a standard for comparison. As a result the price is such that the new fuel is proving a sharp competitor of the Rockefeller product, of which millions of gallons are annually exported to Germany, and it is not a matter of a great many years before the industry should be strong enough to place the empire as a whole in the position which the government has sought to bring about by the fostering measures in question—entirely independent of any outside source of supply of fuel of this nature.

If the price of gasolene is to soar every time a new endowment is to be handed out it may not be wholly surprising if the matter of alcohol should claim increasing attention even in this country. Potatoes, sugar refuse and the like form the basis of the materials used for distillation in Germany, and the process employed is so simple that every farmer makes alcohol for the market and his own use. The former and several similar materials of like nature should be capable of production very cheaply on a large scale in this country, so that there is little reason why alcohol at 12 to 20 cents a gallon should not be a possibility here.

Valves, Automatic and Otherwise.

Although the adherents to the automatic principle as applied to valves have supported their contentions with numerous, to them, irrefutable arguments, there have been, none the less, many defections from the ranks, and the mechanical valve is steadily gaining ground.

The theory of the automatic inlet valve has been demonstrated not to be a constant factor, in that the action of the valve varies with its speed and that it is practically impossible to provide it with a spring which will overcome its vagaries under all conditions. The adjustment of the spring tension of an automatic valve is a delicate matter, as on the latter depends the amount of the charge drawn into the cylinder. Should the spring be weak the suction of the piston will permit the entrance of a large charge of gas, but, on the other hand, by not closing the inlet openings as fast as would be the case with a much stronger spring, part of the charge is forced back into the inlet pipe. Thus a strong spring is essential to a rapid closing of the inlet the moment the piston reaches the end of its stroke, but too much tension prevents the ready opening of the valve. This again is varied by the speed, as at a low speed the valve remains open longer, and not only is there ample time to admit of a full charge being drawn in, but the weak spring has likewise a greater latitude in which to shut.

From this it will be apparent that the higher the speed the less time is allowed for the opening and shutting of the valve and the admission of the gas, and it has been ascertained that this is not always absolutely in proportion to the number of revolutions per minute, as must perforce be the case with the mechanically operated valve.

The lift of the mechanical valve remains the same regardless of the speed, and a strong spring closes it the moment it is released by the turning under of the cam. To overcome the necessity of too long a lift in the case of engines of large capacity, two or more valves are fitted to the same stem, a practice adopted by Panhard and other foreign makers. The shortcomings of automatic action due to the varying pressure of the spring have seemingly caused this form of inlet to be regarded with disfavor.

COMING EVENTS.

Jan. 23-28—Ormond-Daytona, Fla., third annual speed carnival.

Jan. 23-28—Philadelphia, Automobile Show.

Feb. 4-11—Chicago, National Show, Coliseum.

Feb. 13-18—Detroit, Automobile Show.

Feb. 20-25—Cleveland, Automobile Show, Gray's Armory.

March 6-11—Buffalo, Automobile Show, Convention Hall.

March 13-18—Boston, Automobile Show, Mechanics' Hall.

March 13-18—Boston, Importers' Show, Symphony Hall.

March 27-April 5—Washington, Automobile Show.

The door has been opened, and it is now possible for any donor of a trophy, whether he sells whisky or prayer books, to name his own race committee and practically his own rules. There was as much reason in the appointment of a "commission" to direct the contests for the "Scotch Highball Cup" as there was for one to control the Vanderbilt or dozen other trophies given for the Ormond-Daytona meet, which is to say that there was no reason at all, and, worst of all, of a commission composed chiefly of men who are not automobilists. When the A. A. A. permitted a cunning ex-professional six days' bicycle racer with an interesting record, to dictate, or partly dictate, terms, it was guilty of a weakness unworthy of the men who compose it. Courtesy is a very pretty quality, but the blunt truth of it is that Sir Thomas Dewar was lacking in courtesy to permit such a situation which one word from him would have relieved and merited none in return. He might easily have remunerated his chief trustee and press agent in some other way.

Frank Croker was a real sportsman—an American sportsman, for the love of the sport which brought his untimely end. His love of it was as patriotic as it was unprofessional. He had faith in the product of his own country, and evinced his faith by his works. His loss leaves a void. There remain few of his kind.

If gasolene in the tank of an automobile is "freight," as a Federal court has just decreed, what, then, is the air in the tires?

"GREATEST EVER"

New York Show Maintains its Glory to the End—Immense Volume of Business Done—Frost Falls on the Importers.

If ever a lot of tired men earned their rest, they were those whose duties required them to spend last week at Madison Square Garden, New York.

When the doors closed on Saturday night on what, in view of recent occurrences, will probably prove the last general show of automobiles in the Garden, the exhibitors, with few exceptions, had double cause for thanksgiving—first, for the unprecedented volume of business transacted during the week, and, second, that the week's work was over. For, as a matter of fact, there never was such another automobile show.

The promise of the first few days held true to the end. All day and all night—that is, until 11 o'clock—the big building was fairly thronged. After 8 in the evening it was literally packed. There was no diminution of the attendance on a single day, on the part of either trade visitors or the general public. The former were present in astonishing numbers. The dealers came from everywhere—from as far South as Louisiana and Texas; from as far West as California. There were few States in the Union unrepresented.

As very many of them had placed orders for their 1905 goods weeks before, the presence of many of them was at first difficult to comprehend. As the week wore on, however, it was made plain, and another and newer side or influence of the show was uncovered. These dealers from afar were there to definitely close orders with customers with whom they had been dickering, but who would not finally purchase until they had seen and inspected the cars exhibited at the show. This class of purchaser was quite numerously in evidence, and, as a rule, was inclined to the purchase of large cars.

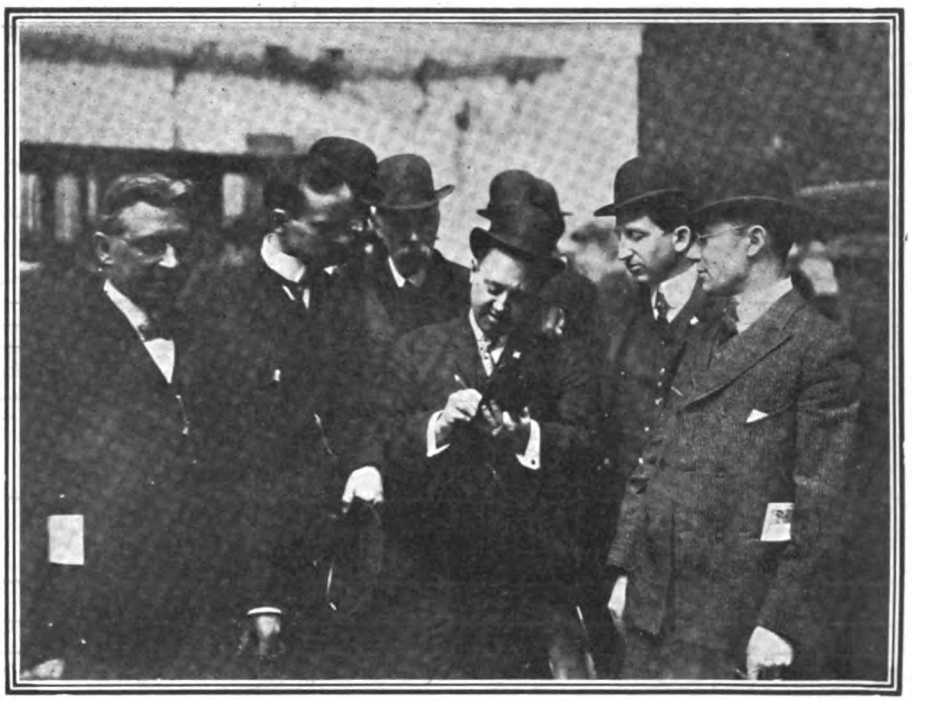
That many of the dealers who came to the show to meet them, and to obtain assistance from the factory staffs who were in attendance on the exhibits, achieved their purpose is well known. As an instance, one dealer sold seven cars to residents of his city who had held aloof until they were able to look over the show.

There has been various and sundry juggling with figures in an attempt to estimate the volume of business transacted, but they are, at best, wild guesses and serve no purpose. It is beyond doubt, however, that the 1905 show, from the business standpoint—and from the attendance standpoint as well—was far and away the most profitable ever held.

"We did more business on the first day of the show than we did during the whole week last year,' was a remark that became so common as not to excite comment. In a few instances a Motor World man was privileged to see the order books of some of those who made this assertion, and is able to vouch for the truth of the statements. The sales simply exceeded the wildest estimate that might have been formed, and the exhibitor who did not obtain his share of the business has either himself or his product to blame for his empty-handedness.

While the runabout was not wholly overlooked, it is certain that the major part of the business transacted was in those cars listing at $1,500 and upwards, and with specifications for March, April and May deliveries. The big cars were the objects of the most interest, and the demand for them points unerringly, as the Motor World stated last week, to the beginning of the end of the imported product.

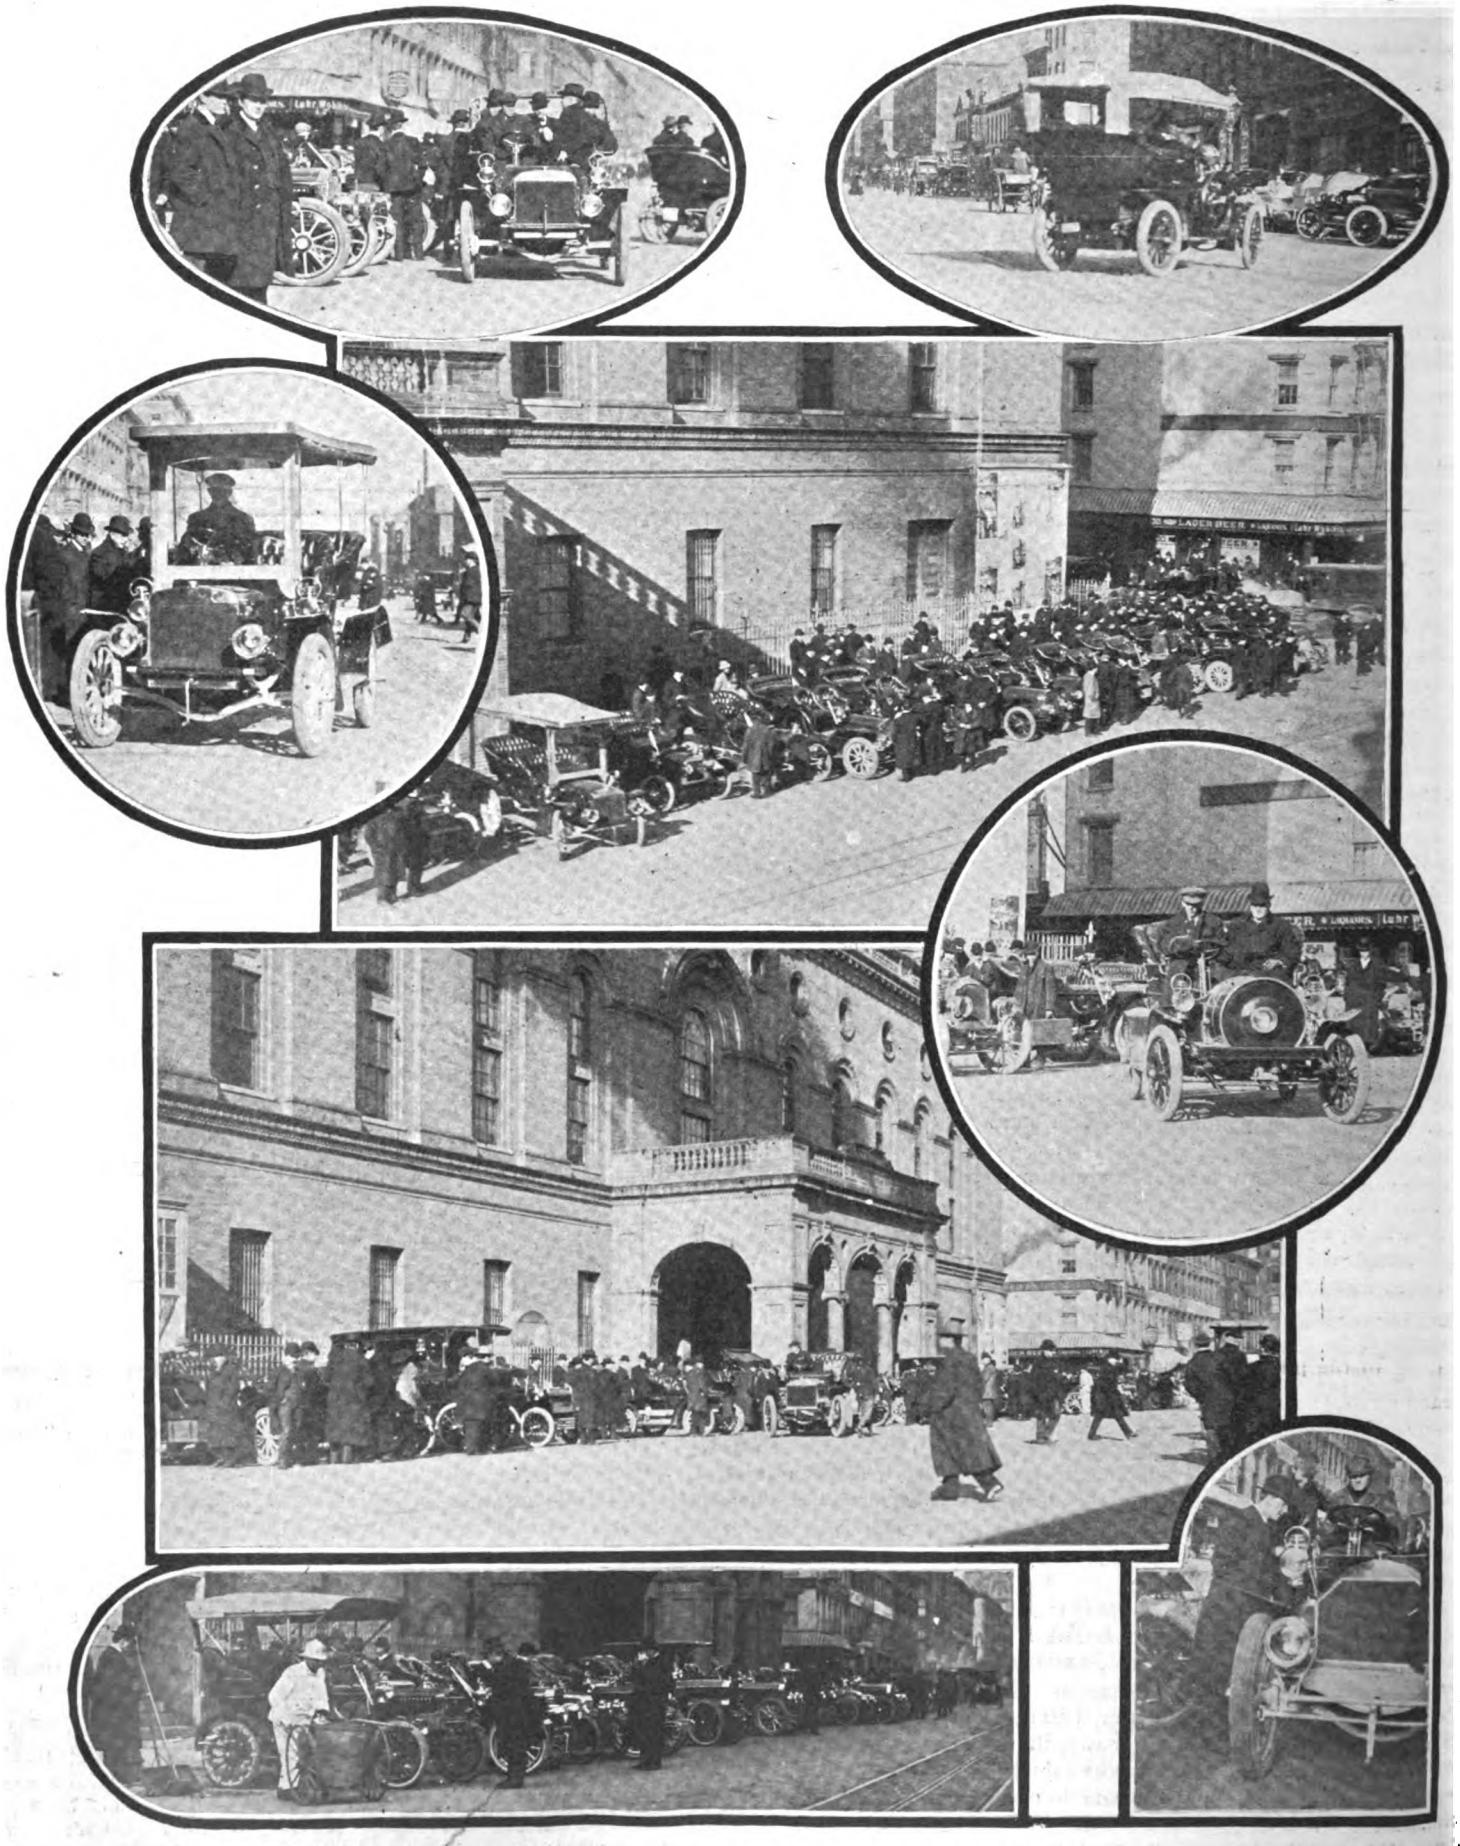
Not a few of those manufacturers who, wholly or largely, disposed of the outputs which they had planned to produce for the year, left the Garden full of that enthusiasm which took the form of a resolution to revise their plans and increase their outputs. It is probable, however, that, after reaching home, most of them have found cause for reflection that will bring them to decide to move circumspectly in that regard.



The crowd that attended was a free-handed crowd—how free-handed is instanced by the unverified remark of a waiter in one of the better known hostelries.

"The automobile crowd beats the horse show crowd," he is alleged to have stated. "I made $106 in tips during the week, where I never made more than $40 during the horse show."

Everything combined to make the show "the greatest on record." The weather itself throughout was simply superb. It was of the "made to order" variety, and it was not until late Saturday afternoon that the skies were even flecked with a cloud. At about that time a gentle snow began to fall, as if regretful that the end of the show was at hand.



By comparison, the display of imported cars, which opened on the top floor of Macy's dry goods store three days before the opening of the Madison Square Garden exhibit, and continued until two days after it had closed, was a graveyard. It was designed to be a rival of the Garden exhibit, but to term it "rival" is to employ sacrilege in its most sacrilegious form. A pretty sum was spent in newspaper and billboard advertising; but not even the nude in art nor the most zealous and liberal efforts of the Franco-American New York Herald served to attract the American public to what was, at first, grandiloquently called "Imported Salon," which style, however, in the frenzy of the last few days, gave way to "Foreign Automobile Show."

There were tall stories printed of immense sales made to prominent personages, but they all should be well salted and well peppered before being swallowed. One afternoon, when Madison Square Garden was almost packed to the doors, by actual count the number of people attending the display on the top floor of the Macy store was exactly twelve. On another afternoon, when the same conditions existed, there were twelve people in the "Salon." The frost crunched beneath their feet, and their footfalls awoke echoes in the almost deserted hall. The speculation which is now going the rounds of the trade is: Who is to pay the freight?

TIME TO BREAK AWAY

So Says Souther Regarding Copying of Foreign Ideas—Sifting of the Show Brings Much More to Light to Justify the Advice.

The most startling thing of all in the whole New York Show was the Shattuck transmission. It has not been worked out practically for automobile application, and it may never do. There may be something about it which will prevent, but it is startling, interesting, hard to understand and most enticing.

The principles are applicable to both bevel and spur gears. The principle is that the pinion is carried up a cone of stepped gears, climbing from one to the other without stopping, jarring, or any possible interruption. It may be shifted to the high speed running slow or fast.

To think it out, as Mr. Shattuck says, was a nightmare, but the product is something more substantial than that produced by a nightmare. It is to be hoped that Mr. Shattuck will apply this to some well known automobile and give the engineers interested in transmission gears a chance to see how it works.

It was apparent from inspection of the air cooled motor exhibits that this type of engine had received more attention as to the location of valves than the water cooled type. This is natural, because it has undoubtedly been forced upon them. Every detail that will tend to keep an engine cool must be taken advantage of by the maker of an air cooled motor.

Consequently, we find valves in the air cooled machines very close to the cylinder proper, doing away with all extra metal and resulting in getting a charge into and out of the cylinder quickly and reducing the cooling proposition to the best possible basis.

The point to be made is this—that what is good for the air cooled type is just as good for the water cooled type. It is just as important for the water cooled engine maker to run his engine cool as it is for the maker of an air cooled engine. Otherwise, the pump, the radiator and the circulating system must be larger than would be necessary if he did so.

Some of the makers of the water cooled type have fully realized the importance of compactness of the cylinder at the top of the stroke. Take, for example, the Welch and the Peerless. They have carried this idea to an extreme, and a good extreme, at that, it will be found before the industry is much older.

The arrangement is not as neat looking, perhaps, because it necessitates bringing the valve cam shaft up on top of the cylinder somewhere, or else to have what seems to be a complicated series of levers to operate the valves. When you stop to think of it, it is just this reason that has produced a bad location for valves. The desire to get something neat and easy to build was so great that an uneconomical and inefficient arrangement was arrived at. The time for building something pleasing to the eye, rather than something correct from an engineering standpoint, has gone, and the old saying will apply, that "Handsome is as handsome does."

In connection with this point, it is to be noted that our engineers are too prone to copy what the Europeans are doing. For example, if the Mercedes or the Panhard makes a change in the location of their valves, our engineers are liable to follow. The time has arrived for this to cease. We have no means of knowing why these people change from one type to another. It may be for commercial reasons, it may be for the sake of a talking point, and it may be to suit European fashion. None of these reasons are weighty enough to affect a good engineer.

The only reason that ought to make any engineer change is because he actually finds some one type better than another type. It is up to the engineers to test carefully and systematically what location of valves gives the best efficiency, and abide by their own findings, and build that which does give the best efficiency, just exactly as the steam engine builders have been forced to build, and have built what has been proven by careful investigation to be the best construction.

Here we are beginning to follow and are following the Europeans in the matter of magneto ignition. The questions arise at once, are we following in the right direction? Is it as good as they think it is? How do we know?

Is it not time for somebody to get to work and make some tests, and absolutely establish which of the two systems is superior on any given engine? There ought to be a sound reason for every mechanical change made.

There has been a long period of guessing and copying. It is about time another method of arriving at the results be adopted.

In the Phelps exhibit at the show there was one motor found hung upon springs. A cross spring under the front end of the engine supported it, the rear support being in a long cylindrical tube, which led back to the rear axle. It is a three cylinder engine, ignited by a "make and break" of very simple construction, the needle making the spark being removable and very light, which is certainly good practice, as inertia becomes of importance in rapidly moving parts.

The Phelps lubrication is rather ingenious, too, as it provides a means for maintaining a constant level in the crank case that is exceedingly simple. It works on the inverted bottle principle, the opening being at a proper height in the crank case, and a small three pint tank fastened to the side of the engine, sealed tight, of course, by a proper cap. This tank feeds oil to the crank chamber whenever it is needed—that is, whenever the oil in the crank case uncovers a small opening a bubble of air rises up and lets down an equal amount of oil. There is no other lubrication on this engine, which makes it neat and clean, to say the least. The principle of transmission involving individual clutches has been worked out in this machine to a very nice point. In the first place, the transmission case and bevel gear case are one near the rear axle, of course. Each transmission gear has within it an expanding bronze friction band, operated by cams. Release is positive, and there is no chance of centrifugal force throwing the clutches into action, inasmuch as a lever is so arranged as to counteract this action.

One maker, the National, deemed it advisable to adopt extraordinary measures for safety as far as the steering mechanism was concerned, and in place of having one cross member between the arms of the steering wheel two were adopted, one in the front and one in the rear. The claim was also made that this gave extreme rigidity and positive steering qualities.

Another innovation appeared in two or three machines—that of carrying the front end of the steering post to a point very near to the front axle, making almost an immediate connection with the steering cross rod. This gave a very slanting steering post, of course, but not objectionably so to look at.

The control of the automobile is as varied as seems possible to make it. In the first place, there is the simple throttle lever, which opens the carburetter or valve at some point in the gas system so as to give the motor more or less fuel. Side by side with this is the spark advance independent of the throttle, two levers controlling the machine as far as fuel and speed are concerned.

The next system is where these two levers are united into one, the spark advance with the throttle lever. This seems rather dangerous, because if the engine slows down it will knock, but the secret underlying it is that the engine must not slow down, that the gear must be changed soon enough to avoid it.

The next system is that in which the operator has nothing to do with the igniter whatever, and has a gas throttle regulated by either hand or foot, the spark being entirely taken care of by an engine governor, advancing with an increase of speed and retarding when the engine slows down.

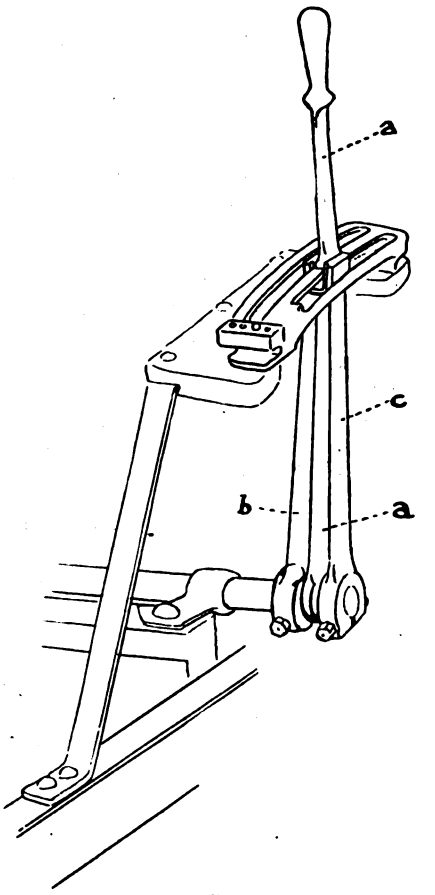
Then there are cases of the governor operating not only the spark, but the spark and the gasolene supply. When the motor slows more gasolene is admitted and the spark is retarded; when the motor speeds up the spark is advanced and the gasolene diminished.

Then comes the additional possibility of changing the tension of the springs in the governor from the seat, so that the governor may be set at any speed from the very slowest to the fastest; then, in addition to this, is the accelerator, which permits the motor being quickly accelerated by means

Digitized by Google

of the foot throwing the governor out of action for a minute or more.

There are other combinations of these coupled together in various ways. The operator becomes skilled in the use of any of them, and usually each maker or owner thinks his system is the best because he is used to it. There is one point, however, which is of much importance in the matter of the position of the levers on the wheels, whether they take the form of levers or handles which turn, or buttons. One may become, as stated, skilled in the use of anything, but the controlling device which can always be found in the same position, without regard to the movement of the wheel, is undoubtedly the simplest and the safest. As the wheel moves around, if the controlling device follows it, the eye must be directed toward it to be sure that the correct controller (spark or throttle) may be seized at the proper instant. At night the hand must follow the wheel around, and by the slow process of touch find it in its changed location.



There must be some decided difference in the location between the controllers usually on the wheel, so that it may be recognized in the dark, if not in position, then in "feel." Every one of these objections is done away with in having a controller or controllers in such a position that they do not move and can always be found instantly in the dark or at any time.

There are times when instant action will avert accident, and slow action cause accident. It is just such a simple thing as this which makes the difference between perfection and lack of it.

The question of fuel consumption and efficiency of the motor is undoubtedly pushing to the front. As an evidence of this is the attention being given to the location of the valves in the engine. Very thoughtful men who understand the principles underlying the whole matter are doing their level best to get the gases into the cylinder quickly, get them in cool, so that there will be just as many heat units in a given volume as possible, and, after burning, to get them out quickly. They are accomplishing this by locating the inlet and exhaust valves just as close to the end of the cylinder as is possible. The accessory valve chambers and explosion chambers are done away with entirely.

The radiating surfaces, the crooked passages which tend to wiredraw the gas and heat it on its way in, the large amount of compression space which must be filled completely, the probability of dead gases remaining in the corners and mixing with the good gases, all these points enter into the problem; then, when the gas is once there, attention is being given to putting the igniter where it will meet the gas which is surely fresh and where the explosion will be transmitted immediately to the piston. This principle will be followed to a finish, and it will be undoubtedly found (when the trade realizes the importance of it) by careful tests that the efficiency of the motor has been greatly improved, that the horsepower developed per pound of gasolene will be measurably and appreciably greater.

On the 18 horsepower Columbia is an effective development of gear shifting levers that is at once simple and commendable; it is here shown. One hand lever, A, is made to do all the work done by the two levers used last year. There are really two levers,

The Columbia Shifting Levers.

B and C, the same as last year, but the operator need know nothing of it. By a clever device the hand lever is made to engage either one or the other, as desired, giving three speeds ahead and reverse.

With the advent of magneto ignition comes one disadvantage, and that is the lack of possibility of self-starting with the four cylinder motor.

This very thing may create a demand for some such device as that shown by Mack Brothers. It is nothing more or less than a heavy spiral spring at the front end of the crank shaft, occupying a small cylindrical box at the front of the frame. This has evidently been very cleverly worked out. While idle it does not touch the shaft in any way whatever to wear it. It releases and seizes the crank shaft, no matter in what position the shaft may have stopped. It gives three complete rotations of the crank shaft before exhausting its power. After the engine has got under way, it picks up the spring again, winds it and locks it ready for use. Although this sounds very simple, it is evident that much thought has been put into it to eliminate all the possible objections that might be raised in the way of noise, wear, rattle and its action. For a small sized car the spring is wonderfully compact and unobjec-

HENRY SOUTHER.

Chicago Club Prepares to Build.

Detailed plans of the new clubhouse of the Chicago Automobile Club have just been issued, and the plans call for a splendid structure on Plymouth Place, just south of Jackson Boulevard. The Chicago club now has a membership of over five hundred, and for a long time the members have realized that the present clubhouse at No. 243 Michigan avenue is inadequate to their needs, and a committee was appointed to plan for erecting a new building.

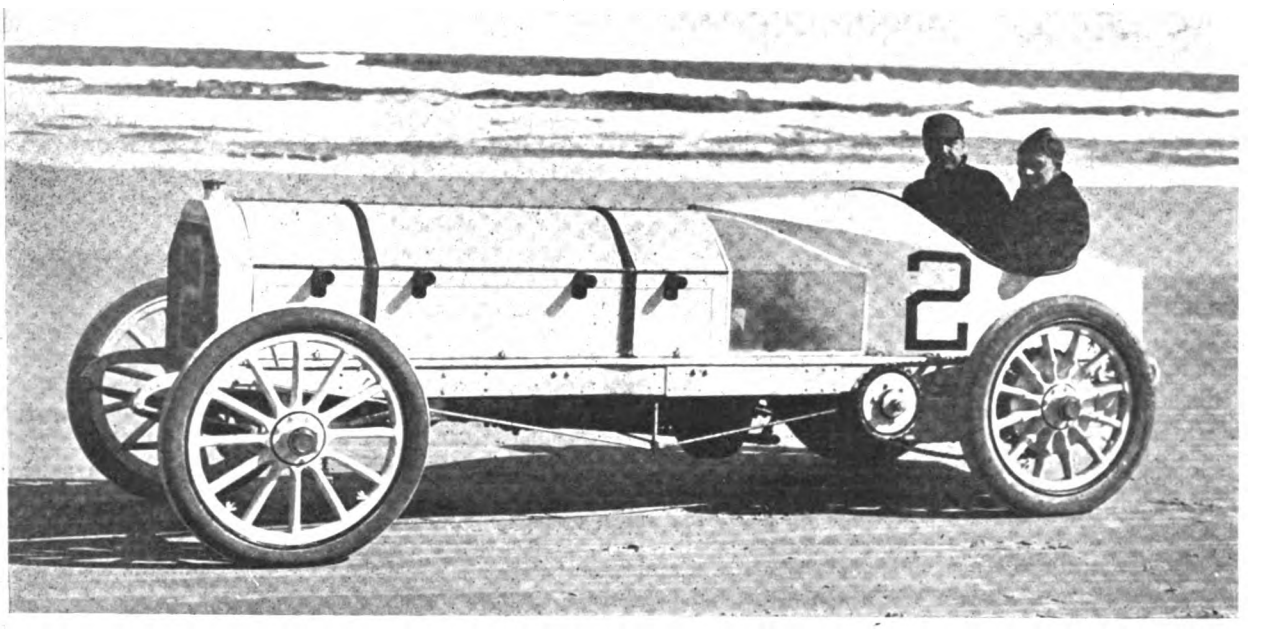
The club has secured an option for a ninety-nine year lease on a lot 96x93 feet, on Plymouth Place, west front, one hundred feet south of the boulevard. It is intended to erect on this site as soon as possible a five story building, to be devoted exclusively to club purposes. In order to finance the proposition the committee recommends the issuance of fifteen year 5 per cent bonds in an amount not exceeding $150,000. These bonds are to be secured by a first lien on the building and the leasehold interest, which extends for a period of ninety-nine years without revaluation. Each club member is invited to subscribe for such amount of the bonds as he may see fit. The work of construction will begin as soon as the bonds have been bought.

In the basement of the building will be located the boilers, dynamo and repair shop. Such space in the basement as is not utilized for the above purposes will be occupied as a garage.

The first floor will be used exclusively for a garage. It is intended to make this feature of the club as perfect as possible, and so to arrange the service as to assure members that their machines will not at any time be tampered with, and lockers will be provided. Inside the garage entrance the plans are such that ladies may ascend direct from the cars to a reception room, where an elevator may be taken to the rooms above.

On the second floor will be located a gentlemen's lounging room, grillroom, billiard room, barber shop, cardrooms and bowling alley.

The ladies' reception rooms, dressing rooms, library and general dining room will occupy the third floor. The fourth floor will contain about twenty-five bedrooms and bathrooms, together with servants' rooms.



The garage will accommodate about one hundred and fifty cars, and will contain all appurtenances, including a testing room, a storeroom and a room for the use of chauffeurs.

During the two weeks of the Paris Automobile Salon 320,000 people passed the turnstiles. This is an increase of 60,000 over last year. On one Sunday 54,000 people visited the Salon, the highest number for any one day a year ago having been 37,000.

"Dark Horses" Develop on the Daytona Beach

Louis S. Ross, in his Little American Steam Car, "Plays Tag" with the Imported Monsters and Proves the Sensation of the Meet—McDonald, of England, Gets the Mile and Five Miles Record.

H. L. Bowden, the Waltham Millionaire, in the Most Powerful Machine in America—120 H. P.—Whose Mile in 34 1-5 Seconds, Was Nullified by the Overweight of His Car.

Daytona, Fla., Jan. 24.—One of those "dark horses" that you hear about trotted out to-day and served to make this, the first day of the third Florida speed carnival, memorable.

In reality, the "horse" was not a horse, but a big 90 horsepower Napier racing car, and, of course, it did not trot—it fairly flew over the broad expanse of marblelike beach—flew over the five miles of closely knit sand faster than ever an automobile traveled before. It was driven by a hearty young Englishman of the name A. C. McDonald. He had been here for several days, and, though he had been going great guns in practice, none of the sharps or press agents seemed to fancy him, and he passed unnoticed and unsung.

However that may be, there was no fluke about his performance to-day. He gave full measure. In his first trial he covered the five miles in 3:32, but four-fifths of a second outside of the record held by W. K. Vanderbilt, Jr. He claimed that he had been interfered with and compelled to slacken pace, and accordingly was given a second chance. He deserved it. He "made good" to the tune of 3:17, fairly smashing the old record to smithereens and averaging 39 2-5 seconds per mile.

McDonald's performance was the one bright spot in an otherwise dull and uneventful day. The only other occurrence smacking of an incident happened in the first event, the one-kilometre race. Webb Jay, driving the 15 horsepower White, broke his shaft within two hundred yards of the finish, but he was then so far ahead of his only rival, Le Blanc, in a 20 horsepower Darracq, that he coasted over the line a winner.

Webb's accident disarranged the entire afternoon's programme. He was entered in the next two events, and to give him a chance to repair they were held over.

Charles Soule, in a 30 horsepower Pope-Toledo, and H. P. Maxim, in a gasolene Columbia, were in all other respects the lions of the day. Each of them won two events in hollow fashion. There was no semblance of excitement. The races were the usual runaways.

It is scarcely necessary to say more: you've all seen runaways and know what they're like.

For the first time since the speed carnival was instituted, the races were to-day started from Daytona, and not Ormond. It obliged a lot of the Ormond visitors to travel six miles to reach the starting point, and not all of them relished it. But the scene on the beach while the travel was in progress was an animated one. Every sort of vehicle imaginable was pressed into service. The crowd this year is, of course, much larger than ever before, but when it is scattered over a length of ten miles, it is difficult to arrive at a true estimate of its proportions.

The beach itself was in perfect condition, save at the Ormond end, where soft red sand had been washed up, making the going rather heavy. The weather itself was coquettish. A slight westerly wind blew across the course and piled up banks of clouds, but though the wind died away, the sun played hide and seek. One moment the balm of spring was in the air; the next, the chill of autumn made itself felt.

The summary of the day's sport follows:

ONE KILOMETRE—FOR VEHICLES WEIGHING 851 TO 1,432 POUNDS.

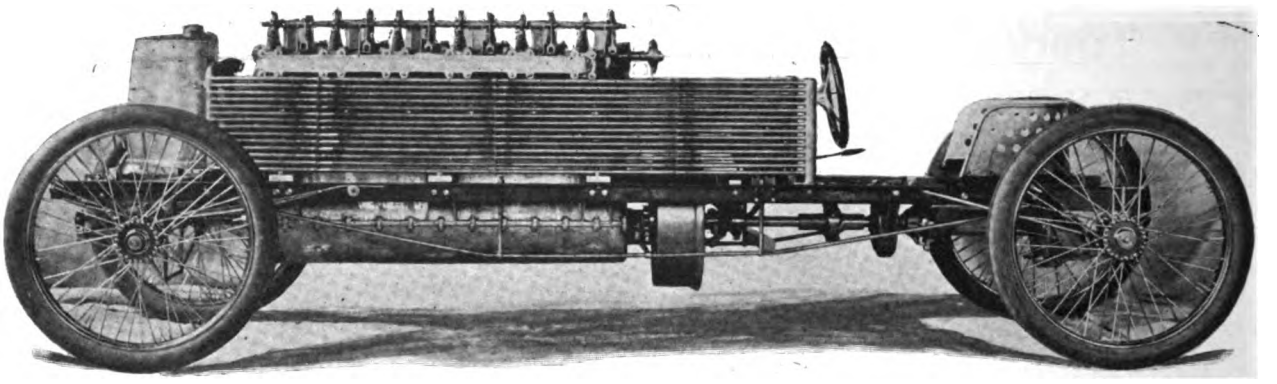
Driver and car.	Time.
Webb Jay, 15 h. p. White steamer	0:14⅘
A. Le Blanc, 20 h. p. Darracq	0:61⅛

FIVE MILES—FOR STOCK CARS COSTING $2,751 TO $4,000.

Driver and car.	Time.
Charles Soule, 30 h. p. Pope-Toledo	5:13⅖
M. Roberts, 40 h. p. Thomas	5:17⅘
John Connell, 35 h. p. Columbia	5:48⅛

FIVE MILES—FOR STOCK CARS COSTING $4,000 TO $6,000.

Driver and car.	Time.
Charles Soule, 30 h. p. Pope-Toledo	5:17⅗
A. Le Blanc, 20 h. p. Darracq	6:22⅛



FIVE MILES—FOR STOCK CARS COSTING $651 TO $1,000.

Driver and car.	Time.
Louis S. Ross, 8 h. p. Stanley steamer	6:42⅗
W. E. Evans, 18 h. p. Autocar	8:16
C. N. Wheeler, 12 h. p. Glide	9:34⅛

RECORD TRIALS—FIVE MILES.
(World's record, 3:31⅘.)

Driver and car.	Time.
A. C. McDonald, 90 h. p. Napier..First trial	3:32
A. C. McDonald, 90 h. p. Napier..Sec. trial	3:17
Guy Vaughn, 40 h. p. Decauville	4:32⅘
H. P. Maxim, 18 h. p. Columbia	7:02⅘
M. D. Altman, 10 h. p. Pope-Tribune	11:38⅘

THE FORD RACER.

TEN MILES.

M. G. Bernin, 60 h. p. Renault..... 7:42
Time at five miles, 3:51⅘.

TEN MILES—FOR STOCK CARS COSTING $1,001 TO $1,800.

Driver and car.	
H. P. Maxim, 18 h. p. Columbia.....	1
C. N. Wheeler, 12 h. p. Glide.....	0

Time, 14:12⅘.

FIVE MILES, HANDICAP (STOCK CARS.)

Driver and car.	Time.
H. P. Maxim, 18 h. p. Columbia (1:47).....	7:18⅘
Chas. Soule, 30 h. p. Pope-Toledo (scratch).	7:28⅘
John Caswell, 35 h. p. Columbia (0:35).....	10:35⅘

All of yesterday and the day before the crowds gathered. Every train increased the numbers, until the spacious hotels were full to overflowing. The scenes at both Daytona and Ormond and on the course to-day suggested that a large part of the attendance at the New York show and at the Automobile Club's banquet in the Waldorf on Saturday night had been mysteriously transported to Florida. Familiar faces of men prominent in trade and in club life are everywhere. It may be strange land, but he is an unusual individual who finds himself among strangers. The tragic accident to Frank Croker has rather dampened the spirits of the crowd, but the interest in the races is intense.

In officialdom the Dewar trophy—dubbed the "Scotch Highball Cup"—has been proving a bone of contention. Sir Thomas, who is here and who might have settled the contention with a breath, has shown no disposition to do so, and W. J. Morgan, whom the Floridans placed on the toboggan this year and who seems to have hypnotized Dewar, has all to say, and is saying a lot before he reaches the end of his downward slide. He provided for a commission to control the trophy, and the commission is made up of himself and his cronies, to whom the entry fees will go for future disposition. The A. A. A., as the ruler of racing, rightly considers that its rules should apply, but out of a desire to be courteous to the titled donor, a compromise has been effected, and two A. A. A. officials will be substituted on the commission for two of Morgan's intimates.

Daytona, too, has been urging its claims to full recognition, not in the Dewar affair, but in the matter of headquarters. In previous years Ormond has had the lion's share of publicity and everything else. Ormond, as may not be generally known, consists chiefly of two hotels, run by Flagler interests. It is something of a "spite town," having been established by Henry Flagler, the railroad magnate, after Daytona had refused to bow down to him. Daytona, which is "quite a place," and has not two, but several, hotels of its own, feels that its share of the speed carnival is overdue, and has taken a firm stand—so firm that Ormond no longer will be the "whole thing." As a result, to-day's races were started from Daytona, and an agreement reached that each day hereafter the starting point will be alternated between the two towns, subject, however, to the direction of the wind, which sweeps the beach like a young gale when it blows at all. It is, of course, a vital factor for or against fast going, hence the agreement.

The new Ford racer arrived to-night. The big Darracq is also here, but has a cracked cylinder that will prevent its use.

THE SECOND DAY.

McDONALD SETS THE MILE AT 34 4-5, AND THEN ROSS TROUNCES HIM.

Daytona, Jan. 25.—"Steam has its victories no less renowned than gasolene."

If this paraphrase sounds atrocious, don't you care; it's true, and Louis S. Ross, of Newton, Mass., to-day proved its truth. In that turtle-shaped thing of his, with its stumpy smokestack pointing upward and rearward, suggesting that a devil-possessed turtle is skimming the earth hind end foremost, he to-day vomited steam all over the "gasoleners." His queer appearing craft is popularly dubbed "the Stanley steamer," but Ross himself says it is Ross's steamer. He is an engineer of no mean ability, and fashioned his car and brought it up to the concert pitch which it showed to-day.

Ross not only annexed the Clowry Cup offered for the swiftest steam vehicle, but he also gathered in the much smoked "Scotch Highball Trophy," otherwise the Dewar cup, to compete for which all comers were welcome, provided they first paid $50 for the welcome. The several fifty dollars' received from the source is to form a special fund which will be applied to the Lord and one other man knows what. All the biggest ripsnorting gasolene racers tried for the whisky man's gift, and though they "vollied and thundered," Ross's little vehicle, shod with Diamond tires and making not much more noise than the ghostly spirit it suggests, claimed it as its own. McDonald's big English Napier, and Vanderbilt's even bigger German Mercedes, Brokaw's French Renault, Heller's Belgian Pipe, Oldfield's American Green Dragon—they all contended. No automobiling nation was unrepresented. But the smallest, most insignificant creation of them all, the little American steamer, lowered their colors and showed them how to run. It won its heat in 41 3-5 seconds, and the final in 42. It won easily, too, and with open daylight between itself and the next best.

It was a great day for Ross, for steam and for America. It was a bitter gulp for the whiskey man and some others. And, oh! yes. Oldfield, in his American car, won his heat, too, and was fourth in the final. Only these two American vehicles started. And then, earlier in the day, Ross went out and proved that he was not "all out" in the "Scotch Highball" event, by skeedaddling a mile in 38 seconds. The best that even Bowden's German monster of 120 h. p. could do was 34 1-5. Ross's machine is rated but 20 horse. Bowden's record, however, stands for nothing, as his car is 300 pounds overweight.

In the record trials McDonald and his Napier did 34 4-5, which time is now the official record for the mile. The beach was not at its best to-day, and those figures may not prove of long life.

Vanderbilt, who held the old record of 39 seconds, tried again to-day, and though he drove a more powerful car than last year, he could do no better than 42 3-5. If he was disappointed, the affable young millionaire did not show it. But he at once set about changing his gears. There were those, however, who were disappointed. Nearly all the "wise ones" expected "Willie K." to sweep the decks clean. Only yesterday Bowden was among those who let fall that prediction.

To-day was notable for two close finishes, as finishes go in automobile races, and also for the appearance of E. R. Thomas, the New York banker, and B. M. Shanley, of Newark, N. J., in the role of drivers. Hitherto they have been content to let their chauffeurs take the risk, but that the Croker accident had not filled their hearts with fear, their work to-day amply demonstrated. Thomas, Vanderbilt and Shanley, representing literally a battle or flight of wealth, were in one heat of the Corinthian Cup event, and Vanderbilt won. But Thomas was al-

Digitized by Google

most at his heels, and Shanley well up. In the first heat of the Dewar Cup race, Vanderbilt and Thomas came together again, and this time the latter turned the tables; they finished third and fourth, respectively. The heat itself was won by Ross and his little steamer, after a pretty fight with McDonald and his big Napier. The struggle was repeated in the final, for which McDonald qualified as fastest loser. He got the best of the start, but Ross overhauled him in the first quarter mile and led by an open length until within 100 yards of home. There the Englishman challenged and drew alongside, but Ross knew his machine, and, giving it a wide throttle, drew away and won by two-fifths of a second, in 42 seconds flat—a new competition record. William Wallace, who did not go to South America, was third, and Oldfield fourth. The latter, who is outclassed by the big foreign cars, qualified by winning the third heat by clever jockeying, beating out a 90 F. I. A. T., an 80 Pipe and a 90 Mercedes. In the second heat the Pope-Toledo lined up, but did not start.

In the mile time trials, Vanderbilt's record of 39 seconds was beaten three times, by McDonald, 34 4-5; Ross, 38, and Bowden, 34 1-5, but, as stated, the latter's car is overweight, and his performance does not count, nor has he been eligible for any of the events. The fact that he is a member of A. A. A. racing committee makes his lapse in this regard the more remarkable. Two other competitors got inside of 40 seconds—Wallace, 39 1-5, and Stevens, 39 2-5.

The balmy zephyrs of Florida that people read about were conspicuous by their absence to-day. Instead, a stiff wind blew that chilled the spectators to the marrow. As it blew toward Ormond, the starts were made from Daytona, instead of from the "spite town," and Daytona smiled, of course. The air was so cold that "racing in heats" became something of a joke. As a matter of fact, the warmest things on the beach were the scarlet caps worn by the officials, or, rather, they were the warmest things until several spectators lighted fires in the effort to keep themselves from freezing. The beach itself was not at its best.

The summary:

ONE MILE—TIME TRIALS.

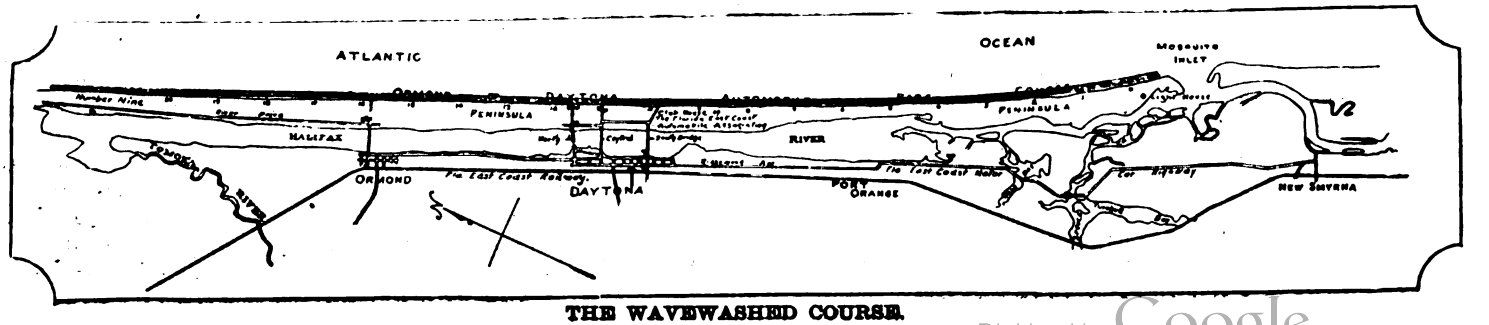
W. E. Evans, 18 h. p. Autocar..... 1:37



THE FATAL ACCIDENT TO CROKER.

For the first time since its institution, the Florida speed carnival was marked, or, more correctly, was preceded by an accident, and one that unfortunately cost two lives. Frank H. Croker, the well-known New York sportsman, and his chauffeur, Alexander Raoul, were the victims. The tragedy occurred on Friday last, 21st inst., while Croker, accompanied by Raoul, were indulging in a practice spin on the beach. They were moving at a terrific pace when, in an endeavor to avoid a motorcyclist directly in their path, Croker swung his car too sharply, and it overturned. The car careened into the ocean, carrying both men with it. When lifted out of the water, Raoul was found to be dead and Croker was insensible. He was immediately carried to Hotel Ormond and five doctors summoned. He was found to be so grievously hurt and the shock had been so great that, though he regained consciousness, the physicians, while hoping for the best, were fearful that the young man's wounds were mortal. His injuries were found to be a compound fracture of the left forearm, the bone protruding through the flesh; right thigh broken near the knee and a little above it; serious injury to left elbow; three ribs fractured; right thumb fractured; right ear lacerated; scalp scraped; numerous abrasions about the face and body and internal injuries, all intensified by the great shock.

Croker lingered until 6:20 Saturday morning, when death came to his relief. His body, with that of Raoul, was forwarded to New York. It reached here on Wednesday, where it awaits the arrival of his father, Richard Croker, the former leader of Tammany Hall, from Ireland, where he now resides.

The best accounts of the accident make it appear that Newton F. Stanley, the motorcyclist concerned, altered his course to escape a wave that washed in on the beach, seeing which Croker swerved to avoid him. At the same instant the car struck a spot of soft sand, which ripped off a tire, and the tragedy followed in a twinkling. The Motor World's representative on the spot, after inspecting the wrecked Simplex and talking with several expert motorists, wires that the blame does not rest on the tires. He says that the axles appear to have been too weak, the rear one having buckled when the car made its violent swerve. One sad circumstance of the accident was that, despite Croker's sacrifice, the motorcyclist did not entirely escape. He was knocked down, and sustained a compound fracture of the leg.

Frank Croker was 25 years of age and a fine specimen of young manhood. Big, broad-shouldered, robust, smooth shaven, in the sweater which he usually wore when speeding, he looked the college football player who radiates health and good humor. He was every inch a sportsman. At Brown University, where he entered with the class of '01, he played on both the baseball and football teams. Leaving college, he became interested in dogs and horses; he owned several high-bred bulldogs. He took up both automobiling and motor boating, being the owner of the X, P, D, N, C, Y, one of the fastest boats in these waters. He had it with him in Florida, where he intended to engage in the motorboat races that occur next week. As an automobilist he last year set up a string of records on the Empire City track, and also competed in the Vanderbilt cup race. On the latter occasion he flirted with fate by driving a car that literally had been riddled with holes in order to bring it inside the weight limit. The car in which he went to death was similarly riddled.

THE WAVEWASHED COURSE.

UNDER THE WALDORF PINES

A. C. A. Banquet a Superb Spectacle and Flow of Eloquence—Even Birds Caroled There.

Each succeeding banquet of the Automobile Club of America proves more magnificently impressive than its immediate predecessor. They have really taken high place in the functions of the year. The six of the line (which several papers had confused with the annual dinner of the American Automobile Association the week previous), which, as usual, was held in the ballroom of the Waldorf-Astoria on Saturday last, 21st inst., was almost beyond comparison. It was a sight to be remembered.

The grand ballroom had been converted into a clearing in a pine forest. The tables were laid literally in a grove of evergreen. Walls, pillars and galleries were hidden by overhanging pines and hemlocks. A rockery, laden with moss and ferns, occupied the centre of the big room; palms were utilized in every conceivable manner. Small evergreen trees adorned the boxes filled with handsome women, and flowers and berries of bright hue completed the inviting and beautiful picture. Even the tables were not neglected in the decorative scheme, and never has the setting of a banquet been more effectively carried out with results so unique and startling. The speakers table was arrow-shaped and pointing away from the guest tables, a unique arrangement.

The feast began at 7:30 o'clock, following a reception, after which the guests were escorted to the ballroom through a hall that had been prepared for the woodland scene, the beauty of which excited an outburst of enthusiasm. On one side of President Dave Hennen Morris sat Lieutenant Governor Bruce, and on the other ex-President W. E. Scarritt. One feature of the banquet was the serving of ices packed in miniature motor cars.

At the guests table, besides President and Toastmaster David H. Morris, were: General George Moore Smith, Commodore Frederick G. Bourne, Thomas A. Edison, James P. Dill, Creswell MacLaughlin, Hon. Henry A. Van Alstyne, William C. Gotshall, Attorney General Julius Mayer, Hon. M. Linn Bruce, Winthrop E. Scarritt, Colgate Hoyt, Colonel John Jacob Astor, Jefferson Seligman, Park Commissioner John J. Pallas, Samuel Walter Taylor, William Phelps Eno, William H. Page, Jr., John Brisben Walker and John Farson.

Other leading motor enthusiasts in evidence were ex-President A. R. Shattuck, who had a table of guests; Augustus Post, R. Lee Morrell, A. W. Church, Royal R. Sheldon, G. E. McIvesten, John Shepherd, Jr., John P. Haines, A. Lincoln Lippett, Fred C. Stevens, H. J. Everall, Lawrence Abrams, Chauncey P. Anderson, A. L. Barber, M. Toscan Bennett, H. B. Vreeland, C. L. Edey, Frederick Glassup.

Men prominent in the industry were numerous. Among them were Windsor T. White, S. T. Davis, Jr., A. L. Riker, H. B. Joy, W. D. Gash, James Couzens, George H. Day, H. F. Cuntz, A. H. Overman, Paul Deming, Carl H. Page, L. P. Mooers, J. J. Amory, Charles L. Seabury, Alden Sampson, 2d, J. H. McAlaman, Frank Eveland, J. D. Anderson, H. W. Chapin, Charles E. Miller, J. J. Mandery.

In his address of welcome President Morris told of the growth of the club and of the automobile's development in the last few years. In contrast to the banquet of Saturday night, he reminded the diners of the first feast of the club, which was held at the Waldorf in 1899 and at which only a handful of men who "owned or intended to own" automobiles appeared.

Continuing, he said:

"Now glance at our club itself. Our membership limit has been twice reached, and now the waiting list is long—a list comprising some of the greatest names in America. Look at our membership, the most democratic of any in this country—beside the millionaire is the artisan, the only qualification being that of gentleman in its best sense. Within the fortnight we have voted to build a half-million-dollar clubhouse and garage, where we may accommodate the thousand members we soon shall have on our rolls, and through which we can curb and control the professional chauffeur."

Mr. Morris then introduced ex-President Winthrop E. Scarritt, "one of the noblest Romans of them all," whose readiness of speech has made him in great demand on all occasions. At its banquet each year the A. C. A. introduces some startling sideplay. Probably because it was suspected that Scarritt had searched the skies or the Bible for his rhetorical flight, this year's innovation was introduced as he arose to speak. It was in keeping with the woodland setting. Birds were unloosed and perched in the trees; their warblings seemed to say "Cheer up! Cheer up! Cheer up!" Scarritt refused to be disconcerted, but the carolings did interfere with the speech making.

Mr. Scarritt did not disappoint expectations. He declared the automobile to be the gift of the gods to the poor earthmen, the idea of Vulcan. "The earthmen," he said, "demanded from Jove some means of 'rapid transit,' and he called a council of the gods. Mercury suggested wings, but Mars remonstrated that Olympus would be endangered, so Vulcan made the fire car.

"The automobile is both an evolution and a revolution. It is an evolution in that it has been evolved out of the necessities of modern life. It is a revolution in that it is a revolt against the slow, antiquated and intolerable conditions of transportation since the days of Abraham.

"It was the lamented Garfield who said that the Pilgrim fathers were opposed to hanging only when they were the people to be hanged. The average American, with good red blood in his veins, is opposed to the automobile only until he gets one himself, and then he becomes an enthusiastic advocate of this sport for kings and king of sports.

"Notwithstanding this great and solemn fact, a late Governor of the Mosquito State, with more audacity than wisdom, recommended in a recent message that no automobile be permitted in the State of New Jersey that could run over twenty miles per hour. And yet this distinguished gentleman, who loves a horse, would swell with righteous indignation if it were suggested that a law be passed to hobble a horse so that it could not do a mile in better than three minutes.

"Four years ago there was in this country one automobile to every 1,500,000 inhabitants. Two years ago there was one to every 6,500 inhabitants. To-day there is one to every 1,200 inhabitants. Give us another five years and they will be as thick in this country as mosquitoes in the Hackensack meadows."

Lieutenant Governor M. Linn Bruce was accused by the diners of playing to the galleries, where many women sat. He got more applause from that quarter than any of the other speakers when, raising his glass, he proposed this toast:

"To the ladies, the only autocrats who elect without voting, who govern without law and who decide without appeal."

Mr. Bruce admitted that he didn't own an automobile and that he had never ridden in one more than two or three times in his life. As for automobilists, he had, he said, usually seen them coming at him with goggles on, disguised, their hands upon the wheels and their feet upon the brakes, travelling at the rate of forty miles an hour. On this occasion, though, he said he was glad to meet automobilists as "equals, glass for glass and bottle for bottle."

Former Lieutenant Governor Timothy L. Woodruff has been converted to automobilism. Although he admitted that he hadn't been invited to the dinner, he came, he said, to declare the fact of his conversion. Mr. Woodruff said that he was one of the men who believed once that he would never give up the horse for the automobile, but he had, he confessed, become a victim of the craze.

"And I have," he announced, "a French chauffeur."

William H. Page told the diners that his experience with the automobile had included almost everything except owning one and being run down by one. He then let fall the suggestion of a national licensing law as a way out of the turmoil of State numbers and State legislation. William P. Eno spoke at length of "Street Traffic Regulation," and State Engineer H. A. Van Alstyne, of good roads, while Samuel Walter Taylor declared that most of the members of the Automobile Club were lovers of horses, and that, instead of relegating the horse to the tomb, the automobile was bringing emancipation to him. It was to the horse what labor saving machinery was to man, he said, and he prophesied a future "brotherhood of man and horse" similar to what he imagined must have existed in the case of the Arab and the Indian of the plains.

ALCOHOL AS MOTOR FUEL

Tremendous Strides Made in Germany—How it Compares with "Standard Oil's" Product.

Following the lead of Germany, or probably because that country has solved the problem of producing an efficient fuel for the internal combustion engine at home so satisfactorily within recent years, the question of doing likewise is now up for discussion in England.

Germany imports vast quantities of petroleum in its crude state, as well as its many products of refinement, but, realizing that in case of war this supply would be in danger of being entirely cut off, the war and naval departments counselled encouraging the manufacture of a substitute. This has been found in alcohol, for which the tremendous crops of potatoes grown on the sandy plains of the eastern and northern parts of the empire furnish abundant material. The waste of the immense beet sugar factories is also used for this purpose.

An apparatus so simple as to be readily handled by every wayside farmer has been devised for the process of manufacture, and in 1901 the industry had reached proportions where its annual output was in excess of 31,000,000 gallons, a very large percentage of which was consumed for power purposes. In the following year an exposition was held in Berlin, at which everything from an alcohol student lamp up to a 25 horsepower locomotive was shown in operation.

The display of alcohol automobiles in Paris a year or two previous will also be recalled, and, though the latter showed wonderful advances, far surpassing anything of the kind hitherto shown, not a great deal on the subject has been heard from that country since. The industry has been fostered in Germany by the passage of consistent legislation removing the tax on this spirit, as a result of which it sells at from 12 to 25 cents a gallon. It is denaturized by the addition of various chemical substances, in no impairing its value as a fuel or for use in the arts, but rendering it absolutely unfit for drinking purposes.

While the engine has to be designed for use with alcohol as a fuel, the latter has so many advantages to its credit as to be well deserving of consideration in this respect. One of the chief reasons why France has not pursued further inquiry along this line is owing to the fact that a large part of the product of her makers is marketed abroad, whereas alcohol fuel is only obtainable at home and in Germany. This is set forth at length in an interview with an English authority on the subject by the Autocar, a contemporary that is urging the matter in England.

Its greatest advantage lies in the fact that its specific gravity permits of its being miscible with water, so that, using air, water and fuel in varying proportions, the cost of the latter is appreciably reduced. The steam generated in the cylinder gives a more even expansion and permits of a longer stroke, indicator cards taken from some of the best types of agricultural engines in Germany and France closely resembling those of the steam engine. The heat absorbing properties also obviate the necessity of water cooling to the same extent as is necessary with gasolene. The heat efficiency of alcohol as compared with the latter is also superior and a better utilization of the heat units in the form of work is possible.

Until the vast fields of Russia are developed Europe must look to the United States for her supply of petroleum, and it is to guard against a failure of the supply in time of war or a raising of the price through the endowment of universities that Germany has put forth such strenuous efforts and accomplished so much. Within another decade the Teuton will be able to put his fingers to his nose at Rockefeller, and it will not be from the bad smell of gasolene, either, as alcohol is free from that, too. England is in the position that Germany drew herself out of, but is taking up the propaganda more from patriotic motives.

New Idea in Water Pumps.

"Amac" is the title of a new centrifugal pump recently placed on the market in England for circulating the cooling water. Its chief advantage lies in its relation to the engine by means of which, should the circulation be suspended for any cause not within the capacity of the pump to remove, the engine is brought to a stop. Many a breakdown for which the car owner has had to give up handsomely to the repair man, might be averted through such a device should it prove reliable. The dashboard pressure gauge is of course an almost universal preventive on the better class of cars in this country, but it needs in many instances, as pointed out by George Ade in his suggestions as to improvements for the "Rolling Peanut," a device which will give the driver a "smart kick in the shins" and inform in a gentle, but firm voice "to back up," for its pointer sometimes loses count of the numerals ornamenting its dial through the agony of internal pressure in its system and the man at the wheel "chauffs" on all unheeding until the engine itself backs up and lays down.

This Motor Cuts Some Ice.

From Lewiston, Pa., comes an account of a genius of that place who has just devised an attachment for automobiles to cut ice. Two years ago E. E. Spangler came to the conclusion that he needed an automobile in his business, and built a machine capable of running fifteen miles an hour. This year he entered the ice business, and, to save buying an ice cutting machine, determined to devote his home made automobile to this purpose. A circular saw attached to the rear axle answered the purpose. The Lewiston man claims that the automobile ice cutter does away with the work of many men and horses, and he is now seeking a patent.

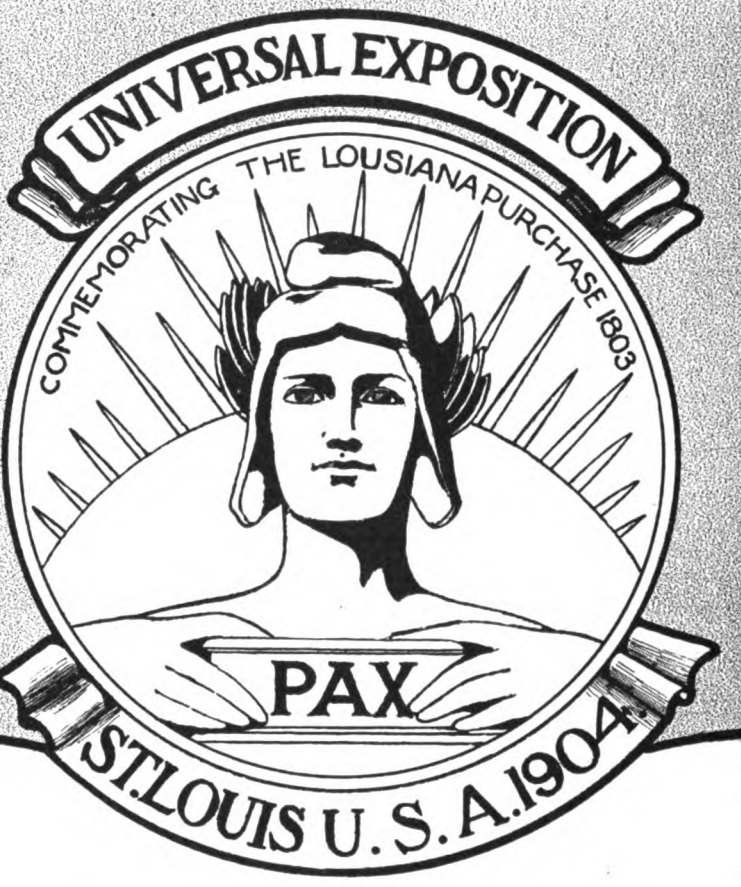
TIRES NOT TO BLAME

Tests Designed to Demonstrate that Punctures and Detachments are of Small Effect.

Tire experiments in the shape of tests to demonstrate that the average pneumatic is not as readily punctured as it is thought to be, formed an interesting exhibit at the Crystal Palace, London, that drew many spectators. S. F. Edge set out to prove that punctures and cuts are not the most common causes of breakdowns.

A specially prepared road, on which were thickly strewn broken bottles, spikes and chisels, was employed for the test, and over this both a touring car and the racer used by Edge in the Bennett Cup competition were driven at a speed of forty to fifty miles an hour. The result was a surprise in that the touring car passed over this chevaux-de-frise a dozen times before a puncture was made, but so little effect had the accident on the car that the occupants were not aware of it until they pulled up. It was not so difficult to puncture the racing machine tires, and one of the latter was soon deflated. no attention was paid to it, however, and the car kept on as if nothing had happened.

The deflated tire was then loosened at one side, in order to permit it to leave the rim at high speed. It flew off when the car was running at full speed, and was whirled quite a distance along the road, but did not disturb the car or its occupants, and the former kept on its course without suffering any further damage.



In the light of the recent deplorable accident in Florida, the latter experiments are extremely interesting and directly in point, though they fail to shed any light on the former, owing to the radically differing conditions.

Variation of Float Feed Principle.

New carburetters are such a matter of daily recurrence as to scarcely merit passing notice. The majority go as they come, unheralded and unmourned. So much so that good points in many that might be availed of are overlooked. The Hennebutte is the name of a more or less recent arrival in France, devised by La Société Force Motrice Economique of Neuilly-Sur-Maine, and is said to be receiving considerable attention. Apart from the manner of controlling the gasolene feed by means of the float, it follows accepted lines, but in this respect an improvement worthy of note has been introduced. As compared with the usual manner of effecting this, i. e., supporting the float on the liquid, the float in the Hennebutte carburetter is scarcely ever fully upheld by the weight of the liquid it displaces, and begins to act only when its unsupported weight overcomes the pressure of a spring surrounding the stem of the intake valve. The effect of this is said to be a marked diminution in the variation of the fuel level due to vibration and jolting when under way.

PIERCE

The Pierce Car was awarded the Grand Prize at the St. Louis Exposition as the best expression of an American car built for American conditions and American temperaments.

The Grand Prize thus awarded is but a recognition of a standard toward which we have been working for five years, and which we believe we have attained.

The six cars which we have built for 1905 comprise the best we know of successful motor car building.

Catalog and technical descriptive matter sent on request.

FERRY TEST CASE DECIDED

Court Says Gasolene is Freight and Rules Against Automobiles—Congressional Relief Sought.

According to the decision of Judge Adams in the United States District Court for the Southern District of New York, the gasolene carried in the tank of an automobile is "freight," and not merely the source of energy, as is popularly supposed. And while it is "not so clear" to the judicial mind that there was fire on the particular car concerned (a four cylinder Mors) when it went on and off the boat under its own power—which is reasonably clear to all who have to do with motors—the judge had ruled that it is plain that "when a motor of this class is in motion under its own power it carries a fire." As a result, he decided that the ferryboat Texas had violated the Federal law—Section 4,472 of the Revised Statutes as amended in 1901—when it transported the car in question, and sustained the libel against the boat, which is the property of the Brooklyn Ferry Co., and imposed the statutory penalty for the offence, $500.

This is the outcome of the suit instituted last fall, at the instigation of the Automobile Club of America, as a means of testing the federal law governing the transportation of automobiles on passengers boats.

The decision was handed down on Jan. 20. The opinion goes into detail, and is quite lengthy; it is averred therein that the "scientific testimony of two witnesses was taken on the trial on behalf of the government, but none on the part of the claimant, which apparently was satisfied with the government's case in such respect." The "scientific" character of the testimony in question may best be judged from the statement "there is not much difference between gas and steam machines—that in a four cylinder car moving at even a moderate speed, the time between the explosions in the respective cylinders would be very short; that the hot tube machines, steam cars, giving a steady, continuous flame, are in very successful operation," made by F. R. Hutton, professor of mechanical engineering at Columbia.

Then follows a lengthy, academic discussion as to the distinction between fire and flame, and the presence of the latter in the cylinder; likewise the danger of flames issuing from the muffler through failure to ignite in the cylinder and then being fired through a subsequent explosion in the latter, and whether surrounding objects or parts of the car itself would catch fire from this. This was part of the testimony of the same expert, who, on being recalled, stated "that there could be fire without flame; that there could be flame without glow, as the result of chemical action or union; that flame and fire are not synonymous terms; that you may very easily have a fire without a flame."

Divested of all superfluous verbiage, the contentions of the libellant (the government) constitute but two questions, which can be summed up in a few words: "First, whether gasolene as carried by the car in this case was freight, and, second, whether in the method of operation there was a fire as such, which had not been extinguished when the car went on the ferryboat and was relighted before it went ashore."

The attorney for the government during the trial said in this connection that "we have abandoned the idea of a spark being a flame," this admission following a statement by the witness, Dr. Hutton, that the electric sparks should not be described as a fire, and then the claimant contended that the language of the act, especially the use of the words "all fire, if any," and "relighted" clearly contemplate the two types of automobiles, one with a fire in the ordinary and popular sense, fed by gasolene and giving forth a continuous flame, and the other, like the one in question, having no such fire; that it is only by a stretch of language that the intermittent electric flashes can be described as a "fire" which must be extinguished before entering and not relighted until after leaving the boat; that the mere circumstance of there being an insignificant residuum of carbon in the cylinder does not make these flashes a fire." The claimant further referred the court to the history of the legislation resulting in the amendment of 1901, and furnished copies of the Congressional reports showing the obvious intent of Congress in passing the amendment, and that the difference above outlined was then taken into consideration.

Both parties to the action were agreed that the burner in the usual type of steam machine using gasolene as a fuel has a diameter of 14 to 20 inches, according to the size of the vehicle, and that the steady flames arising therefrom are from one to two and a half inches in height. And upon this admission and the reports above referred to the claimant contended that the latter was the class of automobile which it was intended to exclude from passenger steamers, and not the one using the electric spark.

The opinion goes on to state that "the contention that the word 'freight' in the act is used in the ordinary sense to indicate the cargo, or any part of it, or anything carried for pay, as this car concededly was, and it is a necessary corollary that all of the machine and everything belonging to it partook of the same character."

After an examination of the briefs and the testimony the judge concludes that "there does not seem to be any doubt that the contents of the tank which formed a part of the vehicle was freight within the meaning of the statute.' But "that the question whether there was a fire on the car when it went aboard and left the boat is not so clear. It appears from the testimony that there was no real danger to the gasolene in the tank from the sparks. But, whatever the intention of Congress may have been in this particular, it is really unimportant in the determination of the question here—that is, whether there was a violation of the law. It is apparent that the act of 1901 required the car to enter and leave the boat by some other method than the use of its own power, and it must be presumed that Congress so intended, however inconvenient it might prove, otherwise the requirement would not have been inserted. The testimony of the experts here makes it clear that when a motor of this class is in motion under its own power it carries a fire." Then, after comparing the steam and gasolene machines and stating that Congress has made no distinction between them, he goes on to say that "it is obvious, however, that neither class of machines can produce motive power without heat, which in these cases is the result of fire, the prohibited thing."

The claimant in its brief set up that a boy carrying kerosene in a bottle or in a bicycle lamp would be equally a violation and, touching on this, the opinion says: "The suggestions of counsel concerning the various possible slight infractions of the law do not bear on the question here. It is not necessary to determine now whether they would be regarded as of serious character or treated as de minimis. It is sufficient for the present to apply the law to the case under consideration."

"It will be observed that the act of 1901 leaves it optional with passenger steam vessels to carry vehicles containing the prohibited fluid so that no liability results from a refusal to transport machines of the kind in question. Decree for the libellants for $500."

A brief prepared by John C. Higdon, chairman of the legal action committee of the Federation of American Motorcyclists, and covering the same issues as applied to the motor bicycle, was filed concurrently with the brief mentioned, by courtesy of Herbert Green, of counsel for the ferry company. No reference whatever to this is made in the opinion, but, arguing by implication, the motorcyclist has somewhat the advantage of the automobile owner, for, being compelled to walk his machine on and off the boat, there is never at any time during the trip any fire in it, but his fuel supply comes under the category of "freight," regardless of its quantity, and the ferry owners may refuse to transport him on this ground should they chose to do so.

A further amendment to the act under which the case in question was brought will shortly be introduced before Congress. It is designed to obviate the effect of the above ruling in regard to the fuel in the tank being considered freight, as well as to permit cars to run on and off ferry boats under their own power without subjecting the latter to a fine. Probably no further action will be taken regarding the present case should this amendment be favorably considered.

New-Orleans is coming to the front. There are 122 automobiles registered in the city, and the owner of one of them was recently arrested for cruelty to animals. The cruelty consisted of "running over the foot of a horse and inflicting what might have been a serious injury."

MOVING IN MASSACHUSETTS

First Gleam of Reason Appears, but the Law's Greatest Infamies Pass Unnoticed.

It is probable that the infamous Massachusetts law will be tinkered with at the present session of the State Legislature. The State Highway Commission, in which power akin to that possessed by the Czar of Russia is vested, has made recommendations to that end, but they deal solely with the matter of speed. The system of triple taxation, of espionage and of suspension or revocation of constitutional rights are not referred to, although a gleam of twentieth century enlightenment shines through the commission's recommendations, which, in substance, are as follows:

"Some of the towns accept the speed limit of the act; others fix their own limit of speed. Some of these last named towns specify four or six miles an hour as the maximum speed. Most of the towns make no apparent effort to enforce the speed law, while others are quite active in this direction. Many of the towns that attempt to enforce the speed law do the work spasmodically, during five days of the week paying no special attention to it, but insisting upon a close adherence to the law on Saturdays and Sundays. The inequality of the local speed laws and the still greater inequality of enforcing the law tend to bring the whole law into contempt."

"The commission believes that there are places and times when the speed as at present fixed is either too great or too small. There are certain narrow streets within fire districts and also certain crooked outlying roads where ten miles an hour is a dangerous rate of speed. There are other roads, straight and clear of obstruction, with no houses or cross roads, where the speed may safely be in excess of fifteen miles an hour; no general law can cover these cases; each cast should be carefully considered by itself. There are some absurdities resulting from local regulation which seem to bring discredit upon this method. Four miles an hour over a State road where there are few houses and no cross roads is neither necessary nor reasonable; the order is not enforced by the town officers and its existence is harmful. The commission believes that the power to vary the speeds should be given to some central authority, no change to be made except after a hearing. The rates of speed, when different from those indicated in the act, should be plainly displayed on signboards at each end of the road affected, and at such other points as may be needed. These signboards should be placed by the person or persons charged with fixing the speed; the cost to the State will be repaid out of the automobile license receipts. With the law amended in the manner suggested, the commission believes that it can be executed in a proper manner. If the commission is to continue to sit as a court, with power to suspend or revoke certificates of registration and licenses to operate, it recommends that it be given power to summon witnesses and administer oaths."

It would certainly cost something to placard all the roads of the State with signs fixing the rate of speed for automobiles on each stretch of highway, says the Hartford Times, in commenting on the Massachusetts recommendations. Those signs would not be visible at night, and would require constant attention if they were to be kept in view in the daytime. The main difficulty is that at present the persons who travel in automobiles are tourists, many of whom are from other States, and who do not pass more than once or twice a year over any given stretch of road. If they violate the speed law and get away without being arrested, there is no further opportunity to deal with them.

The Massachusetts commission wishes to have the law require that automobiles using the Massachusetts roads shall display only the numbers on their Massachusetts licenses, but here again there is difficulty, for licensed automobilists from other States are not, we believe, required to display any Massachusetts number or to be licensed under the laws of the State. It would be a hardship to require that no Connecticut or New ork automobile shall enter Massachusetts unless the owner has first taken out a Massachusetts license. There are now 3,772 automobiles licensed in Massachusetts. Within a very short time the number will be three times as large, while the number of automobiles from other States which will pass over Massachusetts roads some time during the year will number many thousands. There is probably only one way to perfectly control the speed of automobiles, and that is to forbid the use of the public highways to any vehicle capable of attaining a speed of over twenty miles an hour. Even this law might be difficult of enforcement. It may well be doubted whether any automobile law can prove entirely satisfactory to all the residents of any State. When nearly all physicians and business men shall adopt automobiles, as will happen before many years, it will be necessary to permit a speed of at least eighteen miles an hour on country roads, and any law which fixes a lower limit will fail of enforcement, in our opinion.

Missouri Indicts Miss Ruby.

The Supreme Court of Missouri will, in all probability, be called on to determine whether Miss Ruby Fullerton, a St. Louis chauffeuse, must suffer punishment for operating her automobile in St. Louis County in violation of an act passed by the General Assembly. An indictment was returned against her last week by the county grand jury. She filed a demurrer by her attorney, asking that the indictment be quashed on unconstitutional grounds. The attorney for the defendant maintains that the statute is clearly unconstituional, one ground being because it is unreasonable. He declared that if enforced there could be no automobile operated in the State. The title of the act, he contended, was misleading in stating it was an act "regulating" the use of automobiles; that it was an act actually prohibiting their use.

TWO MORE INDIANA MEASURES

But These New Comers are of Enlightened Order—One Provides Signal Code.

Two more bills have been added to the avalanche of automobile legislation that has struck the State of Indiana. Senator Benx, of Spencer, Perry and Crawford counties, and Assemblyman Jesse E. Wilson, of Jasper County, are the authors of the two new measures.

Senator's Benz's bill is not, however, of the motorphobe order. It provides for the erection of guide posts, "substantially built and firmly placed," at the intersection of all crossroads, and wherever the road forks. The bill also requires that the distance to the next village, town or city shall be painted on it in brilliant letters, and the direction noted by a spear or hand in the proper direction. Senator Benz proposes to make the upholders of the law as liable to arrest as the automobilists.

"For each violation of the law the road supervisor of the district, who is to have the erection and mainaenance of these posts under his charge, is to be fined from $3 to $10."

Senator Benz's bill is the embodiment of ideas sugested by the various Indiana automobile clubs. This leaves it "up to the chafeur" of the machine to determine whether or not he is going to fast for the public safety. The posts are to act as a warning, and the observance of the law rests upon the honor of the motorist, as with the distances plainly placarded to govern his speed accordingly.

Representative Wilson's bill is also within reason, and is in some respects novel,that every chauffeur shall be examined by a board of automobile control to be appointed in each county by the judge of the Circuit Court, and shall prove that he is acquainted with the machinery of the automobile. A leading feature of the bill, too, is the code of signals for which it provides. When passing an automobile, if the driver of a horse shall hold up one arm above his head it is the signal for the chauffeur to come ahead. One hand extended out horizontally by the driver of a horse shall mean that the automobile shall slow up, and extended horizontally and swung vigorously up and down shall bring the automobile to a full stop.

"These signals are in use up in our country," said Mr. Wilson, "and they have been found to work admirably. Every chauffeur and farmer in the county knows them and complies with them.

"I do not believe in restricting the speed of "autos" in the country districts. That is what they are for, and when you limit them, all kinds of trouble will result, and there will be no end of law suits. I have prepared my bill with especial reference for the future because the 'auto' has come to stay."

Assemblyman Wilson's bill limits the speed of automobiles only in congested districts, the limit being twelve miles per hour.

WOULD REQUIRE $3000 BONDS

Tennessee Senator Offers a Substitute Bill About as Bad as his Original One.

Senator J. R. Jetton, of Rutherford County, Tennessee, evidently is a genius as regards his comprehensive knowledge of automobiles and how they and their owners should be governed. He has withdrawn his original "auto" bill and introduced a substitute, and the substitute is as much a masterpiece of idiosyncracies as the first one, which provided that automobiles should not be used in the State elsewhere than in towns of 9,000 population. This bill was an anachronism which could hardly be favored by the Legislature of a State that claims to be fairly progressive, and Senator Jetton, realizing the uter futility of having such an idiotic measure passed, withdrew it, but immediately introduced in its place one in which the nonsense is as stupid as the ignorance in the other was dense.

Not to be denied, however, the learned Senator has evolved an act which seeks to compel every owner of an automobile to give a bond to cover whatever damage may be wrought by the machine.

Various conjectures have arisen as to what caused the idea of an automobile law of any kind to originate in this provincial representative's cranium, as it is the opinion of Tennesseeans in general that there is hardly a sufficient number of automobiles in the State to justify even a speed law, and it is thought that Senator Jetton's erstwhile attempt to become a shining light in Tennessee's history, and incidentally to effect the expulsion of automobiles from the State, will be promptly repudiated by the General Assembly.

The full text of the new bill is as follows:

"An act requiring owners of automobiles, locomobiles, motorcycles and other vehicles, or machines of like character, to execute bond for damages arising from injuries caused by the running or operation thereof; to register and number such vehicles, or machines; and to provide a penalty for the violation of the provisions of this act.

"Section 1. Be it enacted by the General Assembly of the State of Tennessee, That before any owner or owners of any automobile, locomobile, motorcycle or and other vehicle, or machine of like character, operated by steam, gasolene or electricity, other than street railway cars, and run by such owner, or owners, or by his or their chauffeur, agent, servant, employe or any other person using the same by loan, hire or otherwise, and employed in the transportation of persons for pleasure or otherwise, and run upon any street, roadway, turnpike or other public highway or thoroughfare in this State, shall be required to execute and file with the Clerk of the County Court, in the county in which such owner, or owners, may reside, a good and sufficient bond, with two or more solvent sureties, in the sum of three thousand ($3,000) dollars, payable to the State of Tennessee and conditioned for the payment and satisfaction of any and all damages which may result, or arise, from injuries caused by the running or operation thereof; provided, that the amount fixed in said bond shall not preclude the recovery of any other, or greater, amount against the owner, or owners, of such vehicle, or machine, by the party injured, or aggrieved, before any tribunal having jurisdiction of the cause.

"Sec. 2. Be it further enacted, That, upon the execution of said bond, as provided for in section 1 of this act, it shall be the duty of said clerk to issue to such owner or owners a certificate of registration showing his or their name and residence, a full and particular description of said vehicle, or machine, and the number assigned to said vehicle, or machine, by said clerk in said certificate, for which he shall receive a fee of two ($2.00) dollars, to be paid by such owner or owners, and it shall be his further duty to keep a well-bound book in which a record of the issuance of said certificate shall be made.

"Certificates of registration issued under this act shall be valid so long as the ownership of such vehicle, or machine, described therein shall remain in the person or persons obtaining the same, but any change of ownership shall require the issuance of a new certificate to the person, or persons, coming into possession or acquiring ownership thereof upon the due execution of bond as required by section 1 of this act.

"Sec. 3. Be it further enacted, That a number of Arabic numerals of not less than three inches in height and two inches in width, corresponding to that assigned each vehicle, or machine, in the certificate issued by the clerk, as hereinbefore provided for, shall be displayed conspicuously at both the front and rear of said vehicle, or machine, which said number shall be plainly written, printed, stamped or otherwise set out upon a durable and substantial plate of the size of not less than four inches in width and eight inches in length, and to be provided by the owner of such vehicle, or machine, so registered.

"Sec. 4. Be it further enacted, That a failure upon the part of any person, or persons, to observe and comply with the provisions of this act shall be deemed a misdemeanor, punishable by a fine of not less than fifty nor more than two hundred and fifty dollars.

"Sec. 5. Be it further enacted, That all laws and parts of laws in conflict with this act, be, and the same are hereby, repealed.

"Sec. 6. Be it further enacted, That this act take effect from and after the first day of April, 1905, the public welfare requiring it."

The Cripple Creek, Col., city fathers are possessed of the spirit of equity, anyway in regulating the use of automobiles. At a meeting of the Board of Aldermen a resolution was passed ordering the Chief of Police to inforce the ordinance prohibiting speeding of all kinds. Horses and bicycles are mentioned in the ordinance as well as automobiles.

TEST IN FEDERAL COURT

N. A. A. M. will Strike High in License Matter Status of New York Legislation.

When the National Association of Automobile Manufacturers institutes its suit to test the constitutionality of those State laws requiring automobiles to be registered and licensed, it will not be merely the test of the law of a particular State. Realizing that any decision that might result from action of the sort would bind only the State affected, the N. A. A. M. means to go "higher up"—in fact, just as high as it is possible to go. The test will be made in the federal courts, that the judgment may be of value to all alike.

On Tuesday Charles Thaddeus Terry, the association's counsel, so informed a Motor World man. Beyond reaching this conclusion Mr. Terry has not proceeded. Meanwhile, however, he is concerning himself with the very respectable West End Improvement Association's effort to have the New York law so amended that automobilists may be jailed for a first offence without the option of a fine. In company with a committee of the N. A. A. M., composed of Albert L. Pope, George Innis and Percy Owen, Mr. Terry will endeavor to talk the matter over in a friendly manner with the committee of the West Enders and bring the gentlemen in question to a reasonable view of automobiles in general and legislation in particular.

When asked his opinion of the present status of legislation on the subject in this State Mr. Terry, of counsel for the N. A. A. M., said:

"If the Hill-Cocks bill placed on the statute books as the successor of the obnoxious Bailey bill in May last will only be allowed to stand long enough to be given a fair chance before being repealed or superseded by something drastic further legislation will be unnecessary. Conditions under this bill have been eminently satisfactory, so far as they have gone, and I have every reason to believe that it fills all requirements where reasonable people are concerned. It protects the interests that have howled loudest against the automobile, and does not unduly harass the owners of motor cars. In fact," he added optimistically, "I really believe that if this bill can only be allowed to remain undisturbed for a year or two the public generally will have come to see the error of their ways and entertain more common sense views of the subject. By that time the bill in question may be repealed and all further attempts to legislate on the question dropped for good, because the general highway laws as they now stand are sufficient. It is nothing more nor less than a repetition of the great hue and cry raised over the bicycle not so very long ago. Bicycles may now be ridden on a country road at any speed that the rider can attain, but there is absolutely no protest from the agricultural portion of the com-

Digitized by Google

munity, and, what is more to the point, no arrests are made or prosecutions instituted whether for speeding or failure to carry lamp or bell, as was at one time rigidly insisted upon. Bicycle laws are so dead that no one thinks of their existence, and it is only a question of a few years when automobile laws will have reached the same state of innocuous desuetude."

"What are your plans should the West End Association not prove amenable to reason?" was asked.

"We shall oppose the bill by every means in our power. Mr. Brower, the moving spirit in this crusade, so-called, is little short of fanatical in his views, but I had an opportunity to talk with him at length on a very similar occasion at Albany last year, and after half an hour's conversation he was not so bitter in his sentiments as at the outset, and I trust he and his colleagues will listen to reason in the present instance. As for the farmers, they seem to think it their bounden duty to repress everything new of the kind, as witness the case of the bicycle above cited and the anti-trolley legislation. The great advantage of the statute as it now stands is that it has for the first time made speed legislation uniform throughout the State by not permitting the local authorities to have any hand in the matter, so that as long as it stands the business of adding to town revenues by means of police traps which flourished to such a notorious extent on Long Island cannot be carried on. Another good feature of the Hill-Cocks bill is that it permits the person arrested to leave his machine as bail, as in many instances he might have to spend the night in jail were it not for this privilege.

"The plans of the West End Association are at present practically the same as they were last year—that is, a bill giving every magistrate the power to imprison for the first offence in his discretion. Why, under such a law a man could be jailed for failure to carry a horn or the required number of lamps, or in many instances where the infraction would not amount to anything more than a technical violation; it is, in short, utterly unreasonable. Where the flagrant and persistent offender is concerned it will not be a difficult matter to apprehend him, and every one is agreed that nothing short of jailing will be sufficient to stop his activities, but as to imprisonment in the first instance, that is absurd."

"How about the suggested bill to make it a misdemeanor for a chauffeur to use his master's care without the latter's consent?"

"Well, there was no necessity for that," was the reply. "In ninety-nine cases out of a hundred the chauffeur observes the law whether he is driving on his own account or not, and certainly no one is harmed but the owner through having his car taken out without his knowledge."

The Spokane (Wash.) Automobile Club has elected the following officers to direct its affairs for the present year: President, F. O. Berg; vice-president C. P. Thomas; secretary and treasurer, W. S. Dulmage; assistant secretary, Harold Buckley.

Minnesota Farmers Make Protest.

The Minnesota Agricultural Society has put itself on record as favoring an amendment of the statute regulating the use of the State highways for automobiles. M. T. Grattan, who introduced the resolution, pronounced the present law the worst in existence, and a disgrace to the State.

He questioned the legality of allowing automobiles the use of the highways at all, and suggested their regulation by a law similar to that under consideration in New York. He then drew on his imagination and described the latter as making five miles an hour the legal speed in thickly settled places. He claimed the highways were for use of the majority, and not the selfish pleasure of the minority. The vote on the resolution was a shout of approval.

Michigan Ruralites Frame a Law.

Michigan farmers have induced Representative Holmes, of Gratiot, to present a bill regulating automobiles to the State Legislature. The bill, if it is passed, will oblige every owner or chauffeur to register with the Secretary of State's office and require each of them to declare what kind of a machine he is competent to run, and that each car to display a number. The speed limit is fixed at fifteen miles per hour in country districts and in cities at ten miles an hour in residential sections and six miles in business portions. It is hardly likely the Holmes bill will be passed.

The Week's Patents.

779,444. Pneumatic tire. Benton C. Rowell, Chicago, Ill. Filed March 15, 1904. Serial No. 198,196.

Claim—The improved tire above described, comprising an inner inflatable bladder, an outer protecting tube with a seam about its inner circumference, and an intermediate sheath of strong, tough hide, with a seam about its inner circumference, all adapted to be secured to the wheel rim and each tube to the others, substantially as described.

779,477. Automobile. Edward R. Hewitt, New York, N. Y. Filed March 23, 1904. Serial No. 199,659.

Claim—1. An automobile, comprising a running gear, an engine and front and rear body portions, the rear body portion covering the engine and being hinged so that it may be lifted up to expose the engine, and the front body portion being fixed upon the running gear, and means for securing the rear body portion in normal position.

779,490. Mixing Apparatus for Explosion or Gasolene Engines. Eddy T. McKaig, Chicago, Ill. Filed November 5, 1902. Serial No. 130,127.

Claim—1. In a mixing apparatus for an explosion engine, the combination of a mixing chamber or cavity having air and fuel inlet ports, parallel piston valves arranged side by side for controlling said ports respectively, means connecting said valves together whereby they may be moved in unison, and means for longitudinally adjusting one of said valves independently of the other, substantially as set forth.

779,578. Tire Cover. Fredson E. Bowers, New Haven, Conn. Filed September 9, 1904. Serial No. 223,858.

Claim—1. As a new article of manufacture, a fabric tire case or cover, consisting of a circular tubular case of three parts, two sides of identical ring form and a narrow crown strip having parallel edges uniting the circumferential circular edges, the inner circular edges meeting in a longitudinal seam, a lacing for said seam and buckle and strap fastenings for the meeting ends of the case.

79,581. Water Cooler. Louis H. Brinkman, West Hartford, Conn., assignor to Whitlock Coil Pipe Co., West Hartford, Conn., a corporation of Connecticut. Filed December 2, 1903. Serial No. 183,427.

Claim—1. In an apparatus of the class described, the combination with an upper and a lower water receptacle, of a water cooling section interposed between said water receptacles, said water cooling section consisting of a series of corrugated metal sheets arranged in pairs, with the longitudinal edges of each pair offset in opposite directions and soldered together and having their ends soldered to vertical side pieces forming inclosed serpentine water passages, with the uppermost communicating with the upper water receptacle and the lowermost communicating with the lower water receptacle, said corrugated sheets having flat surfaces at their ends, with the flat surfaces of the lower sheet in each pair soldered to the flat surface of the top sheet in the next adjacent pair, and openings through said flat surfaces alternately at opposite ends of the cooling section, whereby communication is established between the successive water passages.

779,588. Wheel Tire. Josiah S. Cushing, Norwood, Mass. Filed September 19, 1904. Serial No. 224,990.

Claim—1. In a wheel tire, one or more circularly formed tubular layers, comprising sheets of textile material and a plurality of helical springs connected together which are

interposed between said sheets of textile material and attached thereto, and an outer tubular covering inclosing said layers, substantially as described.

779,589. Electric Battery. Frederic P. Dewey, Washington, D. C. Filed March 25, 1902. Renewed May 19, 1904. Serial No. 208,672.

Claim—1. An electric battery in which the cathode is in the shape of a thin flat strip and is maintained in contact with main body of the electrolyte at one edge only of said strip.

779,661. Gravity Valve. John F. McCanna, Chicago, Ill., assignor to the John F. McCanna Co., Chicago, Ill., a corporation of Illinois. Filed November 5, 1901. Serial No. 81,242.

Claim—1. In a valve for lubricating apparatus, in combination, a valve casing having a minute central induction port and an eduction port at the side of the former port, and both of which ports pass through the bottom of the casing, and a gravity valve filling the casing and having a relatively small conical point for seating in and closing the induction port.

779,702. Pneumatic Tire for Vehicles. Samuel W. Fuller, Malden, Mass. Filed June 1, 1903. Serial No. 159,583.

Claim—A pneumatic tire comprising an outer tube or casing and a series of inflated oblate spheroidal bulbs contained under pressure within the casing with their flattened ends at the inner and outer peripheries of the casing and the convexed sides of adjacent bulbs in mutual engagement throughout their lengths, the outer flattened ends of the bulbs conforming to the shape of and constituting a continuous support for the tread of the casing.

779,730. Vehicle Tire. John Neary, Kokomo, Ind., assignor to Kokomo Rubber Co., Kokomo, Ind., a corporation of Indiana. Filed May 28, 1904. Serial No. 210,252.

Claim—1. The combination with a tire body and a rim base formed by a flat annular band, of side flange members on the opposite edges of said rim base, said flange members each having an inwardly extending base portion, wedge shaped in cross section, and pointing inwardly of the rim seated on said rim base and engaging the tire on its outer inclined surface, whereby to automatically crowd the edges of the tire inwardly of the rim, substantially as described.

779,731. Vehicle Tire. John Neary, Kokomo, Ind., assignor to Kokomo Rubber Co., Kokomo, Ind., a corporation of Indiana. Filed May 28, 1904. Serial No. 210,253.

Claim—1. The combination with a tire body having a laterally projecting base portion, and a rim base formed by a flat annular band constituting a seat for said tire base, of a lateral abutment for the latter in the form of an annular angle iron having its vertical portion seated against the edge of the rim base and constituting an abutment for the outer edge of the lateral base projection, and having its horizontal portion bolted to the rim base, substantially as described.

779,778. Explosive Engine. Franklin W. Hagar, Nashville Tenn. Filed May 17, 1904. Serial No. 208,382.

Claim—1. In an explosive engine, and in combination, a cylinder, a piston movable therein, means for feeding an explosive mixture to the cylinder controlled by the strength of the vacuum suction in the latter, means for feeding a quantity of air to the cylinder for scavenging and cooling the latter, and means for varying the quantity of said air and therethrough the strength of the vacuum or suction created in the cylinder, substantially as described.

779,807. Vehicle Wheel. William H. Schofield, Chicago, Ill. Filed November 16, 1903. Renewed December 9, 1904. Serial No. 236,256.

Claim—1. In a vehicle wheel, the combination of "hairpin" spokes, spoke saddles for the bent parts of the spokes, an inner hub ring having seats therein to receive the bent portions of the spokes, and nuts arranged upon the spokes and bearing against the inner face of the felly, substantially as described.

779,928. Wheel for Vehicles. Clifford R. S. J. Halle, London, England. Filed August 8, 1904. Serial No. 219,985

Claim—1. A spring wheel composed of an axle, two sets of rigid arms carried thereby, a hub situate between the rigid arms, a flange projecting from the inner portion of said hub and having a space between it and the axle, coiled springs universally connected at one end to the flange at the other end to the rigid arms, and spokes connecting the hub with the felly, substantially as set forth.

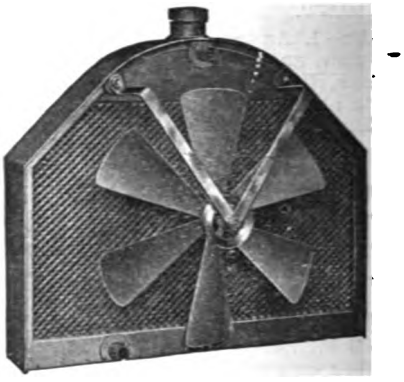
779,929. Wheel for Vehicles. Clifford R. S. J. Halle, London, England. Filed August 8, 1904. Serial No. 219,986.

Claim—1. A spring wheel involving a hub having an inwardly extending flange, a plurality of barred links supported upon an axle box and extending through and beyond said hub, a plurality of laminated springs connecting the outer ends of said links together, a pair of laterally movable disks supported upon the axle box, a spring element interposed between said disks, and a plurality of links universally connected at one end to said flange and at the other end to said disks.

779,930. Wheel for Vehicles. Clifford R. S. J. Halle, London, England. Filed August 8, 1904. Serial No. 219,987.

Claim—1. A spring wheel involving a pair of spring arms adapted to be carried by an axle, a hub situate between the spring arms, a flange projecting from the inner portion of the hub and having a space between it and the axle, means for connecting the flange with the spring arms, and spokes connecting the hub with the felly, substantially as set forth.

780,044. Rubber Tire. Alvaro S. Krotz, Springfield, Ohio, assignor to Consolidated Rubber Tire Co., Jersey City, N. J., a corporation of New Jersey. Filed April 13, 1904. Serial No. 202,914.



Claim—1. In a vehicle wheel, a metallic channel having one or both of its sides removable, an endless rubber tire adapted to be seated therein, said rubber tire being wider than the base of said channel, retaining bands extending through the base of said rubber tire, but adapted to stand substantially flush with the bottom thereof, and a fabric cover for the base of said tire extending between said bands and the base of the channel adapted to bind said retaining bands in position in said tire, substantially as specified.

780,051. Detachable Tire Cover. Frederick Mesinger, New York, N. Y. Filed September 9, 1904. Serial No. 223,909.

Claim—1. A tire cover, composed of a shoe, a series of transverse metal plates, a lining, flaps extending laterally from the shoe, and means for joining the free ends of the flaps, substantially as specified..

WHITLOCK COOLERS

For 1905.

The Leading Automobile Builder have adopted the Whitlock Cooler for 1905 for the following reasons:—

1st: Because it is the most EFFICIENT radiator yet produced.

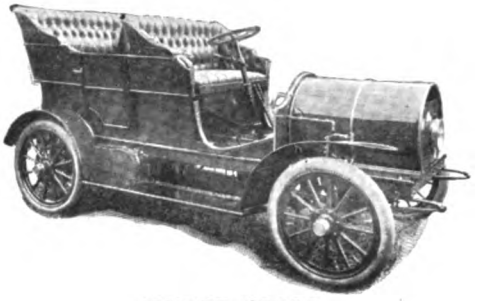
2nd: Because no other approaches it in STYLE and FINISH.

3rd: Because of its POPULARITY, being used on the leading cars.

4th: Because it is a TRIED DEVICE.

5th: Because we pursue a LIBERAL POLICY in taking care of our customers.

6th: Because we can DELIVER THE GOODS, having built about 90% of all cellular coolers made in the United States.



7th: Because our EXPERIENCE for the last two years as the largest manufacturers of coolis worth something to our customers.

We are now shipping coolers on our 1905 orders.

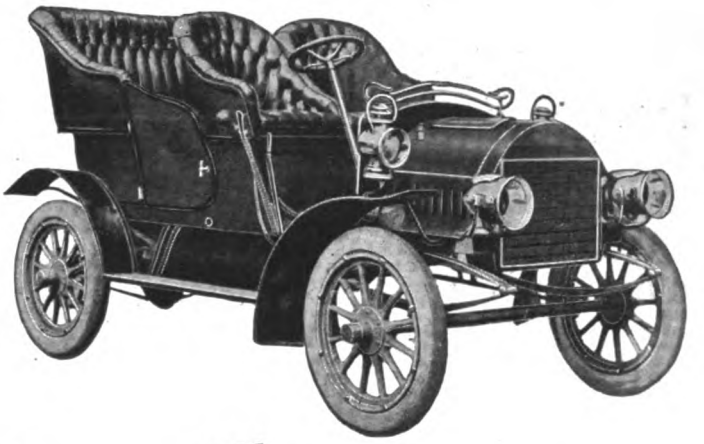
WHITE SEWING MACHINE COMPANY, CLEVELAND OHIO.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.



The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

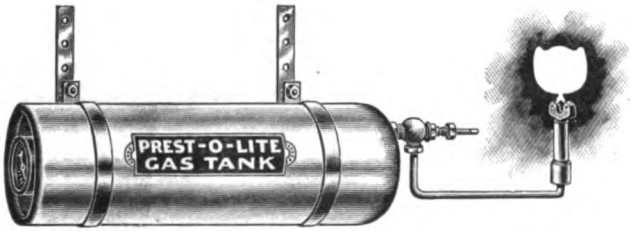
Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about Feb. 1st, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.



The 1904 edition is now out of print.

Sent upon receipt of 6 cents in stamps for postage.

"From my experience, I would certainly recommend a Locomobile to any one considering the purchase of a touring car."—J. H. M., New Haven, Conn.

"As you know, I had in N. Y. City the celebrated —— ($6,700 foreign car), but it is not in the same class with the LOCO to my mind."—D. M. B., Amherst, Mass.

"We have had a letter from his chauffeur, saying Mr. B.—— is highly pleased with his Locomobile, it having gone 700 miles and no delays or difficulties."—J. H. M., Boston, Mass.

"I wish to say the Locomobile fulfills my expectations in every respect; it runs magnificently, does its work easily, quietly and without vibration."—A. S. P., Wichita, Kan.

"I must say the Locomobile has given me entire satisfaction in every way; the more I drive it the more I think of it."—C. L., New York.

"The Locomobile has now run about ten thousand miles, and is in as good condition as ever."—A. A. M., San Francisco, Cal.

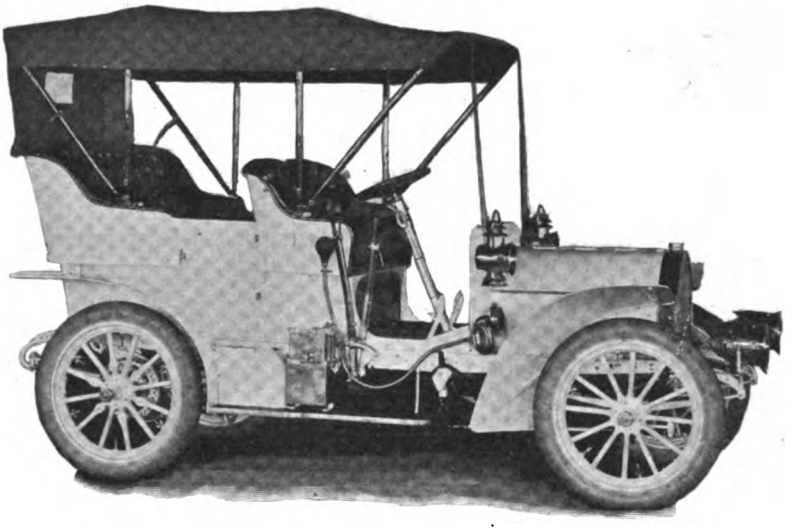
"My Locomobile has made since the 22nd of January, 1903, 13,950 miles."—R. L. M., New York, March 31, 1904.

"The Locomobile is running beautifully and giving entire satisfaction."—W. A. R., Woonsocket, Mass.

"Met on this trip three parties who were running 4-cyl. Locomobiles, and they seemed to be very much pleased with them. One man, in fact, said he would not exchange his LOCO for the best foreign car built."—F. G. T., Springfield, Mass.

"This is the fifth automobile that I have had, but of all the cars I have seen or used, there is none that will compare with the Locomobile in any manner."—S. T. M., Lafayette, Ind.

Locomobile



Gasolene Touring Cars.

"Easily the Best Built Car in America."

"The Locomobile is delightful in every respect, and there has been no trouble whatsoever so far."—H. S. E., New York.

"It gives me much pleasure to say a good word for the Locomobile Gasolene Touring Car—I regard it as the most reliable and generally satisfactory of any of the twelve automobiles I have owned."—G. F. C., New York, N. Y.

"In every way the Locomobile has been entirely satisfactory; never has failed to do what was required of it. Refer any to me you care to."—A. G. M., Norwich, Conn.

"I have now run my Locomobile for about 6,000 miles, and it has never refused to come home under its own power."—F. W., Fitchburg, Mass.

"I am very much pleased with the behavior of the Locomobile, and consider it way ahead of last year's car, although that gave good satisfaction."—F. W. B., Bridgeport.

"Came up to Boston yesterday. The Locomobile went like a bird. Have been over 500 miles, and have not missed an explosion."—F. H. T., New Bedford, Mass.

"I think the Locomobile Company's claim of "Easily the Best Built Car in America" is a perfectly just one. I can readily claim it to be superior to any American and equal in the same horse power to any French car, and at the same time perfectly adapted to American roads."—J. C. S., Boston, Mass.

"I think the construction (of the Locomobile) is absolutely perfect, for never was a more rigid test given a machine than our trip from Bridgeport to Providence."—A. L. P., Providence, R. I.

"I have used it now three months in my business, which is constant. We are averaging sixty miles per day, up hill and down. The Locomobile is certainly all you have recommended."—Dr. R. W. L., Ridgefield, Conn.

"Have run the 4-cyl. Locomobile purchased from you last November about 5,000 miles. About 4,000 miles of this was through the mountains of California. I do not think any machine could give better satisfaction."—D. H. G., N. Y.

Write for full information regarding our 1905 product. All models are of the four-cylinder type, with side entrance tonneau. Prices, $2800 to $8000.

"My Locoombile delivered to me in November, 1902, is running satisfactorily, and with the exception of such adjustments as are necessary on all cars is always in commission."—M. M. R., New York City.

"I am frank to say I am delighted with the Locomobile. Believe there is no better machine made—in fact, do not believe there is another machine in the country that would have gone where I did last Sunday."—C. B. M., Minetto, N. Y.

CHICAGO—No. 1345 Michigan Avenue

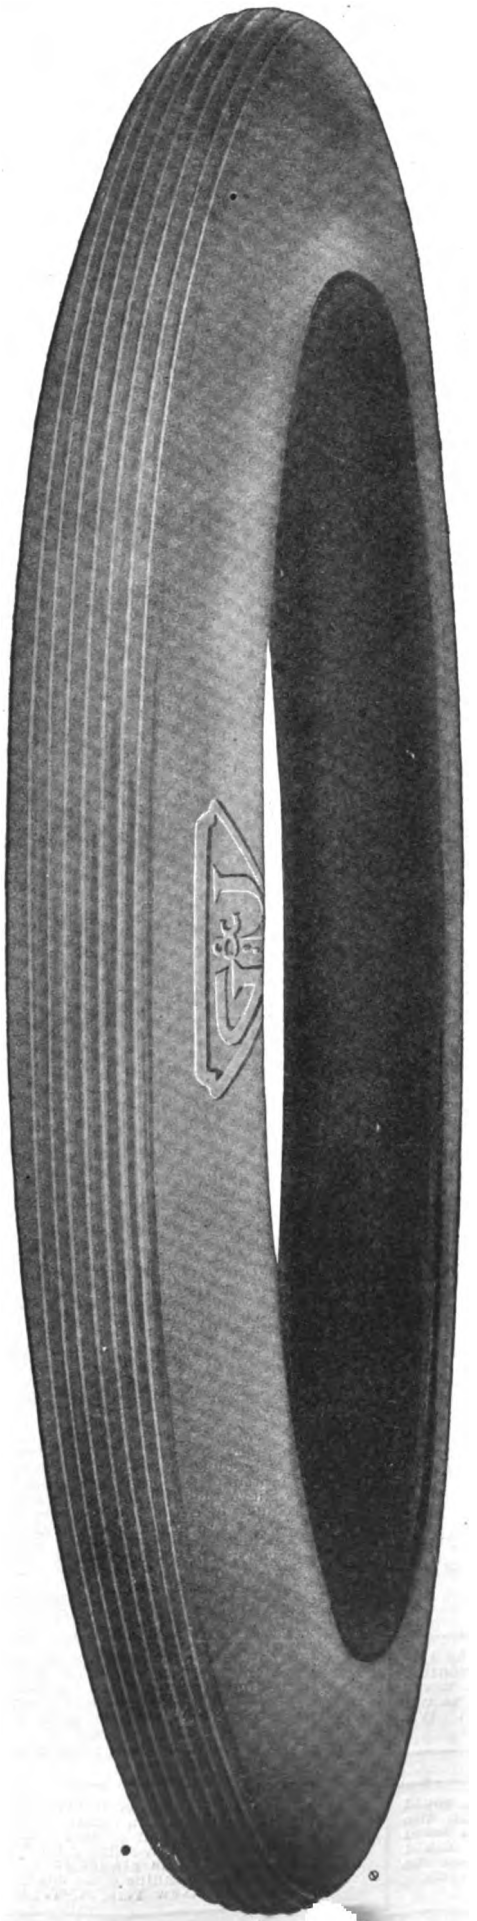
Member Association Licensed Automobile Manufacturers.

"Have run my Locomobile easily 8,000 miles. She has always gone and returned from every place I have started for without any trouble."—D. N. A., Bridgeport, Conn.

"Cannot say too much in praise of the Locomobile. Have several friends who own cars, and they say it is equal to, if not better, than the foreign cars."—C. L. H., Norwich, Conn.

"I have now operated the Locomobile for about five months. During that time I have never wanted the car when it was not ready to go out."—W. A. W., Jr., Hoosic Falls, N. Y.

"I can offer no suggestions which would be of value as to the improvement of the Locomobile. It has far surpassed my expectations."—W. B., Boston, Mass.



"Every time I drive the Locomobile I am more than pleased with it. Saturday evening last I drove 20 miles in 42 minutes, including three long hills, and the car ran like a watch."—F. W. M., Jr., La Salle, Ill.

"I have yet to see a car which I think is better than my Locomobile, or will stand up as well over all kinds of country roads with the ordinary usage which a car gets."—P. W. W., Boston, Mass.

"I fail to see how you could improve in any way upon the Locomobile, as its details seem perfect, and it is without doubt "easily the best built car in America."—A. L. P., Providence, R. I.

"Where my Locomobile was this summer for a month it was the only car out of two dozen, including high-priced foreign cars, that was always in good shape and running every day."—C. W. L., New York, N. Y.

Can you read between the lines? If you can, then you'll find "meat" on this page.

By this time probably nine-tenths of the motor-car dealers have begun to realize that there is something unusual doing in the Orient line this year.

First came our flat-footed announcement that our '05 Touring models would be a sensation.

Then we made good by showing the illustrations, and later the cars themselves.

All the time we kept dropping hints about our new advertising and selling plan (combined).

We said we would push the Orient line in 1905 as no line was ever pushed before.

We are making good on that, too—ask some of the real representative dealers who have closed with us, what they think of the plan we are starting for them. We will furnish you their names on request.

It is a plan which we will start for you if you want to handle the Orient line. We'll give you all you can do, just taking care of the people whom we send right into your garage ready to talk motor-cars. Our campaign will be direct to them, and it will have a force and vigor that will compel attention.

Do you want to know more about it?

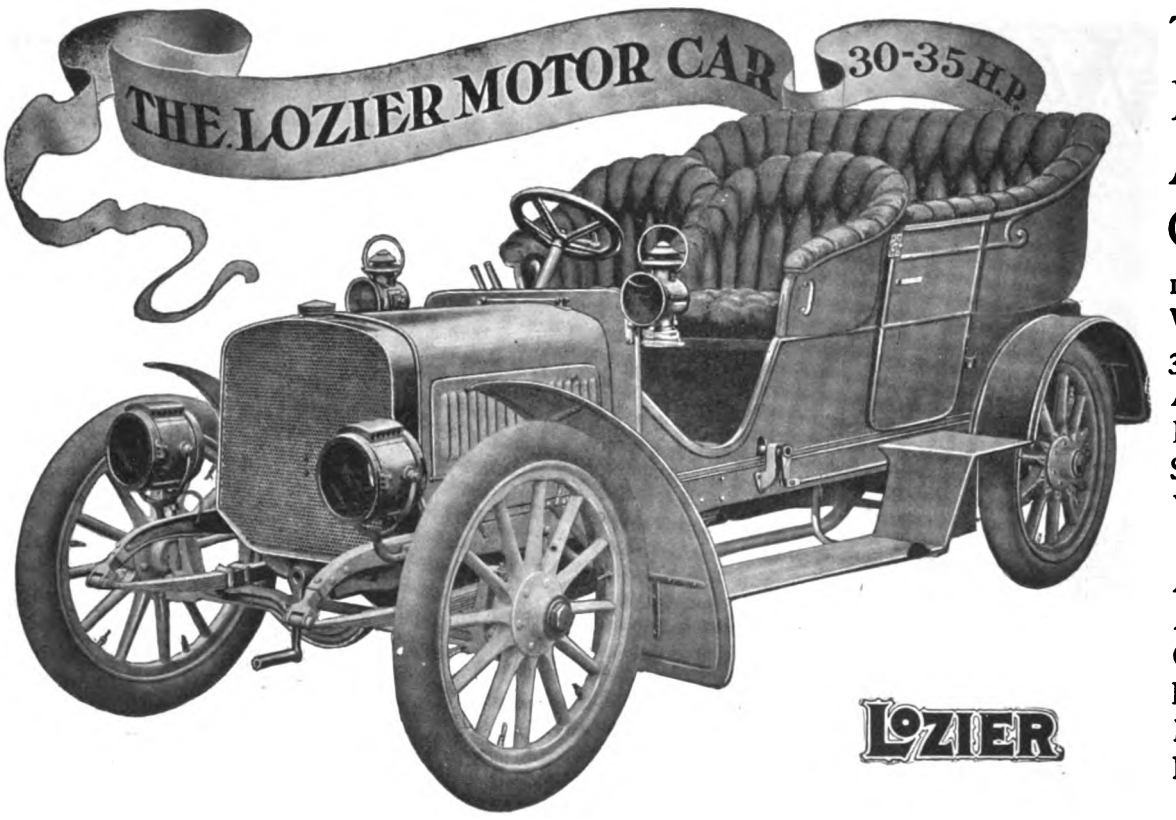
HYDRO-CARBON -MOTORS-

Clyde, O. Jan. 4, 1905.

The B. F. Goodrich Co.,
Akron, Ohio.

Dear Sirs:

Percy F. Megargel, W:S. Harrison, of Rochester, N. Y., and Ralph Megargel of Scranton, Pa., ran an Elmore Pathfinder,- a machine having 16 horsepower and weighing, including passengers, baggage and extras, 2150 lbs. - from New York to St. Louis and back to Philadelphia, on a single set of Goodrich tires, not only without a puncture but without having to pump up the tires during the entire trip. This trip was begun on May 18th when the roads were almost impassable, and on the return trip, when passing through Pennsylvania, the rains had washed the dirt off the roads so that it was an almost continual run over rocks and stones. The severe service through which these tires went would be more appreciated by the perusal of the little booklet which the Elmore Company have gotten out, "The Cruise of the Pathfinder," illustrating and describing this wonderful tour.



The mileage on the first set of tires figures up to a total of about 3000 miles. This same car made the trip a second time but the rear tires were changed, not because the tires had given out, but they were worn some on the sides from continual traveling through deep ruts, and as the second run was made under the auspices of the Association of Auto Mfgrs. and the cars were liable to a penalty unless a certain number of miles were made each day, it was deemed advisable to change the tires to prevent there being any possibility of delay from tire troubles, although there was no reason to believe that the original set of tires would not have been able to make the trip the second time.

Yours truly
Elmore Mfg. Co.

Peerless

The Car of Achievement

SECOND IMPRESSION OF A PEERLESS CAR

COMFORT

You are not only impressed with the beauty of a Peerless Car, but also with its comfort and

EASE IN RIDING.

This is a mechanical problem that goes far deeper than mere upholstery. It depends on the size of the tires, length of wheel base, the spring construction and

DISTRIBUTION OF WEIGHT

of the car.

A ride in a Peerless Car will convince you that these important requirements have all been fully and perfectly met. You are not bounced to pieces over rough roads, but you are pleased to see how the Peerless runs along as smoothly, silently, and comfortably as a Pullman.

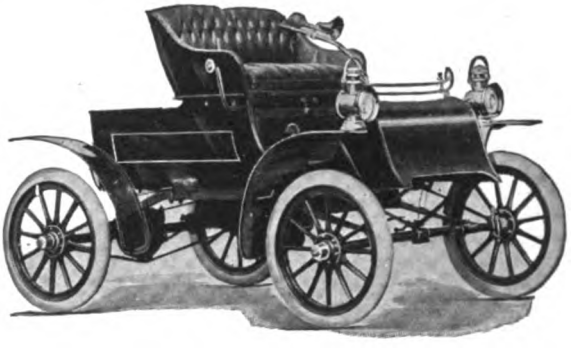
NORTHERN AUTOMOBILES.



1905 Touring Car, Side Entrance, opening on direct line to Running Board. Price $1700.00.

Chainless. Dustless. Noiseless.

Absolutely free from Vibration. *"No expense but the gasoline."*

The refinement of simplicity. Number of parts reduced to the minimum. Easy to operate, easy to understand, and nothing to get out of order. Repair bills practically eliminated. The ideal car for American roads from every standpoint. Three point motor support prevents any possibility of machinery being thrown out of alignment. Roads which other automobiles cover at peril of machinery and passengers, present no difficulties to the Northern. Every part is made in our own shops, and fits to perfection.

Planetary Transmission. 18 H. P. double opposed motor. Power transmitted direct to beveled geared divided rear axle. Northern Automatic Compensating Carburetor, "built to fit the engine," assures a perfect mixture at all speeds. In finish and upholstery the Northern is superb. You may pay twice as much, but you cannot buy a better finished or more reliable Touring Car.

NORTHERN RUNABOUT.

7 H.P. BETTER THAN EVER.

Has full back molded seat, larger oil cups, larger body and new carburetor. It is the ideal machine for the physician—the man of business—or for family use. Price, $650.00.

Rambler

SURREY, TYPE ONE, 18 H. P., $1350.

The New York Automobile Show has demonstrated that no other vehicle of the same price has the beauty, the power and the reliability of this model. Dealers and users from all over the country have shown the greatest enthusiasm over it.

They are most loyal who know the RAMBLER best; and it has been encouraging to know that after their first season with our automobiles, users do not discard our cars for other and higher priced makes, even though their tastes along other lines are extravagant and would be gratified by the purchase of higher priced vehicles, were it not for the remarkable simplicity of our models and the consequent ability to dispense with the service of a chauffeur, and to enjoy the pleasure of being able to run and care for the machine without such help.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, February 2, 1905. No. 19

JEFFERY WANTS A FACTORY

Rambler Plans for Expansion Make Necessary a Second Plant—Tenders are Invited.

It should be necessary to say scarcely more than that Thomas B. Jeffery & Co. want a factory to bring them proposals innumerable. And the fact is, as intimated, that Jeffery & Co. do want a plant, and that they are ready to receive tenders.

Of course, the makers of the well known Rambler cars already have a prodigious factory at Kenosha, Wis., but it is already well filled and fully occupied with the production of runabouts and two cylinder touring cars, and it is with an eye to the enlargement of the Rambler line, so that it may include vehicles of all types. that an additional plant is wanted and quickly. There is ample room at Kenosha for another building, but Mr. Jeffery has set ideas on the subject of producing different models in different factories, and it is to carry out this scheme of manufacture that another factory is desired. The Rambler people are very much in earnest in the matter, "indispensable" being the word they employ in voicing their wish to obtain separate factory space.

With so many patent-possessed promoters tempting local communities by dangling suggestions of automobile factories, and with so many of them eagerly swallowing the bait, the opportunity to have such a substantial and long established concern as Jeffery & Co. locate "in its midst" should keep the wires to Kenosha pretty warm during the next few days. It is such an opportunity as does not often present itself.

Yale Gets Into New York.

The Yale car finally has been placed in position of obtaining its due in the metropolis. which is to say that the New York agency has been placed in the hands of Frank A. Sanford. Mr. Sanford has placed a goodly order for the well known Toledo made cars, the first of which will arrive about the time his salesroom is ready for it. He has several locations in view, and will reach a decision in the matter within the next week. Sanford formerly was a very energetic factor in the piano business in Brooklyn, and there is no reason to doubt that he will bring the same quality to bear in the automobile trade.

Blomstrom Seeks Site in South.

R. P. Janney, representing the C. H. Blomstrom Motor Co., of Detroit, Mich., is reported in New Orleans, La., "looking about him with a view to locating an automobile and power launch factory in or near the city." Janney, it is added, "is well pleased with New Orleans, its climate and promise of future greatness, and is, in fact, in love with the Crescent City, and believes that it will offer an excellent field for him in his efforts to establish a factory of the kind alluded to."

Year's Exports Show Big Increase.

Although the totals for the year 1904 show an increase of more than $250,000 in American automobile exports, the December shipments did not serve to swell the figure. For the last month of the year the value was $214,516, as against $223,548 in December, 1903. The year's business aggregated $1,897,510, as compared with $1,643,029 last year and $1,069,782 for the twelve months of 1902.

How Iroquois is Tempting Rochester.

According to a Rochester (N. Y.) source, the Iroquois Motor Car Co., which hopes to establish its factory in that city, "has a very neat car upon the streets to demonstrate that they at least have made one car."

It is added significantly that "the wives of prospective stockholders are enjoying the sensation of being driven about the streets in the handsome machine."

Clarkmobile Becomes the New Way.

The Clarkmobile Co., of Lansing, Mich., has been reorganized and incorporated under the name of the New Way Motor Co., with a capitalization of $100,000. The officers are: President, A. C. Stebbins; vice-president, J. W. Knapp; treasurer and manager, William H. Newbrough; secretary, E. W. Goodnow.

CONRAD'S LAST SAD RITES

Trustee's Report Shows What it Costs to Wind-up a Bankrupt Estate.

The once prominent Conrad Motor Carriage Co., Buffalo, is now but a memory. The trustee in bankruptcy has filed his final report and the estate is now formally closed. The report is interesting, as showing what it costs to wind up a bankrupt concern.

The receipts during the receivership totaled $52,786, of which sales of merchandise accounted for $34,331.04 and of machinery $2,710.48. The book accounts brought $855.21, the office furniture $68, and "remnants" $1,426. The real estate was sold for $12,000.

Some of the more important disbursements were as follows: Labor and wages in conducting factory, $13,411.23; merchandise in conducting factory, $9,602.38; expense account in conducting factory, $2,659.13; advertising account in conducting factory, $355.74. The creditors received in two dividends, aggregating 6 1-5 per cent., $6,208.04, and the mortgage holder $10,795.26, the total disbursements being $49,024.62. Payments to bankruptcy officials and lawyers accounted for the remainder of the estate of $52,786.74, their fees being as follows: Receiver's commissions, $109.28; services and expenses of receiver's attorneys, $532.09; commissions, fees and court expenses of referee in bankruptcy, $360.71; services and expenses of attorney for petitioning creditors, $159.50; trustee's commissions, $667.87; postage, printing, costs, legal expenses and services of attorneys for trustee, $1,932.67.

Premier in New Factory.

The Premier Motor Mfg. Co. are now in possession of their new plant at the corner of Georgia and Shelby streets, Indianapolis. The new place gives them much needed elbow room.

Lamb with $10,000 Capital.

The Lamb Automobile Co., Clinton, Iowa, has been incorporated, with $10,000 capital. Besides selling accessories, the new firm will handle the Thomas, Cadillac and Waverley cars.

SNOW FOLLOWED THE SHOW

But Failed to Chill Good Effects of Exhibition—What the Dealers Report.

"Sell cars while the enthusiasm runs highest" is the watchward in the trade to-day, and all the branch houses and the agents in the city are following it to the letter.

Results in the shape of sales from show inquiries which have been followed up during the last week are such that a general feeling of satisfaction prevails.

"We were selling four to five cars a day when the blizzard swooped down on us and slowed things," said Carl Page, manager of White's branch to a Motor World man on Monday, "and do you know," he continued, "there were a number of people who insisted on having cars demonstrated even in the height of the storm. Our men were almost frozen to death, but as long as buyers wanted to ride they were willing, and our demonstrating cars were out all through the storm."

Colonel K. C. Pardee, who upholds the New York end of the Maxwell-Briscoe line, was likewise enthusiastic on the question of sales since the show, and willing to convince all comers that the Maxwell cars are the only things on wheels.

C. E. Duerr, of C. E. Duerr & Co., not only reaped a harvest at the show, but is still garnering the grain. "If you ride in a Royal tourist you'll buy one, and that's not advertising copy alone, but experience," he said when questioned on Monday. "I never saw so many people hand out their money after a single demonstration as at the show. On the average we gave them one ride, and that did the business, and we were ready to get the next man's order. I think I can justly lay claim to the sales record of the show in that I disposed of no less than fourteen cars in one day—that is, the agency sales record, for every one of those was an individual purchaser who left his check in part payment right then and there. Oh, of course, agents place orders from the makers for twice that number of cars at a time, but then it's up to the agent to sell—that's another story entirely. These are all bona fide sales to users. Since the show we have almost had to keep people waiting in line for demonstrations, and the Royal is certainly carrying off honors there, too. We take the care over to "Dufffy's Hill, "on Lexington avenue, just to show the intending purchaser what its hill climbing capacities are, and I tell you we surprise him. Why we went up "Duffy's Hill last week time and again on the high gear, once with eight occupants in all, or a load of something like 1,300 pounds. There are mighty few grades like that to be met with in a month's touring."

Corroboration of the utter disregard for weather conditions was forthcoming on all sides, and in one instance was amusing to say the least.

"We had an appointment to demonstrate for Wednesday afternoon, when the blizzard was at its height," said Harry Unwin, of the Harrolds Motor Car Co., "and as the party happened to be a lady seventy-three years old, we 'phoned her and informed her that, of course, we presumed the appointment was off and wanted to know what other time would be convenient. But it was no go; she insisted on having a ride, weather or not, and we booked an order for a Pierce Arrow with a Stanhope top within five minutes of the time she came back."

"We haven't got a great deal to show just now because we sent our entire exhibit to Philadelphia," said Robert P. Parker, manager of the Haynes branch, "but we have been doing plenty of demonstrating in the mean time in spite of the weather, and now that we're through with shows, so far as this end is concerned, we can settle down to business in earnest."

"Well, we certainly can't complain of the number of inquiries we are receiving every day or the number of people who are anxious to have a car demonstrated and equally anxious to buy," replied Percy Owen, head of the Winton department, to the query as to how matters progressed during the interval since the show, "but," he added, "people are wiser than ever before, and they have to 'see the wheels go around' and know the why and wherefore of a thousand and one things that never entered the buyer's head a few years ago. Why, do you know, I've actually had a man come in and hand over his check without even inspecting the car, as much as to say, 'One Winton, please; send it soon,' as if he were buying a hat. Now he takes good care to see that it fits, and I take it to be a good indication of the sound, businesslike basis that the industry as a whole has reached."

Pardee Takes on the Stoddard.

R. Harry Croninger, sales manager of the Dayton Motor Car Co., who has spent the past several days in this city, has placed the New York agency with Colonel K. C. Pardee, 317 West Fifty-ninth street.

The first of the new 25 h. p. four cylinder Stoddards came to New York with Croninger, and is now in evidence at the Fifty-ninth street place. It proves to be a good looker and is of the self-starting type; in this respect it embodies a feature which the makers claim guarantees self starting without fail—not given a hundred and one favorable conditions, then upon switching on the engine will start, but any time there is any compression in any of the cylinders sufficient to turn over, the spark alone will do the work otherwise entailing a use of the crank. This is accomplished by giving the commutator, which, by the way, follows the latest tendency in being placed on a vertical shaft at the rear of the engine and just in front of the dash, an unusual amount of latitude where the advance and retard adjustment is concerned.

THE RANGE OF RUBBER

How Demand and Supply Have Increased and Affected Prices of all Grades.

During the last ten years the imports of raw rubber into the United States have nearly doubled, says the India Rubber World. If we use the official customs returns for the fiscal year ending June 30 the comparison is as follows: 1893-'94, 33,737,783 pounds; 1903-'04, 59,015,651 pounds.

Meanwhile the imports for consumption in other countries probably have increased at a corresponding rate. How, then, can the rubber supply be said to show a decline?

The rate of production has not shown a decline. But that is not the question. The natural supplies of rubber are no greater now than at any given date in the past. The natural rubber area is no greater now than fifty years ago. But meanwhile the yearly production of rubber has increased a hundredfold. The point to be made is that this rate of increase must some time reach a limit. The limit has already been reached in a great number of regions which might be named.

America has consumed millions of pounds of rubber obtained from Africa and produced by processes which enabled a full grown man to get together one pound of the material by working a week on roots torn from the ground. A second crop of roots was never obtainable in the same area. The great bulk of the African rubber output to-day is from lianes (creepers), which never yield a product but once. All the rubber imported from South America under the name of "Caucho" is obtained by cutting down the trees which yield it.

The fact that rubber has so long been obtainable is due to the enormous original supply. But this supply has not been increased or even kept up to the original limits by any process of nature, and the rubber situation to-day is comparable to a private fortune of fixed limits, which is diminished in proportion as its owner draws upon it. He may spend twice as much this year as last, but this does not make him twice as rich; it only hastens the time when he will become bankrupt.

The same customs returns from which we quoted above give the following as the import values of the rubber covered in the statistics of the two years under consideration: 1893-'94, $15,077,903; 1903-'04, $40,444,250.

The chief significance of these figures is that the average import value of rubber—good, bad and indifferent—has increased in ten years from 44.6 cents to 68.4 cents.

Is such a difference—almost 53 per cent—explainable on any other ground than that production has not been developed at a rate commensurate with the increased demand?

The Simpson-Sterns Automobile Co. has begun business in Louisville, Ky. They have secured the agency for the Pierce-Arrow.

BALTIMORE ON GASOLENE

Fire-Swept City Passes Fair but Stringent Measures—Garages Will Not Suffer.

Baltimore's precaution to guard against any more fires has resulted in the passage of an "anti-gasolene" ordinance, which says that hereafter gasolene can only be used in automobiles and engines, and under no consideration will this volatile fluid be allowed for cooking and other household purposes in Baltimore. This conclusion was arrived at last week at a meeting of the Baltimore City Council by the passage of the Gill anti-gasolene ordinance by a vote of 15 to 8.

Under the provisions of this ordinance gasolene for a garage may be stored in an iron, steel or copper tank, the design of which must be approved by the inspector of buildings, and to be buried at least two feet underground. The maximum amount of gasolene stored therein shall not exceed 275 gallons, and only one tank will be permitted on the premises. The right is also given to keep gasolene at automobile stations in non-corrosive cans to the amount of fifty gallons. The further provisions of the ordinance follow:

"Sand shall be kept in buckets fit and available for absorbing any waste oil that may fall upon the floor; and such sand, when saturated, shall be promptly removed to a place and burned; the use of sawdust for this purpose is prohibited.

"No naphtha or gasolene shall be put into or taken out of an automobile within fifty feet of an open fire, nor until lamps or other apparatus intended to be carried upon the vehicle for illuminating purposes or as pilot lights have been extinguished.

"In no case shall naphtha or gasolene be allowed to run upon the floor or to fall or pass into the drainage system of the premises.

"Naphtha or gasolene shall not be carried in open vessels about the premises. If it is necessary to convey naphtha or gasolene it must be done in an approved inclosed can or cans, with an automatic closing device which shall effectually close the same and of the capacity most closely adapted for filling the machine, but not exceeding five gallons.

"If it is necessary to empty the tanks of automobiles, it shall only be done with the utmost precaution against fire, and the fluid must be returned to the approved can or cans directly with the automatic closing device which shall effectually close the same."

Diamond Claims First Tire.

In a chapter on the history of automobile tires in the tire users' text book, just issued by the Diamond Rubber Co., the assertion is made that this company manufactured the first pneumatic automobile tires in America. This is a distinction that for several years has been claimed by the Diamond Rubber Co., and which, they say, has not been challenged.

The first set of American pneumatic motor tires is described as being of the single tube variety, and while it is not to-day being looked upon as at all remarkable, they were the means, the Diamond people state, of turning the attention of the pioneer American automobile builder from steel and cushion rubber tires to those of the pneumatic type. In fact, the original set of single tube pneumatic tires were so satisfactory as compared with those which had up to that time been used that an order for 100 sets was immediately placed by a concern now prominent which was at the time just making a start in automobile manufacturing. By the next season the demand for these tires was very considerable, and other rubber manufacturers began producing them.

The Week's Incorporations.

New York, N. Y.—The Auto Mart, under New York laws, with $30,000 capital. Incorporators: J. D. Cooper, H. Teutic and F. S. Hanley.

New York, N. Y.—Bonton Motor Car Co., under New York laws, with $30,000 capital. Incorporators: A. C. Field, L. M. Field and B. F. Schwartz.

Des Moines, Ia.—Iowa Automobile and Supply Co., under Iowa laws, with $8,000 capital. Officers: C. R. Prouty, president; F. S. Dusenberg, secretary and treasurer.

Paulding, O.—Paulding Motor Car Co., under Ohio laws, with $10,000 capital. Incorporators: W. H. Phipps, C. F. Price, I. H. Loughlin, E. N. Travis and C. W. Burgner.

Cleveland, O.—The State Automobile and Supply Co., under Ohio laws, with $5,000. Incorporators: W. B. Brown, J. W. Burrell, H. C. Gahn, R. E. Dupiene and W. E. Patterson.

Los Angeles, Cal.—Auto. Rental & Repair Co., under California laws, with $50,000, of which $7,500 paid in. Directors: J. M. McLeod, D. A. Casselmann, F. W. Richey, E. C. Richey and J. H. Andrews.

Milwaukee, Wis.—Bates-Odenbrett Automobile Co., under Wisconsin laws, with $30,000 capital, to do general business in automobiles. Incorporators: John W. Foster, Josephine Foster, Robert G. Bates and George L. Odenbrett.

Detroit, Mich.—The Automobile Equipment Co., under Michigan laws, with $50,000 capital, to manufacture electric, steam and gasolene vehicles. Incorporators: Henry Courie, Philip E. Hawley, William F. Cowie and Henry A. Cleland.

Detroit, Mich.—Detroit Steam Engine Co., under Michigan laws, with $50,000 capital, to manufacture and deal in automobiles, engines and motors. Incorporators: John D. MacLachlin, Ovid B. Law, William E. Higginbotham and William G. Malcomson.

Adams to Sell Knox Trucks.

Fred H. Adams, who until recently was with the Knox Co., in Cleveland, O., is now sales manager for the Knox Motor Truck Co., in Springfield, Mass. Adams, who has placed a large number of delivery wagons and large trucks with the department stores in Boston, is well fitted for his new office.

CHICAGO IS READY

Western Show Opens on Saturday, but Very Little Newness is in Prospect.

Because of the precedence and prominence of the New York exhibit, the Chicago Show, which opens on Saturday evening next, will, as always, throw out but reflected glory. However it may appear to Chicagoese, to the trade at large it is merely the reopening of a book already perused to which but a few new paragraphs have been added.

This year these added paragraphs seem fewer than ever, and as the West and South were present at the New York function in much greater force than on any previous occasion, even in the West the Chicago Show can scarcely hold the same amount of interest for the Western trade that was previously its portion.

This is not meant as a disparagement of the Western exhibit, which cannot well fail to prove of some influence and effect, but from the standpoint of the trade in general it promises little that is new, and it is to be added comparatively little real business. Despite the long and persistent effort to avert it and to disguise the fact, the unbounded success of the New York display is likely to finally force home the truth that Chicago's is a local, or at best a neighborhood, show.

How little newness it holds for the man who attended the New York function is shown by the official list of those who were absent therefrom and who will have exhibited only in Chicago. In all there are but fifteen automobile manufacturers in this category, and not more than five of them are large or important.

The full list of those who did not exhibit in New York, but who will be present in Chicago, is as follows:

M. F.—Main floor.
M. F. A.—Main floor annex.
G.—Gallery.
G. A.—Gallery annex.

Adams Co., Dubuque, Iowa, Space 100, M. F.—Adams-Farwell gasolene cars.

Auburn Automobile Co., Auburn, Ind., Space 142, M. F.—Gasolene cars.

Autocar Equipment Co., Chicago, Space 266, G. A.—Automobile trucks.

American Electric and Novelty Mfg. Co., Chicago, Space 291, G. A.—Electrical novelties.

Banker, A. C., Co., Chicago, Spaces 115 to 117, M. F.—Supplies.

Beckley-Ralston Co., Chicago, Spaces 307 and 308, G. A.—Supplies.

Borland, C. B., Co., Chicago, Spaces 317 and 318, G. A.—Accessories.

Chicago Caloric Engine Co., Chicago, Space 16, M. F.—Caloric engines.

Chicago Storage Battery Co., Chicago, Spaces 267 and 305 and 306, G. A.—Batteries.

Cullman Wheel Co., Chicago, Space 268, G. A.—Equalizing gears and sprockets.

THE MOTOR WORLD

Published Every Thursday by

THE GOODMAN COMPANY,

94-95-96 TRIBUNE BUILDING

154 Nassau Street,

NEW YORK, N. Y.

TELEPHONE, 2652 JOHN.

Subscription, Per Annum [Postage Paid] $2.00
Single Copies [Postage Paid] . . . 10 Cents
Foreign Subscription $3.00

Invariably in Advance.

Postage Stamps will be accepted in payment for subscriptions, but *not* for advertisements. Checks, Drafts and Money Orders should be made payable to THE GOODMAN COMPANY.

General Agents: The American News Co., New York City, and its branches.

☞ Change of advertisements is not guaranteed unless copy therefor is in hand on SATURDAY preceeding the date of publication.

☞ Those who are interested in motor vehicles will find the facilities and information of our office always at their command.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, FEBRUARY 2, 1905.

"Automobile racing has been denounced as "tainted with commercialism," because the manufacturers of racing machines have seen in it opportunities to advertise their products. If it is ever proved that the racing meets are not purely sporting events, but mere annexes of the advertising departments of the makers, they will suffer a great setback in popular interest among all classes."—Extract from editorial in the New York Sun.

Florida and What it Teaches.

Sport and commercialism won't mix. As when oil and water are poured into the same vessel, oil rises to the surface, so does commercialism inevitably come to the top when the effort is made to have it comingle with sport.

In the realm of sport, commercialism is designated professionalism, and it is a matter of history that while life lasts professional spirit is strong. The professional spirit is the "What-is-there-in-it-for-me?" spirit. It was this spirit that originally inspired the Florida speed carnival. It was this spirit as embodied in the persons of hotel keepers and most of the others concerned that has dominated the affair. It was a life-long, dyed-in-the-wool professional who held the managerial reins. There were trophies asked for and obtained solely on a commercial basis. Favors to newspapers or newspaper writers were distributed to further purely commercial interests.

It was inevitable that the first attempt to rescue the sport from such professional clutches would result in some turmoil. The effort was made this year, and, of course, turmoil resulted. It cast a shadow on and affected the entire carnival. The turmoil has, however, achieved one good purpose. It has resulted in the formation of organizations that draw a distinct line between sport and commercialism, as they apply to the Florida carnival. The Ormond hotel keepers —good fellows and keen business men, all of them—and their following have finally come out into the open and in their true commercial guise. They mean that the carnival shall continue to be what the Motor World alone had the hardihood to truthfully describe it, i. e., a "hotel annex." They will strive to use the sport to boom their business. The former professional six days' bicycle rider who has striven so valiantly to bring boarders to their several hotels in various parts of the country, and his "pals" and following, are all lined up at the hotel crib and again assured of free transportation, free beds and free board, which is their return for "services rendered."

With the issue so well defined, there no longer exists reason why real sportsmen and men of prominence should permit themselves to be "used" to further the business of a particular hotel or hotels. Henceforth, it will be easy to distinguish between men actuated by love of sport and those possessed by the "What-is-there-in-it-for-us?" spirit.

It would seem, also, that the way of the American Automobile Association is immensely simplified. It will not now be difficult for the organization to make its choice, and if it has strength of backbone and the courage of its convictions, it will no longer temporize. It has everything to gain and nothing to lose by taking a determined and unbending stand. It is the only way properly to deal with the grasping professional spirit and to keep the sport free from stains of commercialism. "Life is a nettle. Disturb it, it stings. Grasp it firmly, it stings not."

Of course, there are professional vultures in the offing, waiting to feast on deceased limbs that may be amputated and ready to create a mighty clatter, but determined men do not concern themselves with carrion.

It would, indeed, be well if the A. A. A. finally recognized that oil of any kind will not mix with water, and that it is flying in the face of real sport in coupling men who compete for sport's sake and those who compete for the money there is in it, or because they are hired to compete. They are not of a class, and never will be so. The ultimate outcome of a rule that attempts to make them one will be to drive out the sportsmen. The present result of the rule is to afford a refuge for professionals in other sports, notably cycling, in which a number of them have left soiled pasts or such dirty trails that, diminished though cycling may be, these same men now strutting peacock-like in the realm of automobile racing, would not dare raise their heads without bringing upon them a volley of brickbats.

Rising Superior to Weather.

Few things have served to demonstrate so effectively the present high grade of efficiency reached in automobile building as the performance of the numerous cars of various makes that braved the recent blizzard, which prevented every wheel of other kinds from turning while it lasted, and in some instances for a day or two after.

New York City's transportation facilities, with the exception of the underground, were annihilated; the elevated roads ran when they could, and the surface cars not at all, and many of the latter, as well as wagons snowed under in all parts of the metropolis, showed how absolutely helpless they were in the face of the storm. Yet through it all automobiles made their way about, frequently being out in the thick of it merely for demonstration purposes, such was the enthusiasm of many would-be purchasers of cars right after the New York show, and not in a single instance did a car fall by the wayside or fail to return to its garage when it was expected. The only extra preparation needed was in the shape of chains or rope about the drivers in order to obtain traction in the extremely fine snow, which rendered walking dangerous, and the car was equipped and ready to combat the drifts, which frequently were over the hubs.

A howling gale, snow drifting many feet

Digitized by Google

deep, and a temperature considerably below freezing point—conditions which made street traffic of any other nature whatever an absolute impossibility—could not prevent the automobile from doing its duty, and the laurels thus earned redound more to its credit from the fact that the tests were carried through by the everyday car, with its usual equipment and its usual load of passengers—it was not an ordeal prepared for well in advance. No attempt was made to put through an endurance trial of any nature, the cars were sent out regardless of the weather, and amply demonstrated their readiness to overcome obstacles insurmountable by any other means of locomotion.

Contrast this picture of the automobile with that of its predecessor of only half a decade ago, and the marvellous progress made in that very short interval cannot but strike even the prejudiced observer as a telling tribute to the genius of the men who have persevered in the face of heart-breaking difficulties and out of the crudities of first attempts produced a self-propelling vehicle in which reliability is a predominant feature. But few years ago a score or more of the pioneers started on a ten-mile run, and under the most favorable weather conditions, over the best of roads—Riverside Drive—the great majority of those that got that far succumbed to a grade which now does not call for a change of gears. Compare the results of the attempted hundred-mile run to Philadelphia a few years ago, in which a pitiful minority of two cars survived the ordeal out of many times that number, with the thousand and fifteen-hundred-mile trips made to-day at a speed but little short of the best railroad service, and the verdict must be that progress nothing less than astounding has been accomplished in the interim.

Apart from the endless improvement in everything connected with the car that has tended toward its perfection as now known, probably no one other feature is so largely responsible for its endurance and capacity to get through in the face of every obstacle as the wonderful increase in power. From the six horsepower car of five years ago we now have the sixty of to-day, intended for the same purpose—touring—and that much better fitted to accomplish its task.

As the result of this there will probably come to be established within the course of the next year or so three to four distinct types of cars, rated according to their power. From twenty to thirty horsepower will be the general utility car, suitable for everything except the heaviest touring, from thirty-five to fifty horsepower, a car adapted to meet the most trying requirements of the latter service, and sixty horsepower for those who wish a large additional reserve, both of the latter, of course, having all the advantages of the first and more general type. An increase over this will be the exception, racing cars excluded, and doubtless with the constantly increasing efficiency of the motor, it will never be found advisable to go beyond these figures for the purposes in question.

Significance of Speed Records.

The usually sane New York Times, which, however, "throws a fit" whenever an automobile record is broken and hugs itself for joy whenever a repressive law is introduced, had two successive spasms on Wednesday. The crop of records on the Florida beach was directly responsible for the convulsions. The Times cannot see that any earthly good is served or can come of such performances, or of cars capable of them. It may be pardoned for not knowing that most of the cars are incapable of practical use on the common roads, even if their owners so willed, but even a frothing motorphobe ought to be able to discern that the vehicle or engine capable of ninety or a hundred or more miles an hour on a road points the way to such an annihilation of time and distance on rails as to on occasion permit even an editor of the Times to eat breakfast in New York, lunch in Buffalo and dinner in Chicago; it points the way to cut days off of railroad travel between the Atlantic and the Pacific. It points the way to real rapid transit and to at least a partial revolution of passenger travel that will make Boston and Philadelphia mere suburbs of New York. As a man who must have frothed when trolleys and bicycles appeared, the Times may not be able to distinguish such promise, but that is the Times's misfortune.

If the subject is settled on its merits, the bill now pending in the Massachusetts Legislature requiring all vehicles to carry lights after dark should pass without a dissenting voice. It is in the fullest sense what its title implies, "An act providing for the safety of those using the highways." The great trouble in such matters is that a considerable part of the populace is always ready to promote such safety provided it does not mean any expense or inconvenience to them. They are willing and anxious for the "other fellow" to carry the safety promoting devices. But if a lamp is a good thing on an automobile—and there is no room for argument on the point—it is just as good on all other vehicles, not only in Massachusetts, but in all other States. It would seem that drivers of all sorts, as a means of self-protection, should carry them, even without requirement of law.

COMING EVENTS.

Feb. 4-11—Chicago, National Show, Coliseum.

Feb. 13-18—Detroit, Automobile Show.

Feb. 20-25—Cleveland, Automobile Show, Gray's Armory.

March 6-11—Buffalo, Automobile Show, Convention Hall.

March 13-18—Boston, Automobile Show, Mechanics' Hall.

March 13-18—Boston, Importers' Show, Symphony Hall.

March 27-April 5—Washington, Automobile Show.

The Motor Age is proud. It says it was the first publication containing a "show report" and a report of the N. A. A. M. meeting to put in an appearance at Madison Square Garden. It is really too bad that the N. A. A. M. held a meeting. Otherwise the Motor Age, with its "show report," might just as well have appeared the evening the show opened. It served as a splendid example of newspaper "enterprise," i. e., of how an affair can be "reported," that is, put into type—weeks before it actually occurs.

The fact that out of a very much larger total, fully 80 per cent of the cars exhibited at Paris were equipped with magneto ignition, principally high tension, as against 10 to 15 per cent of those at the New York show, is a recommendation not to be lightly disregarded, as during the years in which the American maker was belittling the advantages of the alternator, his foreign competitors were trying it out, so that the result really represents three years of ripe experience.

The Southern express trains must be flyers indeed! The New Orleans Item, in rebuking scorching automobilists, takes occasion to remark that "twenty miles an hour is as fast as the average express train goes." It is also pointed out that streetcars in the Southern metropolis are limited to six miles an hour.

INDIANA SIFTS ITS BILLS

The Radical Measures Eliminated and a Fairly Reasonable Law is in Sight.

Efforts on the part of six Indiana State Senators to endear themselves to the hearts of their rural constituents by introducing automobile restriction bills seem to have been of no avail, one bill alone having survived. The collection of bills was referred to the Committee on Roads, and the general house-cleaning methods resorted to resulted in what the committee deemed the "survival of the fittest."

Senator Crumpacker's bill, calendered as Senate bill No. 8, was the only one to survive the diligence of the committee, the other measures suffering an ignominious "smothering." Senate bill No. 8 is a medium between the more drastic measures introduced and the milder ones, and is said to have the indorsement of Indiana automobile clubs generally. The bill stipulates that no vehicle with motor power shall be run at a rate of speed greater than is "reasonable and proper," having regard to the use in common of the highway or public place, nor shall it be run so as to endanger the life or limbs of any person. Specifically, the speed limit of eight miles an hour is given for the business section of a city or town; fifteen miles for other parts of a municipality, and twenty miles on country roads. These rates of speed are not to be diminished or prohibited by any public authorities of any city, town or township.

Senator Moore, of Putnam County, who, by the way, had a little bill of his own drafting, and which he cherished a fond desire to have passed, made a strenuous effort to have the speed limit fixed at five, eight and fifteen miles instead of the original provision of eight, fifteen and twenty. The recommendation of the ambitious amending Senator brought down a fierce storm of protest, and the amendment was not added, to the Senator's chagrin.

Another clause of the Crumpacker bill specifies that upon signal from a person riding or driving a horse which has become frightened, any motor vehicle must stop at the signal of a raised hand, and must remain at a standstill until the horse is under control. If necessary to quiet the horse, the motor must be stopped. A white light in front and a red light behind the automobile are required from one hour after sunset to one hour before sunrise. A car must be equipped with brakes, bell or horn, of course. The only important amendment to the original bill relates to registration. Every automobile must be licensed by the Secretary of State, who shall issue numbers, not less than five inches high, which must be displayed at all times. The registration fee is $1.

The House Committee on Roads, not to be outdone by the Senate committee, has reported a bill of which Assemblyman Yencer is the sponsor. With the exception of the penalty clause, the bill is essentially the same as the Crumpacker measure. In Yencer's bill the penalties fixed are $25 for the first violation of any provision, $25 to $100 for the second offence, and $100 to $500 for the third.

Both bills will be reported this week.

Reason Prevails in Tennessee, too.

As was predicted in the last issue of the Motor World, Senator J. R. Jetton's bill to require each automobilist in the State of Tennessee to furnish a bond of $3,000 to defray damages in case of an accident, was promptly turned down by the committee to which it was referred, and the gentleman from Rutherford County has received such a shock that he will probably never introduce another bill of any description, for fear it will meet a like fate.

Another measure was introduced by Assemblyman Stratton, and it has been recommended for passage by the committee after indorsement by leading automobilists of Tennessee. The present bill, which will undoubtedly become a law, indicates its maker to be a fairminded individual, and that is more than can be said of Senator Jetton.

The new bill requires owners to register them with the Secretary of State, paying $2 and receiving a number and certificate, which must be registered within five days in the owner's county. Speed is limited to twenty miles an hour in the country and ten in the cities, but physicians in the discharge of their professional duties are excepted from this speed limit. Machines must be slowed down on approaching horse-drawn vehicles or persons on horseback, and when signalled by the driver or rider shall stop long enough to give the vehicle opportunity to pass.

Kansas Contributes a Bill.

"All automobiles must carry a bell or horn that can be heard a quarter of a mile, a light which can be seen half a mile, and a system of brakes which can bring the machine to a stop within 100 feet." This is the unique portion of an automobile law that is pending before the Kansas Legislature. Automobilists are laughing at this clause, but another portion of the bill that is not likely to give cause to any risibilities is the portion devoted to speed regulations. It prohibits travelling on any highway in the State at a speed greater than 12 miles an hour. When passing another vehicle the speed must be reduced to 4 miles an hour. Four miles an hour is also the maximum speed for all grade crossings.

Lamp Law Hearing on Monday.

The public hearing on the bill requiring all vehicles, save farm and merchandise wagons, to display front and rear lights, which is now pending in the Massachusetts Legislature, has been fixed for Monday next, 9th inst., at 10:30 a. m. It occurs, of course, in the State House in Boston, in Room 426, to be exact.

WANTS 20-MILE CARS ONLY

New Jersey Legislator Obtains Some Notoriety by Following the Ex-Governor's Suggestion.

Although it was not accepted seriously, apparently to conciliate former Governor Murphy of New Jersey and in line with his recommendations, Assemblyman Gibbs, of Camden, has introduced a bill into the State legislature designed to prevent the use of automobiles capable of a greater rate of speed than twenty miles an hour.

It provides that licenses be issued only to cars incapable of exceeding that speed limit, which, of course, means all cars. Any violation of the regulation is made a misdemeanor, punishable by a fine of $50 or ten days, or, like the signs on expectorating in trolley cars, with "both," at the discretion of the magistrate.

Whether as a joker or for serious purposes, the bill has been referred to the Committee on Agriculture, who, it is stated, will probably bury it for the session.

There is a general sentiment against the adoption of so drastic a measure, in spite of the fact that the bill is less stringent as regards punishment than the proposal of former Governor Murphy in his last message. He desired that the use of automobiles with a speed capacity of more than twenty miles an hour be punished by imprisonment for thirty days for each and every offence, without the option of a fine. It was Murphy's idea that a low gear is all that is necessary to make such a law practicable.

Connecticut to Increase Speed.

In the Connecticut Legislature, Mr. Smith, of Hartford, has introduced a bill increasing the present speed limits from 12 to 15 miles per hour in cities and boroughs, and from 15 to 20 miles outside thereof. In addition to the $200 fine or thirty days imprisonment now provided for, Mr. Smith would have forfeiture of license follow three convictions. Mr. Fosdick, of Lyn, also has introduced a bill which increases the speed limit to 20 miles in the country, but retains the 12 miles in cities' clause.

Saxe Supports the West Enders.

The eminently respectable West End Improvement Association of New York, or, at any rate, the professional reformers in the organization, are on the road to happiness. Senator Saxe has introduced into the legislature their measure permitting magistrates to impose a jail sentence of thirty days without the option of a fine for a first offence against the automobile law At present the limit of punishment is a fine of $100.

Congress Asked to Afford Relief.

On Monday Representative Goulden, of New York, introduced into the House of Representatives the amendment to the federal statutes fathered by the Automobile Club of America, which is designed to permit automobiles to go on and off ferry boats under their own power; it requires merely that there shall be no fires in such cars while the boat is in motion.

Many Sensations Mark Florida Carnival

Marvelous Flights of Speed Shatter the Record Table, but Frost, Real and Figurative, Nips the Function—Disregard of Tides for the Sake of Hotel Keepers at the Bottom of Trouble.

Daytona, Jan. 27.—"Queered," that expressive vernacular, best sums up the Florida speed carnival during the week just ending. It is almost correct to say "ended," is there may be no racing to-morrow, the big one-hundred-mile race for the W. K. Vanderbilt, Jr., trophy, one of the star events that all who came wished to see, having been held over until Monday—or later, the time of its running seemingly dependent on the vagaries of winds and tides and the latest moment it is possible to hold the crowd, many of whom, however, are already taking their departure.

The past week has more than borne out what the Motor World alone has had the courage to point out from the beginning, that the "carnival," as now run, is merely or too largely a "hotel annex," the game being to attract the highly desirable automobile crowds to Ormond when boarders are comparatively few, and before the season has fairly opened, precisely the same as it was to bring them to Mt. Washington in the hotels in which the same men are interested when the season is ending, and between times sandwich them into the same controlled New York hotel.

Successful heretofore, the scheme this time has been somewhat overdone, the object so apparent that even the eyes of the easy-going automobilists have been opened wide, and "hotel keeper's game" has been about the mildest characterization heard about the corridors of the hotels or among the shivering occupants of the stands and along the wind-swept beach.

But out of the fiasco just drawing to a close good may come in the shape of a reconstructed Ormond-Daytona carnival, run by a set of capable officials who have no hotel or other private interests to serve, and to whom the promotion of a speed carnival will be, as it ought to be, purely and simply in the interests of a grand sport and held at the time best suited for that sport, and not at the time best suited for private and already plethoric pocketbooks.

To those in the know, who stood and shivered the past week, the query often heard issuing from the chattering lips of the uninitiated as to why the meet was not held a few weeks later, provoked smiles of pity—or derision. Even the racing officials and press men, those hardy, cheery souls who travelled up the long beach in the teeth of the icy winds at 6:30 in the morning, only to find that "conditions rendered the running of the scheduled events impossible until afternoon," voiced their feelings in that lusty chorus:

"Who brought us here?"

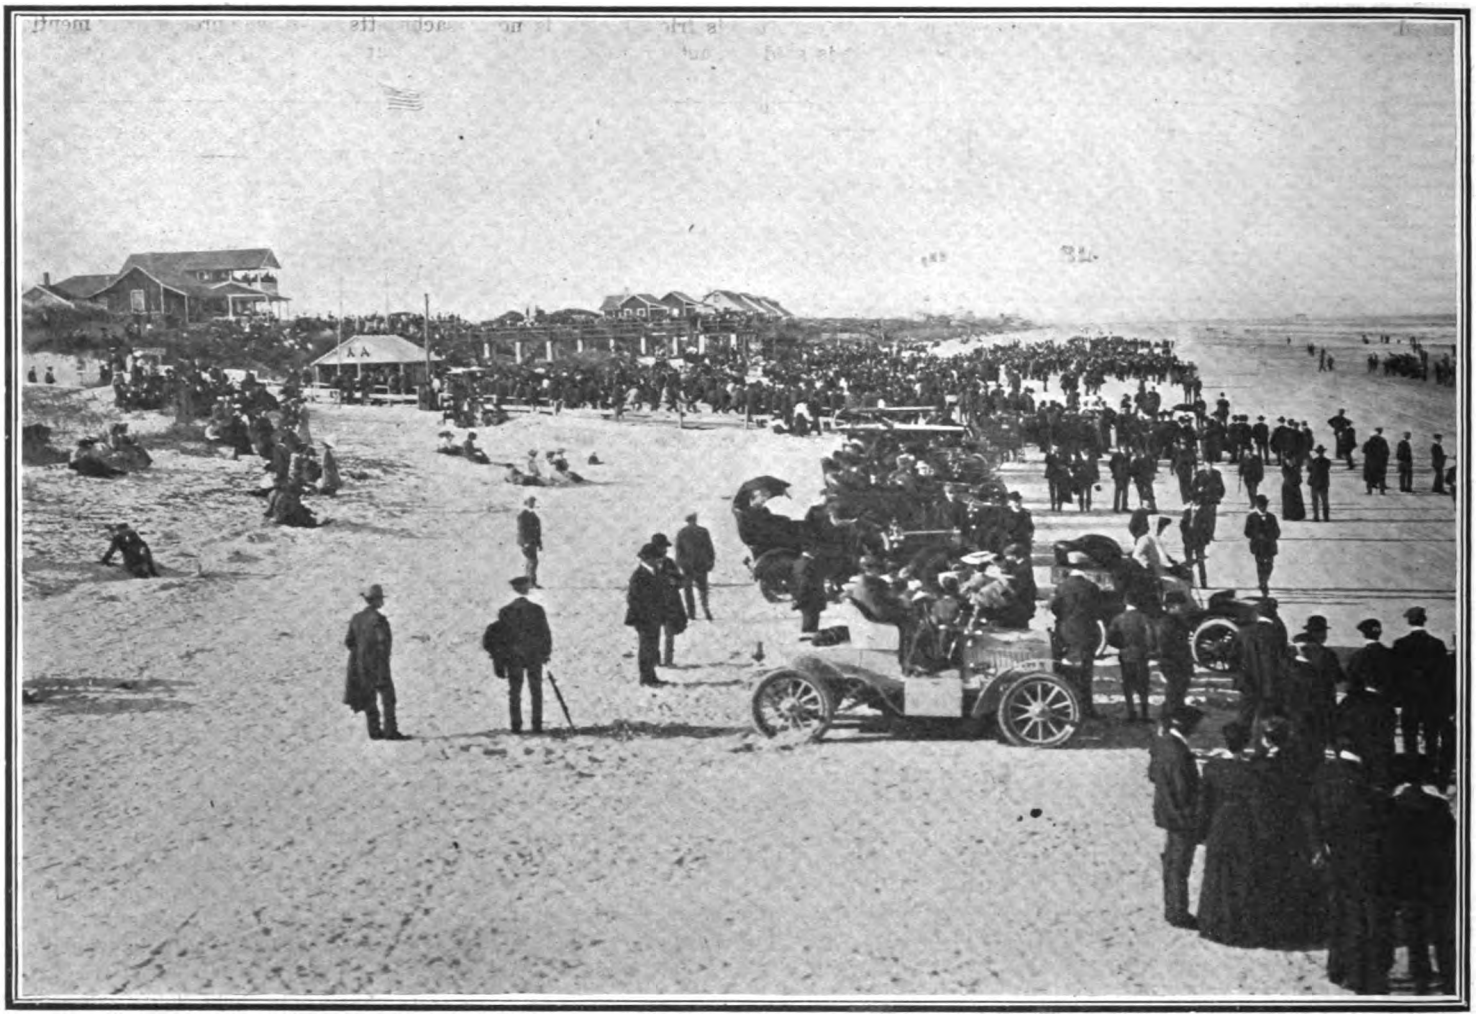
"Morgan."

"What are we?"

"S U C K E R S!'

"Bum-ta-ra-rum-bum-bum!"

Though given good-naturedly, this oft repeated cry had more than a grain of truth in it.



And the pity of it all! That the magnificent course, without doubt the finest speeding ground in the world, was not used at a season when the Florida days are at their best and during a week when favoring tides permitted the races to commence late in the morning or in the early hours of the afternoon, was a thought uppermost in all "hotel-disinterested" ones present.

To the newspaper men and representatives of other journals, who, to use a vulgarism, "pushed" the Ormond game, too much blame should not be given. They were merely carrying out their end of a bargain. They and their wives were fed and lodged free gratis by the generous Ormond hotels, and—what else could they be expected to do?

As the week dragged by and the temper of the majority crystallized into a sentiment of indignation against the lack of management, with suggestions as to the conduct of future meetings, the present promoters, foxy as they are, decided to forestall any action by hastily calling a meeting of themselves, a few stray newspaper men, photographers and others "interested." The necessity of organizing was dwelt upon, after which a resolution was sprung by S. A. Miles, calling for the election of a committee of nine (five to be residents of Ormond) to name a board of directors, nominate officers, arrange for membership, and a general meeting to be held not later than February, 1906. This was adopted, the nine chosen being James Carnell, John H. Price, J. A. Bostrom, Dr. William Miller and W. S. Kenny, of Ormond, and W. J. Morgan, S. A. Miles, Frank X. Mudd and H. L. Bowden. That the "Ormond Racing Association," as the body chose to call themselves, intend to take care of the hotel end of the game was proved by the selection as president of John D. Price, of Anderson & Price, proprietors of the Ormond Hotel; W. S. Kenny, secretary, and W. J. Morgan, general manager.

It was afterwards reported that H. L. Bowden had disclaimed any connection with the movement, stating that he was not present, that his sympathies were entirely with

GENERAL VIEW OF BEACH AND SPECTATORS AT DAYTONA END.

the A. A. A., and that his name had been used without his knowledge or permission. It was subsequently developed that the plans of the "organization" reached beyond attempting to control the Ormond meeting, embracing in scope the creation of a race circuit in the North under rules other than the A. A. A., presumably under the auspices of an organization composed chiefly of persons who do not own automobiles, and with which the new "organization" is closely associated. One of the wild rumors growing out of the rumpus had it that the Ormond Hotel Racing Association, as the new body was promptly dubbed, would form an alliance with the A. L. A. M. This, of course, is wholly improbable, but shows a state of mind existing.

While all this was going on, still another racing club was formed, announced as friendly to the Florida East Coast Automobile Racing Association, and to be called the Sea Breeze Racing Association. From the name selected, it is probable this last body will represent the claims of the Sea Breeze and Daytona people, which have so far been denied recognition, though they are really nearer the best parts of the course, their claims being drowned in the noise of the professional and newspaper tom-tom beating for Ormond.

The Sea Breeze Association played a good card by voting that they recognize only the A. A. A. as in control of the sport. The officers elected were: R. J. Allen, president; John Van Nostrand, vice-president; C. E. Langley, secretary; Ray Turner, treasurer, and A. T. Post, S. B. Stevens, A. W. Church, E. S. Partridge and C. H. Fuller, directors.

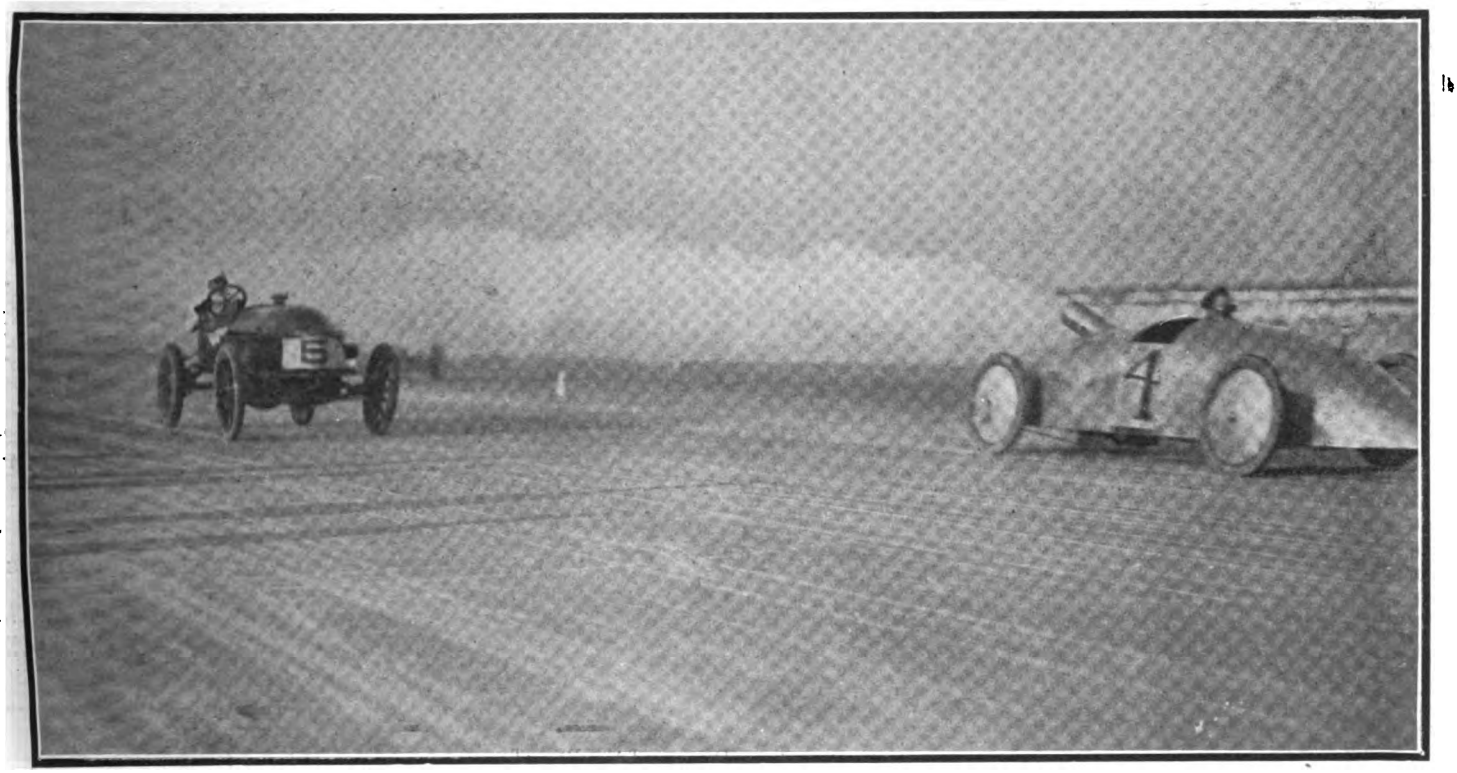
Despite the amount of organizing going on, inquiry among the real racing car owners and those who have the true interests of the sport at heart developed a strong feeling of loyalty to the A. A. A. as the controlling body.

This feeling found utterance in a breakfast given by W. C. Temple, chairman of the A. A. A., and was voiced by E. R. Thomas, William Wallace, H. L. Bowden, E. M. Steca, James L. Breese, Walter Christie and others.

The suggestion was made that in future the A. A. A., acting for the Florida E. C. A. R. A., receive all entries, arrange the programme of events, and set the date of the meet, in this last being assisted by the local club (the F. E. C. A. R. A.), which could be drawn upon for precise information with regard to time of tides, etc. A further suggestion was put forward that all events for stock cars, or anything but stripped or racing cars, be eliminated; that the schedule consist of three classes (A, B, C), of four events each, viz., kilometre, mile, five miles and ten miles. This, it was contended, was programme enough, that such a schedule could be run off promptly and on time, and that visitors come to the races to see racing cars, and not touring cars, the latter a sight familiar anywhere. This suggestion has many strong advocates, among them W. C. Temple, who is heartily in favor of it.

Another subject attracting comment of any but a favorable kind, and which is due to receive attention in the near future, was the palpable attempt to secure cheap advertising by the donating of cups by the agents of a particular car, open only to cars of that brand. Not a vestige of sportsmanship appears in it, and it was commented upon as strongly savoring of the methods of Baxter street.

In refreshing contrast was the Lozier trophy, offered for fifty miles and open to all cars of American manufacture. It seems probable that the plan of requiring prospective donors to submit the proposed conditions to the racing committee of the governing body will be followed, their decision to be final, for cups not accepted by them to be denied recognition, and anyone competing for them disqualified. This is, in substance,



Digitized by Google

following the stand taken by the Automobile Club of France, when a commission is appointed to whom all proffered trophies are referred.

The general situation was intensified to-night, when it became known that President Harlan W. Whipple, W. C. Temple, chairman of the racing committee, and Directors William Wallace, W. K. Vanderbilt, Jr., and H. L. Bowden had all resigned.

Mr. Whipple, it is known, was not anxious for the re-election accorded him this year, and it cannot be said that his resignation is an entire surprise to his friends. He is not well, and it is said his action is due chiefly to a threatened attack of nervous prostration, coupled, doubtless, with the state of affairs that has existed here. Mr. Temple resigned in order that Mr. Whipple's successor might have a free rein. It is too early to guess who will succeed Whipple, but it is known that previous to the recent annual election Eliot C. Lee, president of the Massachusetts A. C., was prominently mentioned, and that he would prove a splendid man for the office is not to be doubted. Regarding the chairmanship of the racing committee, an observant individual remarked only yesterday that A. L. Riker is the sort of "timber" the A. A. A. should seek to make the most of.

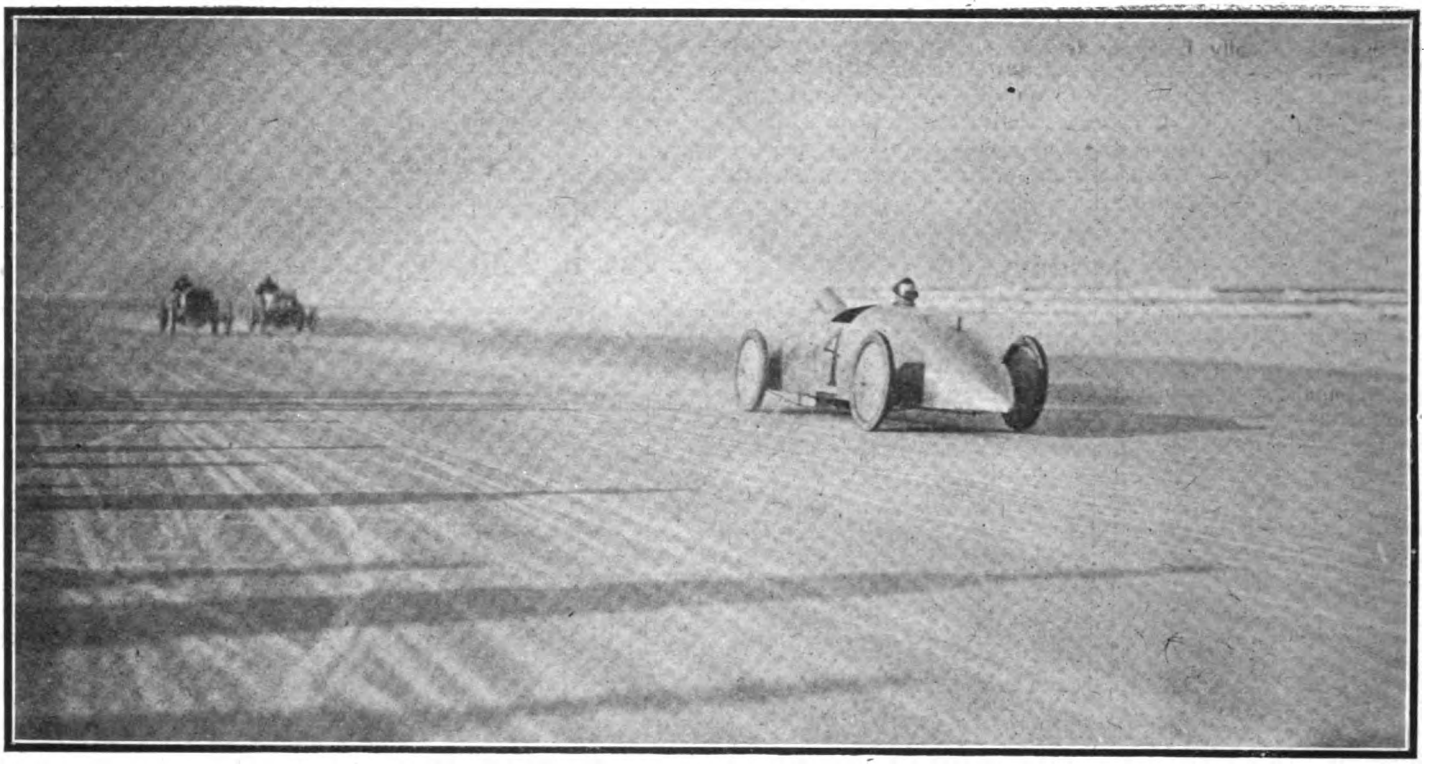
January 26th, the Day of Ross's Solitary Defeat.

McDONALD OVERHAULING ROSS IN THE RACE FOR THE BOWDEN TROPHY—THE ONLY EVENT IN WHICH THE AMERICAN WAS DEFEATED.

Daytona, Jan. 26.—To-day proved another field day for Louis Ross and his little teakettle steamer, the combination annexing three victories, one second and in the final for the Corinthian Cup and the mile open for Class A cars travelling the route in 41 3-5 seconds.

Ross's only defeat was in the final for the Bowden trophy at one kilometre, when A. C. MacDonald, in his 90 horsepower Napier, took him into camp by a few yards, though to do it he had to break the coasting competition record for the distance, setting up the new figures of 27 3-5 seconds. Even at that, there were heard many expressions favoring the running over of the event on the ground that Ross had been crowded, but the Newton man declined to protest, accepting his solitary defeat with placidity, and afterward, when questioned, shrugging his shoulders and smilingly remarking that he preferred to say nothing. This race furnished one of the most exciting finishes ever seen anywhere. There were four starters, Ross, MacDonald in the Napier, William Wallace in the 90 horsepower F. I. A. T. and S. B. Stevens in his 90 horsepower Mercedes. The men got off well together, the Napier slightly leading at the 100-yard mark. Ross then went to the front, and led until about 200 yards from the finish, when the Napier came up with a tremendous burst of speed, front wheels quivering like a butterfly in flight, flashed by the scurrying steamer, which was far to the outside of the course, and seemed to swerve for a brief fraction of a second, then MacDonald thundered over the line a winner in the record breaking flight of 27 3-5 seconds.

The feature of to-day; in fact, the chief feature of the carnival so far, has been the struggles between Ross and MacDonald. Every time they met it has been a battle royal, and, though the steamer has been the victor in every race except the one just described, each time the thundering green monster has been hard at its heels, like a grim British bulldog, refusing to be shaken off and relentlessly pursuing its fast flying prey.



Aside from Ross and his steamer, the honors of the meet so far—and they are not likely to be snatched from him—fall to the nervy MacDonald and his speedy car. With the official mile record of 34 4-5 to his credit, coupled with his annexing of the kilometre competitive record to-day, his uniformly close finishes in every event the plucky Scotchman has proved himself a star of the first magnitude.

W. K. Vanderbilt, Jr., again disappointed to-day by his poor showing, finishing third in the first heat of the kilometre race for the Bowden trophy, second in the first heat of the kilometre event for cars weighing from 1,432 to 2,204 pounds, while in the final of this event he stripped his fourth speed gear and retired. Previously in the kilometre time trials the best he could do was 28 3-5 seconds.

His lack of success has been ascribed to many reasons, some contending that he was carrying too large a sprocket, but, with Mr. Vanderbilt's racing experience and knowledge of automobiles, this view is hardly tenable.

Others have it that the Croker accident made him disinclined to figure too prominently in this year's programme, while still another opinion is that his machine was simply not fast enough, and that he did with it all that it could do. His showing seems inexplicable in the light of the fact that on Tuesday Mr. H. L. Bowden openly predicted

Digitized by Google

ROSS SPREADEAGLING THE FIELD IN THE FINAL OF THE KILOMETRE RACE.

that Mr. Vanderbilt would again sweep the boards and set up new records that would make the old ones look "like a bad thirty cents." However it may be, to-night Mr. Vanderbilt hied himself to Palm Beach, and this week's events will know him no more.

Among the developments of the day was the announcement made to-night by Mrs. Howard Gould that it was her intention to offer for next year a $10,000 cup for a 100-mile race, open only for gentlemen drivers and for machines that are adaptable for touring purposes.

This is chiefly interesting as voicing the feeling of resentment and disgust among the foreign machine contingent over the victories of the Ross "freak" steamer, which, they angrily declare, should be barred from participating or thrown into the sea.

That the victories of the little American steamer have caused much resentment to a certain class there is no room for doubt.

Still another sample of blundering management occurred first thing this morning. The day's events were scheduled to start at 7 o'clock, and once again the shivering officials assembled, three competitors, among them Mr. Vanderbilt, showing up, only to find what ought to have been known, that the tide was unfavorable, and so the races were again called off until the afternoon.

Last night was said to be the coldest here for ten years. Fires were lighted under the orange trees, and the visitors from the North were booming New York and a steam heated flat as the only real summer resort. It was so cold that the water in the radiators of several machines froze, and to those who trudged or rode to the beach in the icy blasts of the morning the folly of trying to hold the meet at this season of the year was vividly apparent.

At 2:30 in the afternoon, the time at which the races were again called, the tide was still high, and the wind blew acros the sandy waste in chilling blasts. Another long delay for "more favorable conditions."

Interest was centred in the kilometre record trials, the fastest time of which was made by MacDonald and his Napier in 23 seconds flat. Considering conditions, the beach in bad state, with many ridges, this time compares favorably with the record of 21 2-5 seconds made by Baras at Ostend, Belgium, with a gale of wind of fifty miles an hour at his back. There was general disappointment when it became known that the Ford racer, which was known to be very fast, and which, it was expected, would try for the kilometre record, had sustained an accident and would not appear.

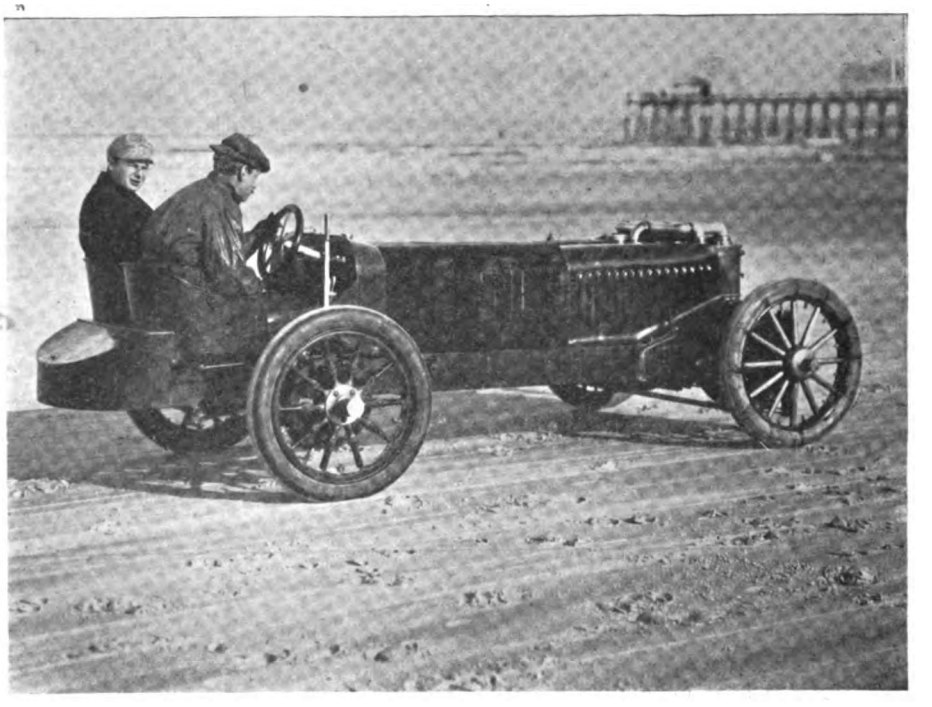
CHRISTIE WINS AT LAST

His Perseverance Finally Earns its Reward in a Race Replete with Mishaps.

Daytona, Jan. 27.—When the bulletin was posted last night, and it was seen that the day's events were again scheduled to start at 7 o'clock this morning, the universal comment was either "they won't catch me again," from those who had gotten up in the "cold gray dawn" of yesterday only to have their trouble for their pains, or "not for mine," from the remainder who had learned from others.

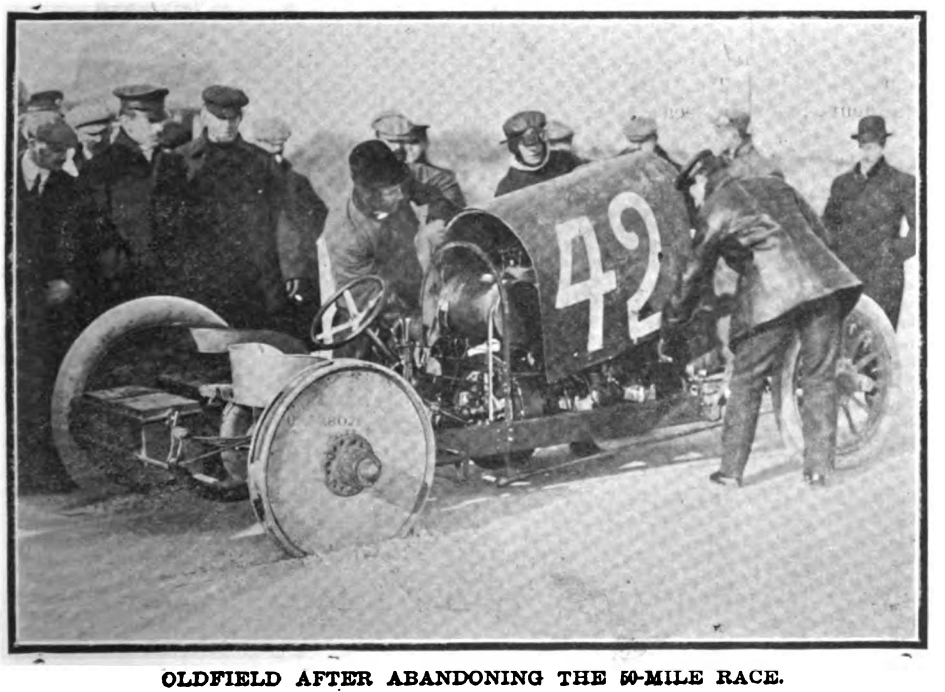
The consequence was that when the fifty-mile race for the Lozier trophy, open to all American cars, was called, there was scant attendance. Three contenders, Walter Christie, in his 60 H. P. direct drive car of his own manufacture; Barney Oldfield, in the 60 H. P. Peerless Green Dragon, and A. C. Webb, in the 75 H. P. Pope-Toledo, lined up. The course was twelve and one-half miles in length, between the sixteen-mile post at Ormond and the three-mile post south of Daytona, the beach in no condition, or in such condition that the last five miles were practically run in the surf and wet sand. The cars started at Ormond and had the turns to make, controls of two minutes being established.

Oldfield, who was first to get away, turned at the wrong mark ten miles out, came back, was restarted and then wrenched a tire off one of the forward wheels after completing his first circuit, continued for about three miles and then withdrew.



Webb, after going to the ten-mile post in the lead, got into a gully, broke a commutator spring and he was out of it.

Christie, on the first round, broke a terminal, could not locate it for some time, then when he did repair it, it short-circuited, necessitating another delay, the total of which was thirty-three minutes. However, he kept on and was the only one to finish. His time was 1 hour 11 minutes 20 1-5 seconds, the first 25 miles being done in 50 minutes 34 seconds elapsed time, and the second 25 miles in 26 minutes 28 2-5 seconds elapsed time. The total of six minutes spent at controls was deducted.



After this "race" further events were postponed until 2:30 p. m. At that hour the waves were lashing the lumpy and dangerous course with wild fury, the day bleak and drear as a day in December, and the sun, shining fitfully one minute, was obscured the next, and matters were at a standstill, the crowd, such as were fortunate enough to hold tickets or who had nerve enough to go in on their face, piling into the clubhouse, while the less fortunate spectators lighted fires along the shores in their effort to keep warm.

The afternoon dragged along, and the monotony of the hours was relieved only when the agent of one and the owner of another imported car got into a wrangle, and their chauffeurs drove an impromptu race for what was announced as a bet for about a million dollars a side—or something like it.

Thus ended the chapter of unlucky Friday, and the announcement was made that the hundred-mile race for the W. K. Vanderbilt, Jr., trophy would be held over until Monday.

The Chicago Automobile Club should certainly bestow a medal or other suitable token of appreciation to Vehicle Inspector Patrick Ward, of that city, and his portrait should be hung in the Hall of Fame. From the City Hall last week came a word of defense for the much abused automobilist.

"An investigation of all recent complaints," said Inspector Ward, "has shown that the automobile is more often sinned again than sinning. In nine cases out of ten examination has shown that, instead of the automobile running down a vehicle while going at top speed, the vehicle has in reality run down the automobile. Most complainants believe any one who owns an automobile must be well provided with this world's goods, and consequently well able to pay any damage claim that is presented, no matter who is at fault."

THOMAS TAKES A RECORD

New York Banker Proves Himself a Fearless Driver—Two Races Run for Advertising Only.

Daytona, Jan. 28.—To the general surprise racing was resumed this morning at about 8 o'clock, the first event being the ten-mile race restricted to German cars, for a trophy offered by the American agents.

The result was a splendid record-breaking performance by E. R. Thomas, who fairly ran away from his field, covering the ten miles in 6 minutes 31 4-5 seconds, a cut of 18 1-5 seconds from the mark of 6:50, established by W. K. Vanderbilt, Jr., last year. In this race Mr. Thomas proved his right to class with drivers of the first rank. His brilliant performances of the week are all the more remarkable when it is considered that they were his first appearances in public, and that they far excelled anything done by his professional chauffeur.

In the line-up four contenders appeared. They were E. R. Thomas, in his 90 H. P.; E. Frederick, in B. M. Shanley's 90 H. P. (the machine which, then owned and driven by W. K. Vanderbilt, Jr., made the record of 6 minutes 50 seconds last year); J. L. Breese, in his 35 H. P., and S. B. Stevens, in his 90 H. P.

The course was in the best condition it has been during the meet, and the sun fairly warm, tempered the morning air to a comfortable degree. The course was from Ormond to Daytona, and the wind, a moderate breeze, was from the northeast.

Jumping away at the pistol shot, Mr. Thomas directed his huge catapult in a course skirting the water's edge, where he seemed to fairly skim along the shore, accelerating every second, flew by the Clarendon Hotel like a flash, and was across the tape at the finish like a whirlwind.

Even before the time was announced it was known that the old record had gone by the board, and when the figures were given, loud were the praises accorded "the human telegraph pole," as the lengthy driver has been called.

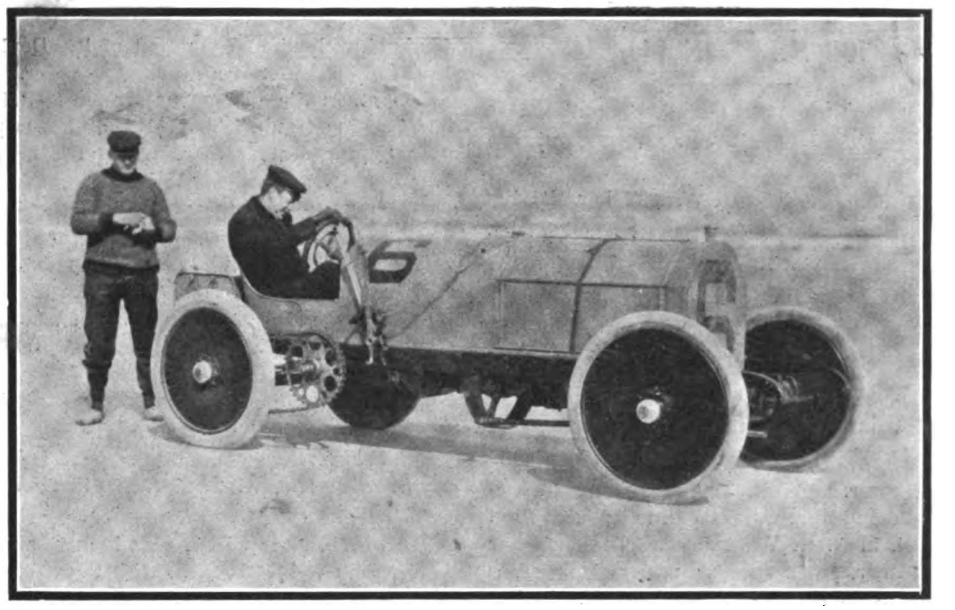
One minute twelve and two-fifths seconds later the Shanley machine crossed the line, the time—7:44 1-5—being nearly a minute slower than Vanderbilt got out of the same car last year.

Breese came trailing across the line about two miles behind the second car, while Stevens developed an overheated cylinder and did not finish.

The next race was of the same kind, ten miles, for Italian cars only, for a trophy offered by the American agents.

Alfred G. Vanderbilt's, much raced but yet-to-win, 90 H. P., with Sartori driving, and William Wallace, with his 90 H. P., the only two racing cars of the kind in this vicinity, and perforce the only two entries, appeared.

Wallace won by a mile, in 6:54 2-5.



Evidently realizing at last that time and tide wait for no man, it was decided to take advantage of the previling favorable conditions, and three heats of the Ormond Derby were run off before the oncoming waters claimed their own.

In the first heat A. C. MacDonald won with ridiculous ease, in 7 minutes 6 seconds; C. Duplus, in an 80 H. P. Belgian machine, second, in 7:40 3-5; Bernin, in W. Gould Brokaw's 60 H. P. Renault, third, in 7:59 2-5.

Second heat—E. R. Thomas's 90 H. P. Mercedes, first, in 7:10 3-5. E. Fredericks, in the Shanley 90 H. P. Mercedes, was distanced.

Third heat—Won by J. L. Breese, in his 35 H. P. Mercedes, in 10:29 2-5. Wallace, in his 90 H. P. Italian machine, did not finish.

Though racing was expected to be resumed at 4 o'clock, the narrow beach made it impossible, and a big Jacksonville excursion crowd, which had come over for the events of the afternoon, had to go back home disappointed—unless they preferred to put up at the Ormond hotels until Monday, when the Vanderbilt 100-mile race is announced.

100 MILES IN 1:18:24

Fletcher's Phenomenal Flight on Florida Beach —Averages 76 1-2 Miles per Hour.

Daytona, Jan. 30.—H. W. Fletcher, driving O. F. Thomas's 80 horsepower De Dietrich car, to-day won the 100-mile race for the W. K. Vanderbilt, jr., trophy, doing the distance in the remarkable time of 1:18:24, smashing to smithereens the former record of 5:52:09, made three years ago by Em. Voight, on Long Island.

M. G. Bernin, in W. Gould Brokaw's 60 horsepower Renault, 3 minutes and 14 seconds behind him, was second in 1:21:38; Paul Sartori, in A. G. Vanderbilt's 90 horsepower Italian car, but a fraction under six seconds behind, was third, in 1:21:44 4-5; E. Fredericks, in B. M. Shanley's Mercedes, was fourth, in 1:24:28 4-5; Walter Christie, driving his 60 horsepower Christie racer, and the only American car in the race, finished fifth, in 1:27:16 4-5, and William Wallon, in his 90 horsepower Italian machine, was the last of the survivors, in 1:29:20.

There were ten starters in all, including, besides the six survivors, A. C. MacDonald, in his 90 horsepower Napier; C. Duplus, in an 80 horsepower Pipe; S. B. Stevens, in his 90 horsepower Mercedes, and C. Canaut, in a 45 horsepower De Dietrich.

The winner was obliged to make seven turns, and, despite the time lost, made the remarkable average speed of practically 47 seconds to the mile for the entire distance.

The result of the race was a big surprise. It had been confidently expected that it would fall to MacDonald and his Napier, a big favorite, but, despite the fact that the clever Scotch driver made the best time for the first four miles, doing them in 3:42 2-5, he developed ignition troubles before sixteen miles had been covered, losing twenty minutes or more in this way, and though he made up all this and more, running second at fifty miles, he shortly afterward sustained a punctured tire, which put him out of the running for good.

S. B. Stevens got an overheated engine, due to faulty radiation, and was obliged to stop for half an hour and was out of it. Deplus, in the Pipe, suffered a cracked cylinder.

Canaut, in the 45 horsepower De Dietrich, had ingition troubles in plenty, and was not seen by the scorers after about the seventeenth mile.

The finishes, as will be seen by the score, were remarkably close. Fletcher, the winner, won by truly blind, daredevil driving, rushing headlong around the turns and thinking only of overtaking the men who had started ahead of him, regardless of possible consequences.

The start was made at 9:53, at the six-mile post, the course being from the two-mile post, below Daytona, to the sixteen-mile post, at Ormond, with the finish in front of the clubhouse.

The beach, as a whole, was in better condition than it has been at any time during the meet, the only bad places being a few soft spots at the Ormond end.

The weather was wellnigh perfect, the air balmy and springlike, while a gentle breeze just combed the tops of the waves with a light touch.

The event, considered from a spectator's point of view by long odds the most interesting of the speed carnival, was witnessed by the smallest crowd yet seen, the majority of the visitors, tired of long delays and postponements, having already taken their departure. But those who could stay were rewarded by seeing the fastest machines in the world, turning and returning at full speeds, and this prospect sent pleasurable thrills of anticipation coursing up and down many spines.

As is known, considerable pressure was brought to bear on the donor of the cup to neutralize the turns, but this he firmly declined to do, maintaining, and rightly, that his trophy was for a race of one hundred miles, not for ten or fifteen mile spurts up and down the beach. Happily the contest was without personal accidents of any kind. Of the contestants, Fletcher and Fredericks seemed to get around the turns quickest, while Wallace made the shortest swing.

Two other races were run off to-day. E. R. Thomas won the final for the Brokaw trophy, while Sartori won a handicap race of five miles, Mr. Thomas making a good run for second from scratch. The summaries:

FIVE-MILE OPEN—FOR BROKAW TROPHY.

First Heat.

E. R. Thomas, 90 h. p. Mercedes..... 1
William Wallace, 90 h. p. F. I. A. T 2

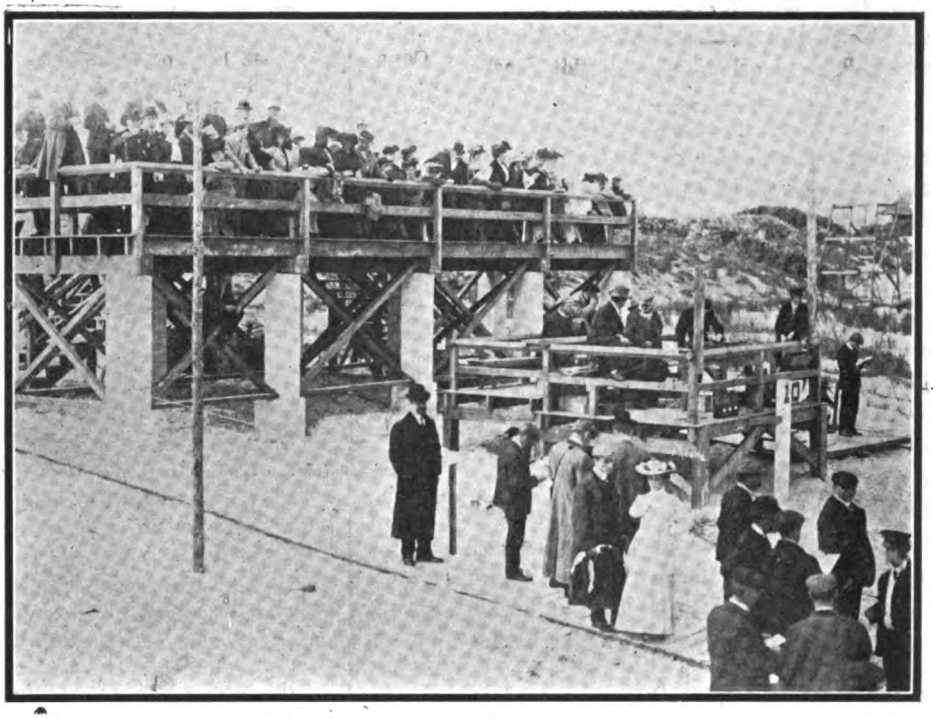
RECORD-BREAKING WIND-UP

New Figures Created in Five of Seven Events —Bowden Goes a Mile in 32 4.5 s.

Daytona, Jan. 31.—Only the enthusiastically faithful and those whose duties required them to be faithful remained to witness this the "grand finale" of the speed carnival, and they were well rewarded. It was a day to be remembered. It wiped the name Vanderbilt off the record slate, although A. G. Vanderbilt's "man," Paul Sartori, finally did something to justify his wages. He plucked two of the records that fell like autumn leaves.

In five of seven events new figures were created, and one of them—a mile in 32 4-5 seconds, by H. L. Bowden, in his big 120 horsepower Mercedes—brings the mooted two miles per minute in plain sight. Of course, Bowden's car is above the regulation weight, and his time may not be generally accepted as a record, but that will scarcely minimise the merit of his almost incomprehensible flight. Think of it! One hundred and sixty feet per second—almost while the heart throbs once. It is at the rate of 109 7-10 miles per hour.



The other records established were: Ten miles, A. C. MacDonald, 90 horsepower Napier, 6 min. 15 sec.; twenty miles, A. C. MacDonald, 90 horsepower Napier, 15 min. 23 sec.; fifty miles, H. W. Fletcher, 80 horsepower De Dietrich, 38 min. 58 sec. The last three records were made in competition from standing start, and all were created on this (the Daytona) end of the beach. The course was in good condition, although not at its best, and the air was springlike.

The competitive events of the day were the fifty-mile handicap for the Burgoyne Cup, twenty-mile open for the E. R. Thomas trophy, ten-mile final for the Major C. J. S. Miller trophy and a ten-mile handicap.

The Burgoyne Cup event, at fifty miles, brought a field of eight, of whom only four finished. A. C. MacDonald's Napier retired at twenty miles with a broken gear wheel; E. R. Thomas's 90 horsepower Mercedes at thirty miles, with a broken clutch; William Wallace's 90 horsepower F. I. A. T., at forty miles, with the gasolene tank empty, and Walter Christie's 60 horsepower Christie at forty-five miles, with weak batteries.

Paul Sartori, in Alfred G. Vanderbilt's 90 horsepower F. I. A. T., with a start of 4 min. 50 sec., took the lead in the second round, and held it to the finish. The race was over a ten mile course, and for the first ten miles the best times were: MacDonald's, 7 min. 4 4-5 sec.; Thomas's', 7 min. 59 2-5 sec.; Fletcher's, 8 min. 7 4-5 sec., and Sartori's, 8 min. 16 4-5 sec.

For other intermediate distances the figures are unofficial, but they show E. R. Thomas the leader at twenty miles, in 13 min. 24 sec., and at thirty miles in 20 min. 37 sec., and Sartori the leader at forty miles in 31 min. 54 2-5 sec. Both Sartori, the winner of the race in 40 min. 20 sec., and Fletcher, who did 38 min. 58 sec., from scratch, cut under the old Vanderbilt figures of 40 min. 49 4-5 sec. Controls were established at each end of the ten-mile course, and restarts were made from a standstill.

THE GRAND STAND AND TIMERS' PLATFORM AT DAYTONA.

Of the most remarkable races of the meeting was the twenty-mile event for the E. R. Thomas trophy, in which all of the five competitors, all driving 90 horsepower cars, made the journey under the former record of 17 min. 2 sec. It was a time contest, with minute intervals between competitors, and the ten-mile turn neutralized it. A. C. MacDonald's six cylinder Napier was a comparatively easy winner in 15 min. 23 sec.

The final of the Major Miller trophy was a close race between MacDonald in his 90 horsepower Napier and E. R. Thomas in his 90 horsepower Mercedes. The former won by three and one-fifth seconds in the record time of 6 min. 15 sec. This is a cut since the beginning of the meeting of thirty-five seconds in the mark set last year by William K. Vanderbilt, Jr., E. R. Thomas having set a new mark of 6:31 4-5 last Saturday. The summary:

FIFTY-MILE HANDICAP—FOR BURGOYNE CUP.

Paul Sartori, 90 h. p. F. I. A. T. (4:50)..... 1
E. Fredericks, 90 h. p. Mercedes (4:01)..... 2
Chas, Canaut, 45 h. p. De Dietrich (8:00)..... 3

No Sanction for Hotel Keepers' Crowd.

Daytona, Jan. 31.—The A. A. A. has made short work of the Ormond Hotel Racing Association, and the two self-exiled Englishmen who inspired it and who long ago left their marks on professional sport will have a chance to show the Ormond Hotel sportsmen a few of those fancy tricks they practised in "the rare old days of yore" when it was a case of "root, hog, or die."

The A. A. A.'s short work consists in having granted sanction to the Florida East Coast Automobile Association for the holding of races at any time between January 25 and March 1, 1906.

The Ormond Association will not be recognized by the A. A. A., which means that the English professional pals will have to play outlaws again if they would secure a "bit" of the hotel money or even free bed and board and an excursion to Florida next winter.

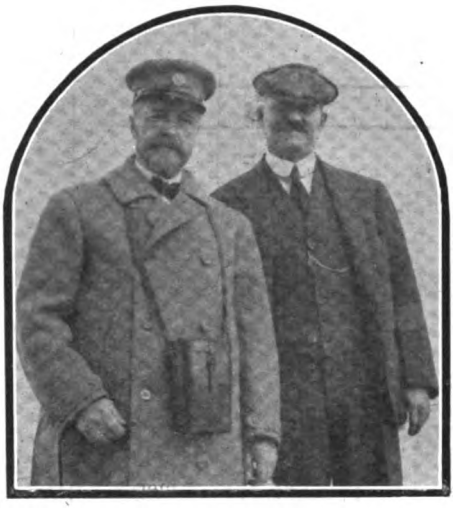
SIDELIGHTS ON THE CARNIVAL



Men, Women and Incidents that Added to the Interest of the Florida Function.

Irresolution and indecision seemed to characterize the whole carnival. The trouble was nobody seemed to be "It." The man who was supposed to be manager disclaimed management, and instead spent the greater part of his time explaining to his auditors what he would do if his hands were not tied. On the other hand, the committee, clothed with indefinite authority, seemed afraid to do anything without a resolution of the board of directors. This conflict of authority brought about a bewildering state of affairs; nobody seemed to know anything, and questions were passed from one official to another. Even Referee Temple himself did not know all that was going on. A little incident, amusingly but pointedly served to illustrate the much mixed situation.

In the State of Florida there is a modest railroad man, who is a whole encyclopedia of information, and whose catchphrase is placarded all over the State, "Ask Mr. Foster. He probably knows," is familiar to every traveller. Some cards bearing the Foster advertisement and attached to a piece of red cord were conspicuously hung on the stand and ropes, and finally Mr. Temple appropriated one of these and pinned it to his coat. Thereafter he laughingly pointed to it when besieged by anxious inquirers.

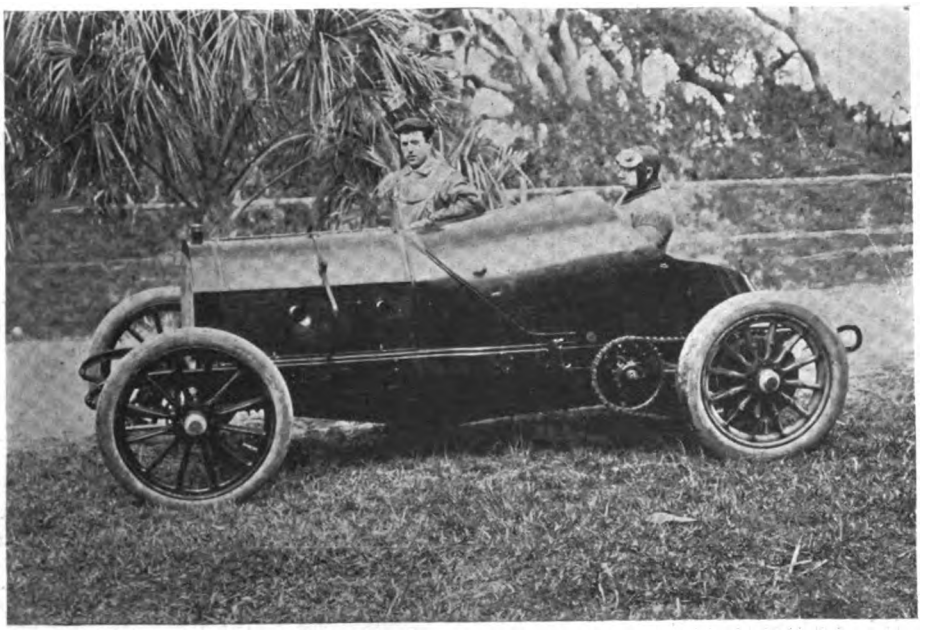
There was the usual amount of local color and an unusual number of the kind of waving palms described by Simeon Ford as attached to strong right arms.

On the beach a colored man had a ladder

REFEREE TEMPLE AND PRESIDENT WHIPPLE.

and support, about fifteen feet high, surmounted by a small platform. A shaggy, forlorn looking dog would laboriously mount the ladder, lie down on the platform, and in response to the commands of his master would obediently stand on his hind legs, beg and perform a number of tricks, and when the inevitable hat was passed along seemed to follow its results with anxious interest.

At the entrance to the Ormond Hotel an old darky, white of beard and black and shiney as coal, dressed in a fanciful costume, half Indian in style, with a few beads suspended on rawhide thongs dangling from an old pair of deerskin trousers, disported a huge rattlesnake, which he handled with perfect impunity. He would place the reptile on top of the box where it was kept, the tail meanwhile buzzing and rattling at a great rate. He would point a finger at the snake, commanding it to keep still, and at once the rattling would slowly decrease in violence, finally stopping altogether. Then old Rattlesnake Pete would wind the snake about his neck, at the same time explaining to his audience that a rattler's fangs renewed every three weeks, exhibiting a pair of the wicked looking curved teeth, with their poison sacs and showing the hole in the tooth where the venom was ejected, stating that he had been bitten innumerable times, but of course had the infallible remedy at hand, displaying it in the bottle which he kept in the box with the serpent.



It was all very interesting until he placed the big serpent's head in his wide open mouth and closed his teeth on it, whereupon his women auditors and some of the men hastily turned away.

Styles in dress and human nature there were in plenty. In the clubhouse during the races (the cold driving every one who could get away indoors), there were gathered as fair and as wholesome looking lot of ladies as could be found anywhere, and the place buzzed with the hum of conversation and the clink of glasses, while hot tea and hot other things helped to make an animated and attractive scene.

Of costumes, they were there in bewildering variety, though even mere man could not fail to note that the day has evidently gone by when ladies fair array themselves in hideous garments, miscalled motoring costumes. Instead there were long, rich looking coats, soft, Fedora-like hats, jauntily, even saucily, turned up in front, and a general effect of comfort and contentment.

Of course, there were some bizarre effects. Mrs. Howard Gould and her hat were there, although the dutiful Howard himself was strangely missing. Mrs. Gould appeared last year wearing a milliner's confection that made the eyes of the average man blink. She evidently appreciated the mild sensation it created, as this year she wore a low, pancakelike "lid" with a pink rose directly in its front and looking for all the world like an automobile headlight. From each side of this, her crowning glory, there depended long white streamers that actually trailed on the ground. Her somewhat generous figure was encased (that seems to be about the word, for it is safe to wager the lady would not venture to pick up a pin) in a smart looking dress, dull gray in color, with broad crimson stripes running up and down and flaring out to the hem. At the hotel the bellboys, as usual, were all running for dear life in various directions in response to the lady's not too gentle commands.

On one day Mrs. Gould gave a luncheon for twelve at the clubhouse. The party rolled up in two large machines, and immediately appropriated the whole place. In the late afternoons and evenings Mrs. Gould was a familiar figure in the grillroom, where she entertained lavishly. Among her party one

S. B. STEVENS, ROME, N. Y., IN HIS 90-HORSE GERMAN CAR.

Digitized by Google

day was the noted A. D. Proctor Smith, resplendent in a flowing red bow tie of generous proportions, suggesting strongly a nice little boy whom mamma had dressed for dancing school. Mr. Smith also wore white spats, and, at the races, a little dinky brown hat. But for costumes among the men "Jimmie" Breese—he of the roving eyes—easily took the palm with a fur overcoat of a yellowish hue that suggested nothing so much as the hide of a polar bear that had been chained in a stable for six months.

Others among the men wore knickerbockers and had their lower limbs wound round and round with leather or various colored materials, and suggested, especially the portly ones, turkeys trussed and ready for baking.

W. Gould Brokaw, whose "man" drives his car (not, of course, because Mr. Brokaw is fearful of it) was about the clubhouse in a skin vest with white spots, the remaining portions having the appearance of being spotted with ink and then having tobacco juice squirted on top of that. It was certainly mottled enough in irregular patches to suggest almost anything. He also wore the rest of his clothes, of course. To hear Mr. Brokaw talk valiantly of the number of cups "he" has won, and remark there was room on his shelves for a few more, was sufficient to provoke that yawning feeling.

E. R. Thomas, who in this, his first, appearance, surprised everybody by his skilful, fearless driving, proved himself a thorough master of his machine. His long form was attired simply in a dark suit and black sweater, and he looked every inch the sportsman he showed himself to be.

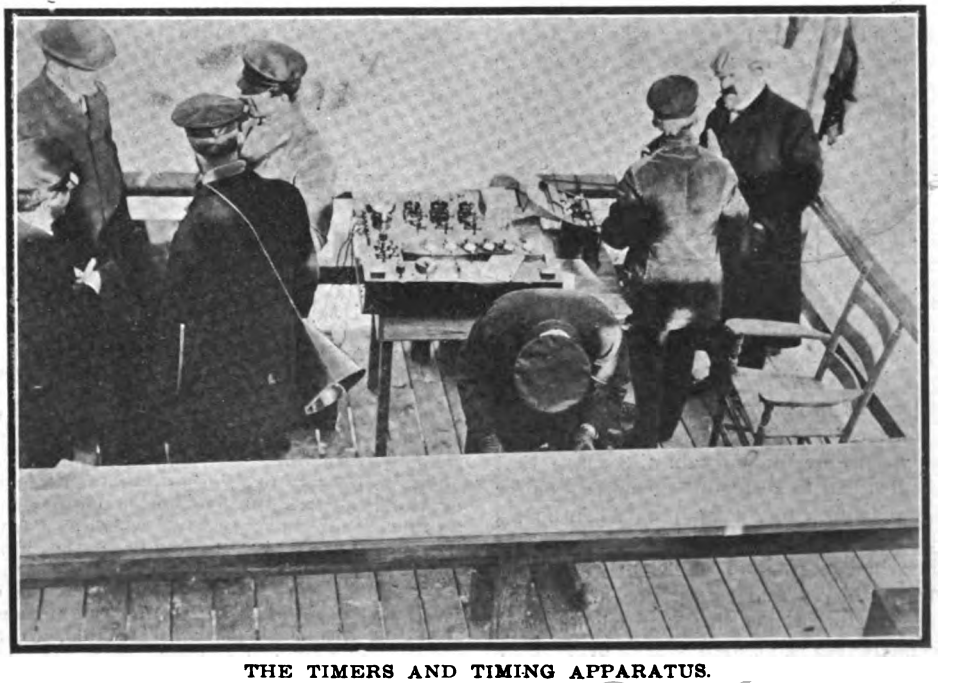
In striking contradiction to the number of these costumes was the one worn by H. L. Bowden, and which fitted his well proportioned figure like the proverbial glove. It was of undressed brown deerskin, with cap to match, tight fitting knickerbockers, leather leggins and tan shoes. It was the simplest and most effective costume in evidence, and was the envy of the men who know.

Back of the timers' stand, where the luckless press men were compelled to stand and shiver, the time was enlivened by a great deal of bantering. Colonel E. H. R. Green, of Dallas, Tex., one of the officials, stopped there at his post day after day, and it was the aim of every other man to work him up toward the end of the stand, from where the wind blew, and then get under the lee of his 287 pounds. Colonel Green good naturedly took it all, and proved himself a thoroughly good fellow.

As a redhot automobilist enthusiast, he has no superior. He talks of Texas and the Dallas track, and his determination, as he expressed it, is "to bring the records to Texas and make the crowd travel down there after them." That he is in earnest was proven

TWO NATIVES "SEE THINGS."

later in the week, when on the toss of a coin he bought the famous Packard Grey Wolf, which held the American kilometre record of 29 2-5 seconds.



Another proof of Colonel Green's enthusiasm for the sport was shown in his bringing half a dozen of his racing associates and the editor of the leading Dallas paper to see the meet; as he said "so that they needn't be bashful next year in coming up and bringing the records back with them."

In common with the other officials of the meet, the timers had their share of trouble and anxiety. The McMurty electrical apparatus was used; it automatically times the first two machines, six stop watches being set in motion as the machines cross the wire tape and stopping as the machines cross the tape at the finish. The tape is stretched across the sands and fastened to a stout stake at the water's edge, and it was the fear of the timers that Ross's little steamer, the nose of which just cleared the ground, might pick up this wire tape and carry it across the arched body of the car and decapitate him; but Ross himself was quick to eliminate this possibility. On the second day he showed up with what appeared to be a stick of wood set at a curious angle and reaching above his head. To one of the inquirers who sought an explanation Ross gave the reason. The timers breathed easier thereafter.

If the 20 horsepower Ross steamer could do a mile in 38 seconds, what would the 40 horsepower White have done if it had got going? was a question that frequently occurred. The failure of the big White to perform was a bitter disappointment to all concerned, and was due to peculiar circumstances. It was designed to be driven by a shaft, but this was not finished in time, and the car was perforce fitted with chains, which broke every time the tremendous power was applied. After six chains had been snapped asunder, the car was placed under cover and stayed there.

The trade was liberally represented. Among those present were Alexander Winton, A. L. Pope, jr., A. W. Pope, A. L. Riker, M. J. Budlong, Louis Clark, of the Autocar Co.; Harry Layman, S. D. Waldon, Henry Ford, Frank B. Stearns, Bert York, Walter C. Baker, George Weiss, H. Rossiter Worthington, E. L. Thomas, Emile Voigt, of Paris, accompanied by Kenneth Skinner, of Boston; J. W. Gilson, Hartford Rubber Works Co.; W. B. Miller and George Bradley, Diamond Rubber Co.; J. Harry Sheldon, B. F. Goodrich Co.; Arthur T. Smith, G. & J. Tire Co., and E. D. Winans, of the Michelin tire American agency.

One of the surprises, sprung late in the week, was the purchase of the Ross steamer by a New York bookmaker. He proposes to send it around to county fairs and similar events for exhibition purposes, under the management of F. Ed. Spooner. It will be driven, it is said, by Joe Nelson, the former bicycle rider.

THE TIMERS AND TIMING APPARATUS.

Digitized by Google

WEIGHT OF BODIES

The Part it Plays and Some Conclusions to Which it Leads.

One of the most encouraging things about the motor car industry is the increasing attention being given by coach builders to the turning out of a larger variety of carriage bodies. It has long appeared strange that while the automobile engineer should be doing everything to perfect details of mechanism, the coach builder should, for so many years, have tried to satisfy the user with the inevitable tonneau for touring purposes and the limousine for general work, and as, despite all sorts of encouragements and competitions, the builder of carriage bodies seemed unable to get out of this narrow groove, he was too often regarded as wanting in initiative and an intelligent appreciation of the enormous field being opened up to him by the automobile.

As a matter of fact, says the Motor Review of Paris, it is only within the past year or two that the coach builder has had any real opportunity for showing his skill. At first the building of car bodies was only a part of his business. Not knowing the dimensions of the frames, which varied with each maker, he had to turn out the bodies to order, the customer selecting from a limited number of types, but as soon as frames were built to a common standard, and there was an increasing demand for carriage work, a large number of coach builders began to lay themselves out solely for these requirements. There yet continued to be a good deal of uncertainty as to what the motoring public really needed. The coach builuer could only study these needs and see in what way he could fill them, for it was obviously useless starting right away with a number of novel and elegant patterns that for some reason or another would be unserviceable. So long as the motorist, for instance, wanted a high speed car for long tours, and laid the vehicle up for the winter, he preferred a light open body, even though it offered very little accommodation, but nowadays he wants a vehicle that will be equally suitable for summer and winter, town and country use, and he also requires a roomy and comfortable body with as much seating capacity as possible. In short, the motor car has come to be looked upon as a general all round vehicle in which comfort, protection and seating room are of more importance than speed alone.

While this gave the coach builder a freer hand in the designing of bodies, it also pointed to a serious difficulty in the sense that the bodies had to be made much stronger for the increasing loads. At a time when bodies were made as light as possible, the coach builder had not taken sufficiently into account the heavy and continuous shocks the upper structure of a car is put to when the vehicle is travelling at high speeds over many kinds of roads, jarring, jolting and jumping over ruts, stones and drains. The use of aluminum and other devices for reducing weight did not prove satisfactory. The bodies had to be strengthened, and at the same time there was a demand for covered bodies, well upholstered and fitted with folding seats for carrying additional passengers. Even this was not sufficient. Some automobilists wanted house cars, with swivel arm chairs and seats that could be turned up for beds; a table, lavatory, kitchen and other conveniences for enabling the fortunate owner to wend his way through the world independent of hotel keepers. The greatest genius in coachbuilding cannot produce a light body of this kind, with all sorts of furniture and fittings, if it is to be strong enough for the work.

Having to carry such a heavy load, the chassis has also had to be strengthened. The frames for big cars are often pressed out of one steel plate, forming an undershield, and with this considerable total of deadweight the engine power and the strength of the car have to be increased. It is hardly necessary to insist on the difference in tractive resistance a small additional load will make, although the importance of this in a touring car, up to a certain limit, may be overrated. The thing to be guarded against is making the cars unnecessarily heavy. If, after providing for the needs of customers, it is possible to cut down some of the weight without sacrificing the strength of the body, it is evident that so much will be gained in the running economy of the vehicle. What has made this question of weight a particularly serious one is the complaint of tire firms that if the coach builders continue to turn out increasingly heavy bodies, the cars will be too heavy for the tires; not that they object to the increased business resulting from a wholesale destruction of tires, but they evidently fear that the considerable expense in replacing tires will ultimately drive the owners of these big cars to try something else. Michelin jumped into the breach with a challenge cup which is to be awarded to the coach builder fitting the lightest body, fulfilling certain specified conditions, on a particular chassis. The coach builders are not altogether pleased at being thus singled out for responsibility, and there is some talk even of their offering a challenge cup to the tire firms for a stronger pneumatic tire. It is certain that they are placed in a very awkward position by being obliged to provide as much comfortable accommodation as possible, and put enough material into the bodies to withstand the shocks they are constantly put to under all conditions of running.

After all, the solution of the problem seems to rest with the user. If he wants to drive at thirty-five to forty miles an hour, he must sacrifice the dead weight and load; if he desire to travel with a covered car carrying half a dozen passengers and luggage, he should be satisfied with taking things easily, while the fortunate owner of a house car ought to be able to take no account of speed or time. A freight locomotive cannot run as fast as an express, so why should a family touring car try to emulate the high-powered tonneau? In time, recognized types of cars designed for special descriptions of work will be built, instead of, as at present, selecting any sort of body needed, to be fitted to one type of chassis.

HOW GERMANS ARE TAUGHT

The Thorough System that is in Vogue in Their School for Chauffeurs.

From more detailed advices it appears that the German school for chauffeurs recently instituted presents something out of the ordinary and its possibilities merit consideration. The Teuton has gone into the subject with that thoroughness and painstaking attention to detail characteristic of him in all things, so that his claim to rank in the vanguard cannot now be disputed.

He has likewise been the first to realize that the haphazard method of making chauffeurs now in vogue is a drawback to the development of the industry, and that, no matter how good a car may be, it is incomplete without a thoroughly experienced hand at the wheel. As expressed in an article descriptive of the first school of this kind recently established in Germany, "a bad chauffeur will spoil ten good buyers, while one with a good knowledge of his subject can win many friends for the automobile." And the subject of the "chauffeur as he should be and should not be" is one that has occupied considerable space in the German automobile press.

The theory of the many complex mechanisms on the motor car is as essential as the practice of their functions, and, compared with the course of instruction outlined for the German who would "chauff," the manner of inculcating the rudiments in the beginner here is as a primary to a post-graduate university grind. First of all, the student delves into the mysteries of a four cylinder 24 horsepower chassis, and a large amount of the instruction centres about this before he can go any further. Having learned to recognize the beauties and intricacies of his future charge in the ensemble, he must then dismantle it, piece by piece, until the last degree of dissolution attainable has been reached, and then the functions of every constituent part, whether moving or fixed, is gone into down to the most minute detail, and it is now up to the class to restore thing to their places in working shape. It must be admitted that in no other way can the same amount of practical instruction be gained as in the manner outlined. The average man who "knows it all" can, with the aid of a wrench and screw driver, spread the parts of a machine so thoroughly that even an expert would be puzzled somewhat in reassembling them; but experience is essential to know just what to take apart and where it belongs when it comes to reassembling. This is the foundation, but the instruction then proceeds to questions of frames, axles and bearings, with a large quota of tire knowledge punctured with some of the vagaries of this adjunct when it meets its natural enemies, as tacks and the like, or through other causes mysterious and unfathomable, it shows a disinclination to re-

Digitized by Google

tain the breath of life. The various makes of rim cushions are gone into and their good and bad points dwelt upon at length.

Then, and then only, does the student get a chance to start the engine, and in all probability the instructor has short-circuited the spark plug or inadvertently done something else to render the engine innocuous, just to make it interesting for his pupils and test their knowledge of cause and effect as applied to the gasolene motor. After managing to get under way, there is a gymkana steering tournament in the schoolyard for novices who have never yet wrecked a car, and once the proficiency of the new "autolenker" in avoiding such a denouement, well established, the whole fleet, comprising some half dozen or more cars of various types, go on a cruise in the country, and breakdowns from causes, probably arranged for well in advance by the instructors, have to be investigated.

Once through such a mill in the fourteen-hour-a-day, learn-things-from-top-to-bottom fashion that the Teuton affects, a chauffeur that knows how to guard against trouble and who is on familiar terms with the variegated forms in which the latter appears on the road should be a possibility.

Oldsmobile Climbs the Andes.

A cablegram received on Saturday last by the Olds Motor Works from Buenos Ayres, Argentina, brought the news that Ramon Camano, in company with a party of friends, performed the remarkable feat of crossing the Andes in an Oldsmobile light tonneau car.

The trip was made from Buenos Ayres to Chili, and traversed for many hundred miles the roughest pampas roads, making the ascent of Cordillera Mandoza, on the Chilian sides of the Andes, which is 13,000 feet above the sea. The trip was a complete success. The dangerous descent of Cordillera Mandoza was safely negotiated, and the daring tourist arrived at the seacoast of Chili without mishap.

Mr. Camano is at the head of the firm of Ramon Camano & Co., which has represented the Olds Motor Works in the Argentine Republic since 1902. Recent reports from Buenos Ayres state the proportion of Oldsmobiles in use to be about 75 out of the 150 cars owned in that city.

Italy Also Has a School.

Turin, the centre of the automobile industry in Italy, can now boast of an automobile school for the instruction of chauffeurs and automobile mechanics. The Mayor of Turin is the honorary president of the institution, which, though recently organized, has no less than 120 pupils.

There are two different courses, one for those who wish to serve in the capacity of chauffeurs to owners of automobiles, and the other is for those who have cars and wish to drive them personally, or, to use the words of an Italian sporting paper, "for hired help and gentlemen."

TEXAS HAS A BEACH

Also a Green, and the Combination May Cause Florida to "Take Notice."

Daytona, Jan. 27.—While Daytona and Ormond may be said to be quarreling over the bone and organizing to obtain each a shade of it, there is danger or promise that a third party may slip in and carry it off, or, at any rate, prove such a serious rival that the glory of Florida may be at least somewhat dimmed. Although not suspected of harboring aspirations of the sort, Texas is the latest entrant in the field.

In conversation with the Motor World man

COL. E. H. R. GREEN, OF DALLAS, TEX.

this afternoon, that big, wholesouled sportsman, Colonel E. H. R. Green, of Dallas, Tex., said the Lone Star State possessed a beach compared with which the Ormond-Daytona stretch is a mere billiard table. The stretch of Texas coast which he had in mind is 168 miles, and every whit as hard and as smooth as Florida's wave washed strand. Colonel Green said that, although the matter of a speed carnival on the Texas beach had not passed the talking point, he intimated plainly that it is in well defined view. As he is free handed with his abundant means and is a railway president to boot, and has a reputation for "doing things," it appears reasonably certain that the last has not been heard of the project.

Colonel Green is very much infatuated with automobiles and deeply in earnest in making things hum. He already has an extensive "stable" of racing cars, which he purposes adding to, and says the three-mile circular track which has been talked of in Dallas is no dream, but surely will be built. He also has decided views on the amateur question, and, although he weighs 287 pounds—"and part of that is cork," as he expressed it (he has a cork leg)—he is ready to get up and drive his own cars, but not against hired drivers.

CHICAGO IS READY.

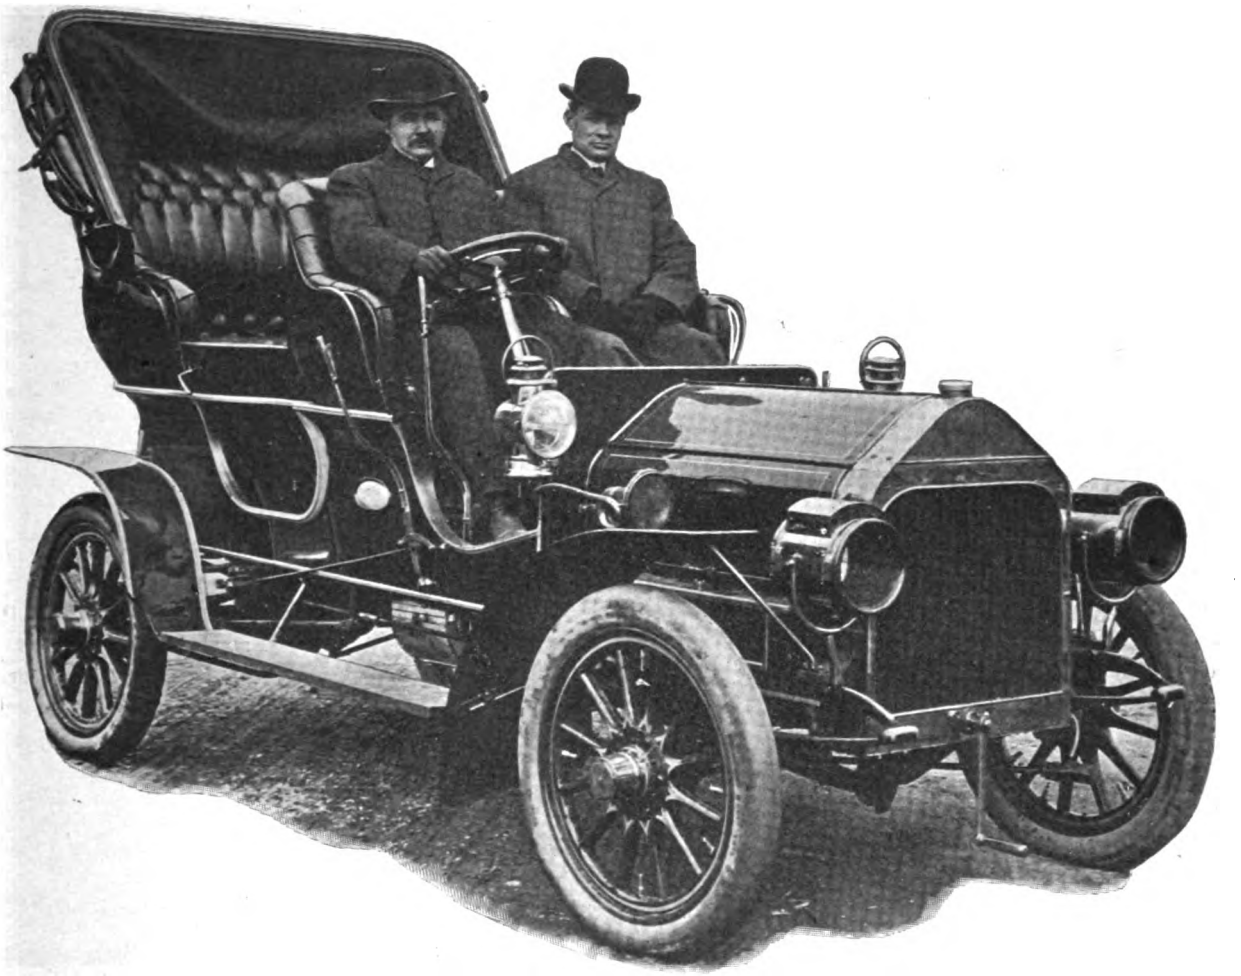
White Sewing Machine Co.—White steam cars.
Webb Co., The—Speed indicators.

As usual in all automobile shows, the demand for space at the Cleveland Automobile Show is so great that the management has arranged to place three exhibits in the equipment room of Gray's Armory, where the exhibition will occupy the main hall. Last year very few tire makers exhibited, whereas in the show to be held on February 20 the majority of these manufacturers have deemed it worth while to have some kind of exhibit.



With the Cleveland automobile show coming after Detroit, quite a number of the automobile trade are booking accommodations at the Hotel Euclid, in Cleveland, which is situated closest to the show building.

This hostlery is managed now by Charles MacCarty, or "Mac," as he is familiarly known to all of the trade from his long connection as chief clerk of the Hollenden Hotel. He knows all the requirements of the automobile "bunch," and is acquainted with most of them personally. "Mac" is in a position to offer accommodations satisfying to the most critical.

The Hotel Euclid has good rooms, good service, and, as stated, its location is admirable, especially during show week, although many are making it a regular stopping place when in Cleveland.

Turner & Emerson is the style of a new firm in Halsey street, Newark, N. J. They will handle the Buckmobile.

ELWOOD HAYNES (AT THE WHEEL), OF THE HAYNES-APPERSON CO., AND V. E. MINICH, SALES MANAGER, IN THE NEW HAYNES 4-CYLINDER CAR.

Long Island's "Continuous Show."

On February 3 the Long Island Automobile Club will open their new house and garage at 360 Cumberland street, Brooklyn, N. Y. The club has arranged for a series of private exhibitions of all the leading 1905 cars. Every Friday night two American manufacturers will show cars in the clubrooms. Edwin Melvin, chairman of the entertainment committee, has sent invitations to a large number of enthusiasts. On February 10 the Oldsmobile Co. will exhibit the new light touring car and the 20 horsepower two cylinder cars. The Cadillac light runabout and side entrance touring cars will also be shown. Announcement will be made by the club of the dates when the exhibitions are held.

Justice as Dispensed in France.

Four days in prison, a fine of $60, and the payment of an annual pension for life to the surviving family of the deceased sounds like rather severe punishment for not having killed a woman with an automobile, but this in substance is what was inflicted on the owner of a car touring through France last fall. The latter was approaching a level crossing in his car when the woman in charge of the gate ran forward to open it and fell dead as the car passed near her, but without touching her, death probably being due to heart disease. The "unjust" decision of the lower court was reversed upon appeal.

Emperor Inspected Their Uniforms.

The German Emperor has evinced great interest in the newly formed volunteer automobile corps, having recently commanded the secretary of the German Automobile Club to appear before him in the newly designed uniform of the corps. This uniform is a sort of brownish gray cloth, similar to that worn by the German expeditionary force in China, with yellow leather knee boots or yellow gaiters. For arms the automobile volunteer will carry a long dirk, similar to that worn by the midshipmen in the royal navy, and a revolver. The Kaiser expressed his general approval of the new uniform, only suggesting changes in a few trifling details.

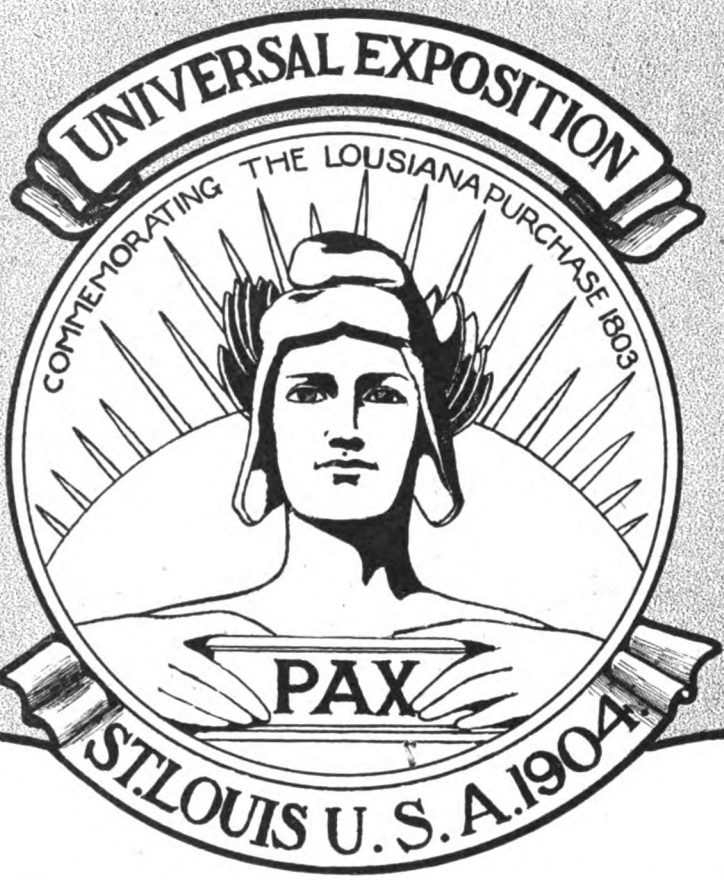
Got a $3000 Car for $1.

It is not every one who can purchase a new four cylinder Royal Tourist, listed at $3,000, for the insignificant sum of $1, but T. B. Ferrias, of Pontiac, Ill., is a man who has this distinction. Ferrias was the lucky guesser in a contest conducted by the Royal Tailors' Association of Chicago.

Fined for Having Noisy Car.

Because his car made too much noise while standing in the street an automobilist in England was fined $2 and costs amounting to $10.

A policeman first noticed the automobile and watched it for "eight minutes," and still the noise continued. The watch of the defendand did not agree with that of the policeman, as the driver declared he was only away from the automobile two minutes. The magistrate deemed it only natural that the officer of the law was right, and fined the automobilist under the Motor Car Act "for not using means to prevent his car making an unnecessary noise."



No More Horses at Niagara.

J. C. Level, Niagara Falls, who for years has had the reservation carriage concession on the State reservation, announces that horse drawn vehicles will be a thing of the past with him the coming summer.

It is his intention the coming season to place in commission three large automobiles, with a carrying capacity of at least twenty-four persons, and as soon as the demand requires additional cars will be placed in commission. Level has long considered this move, and is of the opinion that the horseless carriage in its present state of perfection is far preferable to the horse in the matter of economy and comfort.

PIERCE

The Pierce Car was awarded the Grand Prize at the St. Louis Exposition as the best expression of an American car built for American conditions and American temperaments.

The Grand Prize thus awarded is but a recognition of a standard toward which we have been working for five years, and which we believe we have attained.

The six cars which we have built for 1905 comprise the best we know of successful motor car building.

Catalog and technical descriptive matter sent on request.

CARING FOR THE CAR

Many and Various Useful Hints Let Fall by an Experienced Carriage Man.

These hints come from an old carriage man, whose experience cannot but prove of value to the motorist:

Inspect the entire carriage occasionally, and whenever a bolt or clip appears to be getting loose, tighten it up with a wrench, and always have little repairs done at once. Should the tires of the wheels get at all slack, so that the joints of the felloes become visible, have them immediately contracted, or the wheels may be permanently injured.

Examine the axles frequently; keep them well oiled, and see that the washers are in good order. Pure sperm oil is considered the best for lubricating purposes; castor oil will answer, but never use sweet oil, as it will gum up. Be careful in replacing the axle nuts not to cross the thread or strain them.

Keep a small bottle of black japan and a brush always handy to paint the steps when worn by the feet, and also the edges of the tires; nothing helps more than this to keep a carriage looking tidy. Lay on the japan as thin as possible.

Avoid opening a carriage door while the carriage is in motion, as accidents frequently occur from this cause, the door being intercepted by a tree or lamppost and wrenched from its hinges.

Carriages should be kept in an airy, dry coach house. There should be a moderate amount of light, otherwise the colors will be affected. The windows should be curtained, to avoid having direct sunlight strike upon the carriage.

There should be no communication between the horse stable and the coachhouse. The manure heap, or pit, should also be located as far away from the carriage house as possible. Ammonia fumes crack and destroy varnish and fade the colors, both of the painting and lining; also avoid having a carriage stand near a brick wall, as the dampness from the wall will fade the colors and destroy the varnish.

Whenever a carriage stands unused for several days it should be protected by a large cotton cover, sufficiently strong to keep off the dust, without altogether excluding the light. Dust, when allowed to settle on a carriage, eats into the varnish. Care should be taken to keep this cover dry.

When a carriage is new or newly varnished it is better for it to stand a few days, and to be frequently washed and well dried off before being used. Frequent washings with cold water and exposure to fresh air in the shade will also help to harden and brighten its finish. Never allow mud to remain long enough upon a newly varnished carriage to dry upon it, or spots and stains will invariably result.

While washing a carriage, keep it out of the sun. Have the lever of the "set" covered with leather. Use plenty of water, taking great care that it is not driven into the body, to the injury of the lining. Use, for the body panels, a large, soft sponge; when saturated, squeeze this over the panels, and by the flowing down of the water the dirt will soften and harmlessly run off. Care should be taken to wipe the surface quite dry with soft chamois leather after each washing.

Leather top carriages should never stand long in the carriage house with the top down. After raising the top "break" the joints slightly, to take off the strain on the web, stay and leather. Aprons of every kind should be frequently unfolded, or they will soon spoil.

As a general rule, a carriage will, with gentle work, retain its freshness better than if allowed to stand for long periods in a coachhouse. If the latter be necessary, draw the carriage out frequently to air, in some shady place, and occasionally wash it.

See that coachhouse doors can be so fastened as not to blow to by the wind.

The carriage should be repainted, or at least touched up and revarnished, as often as once a year. Avoid having such repairs made in a hurry; remember that hurried varnishing implies imperfect varnishing.

In washing the body apply the sponge as well to the under parts and wheels, but use for the latter a different sponge and chamois than those used on the body. Never use a "spoke brush," which, in conjunction with the grit from the road, would act like sandpaper on the varnish, scratching it and, of course, removing the gloss.

Never allow water to dry of itself on a carriage, as it would invariably leave stains. Hot water or soap should never be used in washing a varnished surface.

Enamelled leather tops and aprons should be washed with very weak soap and water. No oil should be put on enamelled leather.

In cleaning brass or silver parts no acid, mercury or grit should be used; the polish should be obtained by friction solely.

To prevent or destroy moths in woollen linings, use turpentine and camphor. In the case of a closed carriage, the simple evaporation from this mixture when placed in a saucer (the glasses being closed) will be found a certain cure.

Be careful to grease sparingly the bearings of the front gearing, using only enough to allow it to turn freely.

May Substitute Automobiles for Flowers.

Los Angeles, Cal., may have an automobile floral parade this year instead of the annual Fiesta. The matter is being considered by the automobile club and the Merchants' and Manufacturers' Association. This plan would not necessitate the raising the $35,000 usually asked for the Fiesta, and, it is thought, the automobile carnival would prove more popular anyway.

FOR A STATE LAW

Washington Motorists Move in that Direction to Nullify Conflicting Local Ordinances.

The Automobile Club at Spokane, Wash., has taken the first steps to head off city regulations regarding the use of highways for automobiling purposes, and also to regulate speed laws by State legislation, by sending a copy of the new bill drafted by the Seattle club to each automobile club in the State and asking for unanimous support in having it introduced at the next session of the legislature.

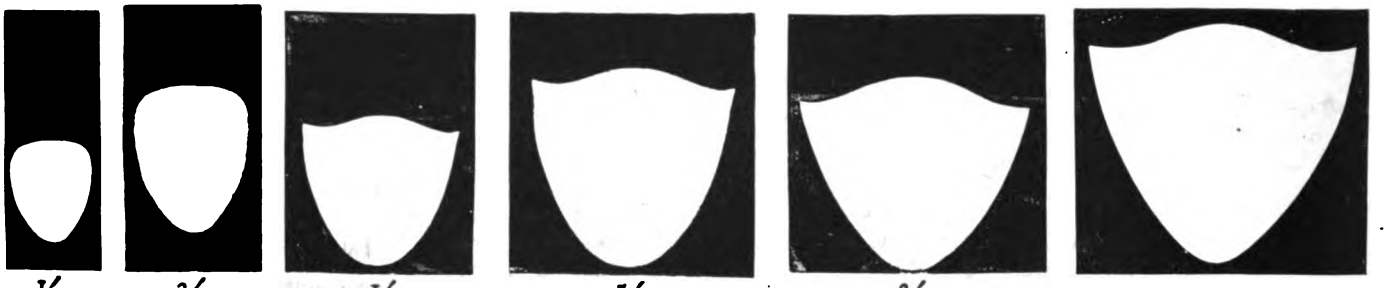
The act provides that the owner of every automobile, motor vehicle or motor bicycle shall file in the office of the Secretary of State his name and address, with a description of the machine. A certificate will be issued, upon payment of a fee of $2, to the State Treasurer. The number of each certificate preceded by the letters "W. N." shall be displayed on the back of each car in light colored Arabic numerals at least three inches high upon a dark background. This provision, however, does not apply to cars owned by non-residents, if the owners of such have complied with the laws of the State from which they come.

Every automobile using gasolene as a motive power shall use a muffler, and the same must not be cut out or disconnected within the limits of any city or village in the State.

The section of the proposed new bill devoted to speed regulations contains features that have not existed heretofore. Twelve miles an hour is given as the limit within any city or village, and twenty-four miles an hour on the public roads outside the settled portions. The rate of speed in the congested districts and over any cross street is four miles an hour. It is distinctly set forth that any automobile racing on any public highroad will be deemed a misdemeanor, and dealt with according to law.

Present conditions in Washington are very unsatisfactory to automobilists, as every corporate town in the thirty-six counties of the State has an individual automobile restriction ordinance, and this act is designed to eliminate this unpleasantness by making a State universal law. No city, town or county shall have the power to pass, enforce or maintain any ordinance relating to automobiles and vehicles of a like character, and all existing laws are to be declared invalid.

If for any infraction of this act a person is arrested, he may demand the right to have the case heard at once, but if no magistrate can be found, an appearance guarantee bail of $50 must be accepted by the officer making the arrest. In default of bail the car may be held as security.



The last clause reads: "The violation of any of the provisions of this act shall be deemed a misdemeanor, punishable by a fine not exceeding $25 for the first offence, nor exceeding $50 for the second offence, nor exceeding $100 for any succeeding offence."

Railroad Repairs Not Satisfactory.

C. F. Mason, of Clinton, Iowa, is the plaintiff in a damage suit against the Chicago, Milwaukee & St. Paul Railroad to recover $900 damages alleged to have been done to an automobile belonging to the plaintiff's wife in shipment over the defendant company's lines.

The case is a peculiar one. Last October Mrs. Mason shipped the automobile from Clinton to Minneapolis, and when the car reached that city it was a total wreck. The railroad company at once repaired the machine and delivered it to the owner. The car, the plaintiff declares, is now defective, and accordingly asks for judgment to the above amount. The defence have brought automobile experts from Minneapolis, Davenport, Des Moines and Chicago, who have testified that the claim for damages is groundless, as the car is in perfect working order.

Suit Follows Open Drawbridge.

The plunge of an automobile into the Chicago River last August when two men and one woman narrowly escaped death in the water, was recalled Wednesday, when attorneys for the three persons filed three suits for damage aggregating $75,000 in the United States Circuit Court. The occupants of the automobile were Lelia S. Williams, John T. Williams and Arthur P. Gemond. It is charged in the suits that the city was careless in not furnishing proper protection against such accidents when the drawbridge was open.

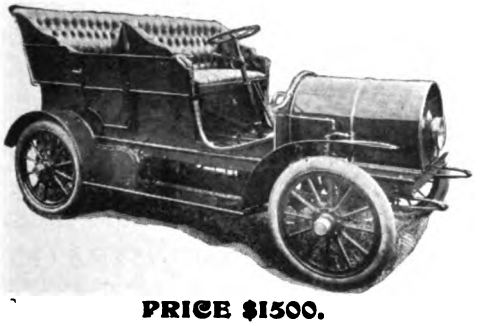
Clubs Elect their Leaders.

Dr. F. E. Constans was re-elected president of the Brockton (Mass.) Automobile Club at the annual meeting last Thursday night. Other officers chosen were: Vice-president, Henry Burbeck; treasurer, Albert Leighton; secretary, W. H. Marble. Organized February 2, 1902, the club has had a prosperous growth. At the time of organization there were but fourteen automobilists in the city, while now the club's membership numbers eighty-four, half of these joining last year.

The Salt Lake City Automobiling Club was formed in that Utah City last week. The officers are: President, O. H. Hewlett; first vice-president, Samuel Newhouse; second vice-president, Mrs. Jay T. Harris; secretary, Dr. H. S. Scott; treasurer, H. A. McCornick; directors, LeRoi C. Snow, C. H. Wilkes, Mrs. F. E. McGurrin and Mrs. LeRoi C. Snow.

The Berkshire Automobile Club, Pittsfield, Mass., has elected the following officers for the ensuing year: President, F. W. Brandow; first vice-president, Samuel G. Colt; second vice-president, Courtlandt F. Bishop; recording secretary, Erwin H. Kennedy; corresponding secretary and treasurer, L. A. Merchant.

The Milwaukee (Wis.) Automobile Club has elected the following officers: President, Arthur H. Anger; first vice-president, Louis Fuldner; second vice-president, Joseph F. Merkel; secretary, James T. Drought; treasurer, W. H. Pipcorn; captain, R. J. Healy.



Automobile "Villian" Lands in Hospital.

The automobile scene which forms a feature of "An Aristocratic Tramp," which played at a Hartford City (Ind.) theatre last Saturday night, was so realistic that the audience shrieked with delight—a most "uncommon" occurrence in Western playhouses. A mad race on the stage ensues, in which the villain's automobile explodes, enabling the hero to overtake him. The stage car is made of steel. Just as the explosion occurred the wires grounded and charged the machine with electricity, and the flash from the explosion set fire to the villain's clothes, besides shocking him. His condition is such that the hospital authorities will see that he does not attempt to impersonate the daring chauffeur for several months yet.

Thinks Westerners are More Obliging.

Lewis Russell, of Portland, Ore., who has made the trip from Portland to Los Angeles, Cal., and return, comprising a distance of about two thousand miles, says the people of California are more obliging than those in some of the Eastern States.

"They all seem ready to aid in any way," writes Russell, "and lend a helping hand when needed. I have travelled through a number of Eastern States, where automobiles are considered a public nuisance, and we expected the same kind of treatment on this trip, but were agreeably surprised to have every one treat us so kindly." Mr. Russell was accompanied by his wife, daughter anad father-in-law.

WHITLOCK COOLERS

For 1905.

The Leading Automobile Builder have adopted the Whitlock Cooler for 1905 for the following reasons:—

1st: Because it is the most EFFICIENT radiator yet produced.

2nd: Because no other approaches it in STYLE and FINISH.

3rd: Because of its POPULARITY, being used on the leading cars.

4th: Because it is a TRIED DEVICE.

5th: Because we pursue a LIBERAL POLICY in taking care of our customers.

6th: Because we can DELIVER THE GOODS, having built about 90% of all cellular coolers made in the United States.

7th: Because our EXPERIENCE for the last two years as the largest manufacturers of coolis worth something to our customers.

We are now shipping coolers on our 1905 orders.

THE WHITLOCK COIL PIPE COMPANY

HARTFORD, - CONNECTICUT.

The Week's Patents.

780,058. Controller for Electric Motors. Thomas S. Perkins, Wilkinsburg, Pa., assignor to Westinghouse Electric & Mfg. Co., a corporation of Pennsylvania. Filed June 24, 1902. Serial No. 112,957.

Claim—1. A controller for electric motors, comprising a main drum and co-operating fingers and a reversing switch drum and fingers, the finger of the main switch that is connected to the current collector being located at an intermediate point between two sets of resistance fingers.

780,119. Explosive Engine. Richard G. V. Mytton, Meridian, Miss., Filed December 13, 1900. Serial No. 39,785.

Claim—1. An explosive engine, consisting of the combination of an inspirator and compressor, a power cylinder communicating therewith, a piston of two diameters for the respective cylinders, an explosion chamber formed in the piston, and means for conducting the charge immediately after explosion, to one side of the larger piston in the larger cylinder, then into the remaining portion of the larger cylinder on the other side of the larger piston, and finally to the outside atmosphere.

780,130. Variable Cam. Bruno Salzer and Gustav Walther, Chemnitz, Germany. Filed December 1, 1902. Serial No. 133,494.

Claim—1. The combination of a rotary member carrying a ring formed with two guides, a member moved thereby, and two rollers carried by the other member, one on each side of the ring, and means for throwing both rollers simultaneously from one guide to the other.

780,134. Acetylene Gas Generator. Frederick L. H. Sims, Toronto, Canada. Filed April 4, 1901. Serial No. 54,316.

Claim—1. In an acetylene gas machine, the combination with the casing designed to be partially filled with water and the carbide holder rigidly connected to the top of the same and provided with a central bottom orifice of the generating casing connected to the bottom of the carbide holder and surrounding the orifices at the bottom of the same, a valve controlling said orifice, a float within the generating casing, said float projecting below the level of the water in the main casing, and a connection between the float and valve, said valve having an opening therein for communication between the generating casing and the carbide receptacle at all times, substantially as described.

780,140. Air Tube for Pneumatic Tires. John R. Taylor, Wandsworth Common, Eng-

land. Filed April 16, 1904. Serial No. 203,481.

Claim—A duplex or double air tube for pneumatic tires, each compartment of which is a complete tube, the two compartments being attached to one another throughout their lengths so that the wall between them is of double thickness and the superficial area of the said wall is not less than that of the remaining part of each tube, as and for the purpose set forth.

780,153. Wheel Hub. Charles C. Brabant, Alpena, Mich. Filed July 14, 1904. Serial No. 216,507.

Claim—1. In a wheel hub, the combination of an axle, a casing loosely mounted on and movable up and down and endwise with respect to the axle, yielding weight sustaining means interposed between the axle and the side of the casing, and yielding means interposed between the axle and the casing and arranged to cushion endwise movement of the same.

780,154. Rubber Tire. Clarence H. Bryan, Chicago, Ill. Filed June 22, 1904. Serial No. 213,616.

Claim—1. The combination of a vehicle wheel with an elastic tire substantially flat on its inner perimeter and having annular grooves on its sides in proximity thereto, and a movable guiding device connecting the tire with the rim and associated with the tire beyond such grooves.

780,155. Rubber Tire. Clarence H. Bryan, Chicago, Ill. Filed October 10, 1904. Serial No. 227,801.

Claim—1. In an elastic tire device for vehicles, the combination of an elastic tire with a rim having overhanging edges adapted to receive the inner surfaces of the tire and a cage having cross rods extending through enlarged openings in the tire and rings which encircle and bear upon the tire and the rim.

780,156. Clutch. Gustav Burr, Chicago, Ill. Filed July 1, 1904. Serial No. 214,963.

Claim—The combination with a driving and a driven pulley arranged in axial alignment, of a rocker carried by the latter and extending across the same parallel to its axis, and adjustable radially with respect thereto, said rocker having on one end oppositely extending arms over the driving pulley, a band connected at its ends to said arms and extending around said driving pulley, and means to turn the rocker.

780,159. Clutch Mechanism. William H. Corbett, Portland, Ore. Filed March 17, 1904. Serial No. 198,656.

Claim—1. In a clutch mechanism, the combination of the clutch members, a shaft on which said members are mounted, bearings for the shaft, said clutch members being mounted on said shaft between said bearings; a clutch actuating mechanism mounted on said shaft outside of said bearings comprising bell crank shaped thrust levers fulcrumed on the shaft, devices for communicating the action of the thrust mechanism to the clutch, and radially acting levers for actuating said thrust levers.

780,169. Clutch Mechanism. Hans C. Hansen, Newton, Mass. Filed May 8, 1903. Serial No. 156,183.

Claim—1. In apparatus of the class described, a shaft chambered at its end, a pulley loose on said shaft, a clutch device comprising a disk, a hollow hub keyed to said shaft, a split ring, a lever and a pin, means including a spring controlled wedge to cause said clutch device to be engaged with and rotated by said pulley, a cam arm carried by the disk of the clutch device, a lever connected with said wedge, a device carried by the loose pulley to maintain said cam arm in its inoperative position and to release the same at a predetermined time in the rotation of the clutch device, and means intermediate said cam arm and lever when said cam arm is in its operative position to withdraw said wedge against its spring and release the clutch device.

780,209. Fastening for Wheel Tires. Arthur von Lüde, Frankfort-on-the-Main, Germany, assignor to the firm of Mitteldeutsche Gummiwaren-Fabrik Louis Peter, Frankfort-on-the-Main, Germany. Filed April 21, 1904. Serial No. 204,149.

Claim—1. The combination with a motor wheel, the felly of which has an externally cylindrical part and a removable flange, of a tire casing having its foot fitted to said felly and formed with an inwardly open channel, and a non-expansive or stiff ring inserted into said channel, substantially as herein described.

780,221. Electric Igniter. James W. Packard, Warren, Ohio, assignor to the Packard Motor Car Co., Detroit, Mich., a corporation of West Virginia. Filed January 10, 1903. Serial No. 138,501.

Claim—1. In an electric igniter for explosive engines, a generator, a spiral cam having a transversely adjustable extension at its rear end, said extension having one end inclined to the axis of the cam, and a spring pressed member bearing upon said cam and operatively conected to the movable member of the generator.

780,355. Carburetter. John M. Kelley, Rochester, N. Y. Filed October 24, 1902. Serial No. 128,600.

Claim—1. The combination in a carburetting apparatus of a carburetting vessel, a tank, a conduit whereby oil or gasolene may pass from the tank to the vessel, a conduit whereby surplus liquid may be drained from the carburetting vessel and returned to the tank, a bell to supply air to the carburetting vessel and a plurality of pumps each operatively connected to the bell and also connected with the conduits respectively to supply oil to the vessel and return the surplus to the tank.

780,365. Storage Battery. Joseph Meizer, Cleveland, Ohio, assignor to the Osborn-Morgan Co., Cleveland, Ohio. Filed April 2, 1904. Serial No. 201,280.

Claim—1. A self-contained electric current rectifier and accumulator.

2. A self-contained storage battery and electrolytic rectifier.

3. A storage battery comprising a cell having independent compartments, an electrolyte in each compartment, and two electrodes in each compartment, one of said electrodes being aluminum and the others of a different metal.

780,371. Vehicle Tire. George D. Munsing, New York, N. Y. Original application filed July 21, 1904. Serial No. 217,515. Divided and this application filed August 11, 1904. Serial No. 220,391.

Claim—1. A laminated tire and rings between the outer layers and the body of the tire to form a bead on the tire, substantially as described.

2. A laminated leather tire, pegs uniting the laminæ, and rings between the outer laminæ and the body of the tire to form beads at the base of the tire, and on opposite sides thereof, substantially as described.

780,436. Rim for Vehicle Wheels. George D. Munsing, New York, N. Y. Original application filed July 21, 1904. Serial No. 217,515. Divided and this application filed August 11, 1904. Serial No. 220,390.

Claim—1. In a vehicle wheel, a two part rim and means to hold the parts together independent of the felly of the wheel, and means independent of the rim to secure the rim to the felly, substantially as described.

780,452. Pneumatic Tire. Wilhelm Struck, Friedenau, near Berlin, Germany, assignor to B. Polack, Waltershausen, Thuringen, Germany. Filed April 8, 1904. Serial No. 202,225.

Claim—1. In a pneumatic tire, the combination with an air tube and a cover having reinforced edges, said edges being flexible but inextensible, of a felly, tongue and groove connections between said edges and said felly, removable rims on said felly, said felly and said rims having grooves forming when the rims are secured on the felly, a channel the walls of which overlap the edges of the cover, and means for securing the rims on the felly.

780,457. Tire Fastener. Edwin L. Thomas, Buffalo, N. Y. Filed May 23, 1904. Serial No. 209,155.

Claim—1. The combination with a wheel rim provided in its periphery with recesses, of a tire retainer comprising a pair of opposing rings surrounding the rim and provided at their outer edges with flanges adapted to engage the base portion of a tire, one of said rings being detachable and provided on its inner side with lugs seated in the recesses of the rim, and means for retaining the lugs in said recesses, substantially as set forth.

If you miss the PREMIER EXHIBIT

You miss the best part of the Chicago Show

Premier air cooled cars were among the distinct sensations of the New York Show. Posted drivers and experienced automobile engineers pronounced the ***Premier*** one of the thoroughly high grade cars exhibited, and it was generally admitted that ***"The Quality Car"*** represented better value than to be found in any other exhibit at the Show.

Side Entrance,	**1905 Model F,**	**$1,500**
Rear Entrance,	**1905 Model F,**	**$1,400**
Runabout	**1905 Model F,**	**$1,250**

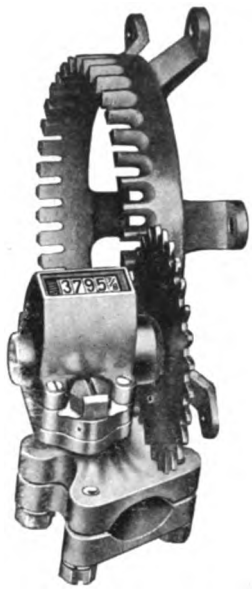
"The Maxwell"

THE FINAL TRIUMPH

achieved by the MAXWELL Cars at the great Automobile Show in Madison Square Garden, New York, was as conclusive to the public as it was satisfactory to us.

We had expected it, and worked for it, but even to us, who knew just how worthy of praise the "Maxwell" is, the great volume of favorable comment, the almost unanimous appreciation of "MAXWELL POINTS" throughout that enormous gathering of automobile EXPERTS came as somewhat of a surprise. There is but one conclusion to be drawn: that the automobile public is no longer dependent upon the statements of manufacturers and agents, that buyers have learned to discriminate for themselves, that they know what they want, and, having found in the "Maxwell" those points which make it the most practical, the most reliable and the most economical automobile in the market, they have been quick to give it their appreciation and their patronage.

16 H.P. TOURING CAR, $1400. **8 H.P. TOURABOUT, $750.**



The "Maxwell" cars have no pump (thermo-siphon). Their double opposed motor is in front under the hood and accessible in every part. They have Bevel Gear Drive. METAL BODIES. Transmission Case and Crank Shaft cast in one Aluminum casting. "Perfectly simple, simply perfect."

Veeder

ODOMETERS FOR MOTOR CARS

will be on exhibition at our spaces at New York, Chicago, Detroit, Cleveland and Boston, where we shall be very glad to talk with manufacturers of cars concerning the special discount we make to those who equip their output with Veeder Odometers.

Dealers and jobbers are likewise invited to drop in at our booths to discuss the sale of Veeder Odometers for this year.

Automobile owners who wish to see the odometers in actual operation should feel perfectly free to come in and ask all the questions they choose. That is what we are there for.

THE VEEDER MFG. CO., 26 Sargeant Street, Hartford, Conn.

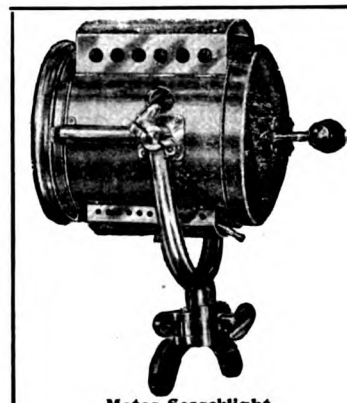
Cyclometers, Odometers, Tachometers, Counters and Fine Castings.

Volier Horns

VOLIER : PARIS

MODELE DE LUXE

The **VOLIER DRACON:** Special prices to jobbers and dealers who come and see us at the show. This is the horn proposition of the year and you can learn more about it by coming up and asking a few questions than you could by reading all night.



The POST & LESTER CO., 36 Sergeant St., **Hartford, Conn.**

Your Auto's Eyes

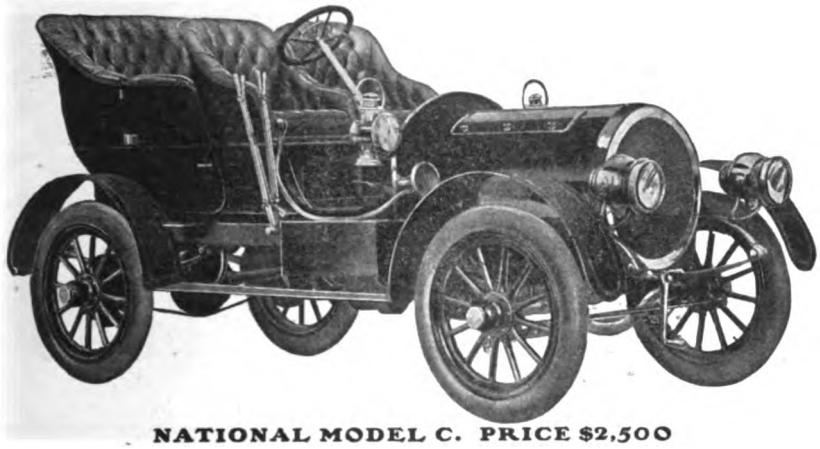
are as important as your own. Your very life often depends upon them. Why then take chances when you know and everyone knows that

SOLARS ARE RELIABLE

At the St Louis World's Fair Solars were awarded the Gold Medal because they excelled all other makes of lamps.

Motor Searchlight.

In the non-stop test ot Packard car made in August, 1904 Solars were selected as the lamps because they could be relied upon to show the way.



Solars cost but little more than "good enough" lamps, and you, Mr. Dealer, should be awake to your customers welfare and insist upon them as equipment.

See our exhibit at the Chicago show if you want to see a beautiful line of lamps.

"STEVENS-DURYEA" New 20 Horsepower 4 Cylinder TOURING CAR.

MODEL R.

In the new STEVENS-DURYEA Touring Car we have produced a vehicle perfectly adapted to the needs of the tourist, due to its great strength, high power, and light weight, combined with the fact that there are no low hanging parts between front and rear axles, thus causing contact with road obstructions. Owing to its compactness and light weight, our machine is suitable for practically all purposes for which a Runabout is ordinarily used.

The manifold joys of automobiling are emphasized in the highest degree possible by touring in the STEVENS-DURYEA.

Send for beautifully Illustrated 32-page booklet, containing full details of our car.

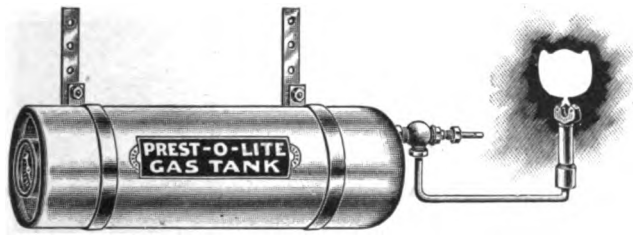
Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about Feb. 1st, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.



The 1904 edition is now out of print.

Sent upon receipt of 6 cents in stamps for postage.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

APPERSON

FORTY HORSE POWER—SEVEN PASSENGERS.

A large roomy car, for five or seven passengers. Built light and strong for **hard service** over American roads. Better material, better wokmanship, and better finish than is furnished in any **French car imported.**

We cater to a **high-class trade,** who want **only the best.** Each order with us means a special hand built car to suit the buyer. Nothing of the "Hand-me-down" type for sale.

Eleven years building High-Grade Cars. Three years building nothing but Four Cylinder Cars.

Why Buy Experiments?

"From my experience, I would certainly recommend a Locomobile to any one considering the purchase of a touring car."—J. H. M., New Haven, Conn.

"If I can do you any good at any time, by speaking to any one who doubts the qualities of the Locomobile, I shall be very pleased."—J. P. T., M. D., N. Y. City.

"I have run my Locomobile 4,000 miles and have never had occasion to leave my seat for any disarrangement or breakdown of machinery."—J. B. C., Bridgeport, Conn.

"I wish to say the Locomobile fulfills my expectations in every respect; it runs magnificently, does its work easily, quietly and without vibration."—A. S. P., Wichita, Kan.

"I must say the Locomobile has given me entire satisfaction in every way; the more I drive it the more I think of it."—C. L., New York.

"The Locomobile has now run about ten thousand miles, and is in as good condition as ever."—A. A. M., San Francisco, Cal.

"My Locomobile has made since the 22nd of January, 1903, 13,950 miles."—R. L. M., New York, March 31, 1904.

"The Locomobile is running beautifully and giving entire satisfaction."—W. A. R., Woonsocket, Mass.

"Mr. G. P. B.—— of Chicago, who owned one of our Type 'D' cars, and has just placed his order for one of our 30-35 H. P. cars, advised the writer that we do not claim enough for our cars." — B. G. Sykes, Chicago Locomobile Supt.

"This is the fifth automobile that I have had, but of all the cars I have seen or used, there is none that will compare with the Locomobile in any manner."—S. T. M., Lafayette, Ind.

"The Locomobile is delightful in every respect, and there has been no trouble whatsoever so far."—H. S. E., New York.

"It gives me much pleasure to say a good word for the Locomobile Gasolene Touring Car—I regard it as the most reliable and generally satisfactory of any of the twelve automobiles I have owned."—G. F. C., New York, N. Y.

"In every way the Locomobile has been entirely satisfactory; never has failed to do what was required of it. Refer any to me you care to."—A. G. M., Norwich, Conn.

"I have now run my Locomobile for about 6,000 miles, and it has never refused to come home under its own power."—F. W., Fitchburg, Mass.

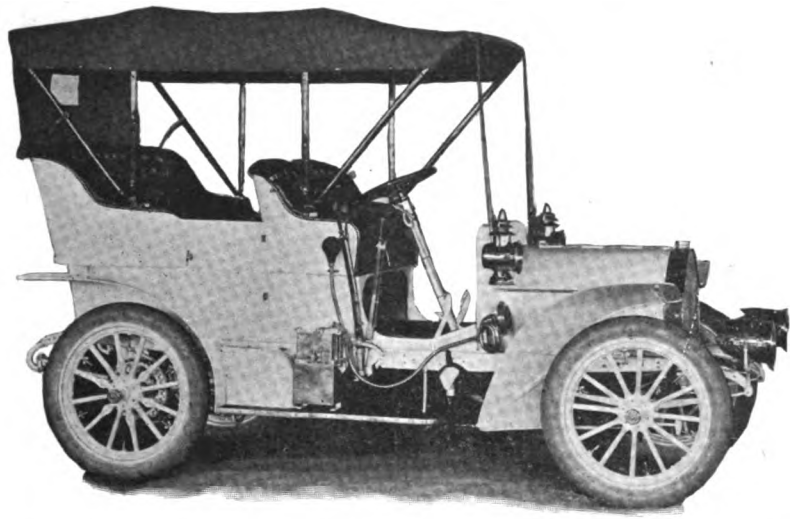
"Of our three large machines, we much prefer the Locomobile for all-round work and its satisfactory results."—C. F. L., Prest., Boston, Mass.

"The Locomobile is simple, efficient and satisfactory in every respect. I have used it over the worst kind of roads and under the most trying conditions, and have found it efficient in every respect." — C. E. B., New York City.

"My Locomobile delivered to me in November, 1902, is running satisfactorily, and with the exception of such adjustments as are necessary on all cars is always in commission."—M. M. R., New York City.

"I know of several owners of other cars who do not always return on schedule time, but have yet to hear of a dissatisfied owner of a gasolene Locomobile."—W. P. A., Ridley Park, Pa.

"I am frank to say I am delighted with the Locomobile. Believe there is no better machine made—in fact, do not believe there is another machine in the country that would have gone where I did last Sunday."—C. B. M., Minetto, N. Y.



"I think the Locomobile Company's claim of "Easily the Best Built Car in America" is a perfectly just one. I can readily claim it to be superior to any American and equal in the same horse power to any French car, and at the same time perfectly adapted to American roads."—J. C. S., Boston, Mass.

"I have run my four-cylinder Locomobile over 5,000 miles, without any bother, doing the driving myself."—W. B. S. Overbrook Farms, Pa.

"Have run my Locomobile easily 8,000 miles. She has always gone and returned from every place I have started for without any trouble."—D. N. A., Bridgeport, Conn.

"Cannot say too much in praise of the Locomobile. Have several friends who own cars, and they say it is equal to, if not better, than the foreign cars."—C. L. H., Norwich, Conn.

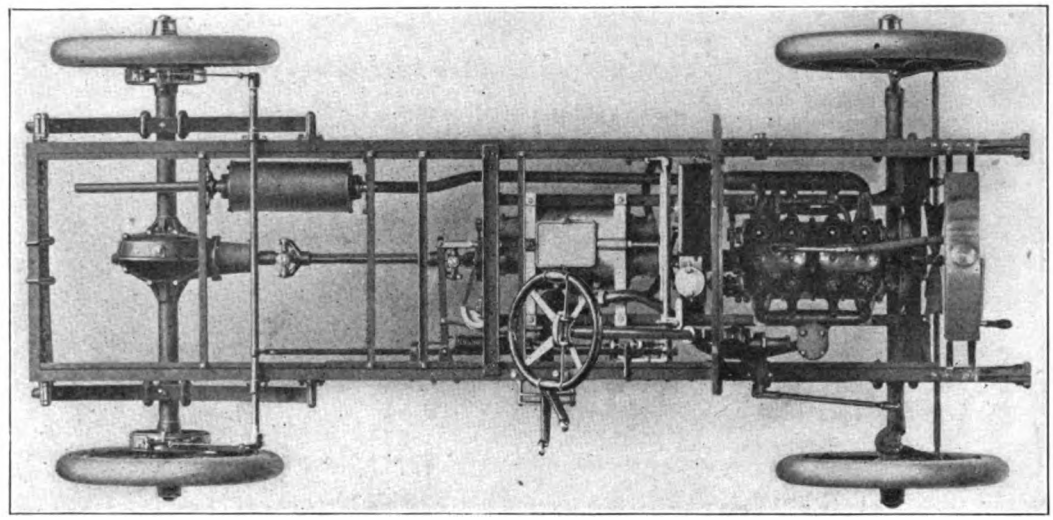
"I have now operated the Locomobile for about five months. During that time I have never wanted the car when it was not ready to go out."—W. A. W., Jr., Hoosic Falls, N. Y.

"The Locomobile has run between 6,000 and 7,000 miles. We have just examined the gear case and find that the gears are in perfect condition, and that there has not been the slightest wear in any of the bearings."—C. C. W., Cortland, N. Y.

"My experience last season was so satisfactory that I feel owners of Locomobiles would be doing intending purchasers an injustice by not letting them know what a good car they can get by buying a LOCO."—F. W. S., Mexico City.

"I have yet to see a car which I think is better than my Locomobile, or will stand up as well over all kinds of country roads with the ordinary usage which a car gets."—P. W. W., Boston, Mass.

"I fail to see how you could improve in any way upon the Locomobile, as its details seem perfect, and it is without doubt "easily the best built car in America."—A. L. P., Providence, R. I.



"Where my Locomobile was this summer for a month it was the only car out of two dozen, including high-priced foreign cars, that was always in good shape and running every day."—C. W. L., New York, N. Y.

The Autocar

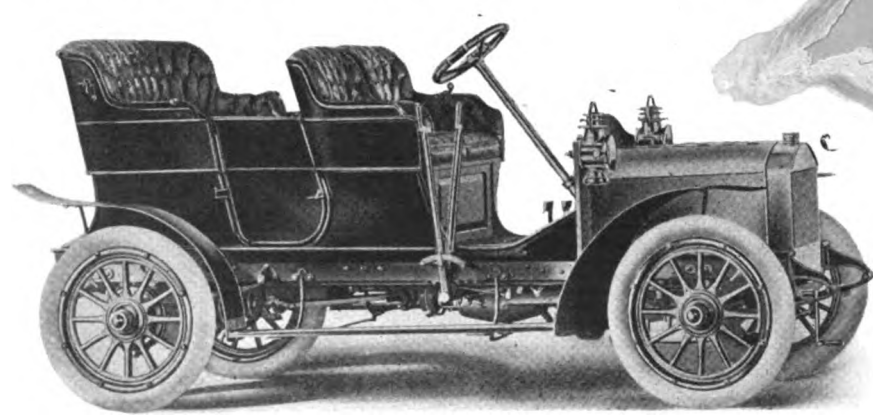
THE CAR OF SIMPLICITY

CHASSIS OF TYPE XI

The Autocar stands as a triumph in automobile building. Its construction combines with greatest efficiency and durability a simplicity that is the wonder of all who see it. This is a feature that commends itself alike to the novice and the expert. It means minimum liability of derangement, greatest ease and safety of operation, and lowest running expense. Each type of Autocar represents the nearest to perfection in its class. Every Autocar is built upon lines proven correct by experience; built of absolutely the best material, and with the best workmanship procurable.

Autocar records of actual performance bear out the claim that for good day-in-and-day-out, up-hill-and-down service, for durability and freedom from annoyance, the Autocar is unsurpassed.

The new car, Type XI, illustrated, with its chassis, shows a number of very valuable improvements, accomplishing increased ease of control, safety, and simplicity.



Type VIII, Four-passenger car, Rear Entrance Tonneau, $1400, and Type X, Ten H. P. Runabout, $900, are the cars which have made the present reputation of the Autocar, to which the new Type XI will surely add.

ORIENT MODEL DE LUXE TOURING CAR, 20 H.-P.; Price $2250.

ORIENT BUCKBOARD, Model A; Price $375.

ORIENT SURREY, Model B; Price $450.

ORIENTS OUGHT TO BE BETTER—

AND THEY ARE.

There is every reason in the world why Orient air-cooled motors ought to be the best air-cooled motors in existence.

In the first place, the Orient motor is made complete in the Waltham Company's Factory—and you know what "Waltham" stands for in machine work.

In the second place this Company has built and has in successful operation more than 3,000 air-cooled motors—a greater number than the combined output of all other makers of air-cooled motors in the world. This experience has been of immense value and it helps to show why the Orient motor is the best air-cooled motor to-day.

The Buckboard is a thoroughly artistic Waltham output, from its snappy, stylish lines, to its simple, speedy, reliable motor, and its light, but exceedingly strong construction. Here is a really wonderful little motor car—a car that is so simple any one of your customers could learn to operate it successfully in half an hour, and yet capable of the speed of an express train. When you consider that it is vastly improved over last year's model, and in spite of this, has been reduced in price $50, your business sense will surely tell you that you ought to have the Buckboard in your line.

This year's improvements are as follows:

Heavier and longer rear springs, giving as much spring surface as many of the large touring cars, an improved and simplified carbureter, which is so good we are thoroughly proud of it, improved driving pinions, which are now almost noiseless; a much more efficient muffler and a new release cock (patented), which is unquestionably the best device of its kind ever attached to a gas engine, making it so simple to start that even a child can turn the engine over without difficulty.

The new price is $375, which puts the Buckboard within reach of hundreds of people in your territory who cannot be sold any other car.

Rambler

SURREY, TYPE ONE, 18 H. P., $1350.

IMMEDIATE DELIVERY.

The operation of this vehicle is both simple and natural. The ignition of the spark is entirely automatic. The brakes are operated by pedals, not by levers. With the steering wheel and throttle attached to it, operable by one hand, the other hand is always free to manage the clutches by the single lever and no confusion is possible.

It has enough power for touring wherever roads are fit for travel. Greater power requires more fuel, more working parts and consequent disorders, a combination that puts a vehicle's operation and repair beyond the ability and means of the average user.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, February 9, 1905. No. 20

MAY GET TOGETHER

Efforts to Organize Independents Making at Chicago—Rumors Regarding Show—Insurance Incident Shows Intensity of Feeling.

Chicago, Feb. 7.—There are strong probabilities that the independent manufacturers will "get together" before the show closes its doors. If they succeed in doing so, it will, of course, carry with it the solution of the show problem so far as the independents are concerned.

A number of them held an informal meeting at the Auditorium on Sunday night, and another meeting for definite action probably will be held later in the week. Few of those who attended the conference are willing to talk, but, according to R. Harry Croninger, of the Dayton Motor Car Company, a settlement—perhaps a sensational one—of the show situation will come of it.

Quite naturally the talk that is going the rounds of the show is "an independent show for independents," to which is added the information that it will be a co-operative effort, all profits being returned to the exhibitors.

There are rumors that the Sixty-ninth Regiment Armory, now in course of construction at Twenty-seventh street and Lexington avenue, New York, has been leased for the purpose, but none of the inner circle will either confirm or deny the report.

There is no doubt that in the interim since the New York show the feeling between the adherents of the Selden patent and those outside the fold has become considerably embittered. As an instance, a representative of one of the New York concerns, who is here, yesterday told a Motor World man that he had been refused fire insurance on his plant because he was not a member of the Association of Licensed Automobile Manufacturers.

"About two weeks ago," he said, "I filled in the usual blank applications, submitted my plant and stock to the insurance inspectors and underwent all the other formalities. Nothing was said or done that would indicate that we were not a good risk, and I, naturally, set back and awaited the receipt of my policy. Imagine my surprise, therefore, when, instead of the policy, I received a letter from the insurance company stating that, as we were not members in good standing of the A. L. A. M., our risk would not be underwritten.

"Unless I am very much mistaken, this constitutes an offense that renders someone liable to investigation by the State Insurance Department, and I am turning over in my mind at this time as to whether or not I shall report the occurrence and ask for an investigation. Having the documentary evidence in black and white, I think I will be able to make out a pretty strong case."

The man concerned seemed to think that in some way the A. L. A. M. was at the bottom of the matter, which, however, will strike the disinterested individual as being inconceivable.

Lozier Swells Capital to $1,100,000.

Plans which for some time have been considered by the principal stockholders of the Lozier Motor Co. have begun to assume definite shape. At a special meeting of the stockholders it was unanimously voted to increase the capital stock from $500,000 to $1,100,000. Over $500,000 of the new stock, which will be issued on March 1, was immediately subscribed. This increase in capital was made necessary on account of the great growth of the marine motor and motor boat departments, and also on account of the additional working capital which will be required in the automobile business.

Richwine Comes East Again.

W. A. Richwine, of Philadelphia, formerly sales manager of the Autocar Co., and late manager of the West Coast Automobile Co., of San Francisco, has returned to the East. He will become manager of the Highland Automobile Co., Pittsburg, Pa., this week.

Canada Increases the Duty.

The Canadian Board of Customs has increased the duty on automobiles to 35 per cent ad valorem, instead of the previous rate of 25 per cent. The duty on rubber tires has been correspondingly increased.

LOOKOUT! WARNS LETTS

His Last Visit Opening Wide His Eyes, he Tells Foreigners America Must be Reckoned With.

W. M. Letts, who formerly was identified with the Locomobile interests, and who is now a member of the firm handling Oldsmobiles in London, has returned to the "tight little isle," and warned his countrymen that they may as well face the fact that the Americans are to prove really serious factors in the markets of the world. Letts spent several weeks in this country and summarizes his impressions in this wise:

"Only those who are keeping in constant touch with America, and have had an opportunity of getting over there, have any idea of the enormous strides that American motor car manufacturers have made within the last eighteen months. I have been interested in American cars for something like five years, during which time I have had an opportunity of going over each year and seeing exactly what they were doing, and I can assure you that within another eighteen months to two years we shall have to count on American competition over here in England. In the early years of the industry every American manufacturer was working out some cranky idea of his own, either in connection with a steam car or a light runabout, with the rsult that so far as the steam business goes they made a number of cars of one type, never improved them, and thought that this car, without any improvements, which would satisfy a man then would satisfy him now. With the exception of the White people—who are building a really good steam car—none of the other manufacturers of steam had the foresight or common sense to continue experimenting and making improvements in their models, with the result, as I say, that with this one exception, the steam car business in America is dead.

"Apart from this the only type that the Americans turned their attention to was the "runabout." One after another came on to the market and went out, and at the present time, although there are other very good runabouts, still I think the Olds Motor Works

Digitized by Google

are quite right in claiming that they turn out more cars than any other factory in the world, for the simple reason that they keep improving their car from year to year, and keep the price practically at the same figure. They can only do this by the enormous quantities that they sell. Last year it is estimated that 10,000 Oldsmobiles were sent out of the works to different parts of the world, and up to the present time they have orders for over half that number for delivery this year. With the exception of the Olds Motor Works, most of the manufacturers are now commencing to put upon the market four-cylinder cars, and there are some of the worst specimens of four-cylinder cars coming out of some of the factories in America that the world has ever seen. Last November I went through a number of the factories and had a look at them, and some of the cars were so much scrap iron; but, on the other hand, it is only fair to America to say that some of the firms are turning out four-cylinder cars built on the right lines, retaining the best points of European practice, and strengthening parts which are too weak for American roads.

"While I was over there I had the opportunity of a run on one or two really good cars; in fact, the four-cylinder cars now being built by the Locomobile Company, the Packard, and the Pope-Toledo, are as good as anyone could wish to own, that is, for ordinary work. Strangely enough, the Locomobile Company, when they gave up the construction of steam cars, had a name which was not one of the best, but after realizing that they were on the wrong lines in connection with their steam car business, they went very carefully to work, securing Mr. A. L. Riker as their designer, and getting the very best superintendent it was possible to obtain in America to take charge of their works; then with plenty of funds behind them they started building petrol cars. The result has been that the first year they turned out a very fair car; the second year they built a car that a man could sell at the end of a year and get a very good price for it; but now they have got, in my opinion, the best four-cylinder car manufactured in America; the design and workmanship are alike good. Mr. S. T. Davis, Jr., president, invited me to take a trip with him from New York to New Haven on his 24 h. p., and I was absolutely surprised. I was in America the two last weeks in November, and in those two weeks the Locomobile Company took orders for sixty cars for delivery in the early months of this year at an average price of over $3,000, and they expected to come away from the Madison Square Show—which is taking place about this time—with every car for delivery in 1905 sold.

"Then I had an opportunity of going over the Packard factory, which, by the way, is an entirely new one, built on the very latest principles in a magnificent style. They very kindly allowed me to try their car, which is first class, runs beautifully, and the price is right, and they are full up with orders. The same applies to the Pope-Toledo. There are also several other very good cars, but I think that if I were asked to place the four best American cars I should say: the Locomobile, Packard, Pope-Toledo and Peerless. Winton, at the time of my leaving, had not produced his four-cylinder vertical motor, but I understood it was about ready to come out. With the enormous factory which he has he ought to be able to turn out a good thing.

"The one thing that surprised me more than anything else was the vast capital which was going into the motor companies in the States. Colossal factories are being put up all over the place, and this not only applies to the manufacture of large cars, but to small as well. The Olds Motor Works have built another enormous plant at Lansing, Mich., to deal entirely with their "runabout" class. Their factory stands on 100 acres of ground, and Mr. Smith, president, told me that, taking the whole of the Olds Motor Works factories combined, there was a mile of frontage. Mr. Metzger, of the Cadillac Company, also gave me an opportunity of going over their new factory (it will be remembered that the old one was burned down some time ago). This new factory is very large, and they seem to me to be starting with the idea of turning out cars by the hundreds and thousands—otherwise what will they do with their huge plant?

"I must say that this last trip of mine to America was the most surprising that I have ever had—I mean in regard to the wonderful progress that has been made during the last eighteen months—and every one of the manufacturers without exception realizes that he has his own market to supply, although they are all looking to get into the European market, and are determined to get there when they have their cars perfected, and can come over and enter into open competition with our French and German cars. So far as the export trade to America is concerned, which at the moment is very considerable—bearing in mind that they have to pay a duty of about 49 per cent.—I think that in two years' time the export trade to America, with this tariff, will be very small. Please do not misunderstand my remarks. I am not saying that America is coming over to England and going to wipe us all out; there is no such idea in my mind; but what I do say is that we are going to get serious competition from America within the next few years."

Russia Sustains Another Defeat.

Russia was defeated again last week, not by the Japanese, but by the Oldsmobile people. Andrew Zembriska, the Moscow agent of the Olds cars, who is now in this country, wagered that a 20-horsepower Olds touring car could not make the trip through the snow from Detroit to Chicago, and the makers promptly "took him up." Several times the car had to be dug out of the snowdrifts, but the trip of 272 miles was made in a fraction under eighteen hours. The car was driven by G. S. Buck, advertising manager of the firm.

The Week's Incorporations.

Lansing, Mich.—The New Way Motor Co., under Michigan laws, with $100,000 capital.

New York, N. Y.—"Le Marquis" Tire Co., under New York laws, with $25,000 capital. Directors—Arthur C. Brady, Charles I. Scott, Henry Nicot.

Dover, Del.—Oxford Motor Car Co., of Pittsburg, Pa., under Delaware laws, with $500,000 capital; to manufacture motor cars and vehicles of all types.

New York, N. Y.—Times Square Automobile Co., under New York laws, with $10,000 capital. Directors—Morris Froehlich, Jesse Froehlich and Frederick Bloch.

Newark, N. J.—The Ford Kerosene Engine Mfg. Co., under New Jersey laws, with $125,000 capital. Incorporators—Henry Hosier, Samuel Oshinsky, Henry B. Ford.

Paterson, N. J.—The Paterson Automobile Exchange, under New Jersey laws, with $10,000 capital. Incorporators—George M. Rusling, E. De Witt Carlough, Arrilla I. Carlough.

Cleveland, Ohio—The Automobile Livery & Repair Co., under Ohio laws, with $10,000 capital. Incorporators: L. P. Stein, G. C. Conway, C. E. Harriet, C. L. Snyder and R. E. Hyde.

Detroit, Mich.—Walker Motor & Machine Co., under Michigan laws, with $25,000 capital, $4,750 paid in. Stockholders—Chas. L. Walker, Henry A. Teall and J. Wilfred Drummond.

Niagara Falls, N. Y.—Niagara Tachometer & Instrument Co., under New York laws, with $200,000 capital. Directors: Charles R. Huntley, Addison H. Hinman and George J. Howard, of Buffalo.

Chicago, Ill.—The Importers' Co., under Illinois laws, with $2,500 capital, to do business in automobile and electrical sundries. Incoroprators—Ralph W. Condee, L. W. Condee and B. H. Kuehn.

Minneapolis, Minn.—Moulton, Jordan Motor Car Co., under Minneapolis laws, with $120,000 capital, to manufacture automobiles. Incorporators—E. H. Manton, Jr., Theordore C. Jordan and Earl A. MacVicar.

Detroit, Mich.—Leinbach Bros. Co., under Michigan laws, with $7,000 capital; to manufacture leather covers and trimmings for automobiles. Incorporators. E. L. Leinbach, Clyde Leinbach and A. W. Muer.

Minneapolis Trade Elects Old Leaders.

The Automobile Dealers' Association, Minneapolis, Minn., made no change in the election of officers at their annual meeting. Albert Strong was re-elected president; W. T. Walker, secretary, and E. H. Moulton, treasurer.

In a discussion regarding the Chicago show the president urged the members to refrain from making disparaging remarks in their business operations about competitors who hail from the same town, and to act in union as much as possible.

WANTS GARAGES LICENSED

Scarritt Advocates Such a Law and Would Have Road Rights Made Revocable Privileges.

In his address, speaking to the subject "Automobile Legislation," at the Automobile Club of America on Tuesday, Winthrop E. Scarritt, former president of the club, dwelt particularly on the inadequacy of fining reckless drivers, and came out, quite unexpectedly to his handful of hearers, with a suggestion to withdraw a man's right to use the roads.

He advocated "that on conviction, in addition to other penalties for a first offence, let the license certificate be revoked for a period of fifteen days; for a second offence, a revocation of thirty days, and for the third offence a revocation of one year."

Scarritt contended that 90 per cent of automobilists suffer on account of the remaining 10 per cent, which consists of either the harum-scarum, daredevil chauffeur who can never be taught a lesson by a fine or the wealthy car owner who drives recklessly and who is not in the least perturbed about paying the fine.

It was his opinion that the object of sound legislation is to protect the public, but not retard the development of a new and important industry.

"We are practically twelve years behind on account of the restrictions placed on automobiling," he remarked.

Another submonition concerned public garages, and that they ought to be under the supervision of the law. "They should be required to take out a license," he said, "and keep a record of each machine, showing the exact time it was taken out and the exact time it was brought back. The duplicate of this record should be furnished the owner of the car once a week, and no machine allowed to go out without written orders from the owner."

Concerning chauffeurs, he recommended "that they take out a license and keep a record of the car when it leaves and returns to the garage. In the event of the car becoming disabled to immediately notify the owner."

Other suggestions were: "That all cars above 5 horsepower be required to have two brakes, one of which should be double acting; that a speed of twelve miles an hour in corporate limits be permitted, and in thinly populated districts eighteen to thirty miles an hour; no speed on highways greater than is justly deemed safe."

"Due to the reckless chauffeurs, all automobilists are singled out and put in the criminal class, with conspicuous tags attached to the vehicles," he added.

Scarritt then gave statistics, mentioning the recent test on Fifth avenue, where it was proved that 437 horse drawn vehicles exceeded the speed limit and no arrests were made, whereas automobilists travelling at no greater speed than the horse drawn vehicles were promptly arrested.

The lecturer called attention to the fact that a man's word, which is taken everywhere without the suspicion of a doubt, is doubted once he is in court on a charge of overspeeding.

Hot Shot for Detroit Men.

Sensational allegations were made in the Toledo (Ohio) court, before Judge Morris, last Wednesday, relative to the Toledo Fire, Police, Notification & Auto Parcel Delivery Co., which had so long a name and such a short existence. Arvide C. Hester was made receiver of the defunct company, as mentioned in the last issue of the Motor World, and brought suit against the directors, charging gross mismanagement.

Attorney Monnette, for the receiver, made a scathing speech in court. "Two men came down from Detroit with the idea that Toledoans were gullible and organized the company, pocketing—yes, stealing—all the money. The directors have paid no attention to the business, but have let it go to the devil."

Creditors will get very little, if anything, and Hester will probably have a libel suit to fight.

Perkins has Ideas, Wants a Factory.

W. C. Perkins, of Stanhope, N. J., thinks he has formulated a sufficient number of workable ideas to manufacture automobiles. Accordingly he has appeared before the Stanhope Board of Trade and petitioned them to erect a suitable factory building, and suggests one 50x100 feet. A committee has been canvassing the town for subscriptions, but seems to have met with little success as yet.

Fire Wipes Out Ware Dealer.

Another winter fire has destroyed the automobile and repair shop of E. S. Ruggles, Ware, N. H. The cause of the conflagration was a defective chimney in another part of the building. The loss is estimated at $5,000, and the amount of the insurance only covers half of that loss.

Two Plants Instead of One.

The Wilson & Hayes Mfg. Co. write that the report that they are removing their body, bonnet and metal specialty factory from Detroit to Lansing, Mich., is due to misunderstanding. What they are doing is enlarging their Detroit plant and establishing a branch factory at Lansing.

Miller Gets Move Room.

Charles E. Miller, the well known New York jobber and manufacturers' agent, has finally obtained the loft adjoining his present place in Reade street. It adds a space 25x75 feet to his much needed elbow room.

Fire Destroys Gates's Garage.

Frank H. Gates was among the sufferers from the fire which swept Islip, Long Island, last week. His garage and repair shop were completely destroyed.

The Ideal Machine & Automobile Co. has begun business in Lebanon, Pa. J. C. Bowman is its manager.

CHAUFFEURS FOR REFORM

"Not a Labor Union" Declares New Organization and then Outlines Possible Usefulness.

The newly organized Chauffeurs' Association of America, which has its headquarters in Philadelphia, is clamoring for reform. One of the so-called abuses which it hopes to correct is the operating of automobiles by coachmen and laborers under the owner's license. Frank Bradley, president of the organization, has this to say in the chauffeurs' defense:

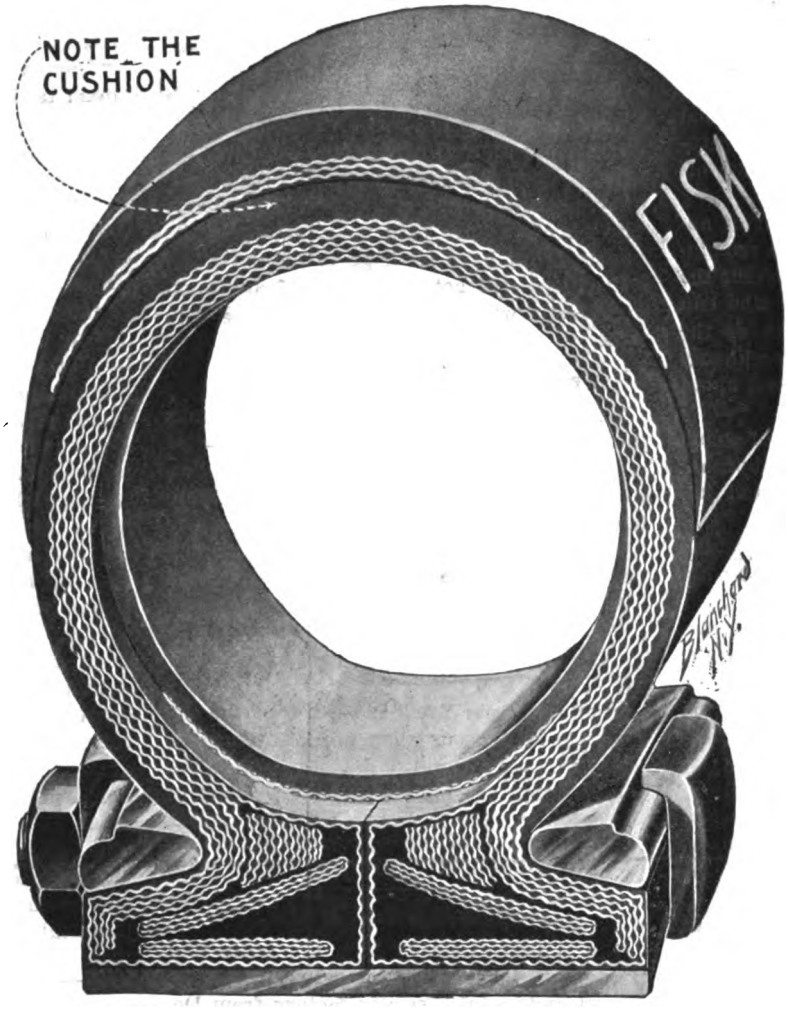
"This is not a labor union. We do not intend to dictate wages or hours, but rather to protect professional chauffeurs from the odium which arises from accidents caused by irresponsible persons. It is also our object to encourage the formation of associations in other cities, so that there may be a chain of clubhouses throughout the country where chauffeurs may stop and meet others of the fraternity.

"One of the chief causes of accidents here in Philadelphia and in other cities is the promiscuous granting of licenses to inexperienced persons. Any man may go to the Bureau of Boiler Inspection, and by the payment of $2.50 get a license to run an automobile, whether he knows the first thing about the car or not. A license should not be granted to any person until he has shown that he knows the principles of gasolene, steam and electric automobiles. This, of course, would require a competent city official to conduct examinations. We have nothing against the Bureau of Boiler Inspection, but the trouble lies with the regulations governing automobiling; the sport has grown so rapidly that the city officials have not kept abreast with it. This is true, not alone in Philadelphia, but in nearly every other city.

"Many accidents are caused by automobile owners themselves. They are not, as a rule, practical men, and yet they take more risks than a seasoned chauffeur. If these men were required to pass a rigid examination before they are allowed to have a permit, there would be less accidents. Applicants have to pass a strict examination before they can be admitted to the Chauffeurs' Association, and we consider 'turn about fair play.'"

The Rush for Fisks.

Evidence of the extent to which the Fisk mechanically fastened tire has "caught on" is indicated by the fact that the Fisk factory, at Chicopee Falls, Mass., last week began to work 22 hours out of the 24.



This rushing state of affairs was made necessary, despite the fact that only last month the Fisk people took possession of a new four story addition to their plant, 45x120 feet. At the same time, they moved into their new shipping and office building, which is a three story structure, 87x45 feet, the office occupying one of the floors. The original factory building, which is, of course, still in use, is of three stories, 50x150 feet.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, FEBRUARY 9, 1905.

The Length of Frames.

Is the long frame here to stay, or will the experience of the coming season show that the extreme has been overstepped and mark a return to more moderate dimensions in this respect?

As matters stand in this country, the question is somewhat premature, and can hardly meet with a definite answer until its advantages have been balanced against its shortcomings in the scale of experience on American roads, for it is only since the introduction of the side entrance tonneau that what appears to be the maximum, or probably what may prove to be a little too much for safety, has been reached.

Abroad, on the other hand, the consensus of opinion appears to be that the maximum was attained before this added incentive made further lengthening a necessity, and, according to foreign contemporaries, efforts are already making to get around the difficulty. This is particularly true in France, whose makers have usually led the way where frames and bodies are concerned, and it is remarked that several of the leading firms are now building short frames to carry side entrance bodies, and making such a radical departure as to place the engine under the driver's seat in order to accommodate the new arrangement. By this means the usual landaulet, coupé, limousine or double phaeton can be easily fitted to a frame of this type, which is thus shortened almost by the length of the usual motor bonnet, the steering gear being placed well forward so as to economize as much of the front space as possible.

It is said that the long frame has not given unqualified satisfaction abroad during the last season, owing to the fact that with increased length the difficulty of adequately supporting the load and taking care of the strains is added to in inverse ratio.

Excessive weight in the frame itself or an elaborate system of stays or trusses are alternatives equally undesirable, and both of which will add to the tiremaker's troubles, but how otherwise is the requisite strength to be attained? Much can be done by improvement in the quality and suitability of the material employed without unduly increasing the weight, as has been demonstrated in the case of freight and passenger cars built of pressed steel. But the constantly increasing weight of covered bodies is a factor that cannot be ignored, and it is said to be the experience of makers abroad that the long frames suffered badly enough from the jolting and racking over rough roads without the latter. Torsion strains due to the use of the propeller shaft are likewise an incident to be considered, owing to the more general adoption of this form of drive.

The inconvenience of negotiating corners under crowded traffic conditions, as in winter, when the car is used almost entirely in the city, and that of storage of the lengthy car in the ordinary coachhouse are put forward abroad as further detracting from the value of extra length, but these are considerations of insufficient weight to enter into the designer's calculations, and doubtless the former is somewhat exaggerated, as it is safe to say that no difficulty of this nature has been encountered with the long framed car here, which even in its extreme does not surpass the length of the average horse drawn vehicle when combined with its motive power.

American roads are notoriously bad, and if the foreign car with long frame has suffered sufficiently serious damage, when run over the immeasurably superior roads of the Continent to compel its makers to consider a return to former standards of length, it would seem to go without saying that their experience will be duplicated here, but only the latter will tell.

The Dream and the Awakening.

When the wish is father to the thought, the dreams of a day that can be dreamed are past understanding. The conflict between sport and commercialism which served to mar the Florida speed carnival caused some dreams of the sort, if some of the stories printed last week are correctly interpreted. The dreamers saw the galvanization of that dear old reminescence, the American Motor League—saw it swallowing the American Automobile Association and with a firm directing grasp on automobile sport. The dream undoubtedly caused long itching palms to itch the more.

To-day, however, the beautiful sleep picture is seen to have been but an empty nightmare. The A. A. A. has come through the fire unscathed, and with more strength than ever before. All wounds are healed, all breaches closed, and the directing head is one at whom no man dare point a finger. The turn of events has proved most happy in its results, although it must be admitted that it holds small hope for itching palms.

It would have been a sorry day had the reverse proved the case. The idea that two ex-professionals, one a former English runner, the other a Welsh six days' cyclist with a peculiarly interesting past, who have fastened themselves, or attempted to fasten themselves, on the new sport, should, backed by a firm of hotelkeepers, attempt to set up themselves as its dictators or to in any way influence the direction or control of automobiling is repugnant to every sense. It is small wonder that real sportsmen should resent such a situation, or that they should determinedly rally around their standard.

If it were not for the fact that the two professional "sportsmen" in question controlled by mortgage or otherwise influenced certain more or less public prints and have what may be termed a "newspaper following," the whole affair, and, indeed, the so-called motor league itself, would be as amusing as it is significant. The prints are able to make things appear large and rose-hued when in fact they are mere dark specks, and this is the case in this instance. Uncovered,

Digitized by Google

the little retinue stands exposed as identically the same set of men who, through the favors of one of their number and who obtained the lion's share, extracted most of the "perquisites" that came of the bountiful days of the League of American Wheelmen—the professional six days' cyclist alone excepted. His "sportsmanship," which reached its zenith during a considerable episode that occurred at Hartford, Conn., placed him outside the L. A. W. pale. Practically all of the others obtained their "bits" in the form of handicapping fees. This is not to their discredit; they doubtless earned their money. But what is remarkable is that several of those who "fell out" with the chief dispenser of patronage, and damned him as lustily as once they acclaimed him, in print and out of it, returned to his shrine when he set up himself or was set up in a seeming position of power in automobiling. Save one, the nearest that any of the coterie come to being automobilists is the possessorship of "automobile cups." It also is worthy of remark that at least four of the men concerned were former business associates of the craftiest and more affluent of the former British "sportsman," while a fifth one, ensconced in an official position in the Chicago Automobile Club, adroitly throws the anti-A. A. A. spitballs in the West, where three other former associates also are located.

Of such is the opposition to the A. A. A. constituted. The truth is not pleasant, but it is well that it should come out. This is it; and there is not a man who dares say to the contrary.

In passing, it may be remarked that the organization that does not control racing has no handicapping fees and few other pecuniary favors to dispense.

Where the Blame Rests.

It is not pleasant to believe that an excess of publicity and popularity have gone to such a level head as that possessed by Winthrop E. Scarritt. It is not possible, however, to escape the unpleasant suggestion when he publicly urges the revocation of the automobilist's right to use the public road as a means of subduing the scorching evil.

Mr. Scarritt's suggestion is unfortunate, as it will undoubtedly serve as a strong peg upon which much undesirable legislation may be hung. If rights are inherited, few, if any, are more precious than the right of the freeman to use the public roads in a vehicle of his choosing; and this right is inherited. We believe it is irrevocable, and that it will be so proven on the first occasion it is put to the test. It cannot be clouded or affected by the hue and cry of the multitude or by the offences of the few. It is a right that should be preserved at every cost.

So far as concerns the State of New York, there is ample legislation now on the books for all purposes. It covers practically every point, and, properly and vigorously applied, it is quite sufficient to subdue the worst terror of the road.

So far as concerns New York City, the magistrates, who are given to delivering speeches whenever an automobilist is brought before them, are entirely to blame. On not one occasion that we can recall have they applied the limit of the law, or even the "second gear," so to speak. Despite their scoldings, their dispensation of justice has in the main been tempered with mercy—too much of it, perhaps. If they scolded less and appeared less anxious to see themselves quoted in print, and brought the law to bear more hardly it would cover every point.

The mental attitude of these magistrates was never better illustrated than by an incident which occurred in one of the city courts within the last month. At the offending chauffeur who was brought before him the learned judge hurled this question:

"What would you do if you saw a crowd of people at a street crossing?"

"Apply my brakes," very naturally responded the chauffeur, which is exactly what 999,999 out of 1,000,000 men would do.

"You would do nothing of the sort," retorted the magistrate; "you would run into the crowd."

It seems to afford these lower tribunals more satisfaction to deliver themselves in this fashion than to really vigorously enforce the law.

Perhaps the most flagrant offence in which an automobile has been involved was that in which an aged countryman was knocked from his wagon on the road, inside the limits of New York, by a chauffeur indulging in a midnight carousal in his employer's car and without the owner's permission. The chauffeur had not the common courage of a dog, and left the victim lying at the side of the road, where he was found at daylight wrapped in a blanket. His life hung in the balance, and, though he recovered, his injuries are such that they will affect him for life.

The public prints were filled with righteous denunciations of the coward, and the Automobile Club of America was moved to offer a reward of $100 for his arrest and conviction.

The incident served to open the floodgates of condemnation of automobiles generally. What was the outcome? The detectives, who devoted themselves to the task of running down the perpetrator of the cowardly deed, performed their work well. They practically secured a confession from the man himself. They certainly obtained witness aplenty. There were seventeen of them in court when the case was called for trial. Two of them were heard, and the prisoner was promptly discharged. When the chief detectives in the case sought to say a word he was abruptly ordered out of the presence of the court.

The case was so flagrant that the Motor World tried to get at the bottom of the miscarriage of justice. It seemed only too plain that influence had been brought to bear. Our investigations went so far as to prove that there was scarcely a reasonable doubt but that the right man had been apprehended. The detectives and witnesses were ready to swear to it. The magistrate himself was the one man who held the key to the solution. He fell ill about the time the Motor World had builded up its case sufficiently to place it before him and to try to "draw him out." Three separate endeavors to see the invalid were unavailing. His death put an end to it all.

The instance is a typical one. The chauffeur in question was the employe of a prominent man, and, though he deserved no mercy, he obtained it in unjust measure. He was not a rich automobilist, about whom the public prints prattle as being the chief defiers of the law. In fact, it is notorious that it is not the rich man, but the humble chauffeur, who is the most notorious offender. A number of them have been arrested three several times, but not one of them has been given the limit of the law nor even the limit of the fine that it is possible to impose.

If there is any blame for the state of things; if, indeed, the hue and cry which has been raised has not been due wholly to unreasonable fear on the part of the populace, inflamed by the newspapers, the blame rests, as we have said, with the magistrates, and with no one else. There is no reason for further legislation. There is no reason under the sun for revoking a man's right to use the public highways. As long as he is at liberty he should be free to use them lawfully, and when and where he will.

Floodgates of Automobile Legislation are Opened.

Indiana Defeats an Odor-ous Amendment.

The advocacy of the Crumpacker Automobile bill by the members of the upper house of the General Asembly in Indiana on last Wednesday afternoon gave rise to an amendment that, if carried, would have been disastrous to the intents of the bill. Skilful jockeying of phrases, however, eliminated the dangerous provision, and the bill became a law by a vote of 44 to 2. The Senators voting in opposition to the bill were Thralls and Durre.

Before the final vote was called for an amendment was proposed that empowered county officials and road commissioners to make arrests of chauffeurs of cars that give out an obnoxious odor of gasolene, but this amendment was promptly thrown out and the bill passed as read.

Senator Crumpacker's bill, as outlined in last week's Motor World, provides a speed limit of eight miles an hour in the business sections of cities and towns, fifteen miles for other parts of a municipality, and twenty miles on country roads. Every car must be licensed with the Secretary of State, and numbers not less than five inches in height must be displayed at all times. The registration fee is $1. A white light in front and a red light behind must be shown between one hour after sunset and one hour before sunrise. On signal from the rider or driver of a horse which has become frightened the car must be stopped until the animal is under control. If necessary to quiet the animal, the engine must be stopped.

Three Bills in Minnesota.

Three automobile bills are now pending in the Minnesota Legislature, all of them making for mischief.

Senator Thompson apparently got hold of a copy of the old and mischievous New York law, since repealed, as his bill embodies its silly provisions requiring that no automobile is to pass a horse, foot passenger or domestic animal at a speed over eight miles an hour, nor pass any schoolhouse between the hours of 8 a. m. and 4 p. m., nor any church on Sundays, nor within half a mile of any postoffice faster than eight miles an hour. A provision is made for the registration of the number of every car with the Secretary of State on payment of a fee of $2. The penalties range from $50 to $100. The bill empowers county commissioners to fix their own speed limits and to make "general rules"—latitude that will result in chaos.

The other two bills were introduced in the House by Assemblymen Kelly and Thundale, respectively. The principal changes proposed by the Kelly bill are that an automobilist must slow down to five miles an hour when passing a horse, and that the number of the car must be printed on both sides of the car in numerals at least 4½ inches high. Thundale's measure is similar to Thompson's, excepting a clause which provides for the repeal of the present law.

New Hampshire May Fix $3 Fee.

Representative Samuel Couch, of Manchester, is the author of New Hampshire's automobile bill, which is now pending in the legislature of that State and which is practically a reproduction of laws now in force in the other New England States. It requires that all machines be registered in the office of the Secretary of State, for which a fee of $3 will be charged. It specifies that a car must not be run at a greater rate of speed than twenty miles an hour on the country roads and ten miles in towns. On approaching a crossing the car must be slowed up. Each machine must be fitted with an adequate brake, a muffler and a horn or bell. Speed must also be lessened when passing a horse drawn vehicle. Persons convicted of violating any of the provisions of the act shall be fined $20, and on the second conviction be fined $50, and on the third conviction be fined $100 or be imprisoned not exceeding thirty days.

California Senator Wants Badges Worn.

Senator Charles M. Shortridge, of Santa Clara County, Cal., has declared against automobiles, motor bicycles and steam road rollers; not declared absolutely that the space eliminators and the stately ironers of the roads must be abolished, but rather that all such vehicles be regulated as to speed and identification. The details of Shortridge's idea are embodied in a bill which the Senator from Santa Clara introduced in the upper house last week. The bill meanders through quite a volume of closely typewriten vellum pages, but the gist of the measure is that each county shall see to the regulation of the speed of all automobiles, motor bicycles and steam rollers, and that each chauffeur must be licensed by the State and wear a badge on his coat like a policeman.

The rate of speed to be allowed is to be determined by the various boards of supervisors of the various counties, and is to be computed according to the use of the roads by horse driven vehicles and by the population bordering on the roads. The result of such computation is to be printed and posted at intervals of every quarter mile in a conspicuous place along the roads.

Instead of the usual method of licensing the car, the chauffeur must be licensed, and, besides the badge worn, the number must be displayed on the body of the car and on the lamps. The violation of any sections of the bill Shortridge would have punished by a fine of not less than $100 nor more than $250, or by thirty days' imprisonment. In case of inability to pay the fine the magistrate before whom the case is tried may hold the automobile until the fine is paid.

Tinkering in Massachusetts, too.

Automobilists in Massachusetts will find their presence greatly needed at the various committee hearings of proposed amendments to the existing automobile law. The bill, No. 759, relative to the speed at which automobiles may be operated on the public roads, was given a hearing last Thursday, and counsel for certain egotistical Massachusetts gentlemen, who firmly believe in the incarceration of all automobilists, attended the hearing and quite naturally expressed themselves feelingly on the subject.

Thornton K. Lothrop, who would place automobilists in the same class as common drunks if he could be the ruling power, proposed that the penalty clause of the automobile law be modelled after the drunk law; that on the first offence the offender shall go free, the second offence shall be punished by a fine, and the third infraction shall mean imprisonment. The only change would be the omission of the fine stage, so that there would be only two stages in the "downward progress" of the transgressor.

In this bill the Highway Commission desires to have its judicial powers increased; to have a registration terminated with the transfer of ownership of an automobile; to prohibit all but Massachusetts numbers on a car, and bring all foreign machines within its power; to retain power to revoke a manufacturer's or a dealer's certificate of registration, and to give novices an opportunity to learn to operate a car without breaking the law. At this hearing no objections to the proposed amendment developed, but it was made plain that a number of influential citizens will make a strong effort to change the penalty clause of the bill. It is desired to amend the law so that the Highway Commission must revoke an operator's license or certificate if he has been twice convicted of overspeeding. Then, if an unregistered machine is operated or an unlicensed chauffeur operates a car, it is desired to make the punishment of the owner a sentence of thirty days or more in jail.

The hearing on this matter was not concluded, but after the horse owning members of the opposition had talked themselves hoarse in denouncing automobilists the presiding officer graciously announced that the hearing would be continued Friday, February 14.

Besides the continuation of the hearing of the above bill, the committee will take up

Digitized by Google

another bill proposed by the Highway Commission. This measure is based upon the recommendation in the annual report of the commission that it be given the right to further regulate speed on certain highways upon petition of interested parties, increasing it on some roads and decreasing it on others. This bill will undoubtedly be supported generally by automobilists, as there are many open, straight stretches of roads in the country where a higher rate of speed than is now permitted would be absolutely safe, although, as a matter of fact, the passage of this bill would merely mean the legalizing of a practice that now exists and has been in vogue for several years.

The other matter to be considered on this eventful day is the bill relative to the speed of automobiles, which reads as follows: "The gearing and other mechanical devices used for transmission of power from the engines of motors of motor vehicles shall be so arranged that the speed of said motor vehicle cannot exceed that permitted by law."

This provision is akin to the one now pending in the New Jersey Legislature, and is, of course, as impossible of enforcement. As one observer pointed out, a car with gearing capable of developing fifteen miles an hour necessarily would be under the ban of the law if run in places where the speed limit is ten miles an hour, or on park roads, where the limit is eight miles.

Delaware Hears a Jester's Bill.

Representative Jester, of Delaware, has introduced an automobile bill in the legislature now in session at Dover which befits his name, although some clauses of the act seem reasonable enough. The Representative must have copied his measure from the Pennsylvania law, for the bill contains terms and legal expressions peculiar to Pennsylvania that could not apply to Delaware. For instance, it provides that certain forfeited bail shall revert to overseers of the poor in various "townships" in which the money shall be forfeited. Provision also is made for appeals to the "Courts of Common Pleas." If the truth be known, there are no townships or Courts of Common Pleas in Delaware, but the townships are designated as "Hundreds."

Stripped of its verbiage, the act provides that all owners of motor vehicles must file a declaration of competence to drive the machine, in the office of the Secretary of State, together with a description of the automobile, the name of the owner, etc. A registration fee of $1 is required to be paid to the Secretary of State, for which a license shall be issued, and no further license or permit shall be required. This applies to all owners of automobiles in Delaware and to non-resident automobilists passing through Delaware.

This feature of the bill as now drafted, however, will need amending some way. Thus a tourist on his way from Chester, Pa., for instance, to Elkton, Md., a distance of only about thirty miles, would be unable to pass through Delaware without first having taken out a Delaware license.

On each automobile the license number shall be displayed on a tag with numbers three inches in height. Each machine shall carry two lights, capable of throwing rays two hundred feet, and on each lamp shall be marked the signal numbers one inch in height. Each machine shall have an efficient brake or brakes and a horn, bell or other signal device.

Speed limits are set forth as follows: In "town, township, hundred or village" where houses are more than one hundred feet apart, a speed of one mile in six minutes upon the sharp curves of a street or highway. A speed of one mile in seven minutes where such street or highway passes through the built up portion of a "city, town, township, hundred or village" where the houses are less than one hundred feet apart. Elsewhere, a speed of one mile in three minutes, provided that nothing shall be construed to permit an unreasonable speed. Any person driving an automobile on any public road, street, driveway or parkway on a bet or wager, or in a race, shall be fined, not exceeding $50 or imprisoned not exceeding twenty days.

Penalties prescribed are as follows: For failing to secure a certificate or license, $50 fine; for failing to display the license tag, $15; for failing to carry proper lights, signals, etc., $10; for exceeding the speed in towns and on sharp curves and intersections, $25; for exceeding the speed in built up sections, $25; for exceeding the straightway speed limit, $50; for failing to stop the car when signalled to do so, $10, or in default of any of the above fines imprisonment not exceeding ten days. For a second conviction for excessive speeding, instead of a fine, imprisonment not exceeding ten days shall be imposed.

Hayseed Influence Takes Form in Wisconsin.

If the number of automobile restriction bills introduced at this session of the Wisconsin Legislature is any criterion it is likely that the regulation of automobiles will be the principal issue before that body. At least this subject has so far received more attention than any other, and from present indications there will be an avalanche of measures having the control of automobiles in view before the session adjourns.

Speaker Lenroot, of Superior, introduced by request of a farmers' grange a bill regulating the speed of automobiles in rural districts. Between the hours of sunset and 10 o'clock at night the speed of automobiles is not to exceed four miles an hour, while at other times of the day it is not to exceed eight miles an hour. Whenever an automobile approaches a horse or team on the highway the chauffeur must stop until the horse driven vehicle passes. The penalty for violations is a fine of from $10 to $100, and justices of the peace are to have jurisdiction.

Assemblyman John Thomas, of Racine County, introduced a measure in the House which provides that no automobile or other similar motor vehicle shall be allowed on the highways of the State unless it shall have first been registered with the Secretary of State, and he thinks the license is worth $10. Numbers must be attached to the car in a conspicuous place, and each machine must be provided with brake, bell or horn. The speed provisions of the measure specify that within the corporate limits of cities the speed shall not be greater than eight miles an hour, fifteen miles on country roads and eight miles within half a mile of any postoffice. No person under eighteen years shall be allowed to operate an automobile. The most exotic portion of the bill is that which will compel the engines of cars to be stopped when passing any horse, which means that no automobile will be able to run in cities or towns where horses are common. For violation of the law the punishment shall be, for the first offence, a fine of $50 or imprisonment in the county jail for thirty days, or both, at the discretion of the magistrate; for each subsequent offence a fine of not more than $100 nor less than $50, or imprisonment in the county jail for sixty days, or both.

Assemblyman Turner's bill provides a $2 registration fee, otherwise it is the same as the Thomas bill.

Apologizes for Texas' Bill.

In Texas all Texans obey the law! It is only the mean fellows who come from other States who offend it. At any rate, this is the substance of what Assemblyman Hall stated last week in apology for the automobile bill he then proceeded to introduce.

"There are many automobiles in this State, but the parties who own them are careful, considerate and humane men and take particular care to avoid frightening teams," he said. "Therefore this bill does not necessarily apply to them, but to pleasure seekers from other States, who are not so solicitous of the public's safety."

Section 1 of the bill provides that it "shall be unlawful for any person or persons, with the exception hereinafter named, to drive, speed or operate any automobile, motor car or racycle, or any motor vehicle of any kind, whether any such automobile, motor car, racycle or other motor vehicle be used as a public hack, truck or for hire or for private use, for pleasure or business, except railway locomotives and electric cars, upon, across and over the public roads of this State in such a careless, reckless and wanton manner as to endanger the life, person or property of any other users of such public places."

Section 2 states that automobiles must stop on meeting any teams drawn by horses, mules or oxen if the animals appear frightened, and remain at a standstill until the animal drawn vehicle has passed.

The other three sections of the measure relate to lamps, registration and penalties. All motor vehicles shall carry two lamps in front, except motor bicycles, which are required to carry but one lamp. A permit must be obtained from the county clerk, and on payment of the fee of $1 he will issue numbers, which must be displayed on the rear of the vehicle. Numbers are not allowed to be transferred or loaned to another person. Any person violating the law shall be deemed guilty of a misdemeanor, and upon conviction shall be punished by a fine of not less than $10 nor more than $100.

BEST OF LOCAL SHOWS

New York's Skimming of the Cream Leaves Chicago Bereft of General Interest and Little that is New Comes to the Surface—A "Negro Lady" the Feature of the Show.

Chicago, Feb. 6.—After New York, the Chicago show—but how very much after, neither the geographical distance nor the interim of a few weeks adequately accounts for.

UNREADINESS AGAIN THE RULE.

Despite the fact that a large percentage of the exhibitors are nearer Chicago than New York, the doors were thrown open Saturday afternoon on a woefully incomplete and forlorn-looking aggregation of cars, such was their isolation in some instances. It was further noticeable that those most distant were the first to show completed exhibits. The more or less deserted appearance of the floor, coupled with the incessant din of many hammers and saws, lent their attractions to the scene, in spite of which the attendance on the first afternoon and evening was large—some twenty to thirty per cent. in excess of last year's introduction.

None the less, the Chicago show is a great big thing—for Chicago—and as everything is comparative, it can only be regarded in this light with a none too sparing use of the kindly veil of charity.

It is, in short, much in the same category as the Philadelphia affair and the many lesser lights that follow it—a matter of great interest to the local fraternity and to the Chicago public in general—but, on the whole, a largely local dealers' and agents' show, the makers, in the majority of instances, leaving their interests in the hands of their representatives in this vicinity.

With the cream so well skimmed off by Gotham's priority, as well as superior claims to importance, Chicago must perforce take second place, and the management has not only made the most of its opportunities in the matter, but produced something that few have regretted to see go down in history with each passing year of the four as "The Chicago Show."

THE QUESTION AND THE ANSWER.

Stone throwing is a luxury that few can afford, particularly when the missiles partake of the nature of the boomerang, so that expression on the part of prominent exhibitors of the show, as a whole, is guarded. The question, "Well, what do you think of it?" usually meets with a quizzical look on the countenance of the interviewed, and a broad smile is the natural outcome when glances meet.

The favorite answer to this pointed interrogatory is, "It's the Chicago show," at once brief, to the point and all embracing, it admits of no further questioning.

When the doughty manager who lords it over the Coliseum and all and sundry therein during show week, first assumed the office, his guiding star and fast set purpose was the automobile, its advancement, and with it the advancement of the interests of all concerned, first, last and all the time. But has any one ever doubted the potency of the automobile, whether in its freak coddling clothes of half a decade since, or in its present state of glittering, polished brass and steel perfection, as an attraction? Nor should they. Then, why, oh, why, in attempting to make the best of his opportunities, does he persist in trying to belittle man's most perfect mechanical achievement by methods purely Chicagoese—ringing in cheap vaudeville—and as what? An attraction? Save the word.

WHEN THE COLORED CONTRALTO "OBLIGES."

To quote one of Chicago's dailies: "The vaudeville show provided by the management will be something pleasing this year. Soloists have been engaged to entertain during the evening. Among the soloists is Miss Albert Benson, a local contralto," and likewise a lady of color."

What next? A cakewalk? How low are the mighty fallen that the monarch of the road should need the quavering strains of a dark contralto to beguile his admirers to the Coliseum or to keep their attention on such fine points as frames and suspension, ignition and carburretion while there.

In the opinion of one of the exhibitors, delivered in a tone well calculated to voice his disgust, "Why not place tables all along the aisles, ring in some more song and dance, serve beer and be done with it?"

No continuous performance other than that afforded by the shining rows of exhibits themselves was necessary to fill Madison Square Garden every day in the week from 10 a. m. until so late in the evening that spectators had to be driven away. Is the Chicagoan a different breed that he must needs have everything a la music hall?

FLAGS THE CHIEF DECORATION.

Another noticeable difference between the New York show and this, its attempted duplicate, is that in the former the exhibitors provided all the decorations and used them for their own benefit—mirrors, trellis work, potted palms and the trained hand and eye of the professional decorator lent an aesthetic air to something otherwise purely mechanical—here, with one or two exceptions, the exhibitors have left this entirely to the management, which has provided a profusion of flags, which, if nothing else, are at least well out of the way up under the roof.

The Rambler, with a more complete exhibit in that room to show two additional cars, or five in all, is available; the Peerless, with the Green Dragon, of Oldfield fame, as the piece de resistance; the Electric Vehicle Co., with its usual very complete showing of all its products, flanked across the aisle by an equally attractive exhibit of the Pope Motor Car Co.; the Royal Tourist, Cadillac, Packard, Autocar, Elmore, Thomas, Woods, Winton, Haynes, Olds, Pierce Arrow, Locomobile, White, Stevens-Duryea, and a few of the other old stand-bys who have formed the bulk of every show predominate the centre of the main floor, the Apperson and Knox exhibits being the first to greet the visitor as he comes in the door. Some of the junior entrants into the fold, not requiring so much space, are ranged around the walls between the abuttments of the arches, while the lesser lights and, unfortunately, some not coming under the head of "also theres" have perforce been relegated to the annex, the second floor of which, where the accessory dealers are housed, would do credit to a Chicago department store, its arrangement is such an excellent imitation of the latter. And one and all of the gentry who handle everything under the sun in the way of parts were howling long and loud at being compelled to exhibit in semi-darkness, as the only lighting provided was in the shape of a few rows of incandescent lamps close to the high ceiling.

FEW FOREIGN CARS IN EVIDENCE.

Besides being a local or neighborhood show, so far as interest is concerned, the Chicago exhibit is now an almost purely American show, and a view of the limited—one is tempted to characterise it as mean—display of the three lonesome foreign firms who have had the hardihood to have their agents exhibit, besides those of the leading domestic builders, would cause the gentlemen from over the water to open their eyes and think there was something doing in the way of an American automobile industry, after all. The Renault, represented by a solitary chassis stuck in an alcove to one side of the passageway between the main floor and annex, and two German makers complete the list, and only the last, with three complete cars, made much of an attempt at an exhibit. There was a Mercedes car also, but no one knew it as such, as, topped off by a body in the rough, it was only there to exploit the builders of the latter, C. P. Kimball & Co., of Chicago.

Of the cars not seen in New York, the Woods, a new departure in the shape of a 40 h. p. gasolene car, is now being placed on the market by the Woods Motor Vehicle Co. This has a 4 cylinder vertical engine, 5x5, with mechanical valves, both placed on the same side, thus reducing the gearing and cam shafts necessary to a minimum. A 108-inch wheel base is used, the wheels running on imported ball bearings. High tension, with two sets of accumulators, is employed, and the builders have followed acknowledged standards of superiority throughout in designing a car with which to enter the gasolene field. At present but two bodies are being put forward, the tonneau, at $4,250, and a very elaborately finished limousine, at $5,000. This company is also showing a novelty in the form of a light electric runabout, equipped with a 3 h. p. motor, suspended directly beneath the centre of the vehicle and with a direct drive through bevel gearing.

Digitized by Google

The Dolson is another Western product, the makers of which pin their faith to the horizontal opposed engine. And about this motive power, rated at 20-24 h. p., they have constructed a very neat and serviceable looking tonneau to sell at $1,500. Planetary transmission with chain drive is employed, a special feature of this car being the method of spring suspension employed, which is said to reduce the force of jolts and shocks transmitted to the frame and engine to a minimum.

The Jackson is the product of another Western maker, the Jackson Automobile Co., of Jackson, Mich., and is the outcome of experience with steam and gasolene extending over several years. The first Jackson produced in 1901 was a steam runabout to sell at $850; the next a steam Stanhope, at $1,000, and after that a 3 cylinder compound engine, driving a car for four passengers, at the same price. Then steam was given up for gasolene, and a single cylinder gasolene runabout at $650 was put forward. From the last it has been but a matter of improvement and increase of power to the double opposed cylinder touring car at $1,250 that now bears the Jackson standard.

TWO ATTRACTIVE WESTERN CARS.

The Royal Automobile Co., of Chicago, is the title of an entirely new comer in the field to manufacture a line of both electric and gasolene machines. In the former they display runabouts, phaetons, Victorias and Stanhopes, all equipped with the "Imperial" motor of their own make. One of these motors is located directly inside each rear hub, and drives the wheels independently through a double reduction gear. Dismantled, there are scarcely half a dozen parts to each, and they form a very compact and entirely self-contained driving unit. On the runabout, listing at $650, a single motor, located in the centre of the rear live axle, is used. In the "Royal Princess," a gasolene touring car, the standard horizontal opposed engine and equipment are combined in an exceedingly neat touring car, listing at $1,600, complete with top.

The Richmond is a four vertical cylinder air-cooled car, named after its birthplace in Indiana. It combines a number of good features usually only found on much higher priced cars, although it sells at $1,750. Its design is evidently the result of careful study to produce the best possible tonneau car to sell at this price.

USES ALUMINUM WATER JACKETS.

The Hammer is a comparatively new arrival, hailing from Detroit, in which the four cylinders are cast integral without the water jacket, thus permitting of critical examination of the casting in the first instance and investigation in case of cracking. The water jacket is also a single casting, but a departure is made by employing aluminum for this purpose. The makers consider this feature of such value that applications have been made for patents. Other noteworthy features are interchangeable valves and concealed cam shaft and rollers. The latter are in the upper half of the aluminum crank case, with the crank shaft, and thus the complete engine presents an aspect of extreme simplicity. The same careful attention to detail has been observed throughout, and the result is evident in the completed car. The 24 h. p. touring car is priced at $2,500, and the limousine, with 32 h. p., at $4,500.

The A. C. Banker Co., of Chicago, of former agency fame in this city, have turned manufacturers and are now putting forth a four cylinder high powered car of standard design, which will doubtless serve to make them better known as builders in the future than they have been as representatives in the past.

IOWA'S SENSATION IN EVIDENCE.

The Adams-Farwell car, with its three cylinder rotary motor, built by the Adams Co., Dubuque, Iowa, is shown publicly for the first time, and seems to bear out the promises contained in the detailed description published in the Motor World several months since. There is no one feature that it possesses in which it cannot lay claim to being unique, and the manner in which the operations of the usual four cycle motor have been adapted to its very unusual conditions is well worked out and apparently fulfills in practice what its designers claim for it. Neither the idea nor its application to the internal combustion motor is new, but no previous attempts have survived the test of every-day working. The motor revolves about a heavy bronze stationary crank shaft, transmitting its power through gearing. Fuel is mixed in a chamber directly over the crank shaft, the carburettor, which is simplicity itself, being fed by an automatic gasolene pump, surplus liquid running back to the well of the latter. The fuel level is always constant, and the air suction simultaneously opens the gasolene intake proportionately. Each cylinder is provided with channels cast integral and communicating from this central full chamber to the intake, a supply being drawn in as it passes the ports in former during a part of each revolution. The engine is mounted directly over the rear axle, and its transmission gives four speeds ahead and reverse. As fitted to an enclosed coupe body, with folding front seat outside, control may be had from either in or outside by merely shifting the starting levers and pedal entire—the work of a few moments. In addition to its being of the rotary, no flywheel type, its chief feature is the speed control accomplished by varying the compression.

The Moline Automobile Co., Moline, Ill., have branched out with a standard four cylinder car, embodying some special features of their own, as have also the builders of the Marble Swift, a Chicago concern, while a new $500 runabout—the Monarch—is a new comer claiming attention in the lighter class. This is equipped with a 7 h. p. single air-cooled cylinder of standard design, and the car is throughout fitted with accessories and parts seldom seen on anything at the price.

ACCESSIBILITY A FEATURE.

R. Harry Croninger, general sales manager of the Dayton Motor Car Co., is showing the Stoddard line, one of the few exhibits in charge of the home office. The factory has made good by having everything ready in good time for the show, so that the new Stoddard is well represented. It follows standard specifications, except where they have been improved upon, and this is particularly so in the matter of accessibility and attention to detail, only single piece forgings being used throughout and every nut being locked in place.

Of all the cars to be seen in the entire show the Holsman can probably lay claim to the unique distinction of having adhered closer than a brother to standards of a decade ago, where running gear and body construction are concerned. The horizontal opposed double cylinder, air-cooled motor is so very carefully concealed that both the buggy and double-seated wagon—tonneau, rather—lack not a thing but shafts to need a "git ap" motor under a sunbonnet in front. They are of the type of first horseless vehicles which impelled the Chinaman to the exclamation, "No pushee, no pullee," etc. In the more ambitious tonneau, which no barnyard nag would fail to recognize, the gasolene tank in front is neatly made to simulate a trunk, with the aid of black enamel and real leather straps.

NOVELTIES IN ACCESSORIES.

In accessories and improvements in parts and construction there is the usual profusion of new ideas and devices sufficient to keep the local talent rubbering and studying for the week in making the rounds to take them all in. And it is in this respect that the local trade, as well as accessory and parts manufacturers, within a radius of several hundred miles, are most strongly represented. With the exception of E. J. Willis & Co., with their usual complete showing of everything under the sun, C. F. Splitdorf, with a display of what vibrator coils should be, the remainder of accessory exhibitors, with some exceptions, are local. Then some of the Eastern makers, such as the American Electric Novelty Co., show through their agents, while others are scattered in different parts of the gallery. The National Carbon Company's booth, showing "Miss Fire" with sparking eyes, drew the crowd in the latter direction.

But the main accessory room affords one of the surprises of the show. It contains an exhibit of bicycles, pure and simple. This is the Excelsior, shown by the Excelsior Supply Co., of Chicago, one of the few concerns that in going in for everything for the automobile have not let the wheel go by the board, but still do a large business in bicycles.

CARRY YOUR OWN SIGNALS!

The nature of some of the devices indicate that the fool killer might find something to do out in this direction if he had any time to spare in the East. One of these is a signal

Digitized by Google

device to be worked by the man at the wheel. He pulls a lever, and, lo! presto! a red or green shield drops over either the port or starboard bright light to show the timid pedestrian which direction the "shover" is going to turn the car, and thus safety is assured. But what's the use of going any further in this direction; every show brings forth its crop.

The Remy high and low tension magnetos, made by the Remy Electric Company, of Anderson, Ind., and patterned after the best types of foreign machines, but with the advantages of interchangeability and standardization, are well represented. The manufacturers of these machines have come to a realization of the fact that the toy magnetos shown in past years by makers bidding for this trade are worse than useless, and, furthermore, that a good magneto, particularly with synchronous distribution, cannot be turned out to sell at a nominal figure. That their efforts in the right direction are appreciated is evidenced by the daily increasing number of makers adopting their system.

TO THWART THE THIEVES.

Lock switches and more lock switches to prevent the car being stolen. Neatly made and practical looking devices, such as the B. & J. and the Autolock—good preventives of the meddlesome small boy, but it is to be feared that the crook who is wise enough to know how to steal a car will laugh at the locksmiths. Then tire pumps, the "pump-while-you-ride" kind, of which the Hibbard automatic, put out by McCord & Co., and readily attachable to any of the wheels as an example are here. Another aid to tires in this direction is a "boil preventer," more prosaically known as a tire shield, and made by the Chicago Raw Hide Co. Of course, it's not the only one, but its makers claim that stout rawhide has leather and rubber shields faded when it comes to real service. It makes a fine surgical bandage for the tire that has suffered to the extent that its "innards" are protruding.

Then there are spark plugs and spark coils, and but one of each that differs at all, the former merely another of the now familiar magnetic type, which no builder of cars has apparently ever adopted, and the latter a "duplex" coil—two complete coils in series operating one vibrator. Increased speed of the latter is the advantage claimed for the arrangement in question, the armature being made extra long and is attracted by the two cores.

The Lehman universal joint, which has been improved since the New York show by the addition of a brass casing to exclude dirt, is attracting an unusual amount of favorable attention through its extreme simplicity and effectiveness for the purpose in view, as it operates equally well at any angle up to 90 degrees. It has been further improved by adapting it to use with the sliding shaft now specified on the majority of direct drive, high powered cars. Three drop forgings and a heavy steel ball complete the entire joint, and by the use of the latter are embodied, practically, every well known scientific principle of this form of joint known for ages through their frequent occurrence in nature, but in a form that is simplicity itself. The use of the ball centralizes the parts, even should its bearings become badly worn.

EXHAUST TO GENERATE ELECTRICITY.

What with utilizing the exhaust to warm the carburettor, blow the horn, pump the tires and warm the car in winter, every ounce of power generated will soon be used to the extent that the stock yards do with the pig—everything but the squeal. The latest device to take advantage of the waste heat of the exhaust is the "Thermo Electric" generator, which actually serves two purposes at once, in that it forms a component part of the muffler. The thermopile depends for its action on the difference in temperature of the ends of its members, composed of differing metals, and in the present instance this is accomplished by building it in connection with the muffler, so that the inner ends are heated by the exhaust, while the outer extremities are cooled by air drawn in around them by injector action. The standard muffler size of this pile will generate 1½ amperes at 10 volts, and starting on the battery will begin to deliver current in three to five minutes.

DEPARTURE IN DIFFERENTIALS.

Hedgeland's "anti-skid" axle and "double driving clutch" is a departure in differentials which looks promising. When at rest the disk comprising its driving member is in the neutral position, and the wheel itself is free to revolve. The disk in question moves out or inboard on a worm actuated by and on the axle itself, and its motion engages the slotted faces of the inner or outer disks, which determine the direction of travel. Should the wheel travel faster than the disk, it will run free, and this is where the differential action comes in, as rounding a corner the outer wheel runs free and the inner one is driven or the reverse of the usual differential gearing now employed.

Where purely mechanical devices are concerned, and particularly when the size of its exhibit is considered, the Schattuck transmission, which caught the trained eye of the Motor World man at New York, came in for an unusual share of attention, which, from the daring novelty of its conception, it well deserves. Its performance when applied to a car will doubtless be looked forward to by many.

The Kingston carburetter, the advantages and reliability of which are already too familiar to call for remark, was well represented, as was also the "Daley," a Chicago product, made by Walter A. Daley.

HERE'S AN UNUSUAL MOTOR.

In engines the Twentieth Century is an interesting departure. It is a combined two and four cycle, three cylinder motor in one, the transformation being effected while running by merely shifting a lever which operates a shaft provided with a double set of cams—one for each phase. Its chief claim to distinction is variable horsepower at any time without change of speed, eighteen horsepower on four cycle and thirty on two cycle, the cylinders being fed by the same carburetter and mechanical inlet and exhaust valves at all times.

Where tires are concerned, the makers monopolized a large part of the gallery and made effective exhibits. Goodrich and Morgan & Wright products are prominent, as were also the Kokomo, and, of course, Hartfords, Dunlops, Diamonds, Fisks, G. & J.'s are very much in evidence.

Dunlop tires are represented on both sides of the gallery, and in each booth there is a rear wheel from the Columbia car holding the Chicago-New York record, showing how the tires withstood the wear and tear, "even to the original mud," observed a spectator.

Morgan & Wright have been quietly working on a new solid tire that is the invention of Dr. Bryant, and now, after exhaustive experiments and tests, they have demonstrated that it is the real thing in solid rubber, where resiliency, long life and non-skidding qualities are concerned, they are ready to drop on that branch of the trade like a ton of brick and get their share.

TIRE FILLERS AND DIRT REMOVERS.

Some of the incongruities of the show are to be found in the widely differing names and character of the products of some of the exhibitors. For instance, the Peerless Electric Co. makes tire filler and dirt remover "Cleanall," while the Chicago Motorcycle Co. doesn't make motorcycles, but cars.

"It's not a clam, though it shuts up like one," is what the Dayton Folding Tonneau Co. says of its device for instantly converting from two to four seats and vice versa. Besides this, they say that, "No man with marriageable daughters ought to be without one. It beats a short sofa," and they back this up with scripture in the original to prove it, so why describe it? Its the only one that has the last named recommendation, so it must fill the bill, and with such qualities is dirt cheap at the price, $100, to match any enamel and upholstery.

In the accumulator field those not seen at New York are the "Bestogo," made by the Miller Signal Co.; the Vesta, by the Vesta Accumulator Co., who are also marketing an ingenious device to charge sparking storage sets from house supply, and the Exmoor, as well as a line put out by the Chicago Storage Battery Co., operated by the Chicago Pneumatic Tool Works, and all of which have reached a stage of efficiency in long life and working power that renders the peculiar distinctions of each to claim attention worthy of investigation.

To sum up, the Chicago show is, in the main, a first-class neighborhood show, and, judging from the attendance and amount of interest manifested, there is little reason to doubt that all concerned will be pleased at the result in every way, particularly in dollars and cents, but mighty glad when it is

Digitized by Google

over. It will go down in history as the biggest of the local shows.

The following is a summary of the exhibits and exhibitors:

Adams Co., Dubuque, Iowa, Space 100, M. F.—Adams-Farwell gasolene cars.

Auburn Automobile Co., Auburn, Ind., Space 142, M. F.—Gasolene cars.

Autocar Equipment Co., Chicago, Space 266, G. A.—Automobile trucks.

American Electric and Novelty Mfg. Co., New York, Space 291, G. A.—Electrical novelties.

Banker, A. C., Co., Chicago, Spaces 115 to 117, M. F.—Supplies.

Beckley-Ralston Co., Chicago, Spaces 307 and 308, G. A.—Supplies.

Borland, C. B., Co., Chicago, Spaces 317 and 318, G. A.—Accessories.

Chicago Caloric Engine Co., Chicago, Space 16, M. F.—Caloric engines.

Chicago Storage Battery Co., Chicago, Spaces 267 and 305 and 306, G. A.—Batteries.

Cullman Wheel Co., Chicago, Space 268, G. A.—Equalizing gears and sprockets.

Chicago Rawhide Mfg. Co., Chicago, Space 269, G. A.—Tire protectors.

Continental Engine Co., Chicago, Space 328, G. A.—Engines.

Dixon Crucible Co., Jersey City, N. J., Space 270, G. A.—Lubricants.

Excelsior Supply Co., Chicago, Spaces 272 to 276 and 282 to 286, G. A.—Supplies

Exmoor Storage Battery Co., Chicago, Spaces 319 and 320, G. A.—Batteries.

Mahoning Automobile Co., Youngstown, Ohio, Space 176, M. F. A.—Mahoning gasolene cars.

Hagaman & Hammerly, Chicago, Space 118, M. F.—Supplies.

Holsman, Automobile Co., Chicago, Space 115, M. F.—Holsman gasolene cars.

Hammer Motor Co., Detroit, Mich., Space 152, M. F. A.—Hammer gasolene car.

Hill Mfg. Co., Chicago, Space 264, G. A.—Bodies and canopies.

Kilfyre Co., Chicago, Space 144, M. F.—Fire extinguishers.

Knoblock-Heideman Mfg. Co., South Bend, Ind., Space 222, G.—Ignition apparatus and carburetters.

Kimball, C. P., & Co., Chicago, Spaces 277 to 279 and 287 to 289, G. A.—Bodies.

Kaestner, Chas., Mfg. Co., Chicago, Space 292 G. A.—Carburetters.

Long Mfg. Co., Chicago, Space 252 G.—Accessories.

Lauth, J., Co., Chicago, Space 304 G. A.—Supplies.

Limousine & Carriage Co., Chicago, Space 313, G. A.—Automobile Bodies.

Moline Automobile Co., Moline, Ill., Space 103, M. F.—Moline touring cars.

Monarch Automobile Co., Chicago, Space 113, M. F.—Automobiles.

Marble-Swift Automobile Co., Chicago, Space 175, M. F. A.Gasolene cars.

Motor Car Supply Co., Chicago, Spaces 298 and 299 and 321 to 323, G. A.—Supplies.

Merrill-Stevens Mfg. Co., Chicago, Space 315, G. A.—Standard automobile jack.

Remy Electric Co., Anderson, Ind., Spaces 218 and 219, G.—Ignition apparatus.

Stoddard Mfg. Co., Dayton, Ohio, Spaces 173 and 174, M. F. A.—Stoddard gasolene cars.

Standard Oil Co., Chicago, Spaces 191 and 192, G.—Gasolene.

Stolp Mfg. Co., Chicago, Space 248, G.—Cooler tubing.

Standard Carriage Lamp Co., Chicago, Space 281, G. A.—Standard lamps.

Star Remedy Co., Chicago, Space 314, G. A.—Puncture bands.

Tincher Automobile Co., Chicago, Space 143, M. F.—Tincher cars.

Vesta Accumulator Co., Chicago, Space 280, G. A.—Batteries.

Whitely Steel Co., Chicago, Space 21, G. A.—Parts.

Woods Motor Vehicle Co., Chicago, Spaces 30 to 32 and 46 to 48, M. F.—Electric automobiles.

Mead Cycle Co., Chicago, Spaces 147 and 148, M. F.—Benz gasolene cars.

Advance Packing & Mfg. Co., Chicago, Space 327, G. A.—Engine packing.

Automobile Supply Co., Chicago, Spaces 295 to 297, G. A.—Supplies.

Chicago Battery Co., Chicago, Spaces 305 and 306, G. A.—Dry Batteries.

Wayne Works, Richmond, Ind., Space 128, M. F.—Gasolene cars.

The following exhibited at New York, and will also stage their wares at Chicago:

Apperson Bros.' Automobile Co.—Apperson touring cars.

Autocar Co.—Autocars.

American Roller Bearing Co.—American roller bearings.

Acme Motor Car Co.—Acme cars.

Austin Automobile Co.—Austin cars.

Autocoil Co.—Coils.

Aurora Automatic Machinery Co.—Thor motorcycles and fittings.

Bartholomew Co., The—Glide cars.

Blomstrom Motor Co., C. H.—Queen cars.

Buick Motor Car Co.—Buick cars.

Badger Brass Mfg. Co.—Solar acetylene gas lamps.

Baldwin Chain & Mfg. Co.—Baldwin detachable and riveted chains.

Brennan Motor Co.—Brennan gasolene motors.

Bowser & Co., Inc., S. F.—Gasolene outfits.

Brown-Pipe Gear Co.—Gears.

Briscoe Mfg. Co.—Radiators and fenders.

Byrne-Kingston & Co.—Carburetters.

Cadillac Automobile Co.—Cadillac cars.

Coldwell Lawn Mower Co., The—Motor lawn mowers.

Cleveland Motor Car Co.—Gasolene cars.

Columbus Motor Vehicle Co.—Gasolene cars.

Concentrated Acetylene Co.—Acetylene gas and gas tanks.

Dolson & Sons, John L.—Dolson cars.

De Dietrich & Co.—De Dietrich cars.

Duryea Power Co.—Duryea cars.

Dayton Electrical Mfg. Co.—Apple dynamos.

Dietz Co., R. E.—Lamps.

Diamond Rubber Co.—Diamond detachable clincher tires.

Dow Portable Electric Co.—Spark coils.

Detroit Steel Products Co.—Steel specialties.

Electric Vehicle Co.—Columbia gasolene and electric cars.

Elmore Mfg. Co.—Elmore Pathfinder cars.

Electric Contract Co.—Electrical goods.

Ford Motor Co.—Ford cars.

Franklin Mfg. Co.—Franklin cars.

Federal Mfg. Co.—Frames, axles, gears, etc.

Firestone Tire & Rubber Co.—Solid tires.

Fisk Rubber Co.—Fisk mechanically fastened tires.

Gray & Davis—Headlight, side and tail oil and acetylene gas lamps.

Goodyear Tire & Rubber Co.—Goodyear detachable tires.

Goodrich Co., B. F.—Goodrich detachable clincher tires.

G & J Tire Co.—G & J detachable clincher tires.

Haynes-Apperson Co.—Haynes cars.

Hartford Rubber Works Co.—Perfected Dunlop detachable and Hartford and Turner tires.

Hartford Suspension Co.—Shock absorber.

Hardy Co., R. E.—Sta-rite spark plugs.

Hendee Mfg. Co.—Indian motorcycles.

Herz & Co.—Spark plugs, etc.

Hine-Watt Mfg. Co.—Lamps.

Hyatt Roller Bearing Co.—Bearings.

Imperial Wheel Co.—Artillery wheels.

Jeffery & Co., Thos. B.—Rambler cars.

Jones, Joseph W.—Speedometers.

Kirk Mfg. Co.—Yale cars.

Knox Automobile Co.—Knox cars.

Locomobile Co. of America—Locomobile gasolene cars.

Mitchell Motor Car Co.—Mitchell cars.

Marion Motor Car Co.—Marion air cooled cars.

Maxwell-Briscoe Motor Co.—Maxwell cars.

Model Gas Engine Works—Model gasolene cars.

Michigan Automobile Co.—Michigan cars.

Morgan & Wright, Inc., Chicago, Ill.—Morgan & Wright clincher detachable tires.

Motor Car Equipment oC.—Supplies.

Motsinger Device Co.—Auto sparkers.

McGeihan Odometer & Mfg. Co.—Odometers.

McCord & Co.—Oilers and pumps.

National Motor Vehicle Co.—National electric and gasolene cars.

Northern Mfg. Co.—Northern cars.

National Carbon Co.—Columbia dry batteries.

Olds Motor Works—Olds cars.

Oliver Mfg. Co.—Jacks.

Pope Mfg. Co.—Pope-Toledo, Pope-Hartford, Pope-Tribune gasolene and Pope-Waverley electric cars.

Peerless Motor Car Co.—Peerless cars.

Packard Motor Car Co.—Packard cars.

Pierce Co., The Geo. N.—Pierce Great Arrow and Pierce Stanhope cars.

Pierce Engine Co.—Pierce-Racine cars.

Pungs-Finch Automobile & Gas Engine Co.—Pungs-Finch four cylinder touring cars.

Premier Motor Mfg. Co.—Premier air cooled cars.

Pantasote Leather Co.—Leather coverings.

Pennsylvania Rubber Co.—Tires.

Pope Mfg. Co., New York City—Motorcycles.

Pneumatic Tire Protector Co.—Tire protectors.

Reliance Motor Car Co.—Reliance cars.

Royal Motor Car Co.—Royal cars.

Roche, Wm.—Autogas dry batteries, plugs, etc.

Reid Mfg. Co.—Wolverine cars.

Reo Motor Car Co.—Reo cars.

Steel Ball Co.—Hill oiler, Hill starter, etc.

Stevens Arms & Tool Co., The J.—Stevens-Duryea cars.

Stearns Co., F. B.—Stearns cars.

Shelby Steel Tube Co.—Seamless steel tubing.

Standard Welding Co.—Rims, tubing, etc.

St. Louis Motor Carriage Co.—St. Louis cars.

Standard Wheel Co.—Artillery wheels.

Sprague Umbrella Co.—Sprague tops.

Swinehart Cushion Tire & Rubber Co.—Swineheart non-puncturable cushion tire.

Smith Co., The A. O.—Frames, axles, gears, etc.

Splitdorf, C. F.—Splitdorf spark coils.

Studebaker Automobile Co. — Studebaker electric and gasolene cars.

Tokheim Mfg. Co.—Gasolene outfits.

20th Century Mfg. Co.—Lamps.

Thomas Motor Co., E. R.—Thomas cars.

Timken Roller Bearing Axle Co.—Roller bearings.

Union Automobile Co.—Union gasolene cars.

Veeder Mfg. Co.—Veeder odometers, tachometers.

Vehicle Equipment Co.—Electric vehicles.

Valentine & Co.—Varnishes.

Wheeler Mfg. Co.—Canopy tops and hampers.

Winton Motor Carriage Co.—Winton cars.

Weston-Mott Co.—Wheels, axles and rims.

Whitney Mfg. Co.—Whitney roller chains.

Warner Gear Co.—Gears.

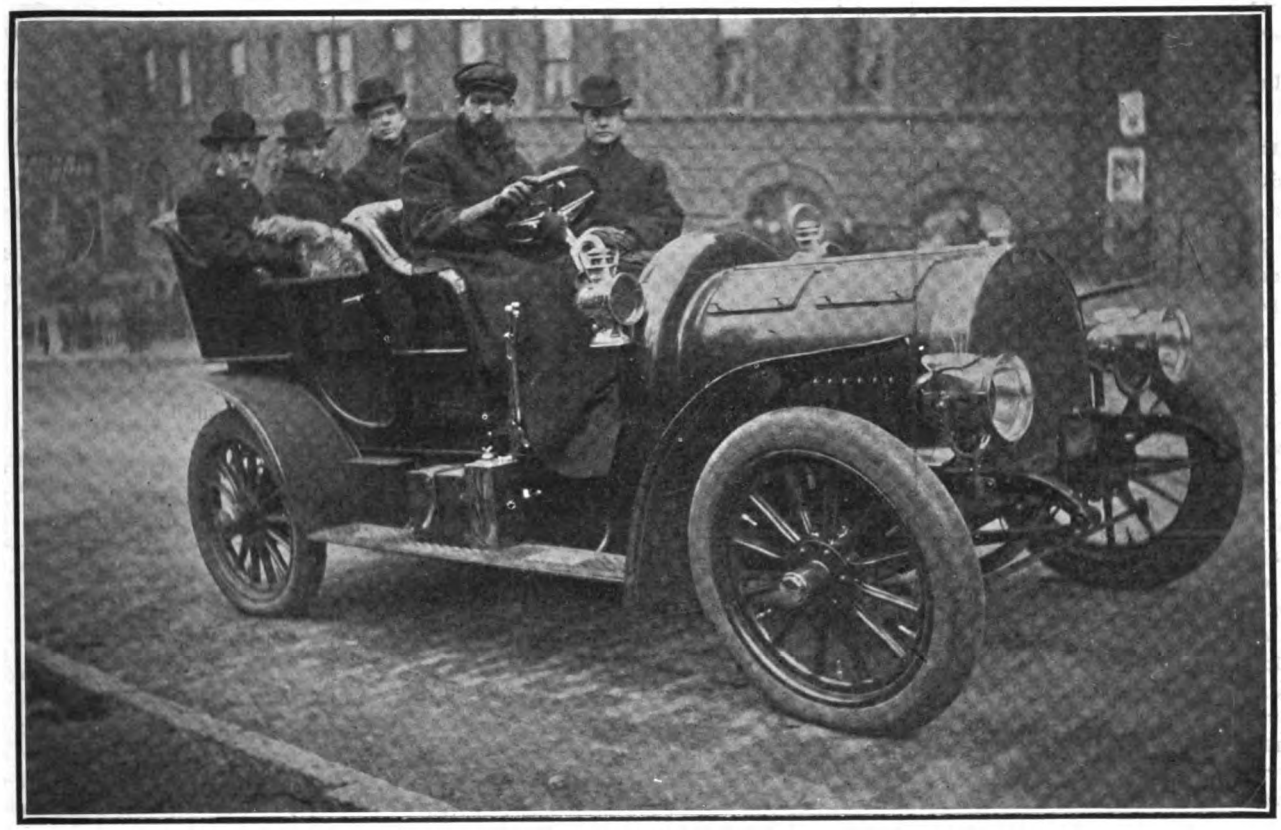
Welch Motor Car Co.—Welch cars.

Wayne Automobile Co.—Wayne cars.

Wray Pump & Register Co.—Pumps and registers.

Warner Instrument Co.—Specialties.

Willis Co., E. J.—Supplies and specialties.



Waltham Mfg. Co.—Orient cars.

White Sewing Machine Co.—White steam cars.

Webb Co., The—Speed indicators.

On New York's Most Famous Testing Ground.

"Duffy's Hill"—an excellent imitation of a precipice that adorns Lexington avenue, from 102d to 103d streets, in New York City—has come to be a regular testing out ground to prove the hill-climbing abilities of demonstrating cars. A few years ago it was considered a marvellous feat to surmount it at all. Now it is done on the high gear with a full complement of passengers, as is evidenced by the accompanying illustration, which pictures a Royal Tourist, with C. E. Duerr at the wheel, making light of it at full speed. Mr. Duerr says the Royal didn't have any more trouble with eight passengers, or a load of twelve to fifteen hundred pounds. Its grade is said to be 16 per cent., but to the average person in the trolley car, it appears dangerously like an almost vertical drop. A car that can chase up its bumpy block pavement like a Harlem goat shouldn't hesitate at anything.

Eleven Year Old Passes Examination.

Master Edward S. Esty, of Brookline, Mass., eleven years old, emulous of the success of a San Francisco boy, age fourteen, who holds an operator's license from the Park Commission of that city and ranks as the "youngest chauffeur" in California, appeared before the Massachusetts Highway Commission and asked to be given a license if examination should prove his fitness.

The courteous secretary of the board, A. B. Fletcher, put the lad through an hour's test in the 24 horsepower Peerless touring car belonging to his father, Clarence H. Esty, of Brookline, and the youngster proved himself its master. The route lay through the crowded Boston streets, and finally along the narrow, steep and icy ways on Beacon Hill, around the Courthouse and Pemberton Square, and upon his favorable report to the commission the boy was granted a license on December 31, 1904. Edward was born November 27, 1893.

It is to be added that, while young Esty was but eleven years and thirty days old at the time of the test, he is larger and stronger than the average for his age, weighing 106 pounds and being 5 feet 3¼ inches in height, and that his knowledge of the automobiling art is not confined to guiding the car merely, but that he has an admirable insight into the working of all the parts, electrical as well as mechanical.

Why the Hayseeds Oppose Good Roads.

Just because good roads are conducive to automobiling, the irate hayseeds of Illinois, who have not sense enough, apparently, to come in out of the rain, are preparing to oppose Governor Deneen's proposal making for the construction of good roads in that State and thus "bite off their noses to spite their faces."

At present the automobile seems to be a red rag to the Illinois farmers, who will stand in their own light by opposing the building of more good roads. The Deneen idea does not contemplate any compulsion. It is what might be termed an enabling act. It gives the people the right to build a road if they want it, and it gives them the power to apportion the costs to those directly benefitted that is, the farmer whose land abuts the road, the county whose roads are for the public and the city whose trade would be helped.

Roads Opened to Californians.

The Automobile Club of California has scored a decided victory, one that will be a source of extreme gratification to all automobilists in that flowery State, and to all visiting enthusiasts who travel over California's excellent roads. The supervisors of Santa Cruz County have passed an ordinance to open to automobilists the mountain road between Santa Cruz, through Los Gatos (the City of Cats), to San Jose, and the ordinance will go into effect March 1.

It is now about two years since automobiles were ruled off this mountain road, and since that time automobilists and hotel proprietors have been endeavoring to have the law revoked. This mountain road is one of the best in the State, and abounds with scenic grandeur. Hitherto touring parties were compelled to go around the mountain via Gilroy and Watsonville, and the trip was long and uninteresting.

It is probable that this act on the part of the Santa Cruz authorities may result in the passage of an ordinance by the road supervisors of Santa Clara County to open the roads in that district, which are equally as good as those in Santa Cruz.

LEE BECOMES PRESIDENT

Succeeds Whipple and All Becomes Serene in A. A, A.—Amateur Rule in Prospect.

Elliot C. Lee, of Boston, is the new president of the American Automobile Association. He succeeds to the vacancy caused by the resignation of Harlan W. Whipple, who is going abroad for an extended period for his health's sake.

Mr. Lee, as the Motor World stated last week, had been prominently mentioned for the office previous to the annual election in January, so that his choice, which was made at a meeting of the directors in New York on Monday last, is not wholly in the nature of a surprise.

He is president of the Massachusetts Automobile Club, a banker, and is a cleancut gentleman of affluence, influence and experience, who cannot but increase the influence and weight of the organization. His election smoothed out all of the kinks caused by the flare-up over the Florida carnival, evidence of which was immediately apparent in the withdrawal of the resignations of W. K. Vanderbilt, jr., and William Wallace as members of the racing board.

The vacancy in the chairmanship of that committee was not filled. There were those who stoutly urged the reappointment of A. R. Pardington, the former incumbent, but Mr. Pardington, who was present, as stoutly declined it, and, with the majority, urged that influence be brought to bear on Mr. Temple to withdraw his resignation. This opinion and desire prevailed, and accordingly the request was made of Mr. Temple, who is still in Florida at his winter home. It is believed that he will not refuse to serve out his term.

At the meeting it was decided also to open correspondence with the foreign clubs in an endeavor to attract entries for the Vanderbilt Cup race for 1905, entries for which close April 16.

Mr. Lee presided at the meeting, the others in attendance being Dave H. Morris, Automobile Club of America; A. R. Pardington, Long Island Automobile Club; George F. Farrington, Automobile Club of New-Jersey, and C. H. Gillette, secretary. The meeting was held in the rooms of the Automobile Club of America.

Since the return of the A. A. A. officials from Florida much additional light has been shed on the situation as it really exists, which appears to have been more or less garbled in the newspaper reports.

In the Dewar Cup matter, for instance, it is now known that the entrance fees will not revert to the commission in charge of the cup, which is composed chiefly of Mr. Dewar's press agent and his intimates, but instead will go to the promoters of the meet at which the cup is raced for, and these races will be held under A. A. A. rules or they will not be held at all. Sir Thomas was informed substantially that, if these terms were not agreed to and the deed of gift changed accordingly, his trophy would be returned to him, or, at any rate, would not be permitted to be competed for at any sanctioned meet.

It has also come out that, as the result of the situation created by the Florida carnival, the adoption of an amateur rule is extremely probable. At an informal meeting of a number of sportsman drivers the subject was discused at length, and the sentiment prevailed that it is not fair to longer oblige them to compete with hired men. For next year's carnival they favor two sets of races at the same distance—one set open to the hired men, the other open only to amateurs. The men involved are of such influence that it cannot well be doubted that the long deferred amateur definition will finally evolve from the sentiment.

The report that a blanket sanction for the dates covering next year's carnival had been granted the Florida East Coast Automobile Association proved to have been untrue, or, at any rate, premature. No action in the matter has been taken.

Germany and America Lodge Protests.

Following the decision of other important countries, Germany has now lodged its protest against holding the Grand Prix or "Consolation race" simultaneously with the Bennett or International Cup contest. The letter, which the German Automobile Club has sent to France, is short and to the point, as follows:

"After having received your communication relative to the conditions that would govern the race for the Grand Prix, we have the honor to inform you that in all probability we shall not be in a position to compete in the Coupe Internationale race should both these events be run at the same time.

"As it is probable that other automobile clubs will take the same position in the matter, we beg you, in the interest of the Coupe Internationale, which has become the classic race for automobilists, to reconsider your decision."

The Automobile Club of America also has filed its protest against the French proposal, but the language of the protest has not been given out.

Signs of "a Frost" in Cuba.

If "frost" falls on the so-called "international road races," which are due to occur in Cuba this week, it need cause small surprise. Indications of a blighting temperature reached several manufacturers this week in the form of this pressing telegram from Havana:

"If you will send a car, we will pay expenses both ways."

The message was signed by the "United States secretary" of the so-called "International Automobile Racing Association of Cuba," the organization of which, it will be recalled, followed a visit to Havana of S. Arthur Miles and William J. Morgan, two unselfish foreign "sportsmen," now resident in America, and who have the reputation of having a keen scent for good things and soft marks.

FERRY BILL PROGRESSES

Passed by the Senate Without Opposition and Favorably Reported in House.

It may now be said that automobiles are half-way on ferryboats—that is, the bill permitting them to run on and off boats under their own power, has been passed by the United States Senate, and its passage by the House of Representatives is now almost an assured fact.

The bill, which was inspired by the Automobile Club of America and introduced by Senator T. C. Platt, of New York, is an amendment to Section 4,472 of the Revised Statutes, approved four years ago, by the terms of which fires in automobiles had to be extinguished before they could be taken on a ferryboat for transportation. The result has been that automobiles have had to be towed on and off boats by horses or pushed on and off by men, and at some stages of the tide this work has proved very onerous, besides being expensive.

The amendment, as introduced by Mr. Platt, went through the Senate last Friday with a rush, not a member voting against it. The House Committee on Merchant Marine and Fisheries has authorized a favorable report on the amendment, and it will be presented in the House of Representatives at Washington to-day.

The amendment repeals the former section of the statute, and reads as follows:

"Nothing in the foregoing or following sections of this act shall prohibit the transportation by steam vessels of gasolene or any of the products of petroleum when carried by motor vehicles (commonly known as automobiles) using the same as a source of motive power; provided, however, that all fire, if any, in such vehicles or automobiles be extinguished immediately after entering the said vessel, and that the same be not relighted until immediately before said vehicle shall leave the vessel; provided, further, that any owner, master, agent or other person having charge of passenger steam vessels shall have the right to refuse to transport automobile vehicles, the tanks of which contain gasolene, naphtha or other dangerous burning fluids."

It will be seen by the terms of the bill that ferryboat owners may, if they so desire, and as is at present the case, refuse to transport automobiles unless the fires in them have first been extinguished, but such a move on their part is not at all likely.

Glidden Goes Farthest South.

Charles J. Glidden, the globe girdler, has reached the most southerly point it is possible for man to drive a motor car. The name of the place, Bluff, in the extreme south of New Zealand, in itself suggests a jumping off place. In New Zealand Glidden travelled 1,145 miles, which brings his total mileage up to 21,438.

Demonstrating with the Thermometer at Zero.

CHARLES CODDINGTON AND E. S. YOUSE AT THE BASE OF MOUNT PENN, READING, PA.

Demonstrating with the thermometer at zero and snow nearly a foot deep on the ground, and not on city streets, but on country roads, is not exactly an enjoyable occupation, but it certainly is a practice calculated to make the public "sit up and take notice" of the practicability of the motor car in all weathers.

Unenjoyable though it may be, however, that is the sort of work that Charles Coddington, of the T. B. Jeffery & Co. staff, has been performing in Pennsylvania for more than a month past. In fact, he has been not only visiting Rambler agents and giving demonstrations to their prospective customers, but he has been driving from town to town, come what may. The trip has proven an eye opener in many parts of the country, and has created a deep impression.

E. S. Youse, of Reading, who handles a slice of Rambler territory, accompanied Coddington for several days, and in a letter to the Motor World tells what the work is like.

"I met Mr. Coddington on Friday morning in Norristown," he writes, "from whence we proceeded to Phœnixville, which is the most southern portion of our territory. There was considerable snow and ice on the ground, but as the rear wheels of the car were equipped with a pair of chain creepers we got along in grand style. The weather was excessively cold, however, but this seemed to have no effect on the car.

"All along the line we had sent notices to prospective purchasers advising that we would be in their place at a certain time and would call and give a demonstration of the new Rambler, surrey type. This, with the sign on the car, created a great deal of interest.

"Upon arriving at Phœnixville we immediately started demonstrating. We remained in this town all of Friday and Saturday, and had something like twenty people out in this machine. Every one seemed to be pleased, and surprised how very satisfactory the car worked in the disagreeable weather. Over Sunday the car was stored in a cold stable, and when we turned over the motor on Monday morning it started with the first turn of the crank. We, of course, let all of the water drain out, which is a very simple matter on a Rambler car, and, aside from filling the water tank and oiling up, we were off for Royersford and Spring City in a very short space of time.

"Over Sunday the weather had moderated considerably, leaving nothing but slush, mud and water. We had these road conditions to contend with for three days, but the car seemed to improve at every stage. Once we were in a snowdrift, then in a pool of water, and the next moment in five or six inches of

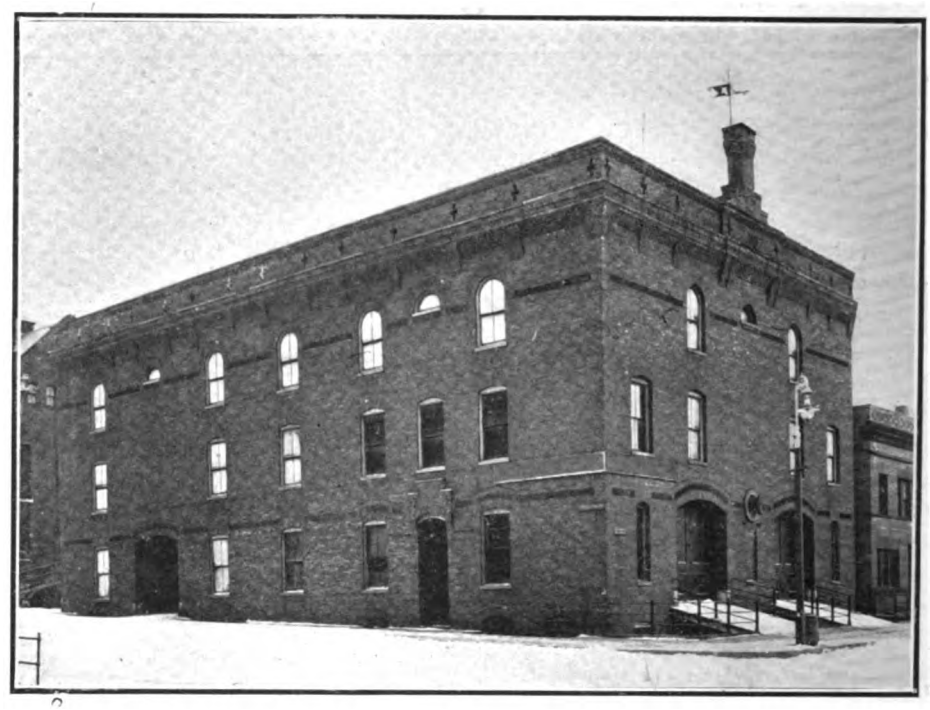
Digitized by Google

mud. These various conditions on a number of occasions recalled to our minds what we had read of the remarkable New York to Pittsburg endurance run.

"In Royersford and Spring City we had out a number of people and got through in both places in about three and one-half hours. We then went to Pottstown, where we put in the rest of the day demonstrating to a number of persons, who all seemed to be elated with the satisfactory working of the machine. On Tuesday morning we started for Reading, a distance of eighteen miles. It was snowing when we started and the weather somewhat colder. We had not gone a very great distance when it started to rain, and continued to do so until we arrived at Reading, about 10:30 a. m. At noon it started to snow, and kept snowing so hard that we did not care to ask any one to go out in the car. The car was run to our garage, where it received a much needed and thorough cleaning. All the following day, Wednesday, it snowed so heavily that we did not go out with the machine until about 4 o'clock in the afternoon, when it had let up snowing some. By this time we had about nine inches of snow, and it was really astonishing to see how the car ploughed through it. Thursday, Friday and Saturday the car was being run practically all the time, and it certainly received some hard work, as every one wanted to see what she was capable of doing on hills.

"On Sunday, January 8, we started for Harrisburg, a distance of fifty-four miles, which was made in about four hours. The roads were good, with the exception of the last twenty miles, in which we encountered some very large snowdrifts, but as everything was frozen, and aside from some deep wagon ruts which necessitated considerable low gear work, we got through all right.

"I returned from Harrisburg by train after putting in the coldest day in an automobile that I ever experienced. Coddington was scheduled to leave for Williamsport on Wednesday morning, a distance of ninety-five miles."



Johnson Goes to Philadelphia.

E. C. Johnson, from the Cleveland factory of the White company, has become associated with the Quaker City Automobile Co., Philadelphia, primarily to push the sale of White steamers. Although Johnson is quite well known in the West, having traversed that territory thoroughly, he is new to the East, but does not lack that experience that should enable him to make his impress felt.

How Thomas Fooled the Blizzard.

During the recent blizzard in Buffalo, N. Y., the E. R. Thomas Motor Co. ordered out a number of their cars and sent them to the homes of their employes. The cars were also used to take them home, as all traffic was tied up. In this way the business of the enterprising manufacturers was not interrupted, and the workmen were enabled to draw their full week's pay.

Where the White will Locate in Boston.

Final papers were recorded at the Registry of Deeds last week in the sale of the property No. 320 Newbury street, the purchaser being the White Sewing Machine Co., Cleveland, Ohio. This property is to be used by the branch office at Boston, George H. Lowe, manager, and is to be converted into an automobile garage and salesroom for the exclusive sale of the White steam car. The building is of brick, with granite facings, and embraces three stories and basement. It has a frontage in Newbury street of about 116 feet, running back 70 feet.

This property was secured after a search of over a year for a suitable garage, and is the selection made after a thorough examination of several of the most prominent properties in the Back Bay. Plans are already in the hands of the architect, and work of remodelling and renovating the building is well in hand. It is expected to be ready for occupancy by March 1.

The basement and first floor will be utilized for storage purposes, waiting rooms, etc., while on the second floor are the various offices, reception rooms and salesroom. The top floor will be used for storage purposes and light repairs. Electric passenger and freight elevators will connect the several floors. In the reconstruction of this building special attention has been given to the comforts and care of motorists and their cars, and all modern appliances and conveniences will be installed.

How Motor Wagons Helped Uncle Sam.

The postmaster at Detroit has no doubts concerning the practicability of automobiles in the postal service. For three years he has used Oldsmobile delivery wagons to relieve the Christmas congestion, and each year to increasingly better purpose. During the holiday period he used four of the wagons, and this is what he says of them:

"The service rendered was on the whole very satisfactory, and their use was instrumental in securing the delivery and collection of large quantities of mail matter in a very short period of time, and they were also of material assistance in the matter of making quick, special trips to our station postoffices. It is, no doubt, a fact that the aforesaid congestion would have burdened the office for one or two extra days had not these machines been employed."

Trade Cup Givers in Drawn Battle.

Two cups recently offered in Paris, one for the lightest bodies and the other for the strongest tires, have practically ended in a "fizzle." It appears now that the leading Paris carassiers have refused to compete for M. Michelin's cup, which makes the event, under the circumstances, anything but a success. The first sign of Michelin's failure was when the Chambre Syndicale des Carossiers retaliated by offering a cup for the most suitable tires for modern bodies in response to his offer of a cup for the best and lightest touring car body. Now that the principal builders have refused to have anything to do with the contest the cup givers are at bay.

Rubber Ball to Absorb Shocks.

Another of the old bicycle ideas has been brought out in Paris and labelled an original device for reducing the shock on the car when traversing rough roads. It consists of a pneumatic rubber ball, yclept by the inventor "aerophere," which is placed between the suspension springs of the car. Its resiliency is assured by its being practically on the same idea as a pneumatic tire.

By inflating or deflating the ball it can be taken out or replaced at will.

ABOUT ACCUMULATORS

Some Suggestions Regarding Recharging and the Testing of Currents, Alternating and Direct.

With the greatly increased employment of accumulators for ignition purposes has come a general desire to learn more about this source of current, how best to maintain it and how to recharge it without the necessity of applying to a station. The inconvenience of the latter is its greatest objection, for storage cells are heavy and the process requires several hours at least for its completion.

Where lighting current is available in the house for this purpose its nature must first be ascertained—that is, whether it is alternating or direct current, as the former cannot be used for the purpose. This information can doubtless be had for the asking from the station, but if not possible to get it in this way a very simple test will suffice. Take a glass of water and pour about an ounce of sulphuric acid (commercial vitriol) into it very slowly, and allow the solution to cool, as the mixture generates a great deal of heat. Never under any circumstances pour the water into the acid, and always add the latter slowly. Then take two small strips or pieces of lead to which lengths of wire should be attached, and the latter connected to the terminals of the current supply, using a plug similar to the end of an incandescent lamp and fitting the socket of the latter. The pieces of lead must be kept apart in the acid solution, for if allowed to come together they will short circuit the current and cause the fusible plug to blow out. If the current be direct a brown deposit will begin to form on one of the lead poles. this combination of an acid solution and lead really being an elementary form of accumulator, the deposit representing the charge.

This test serves the double purpose of ascertaining the nature of the current as well as its polarity, and knowledge of the latter is absolutely essential before proceeding further. Granted the first requirement, the latter may be obtained in a much simpler and more convenient method by the use of what is known as "pole testing" paper, which may be had for a few cents. By placing the terminals of both wires on a short piece of this paper, and switching on the current, the negative pole, designated by the minus sign alongside the binding post on the battery, will gradually turn red, whereas the positive will not be affected. Having ascertained this, the positive terminal of the current supply must be connected to the plus binding post and the negative to the minus binding post of the accumulator to be charged.

As its name indicates, the storage battery accumulates, or stores up, a charge of the current that is sent through it, in the shape of a deposit of active chemical on the positive plates, which in turn is depleted as the battery is discharged, and this is the reason why alternating current is not available for the purpose unless transformed by means of a rotary converter or a rectifier into a direct, or constant, current. The latter may be said to flow continuously as a stream of water, whereas the former is a series of pulsations in opposite directions, the commercial frequencies usually employed—65 or 125 cycles—entailing such a rapid fluctuation that in an incandescent lamp no flickering from this cause is perceptible, but in charging a battery the effect of the current entering on one pulsation would be counteracted by the next in the opposite direction, so that no matter how long an accumulator were left connected to an alternating current it could not receive a charge. All electricity in its inception is alternating in character, but in the direct current generator it is commutated or transformed to flow continuously before entering the circuit. For reasons needless to detail here, the use of alternating current for both long distance transmission and local distribution offers many advantages, and is accordingly coming into more and more general use.

Before going further, another principle of the accumulator must be taken into consideration, and that is that the charge sent through it should be of practically the same volume as it is to give forth, or it is apt to be ruined in the charging process. It is accordingly necessary to introduce a resistance in order to bring this down to the proper level. The capacity of the cells in ampere hours, usually stamped on them, must be taken into consideration when charging in order to get the proper charging rate. Of the very small type this will be 10 to 15, medium 20 to 25, and of the standard type used on motor cars 30 to 40 ampere hours; in other words, at a discharge rate of one ampere per hour the cells in question will last the number of hours for which they are rated, and less in proportion as the discharge rate increases. For the first, the normal charging rate should be about half an ampere, the second, or medium size, one ampere, and of the last about one and a half to two amperes.

The simplest method of controlling the usual 110 volt supply is to insert incandescent lamps in the circuit. For the smallest type of cell mentioned one 16 candle power lamp will be sufficient, as it consumes but slightly in excess of half an ampere, and will only allow that amount of current to enter the battery; for the medium size two must be used, or a 32 candle power lamp, and for the largest three. The duration of the charge will be about ten to twelve hours, according to the state of exhaustion the battery is in when connected for charging, though the latter may be expedited by increasing the resistance, two 16 candle power lamps in the first instance, and so on. If sealed in an opaque case the cells will give signs of being completely charged by the generation of an excessive amount of hydrogen gas, which escapes through the vents; if in glass or celluloid this will be visible in the form of myriads of fine bubbles arising from the plates. They may then be disconnected, and on testing with the ammeter should show the charge for which they are rated, 15, 20 or 40 amperes; but in testing the instrument should only be left in the circuit momentarily. In order to ascertain when the battery requires charging, if it does not give visible signs of exhaustion by a weakened spark, it should be tested with the voltmeter, and should the latter register less than two volts per cell recharging is necessary.

In Germany several manufacturers have placed convenient aids for the motorist on the market in the shape of small portable outfits, which render the process of recharging the accumulators at any hotel or station on the road merely a matter of connecting them in the circuit in conjunction with it. The simplest of these consists of nothing more than an attachment plug, a base carrying a single incandescent lamp, a simple "pole seeker" and the necessary binding posts for making connections. It is intended for the use of the motorcyclist principally. A more elaborate piece of apparatus for charging the usual automobile accumulator set carries four 16 candle power lamps, a pole seeker and a snap switch. As lamps can always be obtained wherever current is available, they need not be carried, and this is a great convenience, as they constitute the greater part of the bulk of the apparatus.

"Intuition" Leads to Verdict for Damages.

If a horse becomes frightened at an automobile and runs away, with injury to the occupants of the vehicle, they are entitled to damages, no matter who is at fault. This is the gist of the amazing verdict rendered by a Utica, N. Y., jury last week in the case of Mrs. Jerome LaGrange, of Dunbarton, who sued Daniel M. Tuttle, the Canastota motor boat manufacturer, for $5,000 damages for injuries which she claimed were caused by the negligence of the defendant in frightening her horse with his automobile.

The circumstances surrounding the case were somewhat out of the ordinary. The plaintiff testified that when she saw the automobile approaching, she alighted from the carriage in which she was driving and led her horse out of the roadway. Tuttle claimed that he construed this act as indicative of an understanding on Mrs. LaGrange's part that he was to continue his way and pass her. The defendant swore that he was travelling slowly, and exercised all due care, therefore he was not guilty of negligence. The plaintiff thought that Tuttle's intuition should have apprised him of the fact that her horse would become frightened if he attempted to pass it, and evidently the "wise" jury was of the same opinion, for a verdict of $200 damages was brought in for the lady.

PIERCE

The Pierce Car was awarded the Grand Prize at the St. Louis Exposition as the best expression of an American car built for American conditions and American temperaments.

The Grand Prize thus awarded is but a recognition of a standard toward which we have been working for five years, and which we believe we have attained.

The six cars which we have built for 1905 comprise the best we know of successful motor car building.

Catalog and technical descriptive matter sent on request.

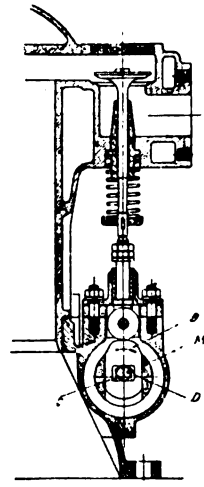
GERMAN TURBINE ENGINE

Berlin Man Has Invented One for which Great Things are, of Course, Predicted.

Though at present behind the point of efficiency attained by the reciprocating steam engine, an attempt is being made to displace this type of internal combustion engine by the gas turbine. The subject is not novel, by any means, as experiments with this end in view have been making in Germany for some time past, where the Stolz Gas Turbine Co., of Berlin, is soon to bring out the invention of a Dr. Stolz, of that city, for which great things are predicted. Of course, the first application of this will be to stationary or marine power purposes, but its progress toward a state of efficiency which will surpass that of the present type of reciprocating motor will be followed with interest by many designers of the latter.

Taking into consideration but one side of the question, this form of power would present the advantages of extreme simplicity, lack of vibration and ease and cheapness of lubrication, not to speak of others; but granted a practical gas turbine, the problem of reducing the excessive speed to a point available for the average car may present difficulties in the way of gearing and transmission more than sufficient to nullify its numerous good points. And there are many obstacles to be overcome before a satisfactory turbine will be produced.



Despite the many and obvious advantages of the steam turbine over the reciprocating engine, years went by before the subject received the attention it merited, and it is only very recently that it has been adopted on a large scale, so that, even should present attempts be fruitful of a successful gas turbine, there is little need for the manufacturer of the usual style gas engine to worry.

Seeking the Variable Inlet Valve.

That the influence of steam engine designing and practise is still felt in the field of internal-combustion engine building is evidenced by a recent return, or possibly adoption in the first instance of one of the best settled and probably one of the most valuable principles of steam engine design, the use of the variable cut-off to change the speed.

This was exhibitied on the Cornilleau de Saint Beuve chassis at the recent Paris Salon, and embodies the usual eccentric valve gear as used on locomotives in this country, except that the reversing links are, of course, missing.

Cams are fitted to a hollow cam shaft in such a manner that they are free to slide up and down in a direction at right angles to the shaft. In the centre of the cam shaft is fixed eccentrically a rod provided with suitable projections coresponding to each cam. This rod is connected by means of a pinion with a lever on the steering wheel. If it is desired to give the maximum lift to the inlet valves the lever on the steering wheel is moved to its limit, and a half turn is thus given to the centre rod which brings the projections to a vertical position. This communicates a sliding motion to the cam, which rides upon the face of the projection and operates the valve tappet. Reversing the operation turns the rod so that the projections on it are horizontal, and it presents a flush surface to the cams, so that the latter on their highest points are then level with the circumference of the cam shaft and the valve tappet is not moved.

Variations of the position of the lever cause the cams to rise more or less on the projections, and by this means complete control of the incoming gases is obtained.

In the diagram, B is the cam in which M is the hollow cam shaft and C is the rod running through M, while D is the projection on the rod C, which causes the cam to rise or not, according to whether it is in a vertical position and the full lift of the valve is given.

On the Germain car the same object is attained by a screwed cap on the cam-actuated tappet. Giving this cap a half turn screws it down on the tappet, which is thus shortened, and the valve is in consequence given less or no lift. Turning it in the opposite way unscrews and therefore lengthens it, giving a bigger lift to the valve. The object of these devices is to control the amount of gas taken into the cylinder and in consequence the force of the explosion.

This is a variation of the throttle method of control which has the disadvantage of requiring added complication to operate it and at first sight does not promise any compensating benefits for the outlay.

Fire Patrol Wagons for Minneapolis.

Two automobile patrol wagons figure prominently in a plan which Chief of Police Doyle of Minneapolis has conceived for the reconstruction of the police department of that city. Chief Doyle is of the opinion that horses occupy too much room and cost more to care for than automobiles. Besides, automobile patrols would be able to reach the alarm boxes quicker.

LIGHT ON LUBRICANTS

Mixtures Recommended in France and Why They Should Not be Blindly Followed.

It is amazing to note to what an extent the automobile press generally regards the dicta of the French members of the fraternity as inspired, and, gulping them down without a choke, regardless of how misleading they happen to be, forthwith translate and reproduce them verbatim for the enlightenment of those who are struggling in darkness.

The following advice taken from Le Journal du Petrole on the subject of lubricating oil is now running the gamut of the English motoring press.

"A very important question must be studied with reference to automobiles, that of the lubricants to be made use of for the motor and bearings, but it must be remembered that the lubricant of an engine of two horse power cannot be the same as the lubricant of one of twenty horsepower." This is, indeed, an illuminating fact, well worthy of consideration.

"Absolutely fixed rules cannot be given for the composition of the lubricant to be used in all motors. It is especially necessary that the supply of the lubricant to the cylinders should be made as regular as possible, and it must not be forgotten that the inside of the cylinder is subjected to a very high temperature which occasions the vaporization of the lubricant, and even its decomposition. In the latter case, a deposit of carbon takes place, which inconvenience should be suppressed as far as possible. That is why lubricants not readily decomposed are preferable to those of the opposite tendency, and consequently petroleum oils are to be preferred to colza and olive oils, and to fats The composition of the oils to be employed is quite varied, but we give that of a good lubricant suitable for automobiles of from 6 horsepower to 10 horsepower: Ten gallons Russian motor oil one gallon of extra refined cylinder oil, thirty gallons of heavy American motor oil.

"For vehicles of less power, a lighter American oil may be employed, and for those of greater power the quantity of cylinder oil may be increased Some chauffeurs prefer to add a certain quantity of fatty oils, like olive oil, but we think that these should not be employed for the reasons given previously. The higher flashing points of oils are embraced between 530 degrees and 600 degrees Fahrenheit. Such oils would be excellent for lubrication, but cannot be employed, not being sufficiently fluid. That is why oils are preferred for motors of which the flashing point is 420 degrees Fahrenheit.

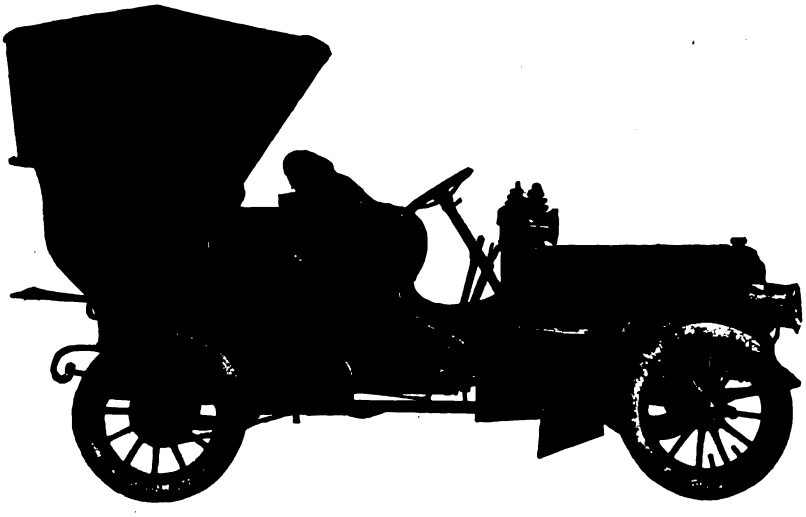
"For the cylinders of automobiles worked by steam, it may be said that an excellent lubricant can be prepared by mixing varying quantities of cylinder oil and of heavy motor oil, with a certain quantity of fatty oil; for

Digitized by Google

example, thirty gallons of cylinder oil, twenty gallons of heavy motor oil, four gallons of tallow."

For the benefit of those to whom lubricating oil means that and nothing else, and to whom "oil for oiling" is all the same, it must be explained that there are enough different grades and qualities of lubricating oil to fill a fair sized volume merely in enumerating them, and that the composition of each is such as to fit it for a particular purpose only. As mistakes in choosing among this endless array usually mean endless trouble for the man who makes them the subject is one deserving of study, which, needless to add, it has not been given to any extent thus far.

It will be just as well not to attempt to make your own compounds by the startlingly clear formulae given above, even though you do handle large quantities of lubricants for automobile use; the refining companies employ high-priced chemists to do it, and it must be admitted they achieve the desired result. And it will, likewise, be advisable for the novice when investing in this great necessity not to ask for lubricating oil for a "two horsepower engine" or a "twenty horsepower engine," because the laugh will be on him. But it will help to clear matters if he will inform the salesman whether he possesses a heavy bearing slow speed engine, or one with light parts running at high speed, and whether the lubricant is for the bearings. crank case or the cylinder. For the first a good grade of machine oil should be used, and a little saving in this respect is false economy of the worst kind, while for the cylinders there should always be used an oil that is made expressly for this purpose. But "cylinder" oil is a fairly large division of the subject, and the exact use it is to be put to will be of value to the man who is selling it. Many have gone ahead on the presumption that cylinder oil is all one and made use of the heavy bodied article designed for use in steam engine cylinders, with the result that in a short time the passages become choked with carbon, the engine loses power and continues exploding, even after shutting off the spark. The proper and only oil for the motor cylinder is a thin lubricant that will not carbonize under the high temperatures it is subjected to. An occasional examination of the exhaust passages of an engine will suffice to reveal whether this is occurring or not, and the remedy is a better lubricating oil. But by better doesn't mean merely cost, as steam engine cylinder oil is worth three to four times as much as the gas engine article, and that many times worse than the latter for the purpose. For use in the crank case still another variety is essential, as here again conditions are different; ordinary oil will soon churn into hard lumps in the presence of water. The best lubricant for this part of the engine is termed "crank case oil" by the trade, and neither the cylinder nor the bearing oil will take its place. From a study of the above the man who has been indiscriminately using one kind of oil to lubricate all parts of the engine should see some light as to at least some of his troubles.



Soft Tools for Driving Work.

For driving keys and other work about machinery a babbitt or lead hammer is better than a copper hammer, which hardens the more it is used. To keep the lead hammer from getting out of shape, take a piece of copper pipe, iron pipe size, drill a hole in one side of it and fit with a handle, and then fill in the hollow of the copper pipe with lead.

Even better than the lead hammer are hardwood blocks on end. Put against part to be driven and strike with a hammer. For driving the stub end of connecting rods on large engines back and forth when keyed up, use blocks about five inches square and three feet long.

Mixture to Prevent Rust.

A good mixture for use as a slush to prevent the rusting of machinery is made by dissolving one ounce of camphor in one pound of melted lard; skim off the impurities and add enough black lead to give the mixture an iron color. After cleaning the machinery carefully, smear on the mixture. It can be left indefinitely, or if wiped off after twenty-four hours will prevent rust for some time. When removed the metal should be polished with a soft cloth.

Thomas 50 Horse Victoria, $3,500

LIVES SAVED

One feature of the THOMAS "FLYER" automobiles is a safety device located in the hub of each rear wheel, which makes it impossible for a Thomas car to back down hill should the engine stop.

Have You Ever Noticed How Many Lives Have Been Lost Through this Backing Down Hill?

THE THOMAS CAR HAS A HOST OF TALKING POINTS.

fety Devices, Lubricating Improvements, Anti-Wear, Anti-Friction, and Fool-Proof Devices—all of which are told in our Catalog. Want one?

THERE CAN BE BUT ONE BEST.
IN TIRES, IT'S THE

Michelin

The supreme test—the hardest and longest races and the swiftest records prove it.

During the year 1904 MICHELIN TIRES did not lose a single important race, and all the cups have been won on them.

March 31.—Rothschild Cup, France.
April 1.—De Caters Cup, France.
May 20.—Chasseloup-Laubat Cup, France.
June 17.—GORDON-BENNETT CUP, Germany.
July 26.—St. Louis Non-Stop Run, America.
Sept. 4.—Brescia Circuit (World's Fastest Road Race), Italy.
Sept. 15.—Consuma Cup, Italy.
Oct. 8.—Vanderbilt Cup, America.
Nov. 24.—Eagle Rock, America.

1905—FIRST IMPORTANT RACE THIS YEAR.

Delhi to Bombay Reliability Contest, Dec. 26-Jan. 2. Count Guilio de Groppelo driving a 16.20 H. P., F. I. A. T., with Michelin Tires, won the cups offered by the MAHARAJAH of KAMPUR and the MAHARAJAH of GWALIOR.

FIRST IMPORTANT RECORD THIS YEAR.

Jan. 31.—One kilometre, Henry L. Bowden, 120 h. p. Mercedes, Ormond-Daytona, Fla. 20 2-5
Former record 21 2-5
Jan. 31.—One mile, Henry L. Bowden, 120 h. p. Mercedes, Ormond-Daytona, Fla. 32 4-5
Former record 39

We are the only direct representatives in the United States, and control entire shipments of Michelin tires. We also guarantee full protection to manufacturers, jobbers, dealers and consumers against all litigation.

The more you know about tires the better you like the MICHELIN.

Immediate delivery. All sizes for touring and racing. Write for instruction book, free.

The Week's Patents.

780,462. Pneumatic tire. William W. Walter, Aurora, Ill., assignor of one-half to Jay D. Miller, Geneva, Ill. Filed August 17, 1904. Serial No. 220,994.

Claim—1. In a pneumatic tire, the combination of an outer tube, an inner flexible tube, a series of non-elastic crescent shaped boards with rounded ends, of unyielding timber free of attachment to the outer or to the inner tube, having their convex edge simply bearing against the interior of the outer tube and their inner concave edge bearing upon the inner tube, air chambers occupying positions intermediate of the outer tube, the inner tube and the rounded ends of the edges of the boards, with a cushion thinner in the middle portion and located between a portion of the inner tube and of the outer tube, substantially as described.

780,480. Clutch. Jacob C. Crabill, Hartford City, Ind. Filed October 23, 1901. Serial No. 79,733.

Claim—In a clutch, the combination with longitudinally aligning shafts independently moved with relation to each other, of a wheel fixedly secured on one of the shafts to rotate therewith and having a peripheral flange, a sleeve rigidly secured on the opposite shaft and provided with radial arms rectangular in cross section, segmental carriers co-operating with the opposite extremities of the said radial arms and having keepers slidable over said arms, the keepers having an angular contour corresponding to the arms and the carriers, each provided with forwardly projecting flanges with segmental shoes thereon, a collar slidable on the shaft to which the said hub is secured and formed with a chamber extending longitudinally thereinto to receive and set over said hub, the part of the collar having the chamber therein having opposite slots to receive the portions of the arms adjacent to the hub, and pairs of adjustable connecting devices movably attached to the upper and lower portions of the collar and to the carriers, the connecting devices being atached to the carrier on opposite sides of the said arms.

780,482. Friction Clutch. James F. Duryea, Springfield, Mass. Filed March 27, 1900. Renewed May 12, 1904. Serial No. 207,694.

Claim—1. In a friction clutch, the combination of two engaging members, one of the members having a cylindrically bored rim, and the other member consisting of a plate with radially movable friction shoes mounted thereon, a flanged sliding sleeve, an equalizing plate in two parts mounted on the sleeve and transversely movable with respect thereto, forked toggles between the equalizing plate and the shoes, a hinged pin through the forks of each toggle and both parts of the equalizing plate, and means for applying the clutch through the sliding sleeve, substantially as described.

780,486. Friction Clutch. Ralph M. Phillips, Jamestown, N. Y., assignor to Thomas Henry Smith, Jamestown, N. Y. Filed August 24, 1903. Renewed November 28, 1904. Serial No. 234,544.

Claim—1. In a friction clutch having a revoluble driving member, a driven member having means for gripping said driving member, connecting and disconnecting means for said members consisting of a "wabble plate" mounted on the driven member to be drawn into frictional contact with said driving member, and means for putting said plate in and out of touch with said driving member.

780,519. Pneumatic Tire. Winfield J. Mitchell and James R. Mitchell, Lynn, Mass., assignors to Flexible Metal Mfg. Co., Lynn

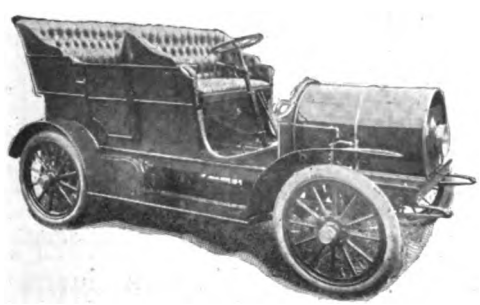
WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—4 passenger side-entrance car bodies, in good condition at considerably reduced price. DETROIT CARRIAGE CO., Detroit, Mich.

FOR SALE.

One—1904 Franklin, light tonneau, blue body, yellow running gear. Practically like new, run less than 800 miles.



One—1904 Franklin Run-about, elegant condition, color red.

Both the above cars will be sold at a bargain to a quick buyer. Owners have purchased large Franklins. Address O. H. DIETRICH & Co., Ltd. Allentown, Pa.

WANTED—One second-hand Elmore or Cadillac. Give number of motor, miles used and date bought. Also state lowest spot cash price. Address POST OFFICE BOX No. 239, Allentown, Pa.

FOR SALE—Columbia 24 h. p. Mark XLI Touring Car. Mechanical condition first-class; trimming practically new and entire car revarnished. Any speed from 4 to 55 miles per hour. Owner desired to purchase higher power Columbia Car. Address "MARK XLI" care Motor World.

INCREASE your horse power on Oldsmobiles, Autocars, Franklins and other cars about 20 per cent. for $7.20; sent on trial to responsible parties. JOHN HOWARD, 109 North Broad St., Trenton, N. J.

PRICE $1500.

Digitized by Google

Mass., a corporation of Massachusetts. Filed March 18, 1904. Serial No. 198,701.

Claim—1. A pneumatic tire containing in its wall a flexible layer of comminuted metal having a polished outer surface.

2. A pneumatic tire containing in its walls a protector composed of a flexible inner base layer, and a comminuted metal outer layer adhering to said base layer and having a polished outer surface.

780,533. Motor Controlling Mechanism. Peter A. Sheley, Louisville, Ky. Filed September 24, 1904. Serial No. 225,858.

Claim—1. The combination with a power shaft of an endless flexible connection engaged therewith, rotatable retarding devices carried by the flexible connection, a trip device located in the path of the retarding devices to rotate the same, and means carried by the shaft to frictionally engage the retarding devices during the rotation thereof.

780,549. Explosive Engine. John G. Callan, Lynn, Mass., assignor to General Electric Co., a corporation of New York. Filed September 4, 1903. Serial No. 171,865.

Claim—1. In an engine, the combination of a rotary shaft, a plurality of cylinders arranged in parallel relation to said shaft, a pair of balanced pistons in each cylinder, and means for imparting rotary motion to the shaft from the pistons.

780,555. Electric Igniting System for Vapor Engines. Albert E. Doman, Elbridge, N. Y., assignor to the Elbridge Electrical Mfg. Co., Elbridge, N. Y., a corporation of New York. Filed July 7, 1902. Serial No. 114,608.

Claim—1. In combination with the sparking terminals of a gas engine, dynamo and its working circuit in which said terminals are connected, a variable resistance device and electro-magnetic operating means therefor, both connected in series in the working circuit.

780,556. Gas Engine. Albert E. Doman, Elbridge, N. Y. Filed April 20, 1903. Serial No. 153,462.

Claim—1. In a two cycle gas engine, a cylinder, a crank case inclosing one end of the cylinder, a self-closing valved outlet in the opposite end of the cylinder, a conduit connecting the interiors of the cylinder and crank case, a piston operatively connected to open the valve, a manually operated valve in the conduit to control the amount of mixture admitted to the cylinder and connected to the first named valve to vary the time of its closing to correspond to the amount of mixture present in the cylinder.

780,564. Charging Storage Batteries. John L. Hall, Schenectady, N. Y., assignor to General Electric Co., a corporation of New York. Filed July 13, 1903. Serial No. 165,219.

Claim—1. The combination with a generator and a storage battery, of an automatically opening charging rheostat provided with a control magnet having two windings, one winding being connected across the generator terminals and the other winding being connected across the battery terminals and arranged to act always in opposition to the first mentioned winding.

780,633. Speed Changing, Driving and Reversing Device for Motor Vehicles. De Lonson E. Barnard, Chicago, Ill. Filed March 21, 1904. Serial No. 199,322.

Claim—1. In a motor-vehicle, in combination with the front and rear axles, a motor mounted upon the vehicle-frame intermediate the vertical planes of said axles, comprising a longitudinal main shaft; friction disks on the opposite ends of said shaft; frictionally-driven trains of which said friction disks, respectively, are the initial wheels; frames in which the secondary wheels of said trains are journaled, said frames being pivoted for carrying said secondary wheels toward and from the initial wheels respectively; connections between said pivoted frames for moving them simultaneously, and means at one end for operating said frames to carry said secondary wheels into and out of frictional engagement at will.

780,635. Gas Engine. Sheldon F. Burlingame and Carl E. Burlingame, Worcester, Mass. Filed December 18, 1903. Serial No. 185,670.

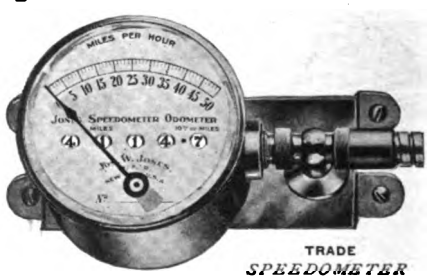
Claim.—The combination of a gas engine cylinder, and an attachment for starting the engine by the explosion of a cartridge consisting of an explosion-tube adapted to receive a cartridge or shell at one end, with its other end extended into the engine cylinder in position to be exposed to the successive charges of burning gas, said inwardly-projecting end being closed except for perforations of smaller diameter than the bore of the tube, whereby the wad of the cartridge fired in the explosion-tube will be lodged and consumed in the explosion-tube without passing into the engine-cylinder.

780,665. Motor-Vehicle. Henry E. Kellogg and George F. Swain, Harvey, Ill. Filed June 15, 1903. Serial No. 161,591.

Claim.—1. A motor-vehicle having two axles with supporting wheels mounted thereon, one of the axles pivotally mounted and adapted to be swung laterally and out of parallel with the other axle for steering purposes, a motor supported by one axle and means for normally connecting the motor with the supporting wheels of both axles, but adapted to disconnect the motor from the supporting wheels of the said other axle after the two axles are out of parallel.

780,673. Carburetter. Jay F. Lawrence, Chicago, Ill., assignor to National Light, Heat and Power Company. Filed October 30, 1903. Serial No. 179,184.

Claim—1. A carburretor comprising a generating and mixing tank, an air inlet-pipe therein extending to near the bottom thereof, a hydrocarbon-inlet pipe extending through the top of the generator, a valve therein, an inclined evaporating surface, a float in the bottom of said tank, a rod connecting the same with said valve, a vapor-discharge pipe connected in the top of said tank, and means delivering a blast of air through said air-pipe to the bottom of the generator and mixing-tank whereby an air-current flows upwardly along the inclined evaporating-surface against the downwardly-flowing current of hydrocarbon.



780,692. Face Shield for Riders of Motor-Vehicles. Clement H. Whatley and Lena Benck, Hammersmith, London, England. Filed March 8, 1904. Serial No. 197,070.

Claim—1. A wind and dust protecting face shield comprising a frame surrounding and retaining a disk of transparent material and having a leg or foot attached thereto for adjustably connecting said shield in a socket or recess attached to a waist-belt substantially as and in the manner herein described.

780,705. Regulating Device for Petroleum Motors. Ferdinand Charron and Leonce Girardot, Paris, France. Filed March 22, 1902. Serial No. 99,500.

Claim.—In a regulator for petroleum motors, the combination with the sliding valve-actuating rods, guides therefor, and friction rollers carried by the rods, of a shaft, a sleeve slidably mounted thereon, having a cam on each end thereof, said cams engaging with the rods, rings on said sleeve, a rod G arranged parallel to said shaft, a fork integral with said rod and engaging with the sleeve between the rings thereon, a second sleeve J slidably mounted on the shaft, a centrifugal governor for moving said sleeve and a second fork adjustably secured to the rod G and connected to the sleeve J whereby on the movement of the sleeve J the cams will be disengaged from the friction rollers on the rods.

ELMORE MANUFACTURING Co.

Elmore Automobiles AND Launches

HYDRO-CARBON -MOTORS-

Clyde, O. Jan. 4, 1905.

The B. F. Goodrich Co.,
Akron, Ohio.

Dear Sirs:

Percy F. Megargel, W:S. Harrison, of Rochester, N. Y., and Ralph Megargel of Scranton, Pa., ran an Elmore Pathfinder,- a machine having 16 horsepower and weighing, including passengers, baggage and extras, 2150 lbs. - from New York to St. Louis and back to Philadelphia, on a single set of Goodrich tires, not only without a puncture but without having to pump up the tires during the entire trip . This trip was begun on May 18th when the roads were almost impassable, and on the return trip, when passing through Pennsylvania, the rains had washed the dirt off the roads so that it was an almost continual run over rocks and stones. The severe service through which these tires went would be more appreciated by the perusal of the little booklet which the Elmore Company have gotten out, "The Cruise of the Pathfinder," illustrating and describing this wonderful tour.

The mileage on the first set of tires figures up to a total of about 3000 miles. This same car made the trip a second time but the rear tires were changed, not because the tires had given out, but they were worn some on the sides from continual traveling through deep ruts, and as the second run was made under the auspices of the Association of Auto Mfgrs. and the cars were liable to a penalty unless a certain number of miles were made each day, it was deemed advisable to change the tires to prevent there being any possibility of delay from tire troubles, although there was no reason to believe that the original set of tires would not have been able to make the trip the second time.

Yours truly
Elmore Mfg Co.

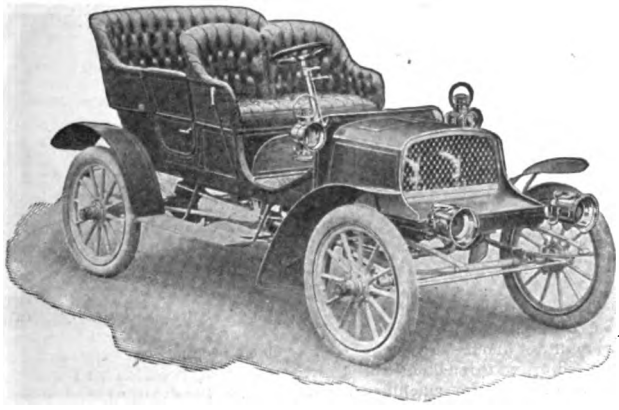
Two Impulses with Every Revolution

This is the famous Elmore Pathfinder, which has demonstrated beyond a doubt the superiority of the two-cycle engine over the four-cycle engine. The most significant feature of the American Automobile situation to-day is the complete triumph of this impulse-every-revolution idea, or, with two cylinders, two impulses every revolution, as exemplified in the Elmore. That the Elmore does produce a constant torque; that it does utilize every particle of power and put a stop to waste energy; that it will take the steepest hill or roughest road at high speed, and that it has the most reliable self-starting engine in the world—for each and every one of these claims overwhelming proof has been produced.

The whole trend of expert and popular opinion is rapidly being directed toward the two-cycle engine.



You owe it to yourself to see this car, which will astonish you, not only by its fine appearance, but by its excess power and its extraordinary control on the high speed.

Send for our full line of literature, the booklet illustrating the 6,000-mile trip, our catalogue, explanation of our engine, and the opinions of people who have used our cars, all sent free, or, if you wish, we will send a 10x12 photograph of the Pathnder on receipt of 10 cents in stamps.

"The Maxwell"

THE FINAL TRIUMPH

achieved by the MAXWELL Cars at the great Automobile Show in Madison Square Garden, New York, was as conclusive to the public as it was satisfactory to us.

We had expected it, and worked for it, but even to us, who knew just how worthy of praise the "Maxwell" is, the great volume of favorable comment, the almost unanimous appreciation of "MAXWELL POINTS" throughout that enormous gathering of automobile EXPERTS came as somewhat of a surprise. There is but one conclusion to be drawn: that the automobile public is no longer dependent upon the statements of manufacturers and agents, that buyers have learned to discriminate for themselves, that they know what they want, and, having found in the "Maxwell" those points which make it the most practical, the most reliable and the most economical automobile in the market, they have been quick to give it their appreciation and their patronage.

16 H.P. TOURING CAR, $1400. **8 H.P. TOURABOUT, $750.**

The "Maxwell" cars have no pump (thermo-siphon). Their double opposed motor is in front under the hood and accessible in every part. They have Bevel Gear Drive. METAL BODIES. Transmission Case and Crank Shaft cast in one Aluminum casting. "Perfectly simple, simply perfect."

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about Feb. 1st, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

The 1904 edition is now out of print.

Sent upon receipt of 6 cents in stamps for postage.

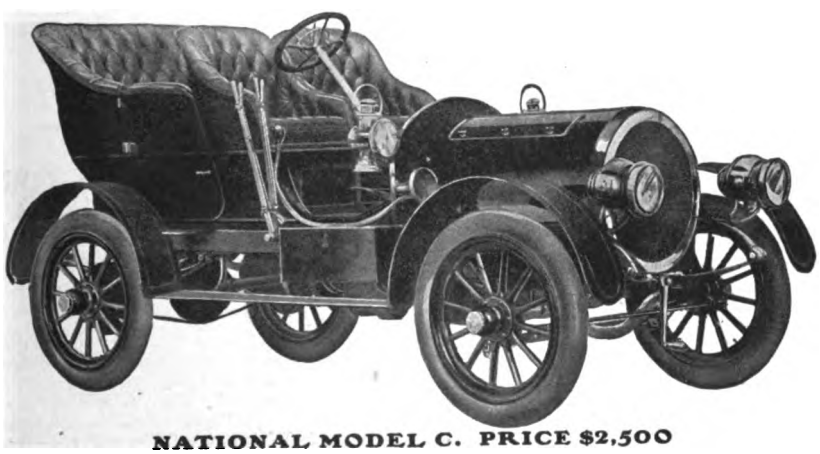
"STEVENS-DURYEA" New 20 Horsepower 4 Cylinder TOURING CAR.

We believe that the owner of this light weight but high power car will find it so easily handled, and its cost of maintenance so low, that it will not be at all uncommon to find the STEVENS-DURYEA MODEL "R" subjected to the same daily uses for which the Runabout has hitherto been considered necessary.

MODEL R.



We are of the opinion that the public will find in this new car not only workmanship and material equal to that which has made the STEVENS-DURYEA Runabout famous, but it will find the same quality of durability and power as compared with other Touring Cars, which has kept the Runabout in a distinct class by itself.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

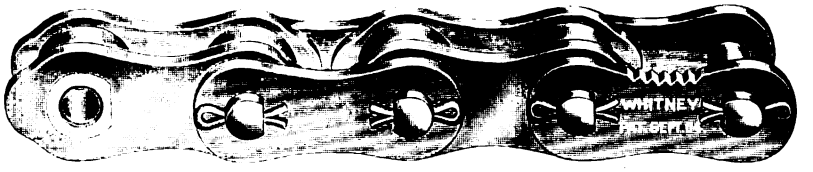
These are **"WHITNEY" STANDARDS** for Roller Chains.

PITCH.	Diameter of Roll.
1 in.	5/8 in.
1¼ in.	¾ in.
1½ in.	7/8 in.
1¾ in.	1 in.
2 in.	1⅛ in.

The PITCH SIZES and DIAMETERS advance uniformly in perfect proportion.

They have broken all records for efficiency, and have been adopted for most of the leading American Cars, including



"ACME" "AUTO-CAR EQUIPMENT" "BAKER" "BRAMWELL" "CADILLAC" "COLUMBIA" "CORBIN" "CHAMPION" "ELWELL-PARKER" "FORD" "FRANKLIN" "GROUT" "GAETH" "GIBBS" HARTFORD MOTOR STREET SWEEPER" "KNOX" "LENAWEE" "MITCHELL" "MOLINE" "MATHESON" "MANHATTAN" "OLDS" "POPE-HARTFORD" "PIERCE-RACINE" "PRESCOTT" "QUEEN" "RAMBLER" "STEARNS" "SOMMER" "SNELL" "THOMAS 50 & 60 H. P." "TOURIST" "WAYNE" "WESTERN ELECTRIC"

"Whitney" Roller Chain

RIVETED TYPE.

All links on both sides are Riveted, with exception of one Connecting Link shown.

"Whitney" Roller Chain

COTTER DETACHABLE TYPE.

All links on one side are Riveted and all links on opposite side are Detachable. One link only is considered the Connecting Link, this being distinguished from the others by notches in the top surface.

PITCH.	Diameter of Roll.
1 in.	9-16 in.
1¼ in.	5/8 in.
1½ in.	¾ in.
1¾ in.	1 in.
2 in	1⅛ in.

These are the OLD or COMPETING Standards.

The PITCH SIZES advance uniformly, but the DIAMETERS are irregular and not in perfect proportion.

All Chain Manufacturers have adopted "WHITNEY" Standards for these new sizes 1¾ in. and 2 in. pitch

G & J TIRES

at the

Ormond-Daytona Races

WALTER CHRISTIE, in car of his own design, fitted with G & J Thread Fabric Tires, won the 50 mile race for the Lozier Trophy.
In the 100 mile international race, Mr. Christie's was the first American car to finish. Mr. Christie covered the 100 miles at a speed of 70 miles per hour.

CHAS. SOULES, in Pope-Toledo, fitted with G & J Thread Fabric Tires, won the five mile race for stock cars $2751.00-$4000 00—time 5:13 1-5; five mile race for stock cars $4001.00-$6000.00—time 5:17 3-5; and ten mile race for stock cars $2751.00-$4000.00—time 10:35 3-5.

CHAS. SOULES, in Pope-Toledo, with G & J Thread Fabric Tires, also took second place, from scratch, in the five mile handicap.

Not a moment's delay in any Race, nor any accident, was due to G & J Tires.

G & J Thread Fabric Tires hold every world's track record, from one to 50 miles.
The G & J Tires used on racing cars are precisely the same thread fabric construction as our regular product. These long distance races run at tremendous speed give added proof of

Indianapolis, Ind.

"HALF OF THIRTY-FIVE."

THE ELECTRICAL WIZARD OF MOTORDOM.

Mr. Hart, of the Splitdorf Coil Co., said to an inquirer: "The Duquesne Car is equipped with the best coil known to man! The concern gave us *carte blanche,* as to price, to produce the best we could—and we did so. Single coil sparks four or six cylinders at any speed with "nary a miss"! This proves that neither

FRENCH, GERMAN NOR TIMBUCTOO coils can surpass the best American product—if the manufacturer will pay for the latter."

DUQUESNE CONSTRUCTION throughout is of the same high class. The price of the car—"HALF OF THIRTY-FIVE"—is made possible by its *extreme simplicity,* not by the use of inferior material.

BY THE WAY—that *simplicity* is its greatest attraction for you as a prospective motorist—isn't it?

DUQUESNE CONSTRUCTION COMPANY,
Manufacturers, JAMESTOWN, N. Y.

Peerless

The Car of Achievement

FOURTH IMPRESSION OF A PEERLESS CAR

CONTROL

Besides being impressed with the beauty, comfort and speed of a Peerless Car, you are equally impressed with the fact that this great power and speed is under absolutely perfect control. A trial of the Peerless demonstrates the fact that a child can easily drive it, so simple it is of operation and so

INSTANTLY RESPONSIVE

To the driver's will. Now it goes as slowly as an electric, and again with a slight pressure of the foot it darts away like a spirited horse. The changes from slow speed to high speed and from high speed to full stop are in reality instantaneous. And perfect control means

PERFECT SAFETY.

ORIENT TOURING RUNABOUT, with Semi-Racing Body, 16 H.P., Model E. Price $1500.

THE ORIENT RUNABOUT

SEMI-RACING BODY.

Price, $1500. With Detachable Tonneau, $1650.

This car completes your line—just fits right in where there is a gap—between the low priced light cars and the big touring cars.

It is very light and fast—will easily do forty miles an hour, with an extra link held in reserve. Has the beautiful, clean cut, powerful lines of the high-priced imported cars—in fact, an owner would be proud of the appearance of this car in ANY company.

With the detachable tonneau this Runabout is the ideal car for business and professional men who wish to use a car as a runabout during the week, and as a family car on Sunday.

The Model E is remarkable as being the only Runabout of 16 H. P., or less, having all the engineering features of the larger cars—4-cylinder, vertical fore-and-aft motor, direct drive, sliding gear transmission, three forward speeds (and reverse), Positive Air-Cooling by means of direct air-blast from a powerful 4-bladed fan, and full Mercedes type hood.

Catalogue, showing all these:

Needs American Construction.

LET US TELL YOU ABOUT

"THAT CAR OF QUALITY."

Logan Construction Co., Chillicothe, Ohio.

Digitized by Google

Two Impulses with Every Revolution

This is the famous Elmore Pathfinder, which has demonstrated beyond a doubt the superiority of the two-cycle engine over the four-cycle engine. The most significant feature of the American Automobile situation to-day is the complete triumph of this impulse-every-revolution idea, or, with two cylinders, two impulses every revolution, as exemplified in the Elmore. That the Elmore does produce a constant torque; that it does utilize every particle of power and put a stop to waste energy; that it will take the steepest hill or roughest road at high speed, and that it has the most reliable self-starting engine in the world—for each and every one of these claims overwhelming proof has been produced.

The whole trend of expert and popular opinion is rapidly being directed toward the two-cycle engine.

You owe it to yourself to see this car, which will astonish you, not only by its fine appearance, but by its excess power and its extraordinary control on the high speed.

Send for our full line of literature, the booklet illustrating the 6,000-mile trip, our catalogue, explanation of our engine, and the opinions of people who have used our cars, all sent free, or, if you wish, we will send a 10x12 photograph of the Pathnder on receipt of 10 cents in stamps.

ELMORE MANUFACTURING COMPANY,

1104 Amanda Street, CLYDE, OHIO.

Members of Association of Licensed Automobile Manufacturers.

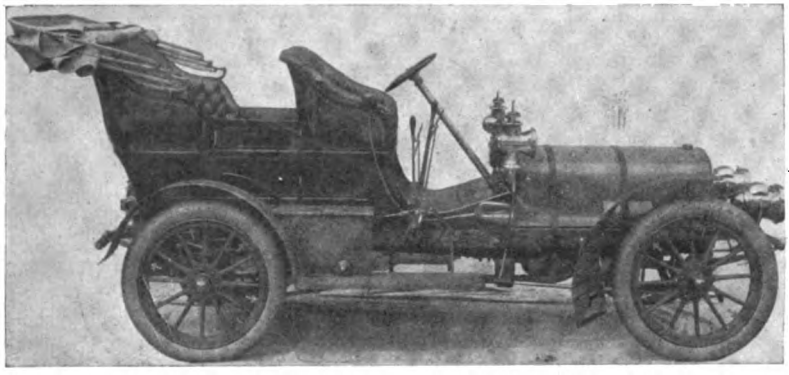
The "Maxwell"

There is not one complicated detail throughout "Maxwell" construction. The number of parts has been cut down to a minimum, and each part has been treated as a special problem and carefully worked out to perfection. It is fundamentally a car easy to explain, easy to understand and easy to operate.

The owner of a "Maxwell" is absolutely sure of two things.

First, that no car in the market AT ANY PRICE is more reliable than his, and, second, that he owns the one car before the public to-day in which, through its rare simplicity of construction, there is nothing to do but ride.

The "MAXWELL" cars have no pump (thermo-siphon). Their double opposed motor is in front under the hood and accessible in every part. They have Bevel Gear Drive. METAL BODIES. Transmission Case and Crank Shaft cast in one Aluminum casting. "Perfectly simple and simply perfect."



16 H. P. TOURING CAR, $1400. 8 H. P TOURABOUT, $750.

Rambler

SURREY, TYPE ONE, 18 H. P., $1350.

IMMEDIATE DELIVERY.

Actual use has demonstrated that this vehicle is exactly suited to the needs of persons of moderate means for a beautiful, roomy, powerful and reliable family touring car.

Its operation is both simple and natural. The ignition of the spark is entirely automatic. The brakes are operated by pedals, not by levers. With the steering wheel and throttle attached to it, operable by one hand, the other hand is always free to operate the clutches by the single lever, and as many women and children have found, no confusion is possible.

The working parts are easily inspected by removing the hinged floor, and seat falls, and it is never necessary to crawl under the machine, nor to keep a mechanic to look after repairs.

SIX OTHER MODELS, $750, $850, $1250, $2000, $3000.

Send for the current issue of THE RAMBLER MAGAZINE (free) and learn with what remarkable facilities RAMBLERS are made, and better understand why we can undersell other makers of fine cars.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, February 16, 1905. No. 21

CLAIM OF BASIC PATENT

Brought to Light by Litigation Aimed at Ford—Other Suits to Follow.

What promises to be an interesting development in patent litigation came to the surface last week, when suit was entered against John Wanamaker, as agent for the Ford Motor Company, of Detroit, Mich., in the United States Circuit Court in New York, for alleged infringements of patents covering the Ball transmission and reversing gear owner by the New York Gear Company, of Brooklyn, N. Y., which company is composed of Frederick J. and George Ball, the inventors.

The suit had been anticipated for some time, owing to the fact that the New York Gear Company had warned a number of automobile manufacturers that they intended to take action to prevent infringement of their patents. As a result of this warning, a number of concerns, it is stated, have taken out licenses, but quite a few totally ignored it, and, in consequence, other suits are in prospect against both members of the Association of Licensed Automobile Manufacturers and those outside of it.

The Ford Motor Company, through its attorneys—to whom Wanamaker turned over the case—have put in an appearance, and their answer is returnable the first week in March.

The New York Gear Company claim that theirs is a basic patent—No. 641,..., granted April 9, 1901, covering the application on reversing gears and transmissions, and two additional patents covering improvements on the original, No. 749,516 and No. 749,602, both of which were granted January 12, 1904.

Following is the inventor's claim in the original patent, 671,747:

In combination, a rotary driving shaft having a gear wheel fixed thereto, a concentric power-transmitting sleeve loosely mounted on the shaft, and having a gear wheel fixed thereto, a pair of drums concentric with the driving shaft, a secondary shaft mounted in one of said drums and having two gear wheels fixed to rotate together in one of the said drums, one of the gear wheels intermeshing with the gear wheel on the driving shaft, an intermediate gear wheel in said drum for connecting the second gear wheel on the secondary shaft with the gear wheel on the loose sleeve; a gear wheel fixed to the other drum, concentric with the driving shaft, a gear wheel located in said drum and fixed to rotate with the said gear wheels on the secondary shaft and a pair of intermediate gear wheels located in said last named drum for connecting the gear wheel upon the secondary shaft with the gear wheel carried by the drum, whereby when one of the drums is held stationary the drive shaft will rotate the sleeve in one direction, and when the other of the drums is held stationary the driving shaft will rotate the sleeve in the reverse direction, substantially as set forth.

Midgley Becomes a Hartford Advisor.

Thomas Midgley, head of the Midgley Mfg. Co., of Columbus, O., and inventor of the well-known pressed steel wheel bearing his name, has been retained by the Hartford Rubber Works Co. in the capacity of consulting engineer, arrangements to that effect having been consummated with Vice-President William Seward, at the Chicago show, last week.

As Mr. Midgley's services to the Hartford Co. will be in a purely advisory capacity, he will, of course, continue to actively manage the fast expanding Midgley Mfg. Co., which, in addition to turning out a large number of pressed steel wheels, is manufacturing all the new perfected Dunlop tire rims, in the development of which Mr. Midgley bore no small part.

Fire at Pungs-Finch.

Fire which started in the Pungs-Finch Automobile & Gas Co.'s plant, at 1524 Jefferson avenue, Detroit, Mich., on Monday last, did damage to the extent of $25,000 and effectively crippled the boat building end of the works. Insurance to the amount of $19,000 is divided among fifteen companies. Fortunately it was confined to the buildings housing that department, so that the automobile department is running, as usual.

Leinbachs now a Corporation.

Leinbach Bros.' Co., Detroit, Mich., have filed articles of incorporation with the county clerk, capitalizing at $10,000, of which $7,000 worth of the stock has been paid in property and business of the old firm of Leinbach Bros. The stockholders of the new company are E. L. Leinbach, Clyde Leinbach and A. W. Muer. The firm will conduct a general automobile business.

MORRIS IS INTERESTED

Knows Nothing of an A. C. A. Show and Would Welcome Information.

"Rumor and report to the contrary notwithstanding, I know nothing of any development thus far in the matter of the A. C. A. holding a show," said Dave H. Morris to a Motor World man this week. "I'm interested in learning myself. Who's floating all these rumors, and where did they originate?" Upon being informed, he continued: "There can't very well be any definite news in regard to the fact of whether or not a show will be held under the auspices of the A. C. A., or where it will be held, until at least there has been a meeting of the show committee of that body, and up to the present none has taken place. General Smith, H. B. Shattuck, one or two other gentlemen whose names I do not recall at the moment, and myself, as an ex-officio member, comprise the committee in question, and I can assure you that there has been no meeting, and the matter of a show has not been discussed officially to my knowledge."

In reply to the question as to whether developments in this direction are to be looked for speedily, he said: "No meeting has been called for any date in the near future, but as to whether one will be in the course of the next week or so, is a question I cannot answer. In the meantime, I can neither deny nor affirm the rumors you refer to any further than to say that no call has been issued for a meeting to discuss the matter, and without a meeting of the show committee, where is the news you want to come from?"

How Ramblers Will be Rushed.

Thomas P. Jeffery & Co., Kenosha, Wis., have offered a novel premium to test the capabilities of their employes.

Twenty-five hundred machines ready for the market by the first day of July is the word that has been passed along to the men employed at the plant, and in order to emphasize this demand the company has offered to give to every man in the factory a two weeks' vacation, with full pay, if these cars are made in time. Nor is this all; for the com-

Digitized by Google

pany offers the men not desiring to take the vacation two weeks' wages without work, or they may divide the time and take a week's vacation with double pay. The offer will cost the company thousands of dollars, but the managers consider it good business, and it is expected that it will aid materially in getting out the large number of machines needed to fill the orders.

The Week's Incorporations.

Milwaukee, Wis.—Richard F. Mokros Co., under Wisconsin laws, with $8,000 capital; to deal in automobiles. Incorporators: Richard F. Mokros, N. A. Stenzel and Oscar Hehr.

Camden, N. J.—The Adams Storage Battery Co., under New Jersey laws, with $4,000,000 capital. Incorporators: Henry F. Stockwell, Joseph Tyler and E. G. C. Blakeby.

Chicago, Ill.—Peer Automobile Co., under Illinois laws, with $2,500 capital; to manufacture and repair automobiles. Incorporators: Godfrey Johnson, Charles Stilwell and C. C. Bowersock.

Detroit, Mich.—Peninsular Machine Co., under Michigan laws, with $5,000 capital, $1,200 paid in; to manufacture automobile parts. Incorporators: John A. Etzold, John E. White and Otto F. Barthel.

Augusta, Me.—The Atlantic Co., under Maine laws, with $50,000 capital, nothing paid in; to deal in motor vehicles. Incorporators: Jacob R. Huntington, John S. Payen, Howard E. Bartlett, M. H. Simmons, E. F. Whitten, Charles L. Andrews and G. R. Hadlock.

In the Retail World.

In Newburg, N. Y., John McLean has taken up the automobile storage and repair business.

The Keystone Automobile Co., of Pittsburg, has secured the agency in that city for the Locomobile and Stevens-Duryea agency.

The garage at Lincoln, Neb., formerly owned by T. F. Mark has been sold to G. A. Buckingham and Peter F. Peterson, who will continue the automobile business.

M. Brotherson will shortly open an automobile supply and repair house at Nos. 305 and 307 Main street, Joplin, Mo., and will conduct the business under the firm name of the Southwest Automobile Co.

Muncie, Ind., is to have a new automobile garage, which is to be leased by the Machine Electric Co. This company will also handle several standard lines of automobiles, and, in addition to this, the company will undertake repair work.

E. A. Colburn will erect a large garage at Fifteenth street and Colfax avenue, Denver, Col., the strip of ground costing $47,500. The foundation walls will be built so that two additional stories can be added should further demands make it necessary.

The Calvary Church property, Penn avenue and Station street, Pittsburg, Pa., has been puchased by William J. La Fountaine for the Atlas Automobile Co. for a consideration of $85,000. It will be used as a garage by the firm.

York, Pa., will have two new automobile firms in the near future. The New York City Automobile Garage has located at South George and Maple streets, and will handle the Rambler. The other is the Richley Automobile Co., at Nos. 16 and 18 North Beaver street. The latter firm will act as agents for the Cadilac car.

M. & A. M. Now Numbers 101.

The first meeting of the new board of directors of the Motor and Accessory Manufacturers was held at the Auditorium on Wednesday, February 8, 1905. All of the members were present, with the exception of D. J. Post, of the Veeder Mfg. Co., who was in the city, but ill; Howard E. Raymond, of the B. F. Goodrich Co., who was compelled to leave Chicago before the meeting opened, and George L. Weiss, who was absent in the South.

While no important matters of interest came up, the trade situation was carefully gone over and various matters were informally considered. The total membership of the organization was brought up to 101 by the election of the following:

J. H. Williamson Co., Brooklyn, New York; Iron Clad Mfg. Co., Brooklyn, New York; Electric Contract Co., New York City, N. Y.; C. W. Spicer, Plainfield, N. J.; Stolp Mfg. Co., Chicago, Ill.

After the meeting, President Chapin entertained the directors at a luncheon in the Auditorium Annex, the object being to give the new members of the board an opportunity to meet each other socially.

Weaver to Sell Apples.

Charles E. Weaver, of Cleveland, O., known to the trade the country over, has been appointed sales agent of the Dayton Electrical Mfg. Co., makers of the "Apple" igniter, which he will handle in conjunction with other lines. In securing Mr. Weaver the Dayton concern has made a ten-strike, and at the Chicago show, where the deal was arranged, results of his work were apparent in the shape of good orders.

Bad Fire in St. Louis.

A serious fire last week destroyed the garage of the Interstate Automobile Co. of St. Louis. The loss, according to President McNair, amounts to about $20,000. Although an investigation has taken place, the cause of the fire has not been discovered. Nor was any evidence found that it was due to "gasolene, as usual."

Odd Origin of a Fire.

To correct a garbled report by the daily press of a slight fire occurring in his garage recently, Thomas J. Northway, the Rambler agent for Rochester, N. Y., wishes to have it made clear that the conflagration so called was of insignificant proportions, and the resulting damage merely nominal, several hundred dollars in the shape of blistered paint and minor injury to cars and less than $100 to the building.

The fire originated through the explosion of an incandescent light globe which a repairer had hung on a machine he was working on, the globe coming in contact with the carburetter. When it exploded it ignited the gasolene in the carburetter, and before the workman realized what had happened, it spread to the tank on the same machine, containing probably a gallon or two of gasolene. The tank did not explode, but a joint melted and allowed the gasolene to escape. The garage in which the fire occurred is located in a separate building in the rear of the showroom, so that no new cars were damaged.

Jefferson is in Trouble.

The Jefferson Automobile Livery Co., Detroit, Mich., organized October 10, 1903, with a capital stock of $20,000, is to have its affairs aired in the Circuit Court. Louis L. Elbert has filed a bill for the appointment of a receiver and for injunctions to restrain the constable from selling goods and property seized by him under process of the justice's court and to restrain the officers from destroying or mutilating the firm's books. Elbert claims that he owned half of the capital stock, but by fraudulent methods the officers of the concern managed to get it away from him.

Seized De Dietrich Show Car.

De Dietrich & Co., 1 West Thirty-fourth street, New York City, lost a $10,000 four-cylinder car at the Chicago show, in a manner that was not at all appreciated by those in charge of the exhibit. Armed with a writ of attachment, Deputy Sheriff Henry Higgins levied on a car and had it removed from the Coliseum. The writ was signed and sworn to by Walter D. Douglass, a capitalist at Cedar Rapids, Iowa, who declared the De Dietrich Co. owed him $2,700.

Quaker Trade Incorporates Itself.

Judge Bregy, in the Common Pleas Court, Philadelphia, last week granted a charter to the Philadelphia Automobile Trade Association. The association is composed of manufacturers, jobbers and retailers in automobiles, and its object is for the better protection of the trade. The directors are Albert E. Maltby, William Morgan, Percy L. Neel, Robert D. Garden and Charles A. Godshalk.

New Home for Columbias in Chicago.

The Columbia Electric Vehicle Co., Chicago, Ill., has given out the contract for the erection of a two story building on the lots at No. 1,328 to 1,334 Michigan avenue. Construction will be started on May 1, and the building will cost about $40,000. The building will make a valuable addition to Chicago's "Automobile row."

To Make Carburetters in Detroit.

Detroit, Mich., has a new accessory manufactory, doing business under the firm name of The Phelps Vaporizer Co. The new firm will make a specialty of a carburetter for gasolene and all hydro-carbon engines.

DETROIT DOES ITS TURN

Local Show a Big Success, as Usual, and Without the Aid of Negro Songstresses.

Detroit, Feb. 14.—Sam Miles's show in Chicago may have needed the carolings of a "negro lady" to give it point and interest, but Detroit's display never has required anything of the sort. The singing of bullets and the deep basso of dogs have always been a feature of the local show here, and they are not lacking in the one which was inaugurated last night. It's a sportsman's show as well as one for automobilists, and a good one from both viewpoints. Automobiles predominate, of course, and, drawing directly from such a numerous colony of manufacturers located on the very ground, it goes without saying that it is a large success. Each maker has his best foot forward, and the result is easily pictured, despite the fact that the thermometer, as usual, is hovering around naught.

Those who are exhibiting are as follows:

M. F.—Main floor.
G.—Gallery.

Auto-car Equipment Co., Buffalo, N. Y., Spaces 27, 28, G.—Automobile trucks.

Wayne Automobile Co., Detroit, Mich., Spaces 26 to 29, M. F.—Wayne cars.

Welch Motor Car Co., Detroit, Mich., Space 16, M. F.—Welch car.

Weber & Co., W. H., Detroit, Mich., Spaces 30 to 33, M. F.—Agent for Rambler and Mitchell cars.

Young & Miller, Detroit, Mich., Spaces 34, 36, M. F.—Agents for Elmore and Yale cars.

Fisk Opens Another Branch.

Kansas City, Mo., constitutes the eighteenth link in the Fisk Rubber Co.'s chain, its branch there having been just established. Like all the others, it will be complete in every detail.

"I don't think it is generally known or that I am wrong in claiming that these branches of ours are the most completely equipped establishments of the sort in the world," said J. W. Bowman, Eastern sales manager of the Fisk Rubber Co., in remarking the opening of the Kansas City place. "Of course, I'm interested, but I do think the fact should be cause for some pride on the part of Americans generally. Each and all of the Fisk branches not only carry a complete stock of Fisk tires, but are able to make any sort of a repair of any tire, of any make, that may be brought to them. The men in charge of the repair departments were all thoroughly schooled in our factory, and, if occasion required, are competent to build a tire from the ground up. Each place is equipped with a battery of vulcanizers and all other facilities to permit the handling of tires of all sizes, from those for the biggest automobiles to the ones for the smallest bicycles. In this way we have made it unnecessary for any one to ship tires a thousand miles or more for even the most intricate repair—and we don't charge anything extra for doing the work on the "other fellow's" tires, or for the saving of days of time and dollars of express charges made possible by the proximity and completeness of our branches," added Bowman with a smile.

Why Miller Was Ruffled.

Charles E. Miller—you all know him—has been very much ruffled this week. Although Miller has absolute control of the sale of Brampton chains in this country, some man, as yet unidentified, has been making the rounds of the trade endeavoring to do business as a representative direct from the Brampton factory.

When news of the imposition reached Miller, he immediately cabled to the Brampton people and received their assurances that they had no representative in this country, and recognized Miller only as their exclusive sales agent. The tradesmen who receive visits from other than a Miller man should, therefore, know how to "receive" him, and—likewise—to speed his parting.

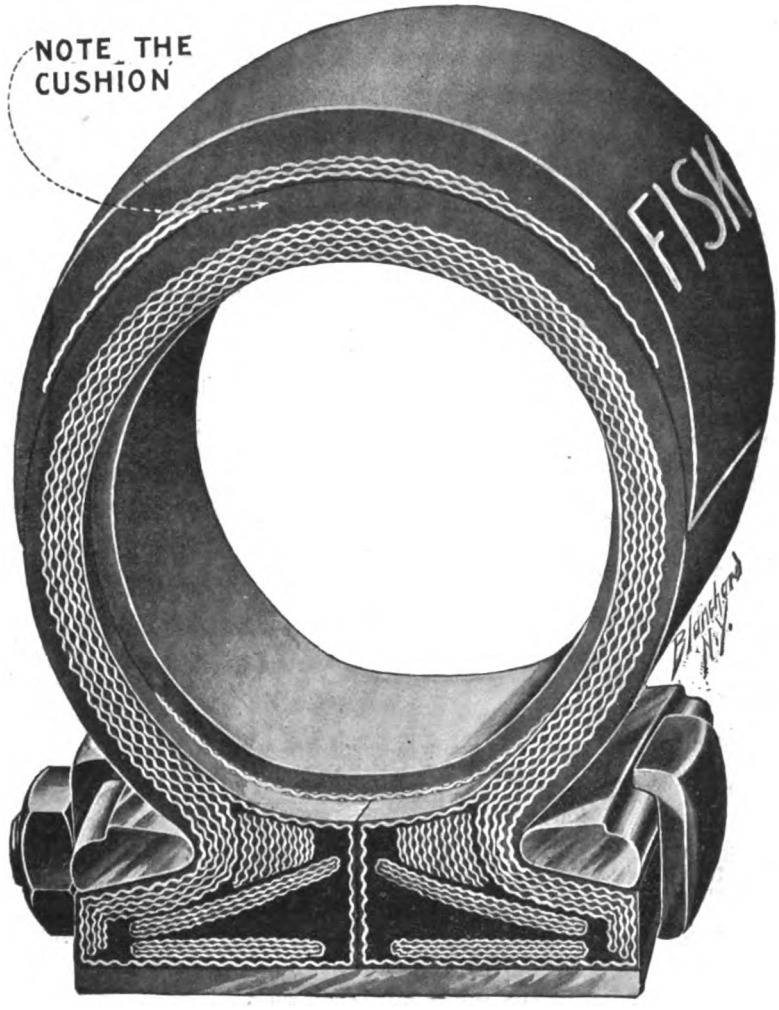
Buggy Factory Will Build Automobiles.

The Detroit-Oxford Mfg. Co. is the style of Michigan's newest automobile manufacturing concern. It will be capitalized at $100,000 and be located at Oxford, where the Crawford buggy factory has been purchased and will be used for the production of the Detroit-Oxford cars. C. H. Crawford, the former head of the buggy works, is the president of the new concern. His associates are as follows: E. C. Lieprand, of Detroit, vice-president; E. L. Peterson, of Detroit, secretary, and J. G. Sutherland, of Oxford, treasurer. The above named officers, with W. A. Dumas and A. Radford, of Detroit, are the directors.

Densmore to Face Old Charge.

Park Densmore, formerly president of the extinct Foster Automobile Club, of Rochester, N. Y., is in jail at Pasadena, where he has been in the contracting business. His arrest is based on a charge of grand larceny, growing out of the failure of his automobile company some two years ago. Densmore is credited with saying that he will come East on his own account to fight the proceedings.

Boston Show Opening Advanced.



It has been decided to open the Boston Automobile Show on Saturday, March 11, in lieu of March 13.

Digitized by Google

LIFE PRESERVER

is the term used by one of the many discriminating users of Fisk tires to characterize the

FISK MECHANICAL FASTENING.

And when you think of it, it is a very apt definition of it. You never hear of accidents due to Fisk tires "creeping" or rolling off, or blowing out of the rim. They simply can't do it. That fastening holds them as securely as a safety deposit vault holds its contents.

Buyers Are Wise Now.

Time was when the reputation of its builders sold the car, and this is true to an extent incredible to-day. Wealth was, of course, a prerequisite to the ownership of a car of any kind then, not alone from its first cost, but the expense of maintenance which frequently might exceed the latter in the course of a little over a year. Cars were ordered simply by name rather than the fact that they met any specific requirements which the buyer might have in mind, because the latter were non est—knowledge of anything but the name of the car was lacking, and as brought out in an interview with the representative of a prominent maker, it was nothing unusual for the purchaser to hand out his check when ordering a car without going through the preliminary of an inspection of any nature; others would casually take in the external fitness of the car and the color and upholstery were more weighty considerations with many of these than the character of the motive power or its efficiency.

This in reference to the question, "Is it easier to sell cars to-day than it was a few years ago?" Looked at from varying points of view, this may readily be answered both in the affirmative and negative. The latter because the purchaser now wants to know exactly what he is getting, and is not so readily influenced by the reputation of the manufacturer, the tables having been turned in this respect, in that the car must make its own name. He wants to know the why and wherefore of innumerable things regarding which he was in utter darkness formerly; the car must meet preconceived requirements differing with probably every third buyer, and the result of personal experience, and many considerations then not taken account of now sway his decision one way or the other.

The purchaser now talks carburretion, ignition and the advantages or otherwise of certain types of valves, frames, suspension and the hundred and one details that interest him as glibly and often to more purpose than the salesman, to whom he can give points. The mere fact that the car does not break down in the course of the demonstration is no longer sufficient; its action is closely watched; the operation of the motor and its accessory apparatus under the varying conditions of speed on the level and hill climbing, and particularly its capacity in the latter direction are important considerations. And frequently several demonstrations are necessary. Considered from this point of view, the question must be answered decidedly in the negative: it is not as easy to sell cars now, by any means.

But the converse of the proposition likewise holds good. Where formerly there was one prospective buyer, there are now hundreds, nay, thousands. That the prevailing dense ignorance as to everything concerning the car has given way to an enlightenment of the opposite extreme, militates in favor of the maker and his agent rather than against him, for the car bought merely on the latter's reputation frequently failed to substantiate the good service expected of it and ended by ruining its only recommendation in the eyes of its owner—that it was of a certain make. If his enthusiasm survived this trying test, he looked elsewhere for his next choice. Now the car is bought on its own reputation, supplemented by a personal knowledge of its many good points and cognizance of the value of improvements which the maker may be able to lay claim to as exclusive on his product.

Looked at in this light, it is easier to sell a car than ever before, because there are now thousands who recognize its advantages and know how to utilize them, and who will buy new cars of the same make season after season because of this knowledge. Then, despite the ever increasing competition and tendency to settle on a firm economic basis brought about on lines similar to those necessary for any enduring business, there is the tremendous, almost daily, increase in the number of votaries of the automobile.

Sympathy for the Specialist.

Human nature proceeds on the assumption that a device which performs what is expected of it merits no praise—so long as it keeps up to the mark, but once let it fail or fall short of the mark, and nothing less than eternal damnation is bad enough for it. This is the inherent trait in man which the specialist, the manufacturer who devotes his entire time to producing a good carburetter, ignition apparatus or any one of the hundred and one odd essentials of a car which the builder seldom makes himself, has to contend with early and late. After evolving an invention of merit, reducing it to practical shape and placing it on the market in a form so simple as to be readily understood by the veriest tyro, then his worries commence and a detailed account of some of them would put fiction to the blush to an extent that appears incredible.

Take the carburetter as an instance. A prolific source of guesswork on the part of the uninitiated, even under favorable circumstances, when properly applied and given intelligent attention, it performs its duty or gives some inkling of the reason for its shortcoming to the practised eye. But in the hands of the hundreds who are only satisfied with a device that stands up under all conditions, its most violent symptoms of distress too often go all unheeded, and the manufacturer is informed in no uncertain terms of the worthlessness of his product. Investigation of complaints of this order usually results in showing them to be totally unfounded, and the so-called defect nothing more serious than some temporary derangement requiring but a moment to set right. Nor is the user the only transgressor in this respect, the builder of the car—not always quite as expert as he thinks him-

Digitized by Google

self—may have applied it in the first instance in such a position as to nullify any beneficial effect a good carburetter might otherwise be able to exert, as where it has been placed several feet from the inlet valves, or not equidistant from the different cylinders and connected through tortuous pipe of a diameter far too small to give the proper result. This is but one type of complainer, and the instances cited are not suppositious, but such as freqeuntly occur in practice.

Then, there is the amateur or newly fledged professional who undertakes to set things up himself unaided, and when, as the result of his efforts, he finds it impossible to make his engine run, he damns the latter and the maker is made to realize that it is not a motor, but a piece of junk that he is selling. A sample of the latter species came to notice not long ago, where in connecting up the engine, a marine one in this case, the gasolene tank was piped to the water jacket and the water to the fuel supply. Such stupidity seems beyond the pale of reason, but such was the actual fact, and, after having toiled over it several days without any success, the purchaser finally gave up in despair and wrote the stereotyped letter to the maker—the engine was no good whatever; it was simply impossible to even make it turn over. Corespondence aggravates a case like this, so a factory representative was sent, and, needless to add, it did not take him long to locate and remedy the trouble. This is another type, and it is one that makes the manufacturer's life a burden to him at times. But these two do not sum up the total, for even the repair man, who should be his chief ally, is more often guilty of unwarranted pieces of stupidity and serves to add his quota.

A broken or chafed wire or oftimes a dead battery will bring disgrace to itself, the engine and car alike in the eyes of its owner, who cusses the whole outfit as no good, and an instance has occurred where solely through failure to operate from a dead battery a car has been returned by express more than a thousand miles, with a letter expressing in terms more forcible than elegant the opinion of the purchaser. Frequently for some apparently unaccountable cause the engine will run by fits and starts, and it must be admitted there are few things more exasperating, and, failing to remedy the difficulty by trying everything that occurs to him until absolutely disgusted, the maker gets the usual communication, often couched in terms more expressive than pleasant, telling him how little he knows about building automobiles.

But on the other hand, the manufacturer has in the past been so frequently to blame himself that neither he nor his customer can afford to indulge in any superfluous stone throwing—it is, in short, a matter for considerable give-and-take on both sides. Through his ignorance or stupidity the buyer of a car does not see unavoidable temporary derangements which in some instances would bite him if animate, but, on the other hand, cars have sometimes been sent from the factory in this condition, and the maker must in such a case accept the responsibility. Likewise should he confess himself to blame for poorly designed springs on automatic valves, a poorly placed carburetter—or a great many of the odd defects that go so far toward disgusting a car owner.

Truly the specialist is a man who gets more kicks than ha'pence, and of all those in the trade deserving of sympathy his should be the major share.

Not Due to American Air.

"Does American air cool better than European air?" is the ingenious question put forward by a foreign observer who has noted the success and steady increase of air-cooling in this country, in contrast with the lack of experiment in this direction abroad. According to this observer, some of the methods resorted to here to render air cooling effective are so elaborate and expensive as to render it questionable whether a water circulating system would not only be simpler, but cheaper. This, however, is an opinion based more upon superficial observation of illustrations of new systems for this purpose than of the cars themselves or their performance in actual service.

The results thus far achieved with air-cooling here are due in large measure to the initiative of the American builder, and the fact that he is not bound by French standards, while the small amount of attention given the subject abroad is owing in great part to lack of the former quality, or extreme conservatism, backed by adherence to "across-the-channel" ideas, where the Englishman is concerned, and almost entirely to the latter, where the remainder of the Continent is considered. And to the American designer and builder is due so much greater a measure of credit for having successfully defied precedent to the extent of radically departing from standards acknowledged by the rest of the automobile world.

As to the question which gives rise to the discussion, that may at once be answered in the affirmative, with the reservation that while American air undoubtedly cools better than the atmosphere of over-seas, it is not due to any inherent quality of the latter itself, but to the manner in which its properties are taken advantage of. American air certainly has greater cooling power when applied to an American air-cooled engine than the English atmosphere has for an engine native to its soil, but the latter would not do any better here than at home, while the American engine will run cool in any air, as has been successfully demonstrated by the use of air-cooled cars in the tropics.

There is no one feature of the successful air-cooled car as turned out in this country on which the American designer can claim to base his achievements. The latter are the result of long study of the subject and a realization of the fact that the air-cooled motor is in a class by itself. So far as the interior of the cylinder is concerned, the advantages and limitations of the water-cooled type apply to it in equal measure, but apart from this it is a totally different proposition, and a reference to the detailed report and illustrations of the various air-cooling systems now on the market contained in the show number of the Motor World will readily show that departures in the design of cylinder heads, intake and exhaust valves have been found necessary, and that all have combined to form an engine that will operate satisfactorily under atmospheric conditions to be found in any part of the globe.

To Win by Hook or Crook.

The Bennett Cup situation is a notable illustration of what comes of the effort to mix sport and commercialism. The Grand Prix, which the Frenchmen would run in conjunction with the cup race, is inspired by the most commercial motives—the desire that there shall be a preponderance of French entries, and that therefore it may be possible, should France lose the Bennett Cup, for the Frenchmen to advertise, 'We may have lost the Bennett Cup, but a French car beat the winner of it.' It is a contemptible attempt to sacrifice sport for commercial prestige, and well merits the snub administered by the Germans, who have curtly intimated that if France maintains its unsportsmanlike stand there will be no German cars in either race. It were well did America take the same position.

FROST IN CUBA

"International Meet" Proves Farcical, a Native's Victory Redeeming it from Abject Failure.

Except to gratify the aims of a so-called sportsman, who made a mark as a six-day professional bicyclist and other things, and doubtless to add to his exchequer, there was at no time sound reason for either the so-called "International Automobile Racing Association of Cuba," or its so-called first annual "international race meet," which "held the roads" last week. It was doomed to failure from its inception, and if, by a lucky turn of fortune in the form of mishaps to others, a Cuban had not won the principal race of the so-called meet, it is probable that the Cuban gentlemen who permitted themselves to be inveigled into the "International Association" would be quick to see beneath the gilding of the brick which was handed out to them, and even beneath the heralded "mile record" in 46 seconds—that is, a "record" made on a macadam surface instead of one of sand.

As a matter of fact, and as the Motor World of last week intimated plainly was likely to be the case, the race meet or carnival was beautifully embroidered with "frost" from beginning to end. The "boatloads of rich Americans" were conspicuous by their non-arrival, and "all of the fast American cars" were as lacking. The races and the so-called "battle of the roses" were small affairs.

The interest of the Cubans themselves was not even lukewarm, and the contests were largely farcical. The fact, as stated, that a Cuban managed to win the 160 kilometer race was the saving clause. It gave a chance for the Cubans' patriotism to come to the surface, and gave them cause to believe that they really had got something for nothing, despite a generous deficit which some one must make good.

The 106 kilometer race over the San Cristobal road Sunday, February 12, was the principal event, and it was won by Ernesto Carricaburn, a Cuban, in a 60 h. p. Mercedes, who beat Joseph Tracy, in a 30 h. p. Renault, by 0:1:32 2-5. Carricaburn's time over the course was 1:50:53 3-5, and his average per hour 53 7-10 miles. The eastward run to San Cristobal was 79¼ kilometers, and the return 80¾ kilometers, the 160 kilometers falling short of 100 miles by about two-thirds of a mile. Joseph Tracy, driving a 30 h. p. Renault, started first; then H. W. Fletcher, in a 90 h. p. De Dietrich; then Joseph Birk, in a 40 h. p. Mercedes; Ernesto Carricaburn, in a 60 h. p. Mercedes, and H. A. Robinson, driving a 40 h. p. De Dietrich. The starts were made at intervals of ten minutes, and finished at the San Cristobal control in the same order. Tracy made the distance in 0:51:22 3-5, Robinson in 1:17:01 4-5, and the others were scattered between. For the return trip the starts were made in the same order, except that the cars were startd at intervals of two minutes.

Tracy covered the last half in 1 hour 1 minute and 3 2-5 seconds. At first it was believed that he had won, but Carricaburn, who started half an hour later than Tracy, covered the course in a little over a minute and a half faster. Tracy led at San Cristobal by about three minutes, but a broken pipe and a fallen battery robbed him of the victory.

After starting, Fletcher punctured a tire and had other drawbacks, necessitating stops for water and repairs. The 30 horsepower Renault, driven by Tracy, was the lightest car in the race. In addition, its battery was loosened and gave trouble toward the end of the contest.

Carricaburn rode like a madman, waving his hand to the crowds along the course while he was speeding at a rate of eighty miles an hour, and taking the turns with reckless daring. It was his first race.

E. R. Thomas and Edward Hawley were injured Friday preceding the race, as the result of a collision between Thomas's 90 horsepower Mercedes and an ox cart on the road between Punta Brave and Guanajay. The accident kept them both out of the race.

Tuesday's races were attended by scarcely a hundred spectators, as the events took place on the stretch of road between Guanajay and Artemis, fully thirty miles distant from Havana. The only means of transportation from the city was either by stage coaches or automobiles, and but few of the latter were available. The first event was a one-mile speed trial. H. W. Fletcher, driving a 90 horsepower De Dietrich, made the mile in 0:46 4-5, and Joseph Tracy, driving a 30 horsepower Renault, drove over the course in 0:52.

The one-mile kilometer race was run by Fletcher alone, as Tracy broke a gear while making a flying start. The time for the kilometer was 0:28 3-5.

As night was approaching, rain began to fall, and the few spectators were leaving in disgust, the five, ten and twenty kilometer events were run as a single event, the only contestants being Fletcher and R. G. Mendoz, the latter driving a 35 horsepower De Dietrich. Fletcher covered five kilometers in 3 minutes 4 1-5 seconds, ten kilometers in 5 minutes 57 seconds and twenty kilometers in 11 minutes 18 1-5 seconds. Mendoza took 21 minutes 13 seconds for the twenty kilometers. The summaries for the events follow:

SUNDAY.

160 Kilometer Race for Municipal Cup of Havana.

Ernesto Carricaburn, 60 h. p. Mercedes	1
Joseph Tracy, 30 h. p. Renault	2
Joseph Birk, 40 h. p. Mercedes	3
H. A. Robinson, 40 h. p. De Dietrich	4
H. W. Fletcher, 90 h. p. De Dietrich	0

Times—Carricaburn, 1:50:53 3-5; Tracy, 1:52:26; Birk, 2:34:28; Robinson, 2:40:17.

TUESDAY.

One Mile.

H. W. Fletcher, 90 h. p. De Dietrich	1
Joseph Tracy, 30 h. p. Renault	2

Times—Fletcher, 0:46 4-5; Tracy, 0:52.

One Kilometer, Open.

H. W. Fletcher, 90 h. p. De Dietrich	1
Joseph Tracy, 30 h. p. Renault	0

Time—Fletcher, 0:28 3-5. Tracy broke gear at start.

20 Kilometer, Open.

H. W. Fletcher, 90 h. p. De Dietrich	1
R. G. Mendoza, 35 h. p. De Dietrich	2

Times—Fletcher: 5 kilometers, 3:04 1-5; 10 kilometers, 5:57; 20 kilometers, 11:18 1-5. Mendoza's time for 20 kilometers was 21:13.

CHICAGO IS PROUD

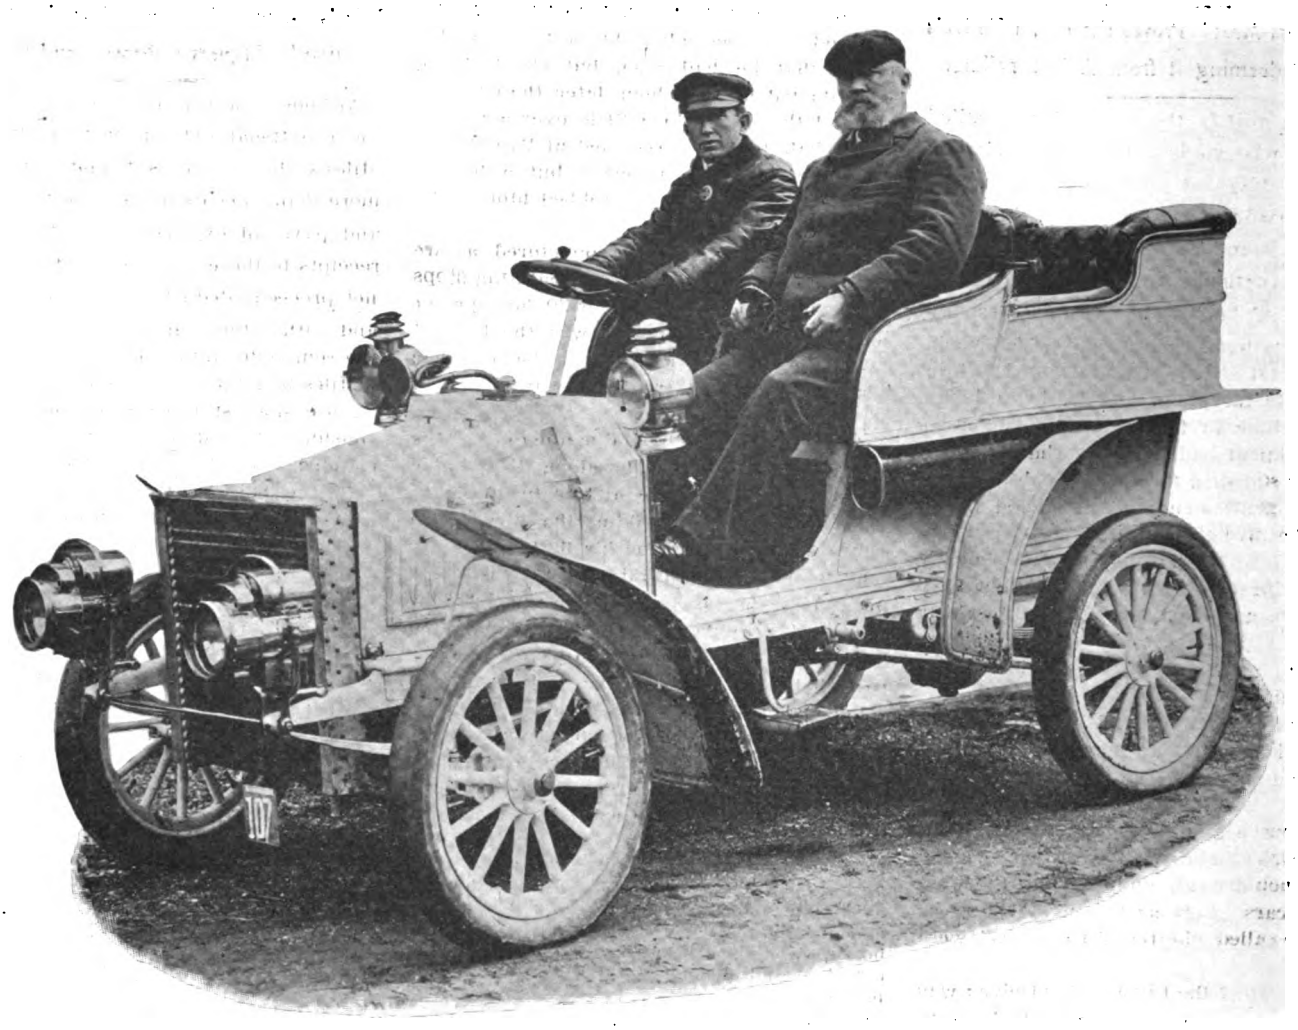
Miles's Show "Knocked New York Silly," of Course!—Figures "Prove" and Disprove it.

Although the Chicago show is supposed to be a national exhibit, it is really Sam A. Miles's show. He is bound not to charge more than 75 cents per square foot for space, and pays all expenses, applying the initial receipts to these expenses, and then from the net proceeds deducts $6,000 in a lump sum, and with it tucks an added 33 1-3 per cent of the remainder into his personal pocket.

Miles is a former resident of Chicago, and, on occasion, still poses as one. He had a considerable following out there, and this, coupled with Chicago's pride, makes it possible for those "in the know" to readily comprehend the fulsome stories that follow each succeeding show in the Western metropolis.

This fulsomeness was not lacking in the case of the show which closed on Saturday night last. If one-half of what was said and printed in Chicago were true, Miles's show made the prodigious affair in New York look almost like the proverbial "thirty cents," and Miles must have had to enlarge his pocket for his 33 1-3 per cent. According to what are described as the official figures, 122,421 persons attended the show during the seven days which, according to Chicago's fulsomeness, is something like 25 per cent more than the total attendance at the New York exhibit.

It is not stated who made the official count or what process of multiplication was employed in reaching the result. There is no doubt, however, that the attendance this year was much greater than at any previous show, but that it approached the proportions of the New York function is incredible. The evening crowds at Chicago did not seem to be even so large as the morning crowds in New York.



The Chicago public responded liberally, and the trade of the surrounding towns was also well represented. There were a few scattered dealers present from as far West as Omaha, Neb., and Minneapolis and St. Paul, Minn.; but, generally speaking, the show did not reach above the dignity of a neighborhood event, notwithstanding any statements to the contrary that may be inspired by local or sectional pride. How far apart are the Eastern and Western shows is well illustrated by the number of trade tickets supplied by the Motor and Accessory Manufacturers to their members. At New York this organization purchased and made use of twelve thousand of these trade tickets; at Chicago the total number of the same pasteboards sold by the organizations' representative on the ground, up to the afternoon of the closing day, was exactly 372.

There was business done, of course; but, generally speaking, not a very great deal of it. Few of the manufacturers whose cars were in evidence did more than "drop in" or spend more than a day or two at the show, when, indeed, they attended at all.

At Chicago the number of would-be dealers from little specks on the map of the West were remarked. Nearly all of these men had the sale of one car in sight; but, as one of the exhibitors told a Motor World man, they "almost fell in a fit" when they discovered that an order for five or ten cars was necessary to obtain an agency.

The New Head of the A. A. A.

ELLIOT C. LEE, THE NEW PRESIDENT OF THE A. A. A., IN HIS WHITE STEAMER.

Col. Pope Also Protests.

Colonel Albert A. Pope wishes to go on record as protesting against allowing French commercialism to dominate the Bennett Cup race, and is supporting the Automobile Club of America in its protest that the big road race proposed should not be permitted on the same day as the international event. He expresses himself in the following communication to the A. C. A., which is indicative of his feelings in the matter:

"Permit me to thoroughly commend the course taken by the Automobile Club of America in protesting against the plan of having the Grand Prix run over the same course and on the same day as the international cup race.

"When I entered our Pope-Toledo racer for this event it was done with the definite understanding that we were in possession of the rules and regulations governing entries and contestants for that race. I should, therefore, deem it eminently unfair to find our car racing under other conditions than those stipulated. I feel strongly about this matter, but am sure that such action as has been taken by the Automobile Club of America and other clubs in Europe will have the desired result."

Whipple Wants His Money Back.

Harlan W. Whipple, former president of the A. A. A., is making a determined effort to obtain the $5,000 in cash put up with the authorities of West Orange. This sum served the purpose of indemnifying the town from any damage that might result from the Eagle Rock hill climbing contest of last Thanksgiving Day.

The town officials announce their intention of keeping the money for five years in case any suits should come up in that time, but Whipple will apply to the courts in order to have the money refunded, as there were no accidents at the climb that could possibly involve the town.

Chicago Thieves are Indicted.

Indictments have been returned against William Knight and M. B. Neele, of Chicago, on charges of having received stolen property. It is alleged that they purchased automobiles which had been stolen from Sidney F. Gorham, secretary of the Chicago Automobile Club; Jacob Rosenstyn and C. E. Plamondon. Gorham's car was valued at $750, Rosenstyn's at $400 and Plamondon's at $1,000.

Sporting Life in Philadelphia!

Philadelphia had a sensation last Saturday afternoon—an automobile hill-climbing contest extraordinary, and on the toughness of the crank shaft depended whether Nat Folwell, a former "Pennsy" football player, would pay double price for a car or get one for nothing.

Carl W. Kelsey, who owns a 16 horsepower Maxwell car, was explaining its virtues to Folwell, who wagered the machine could not climb the granite steps of the Mercantile Club, on Broad street, and Kelsey promptly took him up. The Mercantile Club steps consist of seventeen nice little granite blocks, each sixteen inches wide and seven high. The Maxwell car climbed the steps three times without using a non-slip device on the rear tires, and Folwell was satisfied.

Col. Green's Race is Off.

The fifty-mile automobile race between Colonel E. H. R. Green's Pope-Toledo and Howard Hughes' Peerless cars, which was scheduled for last Saturday at the State Fair Ground track, Dallas, Texas, has been indefinitely postponed. The sudden climatic changes have made the Dallas track unfit for racing.

AUTOBUS LINE FOR MONACO

Gambling Pays for Modern Transport and Ancient Coaches Had to Go.

From the old stage coach to the modern automobile is the progress made in a very few years on the coast of the Mediterranean as a means of communication between Nice and Monte Carlo. It is interesting to take cognizance of the changes which conveyances have undergone in the past thirty years between these two points.

When gambling was first started in the old town of Monaco, the only means of transit from Nice was a rickety old steamboat, which usually took more than four hours, or, by coaches, equally antique, making periodical trips; but on account of the steep climbs, these vehicles did not make much better time for the short distance of twelve miles than the boats. Nice had long been a town of importance, and being in France, where gambling was prohibited, the natives were forced to undertake the tiresome journey when they wished to indulge in this questionable vice or go to Mentone. The railway went as far as Nice, but there came to a full stop, so all visitors had at some time or other to put up with the boat or coach journey, which was so inconvenient that many of them did not attempt to go to Monaco, and the gambling resort suffered in consequence. It was then finally decided that a railway should be constructed between Nice and the Italian frontier.

This project meant the overcoming of great difficulties, as so many tunnels had to be bored to make the line at all direct, and on account of the mountains further inland there was no alternative. Engineers took the matter in hand and constructed a line which went as far as Ventimigilia, and no less than thirteen tunnels were bored in the twelve miles from Nice to the gambling casino, which had been transferred to Monte Carlo. Visitors were then able to reach the Casino in forty-five minutes. This was a decided improvement, but the idea of so much beautiful scenery being hidden from view more than half the time, the soot and smoke caused by the numerous tunnels, besides the extremely foul air, made aesthetic vistiors prefer to take cabs, which cost about ten times as much as the train.

A line of modern coaches was then organized for those who preferred the old mode of transit, which appealed to them as being more healthy; an important factor, considering many of them were in the South for the purpose of recuperating their health. This line of vehicles was so successful that it has recently been decided to replace them by automobiles in order to cater to those in haste and those of taste. This public automobile service will be run between Nice and Mentone, and will cover the distance in about the same time as the local steam trains, but without the same discomfort. The automobiles are Serpollet steam cars, and they will be run with sufficient frequency to make it convenient and also of great pleasure to all visitors.

Oil Cooling.

The use of oil as a cooling medium for petrol motors instead of water has not a few advocates in countries where the cold is so excessive that there is much difficulty in preventing water from freezing, and thus bursting the pipes, etc., says The Car. Votaries of the oil method point out that this fluid will not freeze at 18 degrees below zero, and, even if it does freeze at a lower temperature, it forms a jelly which has not the expansive and destructive power of frozen water. As to the temperature to which the oil rises when the engine is working, one user states that the highest point ever reached on his car was 209 degrees Fahrenheit. The danger of the oil catching fire is prevented by covering with asbestos the silencer and any heated pipes on which oil from the cylinder is likely to drop. A good pump is said to be an absolute necessity with oil circulation, as otherwise the oil easily boils, and the engine is no longer well cooled. It is at such a time that the risk of the oil taking fire is greatest. In America the new method is being tested by several experimenters, and some of them claim considerable success.

Verily is it needful to go abroad to learn what is being done at home. The fact that oil is being experimented with in this country for cooling purposes will probably come as a piece of news to the supposed experimenters themselves.

Another "Long Felt Want" Filled.

According to an English contemporary, something has been lacking all along to make the motor car really popular and the "ha'penny newspaper," the Britisners's name for the yellow journal, has recently exploited the dream of a "talented inventor's" cranium, which, like our own Sunday newspaper inventions, is destined to "revolutionize" the industry. This is a "detachable engine that can be taken into the house and attached to the sewing machine, the soul stirring mangle, the enlivening knife cleaning machine, or to some mechanism that will clean all the boots before breakfast, first calling up the hired help—and all that at about a quarter of the price at present demanded by the capitalistic plutocrats who are now living luxuriously out of the huge profits of the motor industry." One thing the dreamer of that portion of the press seems to have overlooked stating, and that was that the new invention filled "a long felt want."

This Berry is of the Right Sort.

T. C. Berry, of San Rafael, Cal., has taken steps to test the anti-automobile ordinance now existing in the county, which prohibits the use of automobiles on the roads after dark, on the grounds that it is unconstitutional. Berry was arrested last August for offending the law in this respect. He was convicted in the lower court, and has appealed to the Supreme Court.

Club News the Country Over.

The following officers have been elected by the Pasadena (Cal.) Automobile Club: President, Tracey N. Drake; vice-president, Louis S. Laflin; treasurer, Dr. Thaddeus Updegraff; secretary, B. O. Bruce.

The New Hampshire Automobile Club is planning the construction of a well equipped clubhouse at Hampton Beach. Last summer the club rented the new Boar's Head Hotel at that resort, and used it as a clubhouse and garage.

These officers have been chosen by the Colorado Automobile Club of Denver: President, Dr. F. L. Bartlett; vice-president, Brayan Haywood; secretary, W. H. Bergtold; treasurer, Louis Searing; executive committee, E. P. Hershey, B. V. Brown and J. W. O'Connor.

Courtland F. Bishop, the new vice-president of the Berkshire Automobile Club, Pittsfield, Mass., has offered a silver trophy for competitors in the club's hill climbing contests next spring. Bishop suggests that the matches take place on Florida Mountain, in North Adams.

The Philadelphia Automobile Club is finally moving in the effort to have the Pennsylvania law so amended that the license tag and number of an automobile from any other State shall be accepted in Pennsylvania. As it is now, automobilists from other States must secure Pennsylvania licenses and numbers before using a car there.

The Colorado Automobile Club, of Denver, has decided to establish a school of instruction for its members. Lectures and practical demonstrations will comprise the curriculum. Dr. F. L. Bartlett, president of the club, will deliver the first lecture in the course. His subject will be, "The Use of Agents Other Than Gasolene for Automobiles."

The decorations at the first annual ball of the Rockford Automobile Club, Rockford, Ill., held last Wednesday evening, were rather unique. Automobile tires were arranged in festoons, and posters, covers from automobile publications, and a generous assortment of horns, spark plugs, lamps, pumps, license tags, and other accessions adorned the walls. The orchestra played in three touring cars in the centre of the hall.

Didn't Juggle but Got Damaged.

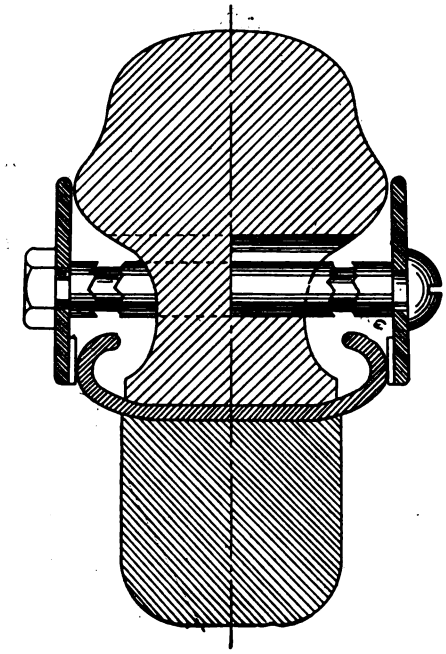
Failure to juggle an automobile in a Chicago theatre, which, according to the terms of his contract, he had promised to do, led to a dispute about salary between Paul Spadoni, a juggler, and Manager W. S. Cleveland, which finally terminated in court. Despite the theatrical man's testimony, the jury returned a verdict of $225 in favor of the man who failed to do the automobile trick.

Not How Cheap, How Good?

The Postmaster General of England has advertised for bids for an automobile mail service between London and Brighton. Not the lowest bidder, necessarily, will be given the award for such service, but what the committee considers the best.

Digitized by Google

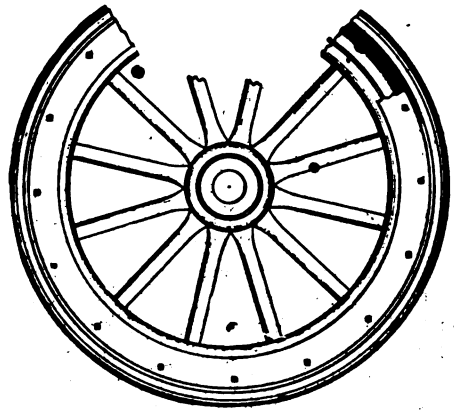
M. & W.'S NEWEST TIRE



It's an Improved Solid-Cushion Taking Advantage of Pneumatic Principles.

To meet the widespread demand manifest in the past few years for something affording a higher degree of comfort than the average solid tire, but without liability to puncture, Morgan & Wright have, after exhaustive experiments and tests, recently placed on the market what they term an "improved cushion automobile tire."

The peculiar cross section of this new tire, as well as the method of fastening, both of which may be noted by reference to the accompanying illustrations, are the result of long study of the scientific principles involved. The area of the load-bearing surface of any tire is but an extremely small fraction of the total circumference of the wheel at any time, and in the case of the ordinary solid rubber tire of semi-elliptic section, rigidly attached to the rim, this is scarcely more than a point. In consequence of this, as well as the method of fastening the only possible offset to the jolts caused by meeting obstructions, is the compressibility of the material itself, which is reduced to reduced to a minimum by its cross section, bringing the greatest amount of rubber at the base. Thus the amount of resiliency obtainable by this method is not only minimized by the design of the tire itself, but also by limiting the compression area, transmitting all but the small amount of shock absorbed by the rubber at that particular point directly to the rim.



The pneumatic tire is not open to this objection, owing to its continuous air cushion circumference, thus supporting the load on a very much larger fraction of the latter, and always tending to keep the wheel itself in equilibrium.

In the improved cushion automobile tire this principle has been taken advantage of as far as possible by greatly reducing the cross section just above the base, thus allowing the whole tire to compress, also by the method of attachment which permits of a very much larger portion of the circumference being utilized to support the load at once. As will be seen, the tire is much narrower at its centre than at either the base or tread, and is adapted to the ordinary clincher rim. It is held in place by annular discs, or flanges, bound together at frequent intervals by bolts. These bolts pass through slots in the tire, which in width substantially correspond to them, but are elongated to about double their diameter in depth. Surrounding each bolt on the inside of the flange is a loose sleeve or tube for the double purpose of preventing wear and maintaining the proper distance between the flanges. As it is only by the inter-relation of the latter and the tire that this is held on the rim, neither is rigidly fastened to the latter, thus allowing a large fraction of the tire to compress at a time, unhampered either by fastening to the rim or the flanges which move with it. This feature, in conjunction with the greatly increased compression obtained

CROSS SECTION TIRE, SHOWING METHOD OF APPLYING.

by recessing the tire itself at its central cross section, should result in obtaining the great amount of resiliency claimed and which has

AS APPLIED TO THE WHEEL.

been borne out by long tests. The makers will be pleased to furnish further information on application.

Darwin's Evolution of the Auto.

Not Darwin's idea of the evolution of man, but Darwin's theory of the evolution of the automobile is expected to be made known in Aurora, Ill., when Dr. Delos Culver Darwin springs his new car on the unsuspecting public in April. Dr. Darwin is having what he considers a practical doctor's runabout constructed. It will be a low powered gasolene car, with closed top and solid rubber tires.

Lamb to Build its Fold.

The Lamb Automobile Co., incorporated last week at Clinton, Iowa, is showing a spirit of progressiveness. Ground was broken this week for the erection of the new garage, where the Lamb Co. will also conduct an automobile livery. The specifications call for for a building 80 feet deep, 40 feet wide, one story high, with walls of brick veneer and front Ashlar granite blocks.

COULDN'T GET TOGETHER

West Enders Still Obstinate—N. A. A. M. and Allies to Swamp Saxe Bill.

Nothing having resulted from the friendly overtures of the Committee on Legislation of the N. A. A. M. to a like select few of the exalted West Enders, with a view to bringing the latter to a reasonable state of mind in regard to the obnoxious Saxe bill, no further steps in this direction will be taken, but all efforts will be centred on killing the bill when it comes before the Assembly and Senate by an overwhelming mass of protestants. Through the efforts of the committee of the N. A. A. M. and their counsel, Charles Thaddeus Terry, the bill, which had already been favorably reported to the Senate by its committee, was referred back to them and a hearing set for the 28th inst., which should certainly mark a gala day in the annals of automobile legislation, as it is the intention of the New York State Automobile Association to have delegations from all parts of the State present, while the A. A. A. and the N. A. A. M. will be represented by as great a force as possible. If mere numbers count for anything, the Saxe bill and its sponsors from the frigid zone of Manhattan Island will be lost in the drifts, but it is not alone numerically, but in influential strength, that the various delegations should be able to bring the greatest power to bear, as representative men from all over the State are expected to voice their sentiments and use their influence in killing this iniquitous piece of stupidity. In order to render this plan of campaign more effective, the bill will be reported to the Assembly and Senate on the same day, this having been brought about through the efforts of Mr. Terry.

In an interview the latter informed a Motor World man that the license test matter, which, as recently outlined in these columns, was soon to be taken up and litigated, had of necessity been sidetracked for the time being owing to the amount of attention centred on the Saxe bill, as well as the fact that the Chicago show intervened and many of the principals were out of the city. Contrary to the statement previously published that this test would be brought in the Federal Courts, it is now learned that as yet no definite plan of action has been decided on to cover this particular, except that, regardless of whether the action is first instituted in a State or Federal Court, it will be carried to the United States Supreme Court in due course in order to make its application to the country at large uniform.

Motorist Sues Trolley Company.

Edward C. Schwab, of the firm of R. J. Schwab & Sons Co., Milwaukee, Wis., has brought suit against a street railway company of that city for $4,000 damages. Schwab was backing his machine across the tracks when the trolley car collided with and damaged it.

STILL THEY COME

Solons from Maine to California Get Busy—Some of the Results.

Following the example of other States, South Carolina has come into line with an automobile bill, and Assemblyman Morgan, of Greenville, is its sponsor. The bill, as passed by the House, specifies that no motor vehicle of any description can be run on the highways at a greater rate of speed than fifteen miles an hour, but this rate applies only to country roads. When approaching a crossing or bridge the speed must be reduced to six miles an hour. On approaching a pedestrian or horse drawn vehicle warning must be given by sounding the bell or horn, and if the horse shows any tendency to become frightened the car must come to a full stop if asked to by the occupant of the vehicle. Lamps must be carried at night and on foggy days.

One pleasing feature of the bill is that a car need not be registered before it can enjoy the privileges of South Carolina's roads. Section 7 relates to penalties and is as follows:

"Whoever shall violate the provisions of this act shall be deemed guilty of a misdemeanor, and upon conviction be fined not less than $10 nor more than $100, and in addition thereto shall be liable in a civil action to any person injured in his person or damaged as to his property by the violation of the provisions of this act, and a lien shall attach to the vehicle causing the injury or damage in favor of the person injured or damaged, upon the filing of a suit for damages, whether such vehicle belongs to the person operating it or not, and said lien shall be a prior and first lien thereon, outranking any and all liens save of the same kind as this."

Two additional automobile bills have been added to the already large number now pending before the Wisconsin Legislature.

Senator Stondall has introduced a bill which he believes to be the necessary restriction of motor vehicles, without any of the provisions that are so objectionable to reputable and careful drivers of cars. The Stondall measure fixes the speed limit at twenty-five miles an hour on country roads and eight miles an hour within city limits; also requiring the driver of any car to slow up, stop or otherwise manage his machine so as to assist the drivers of frightened or skittish horses. A penalty of from $10 to $25 fine is provided for violation of any of these requirements. The bill also requires automobiles to display bright lights at night, under the penalty of a fine of $50 to $100.

Although the Stondall bill does not provide for numbering cars, Senator Wylie is the sponsor of a measure in which this provision is not overlooked. Each car must display a legible number, which can be secured from the Secretary of State. In this bill speed is indiscriminately limited to fifteen miles an hour, whether in country or city. The violation of either of these provisions is made punishable by a fine of from $10 to $100, according to the magnitude of results occasioned by an infraction of the law.

Pittsburg Councilmen saw a pretty little ascension in the Council chambers of that city last Wednesday, and the particular item to make the ascent was an automobile ordinance. Advices from Pittsburg state that it was "knocked sky high."

Peter Hermes, who claims to be the owner of more cows than any other man in the Sixth Ward, circumvented City Treasurer Steel's automobile ordinance in a way calculated to open the eyes of that official. The City Treasurer, "with an eye single to the interests of the city," had inspired an ordinance regulating the licensing of automobiles and regulating the maximum speed at which they may be driven through the city streets at fifteen miles an hour. The City Treasurer is a horseman, and owns no automobiles. Besides owning cows Councilman Hermes, however, owns several automobiles. Consequently, when he woke up and found that the ordinance had been passed by a vote of 14 to 12, he became very active and asked for an immediate reconsideration of the measure. A little lobbying produced the desired result, and the ordinance was smashed to smithereens by a vote of 14 to 12.

Country members of the Illinois Legislature have a few irons in the fire for automobilists of that State. Senator Berry, of Carthage, has introduced a bill requiring automobiles to come to a full stop before meeting or passing any other vehicles. A strict interpretation of the Berry bill would mean that if one chauffeur desires to speak to another he must stop his car 300 feet away and carefully approach his friend on foot. So far as is known, there is but one member of the Illinois Legislature who owns an automobile, Henry W. Austin, of Oak Park. It was stated that the fact that he possessed one cost him the chairmanship of the House Committee on Good Roads, for when the country members learned of it they effectually protested against his appointment.

Although the Berry bill does not make any provision as to speed, it is expected that before the session adjourns a deluge of automobile bills will be introduced.

Although the Mayor and Council of Glen Echo, Md.—of course, you all know just where that is—have passed an ordinance limiting the speed of automobiles, motor bicycles and all other conveyances not propelled by horses, mules or oxen, to six miles an hour within the corporate limits of that town, automobilists need not be alarmed, as the entire length of the village does not exceed half a mile. The Conduit Road, the favorite route for tourists to Cabin John Bridge from Washington, passes through Glen Echo. As the road is one of the best in the country, and is particularly alluring to speeding automobilists, they usually "let 'er out another notch" when going over it. However, the town authorities will have two constables mounted on bicycles with speed indicators to try to chase down automobilists who go fast, and, incidentally, fine them $5 if caught.

A monster petition is being circulated in all the wards of Los Angeles, Cal., for signatures to be presented to the City Counsel asking for the regulation of the speed of automobiles on the city streets. The attention of the Council is called to the fact that an ordinance allowing a reasonable rate of speed is altogether too indefinite to be of any use whatever, and a request is made that an ordinance be passed limiting the speed of automobiles and motorcycles to eight miles an hour within the territory mentioned.

The petitioners represent that they are all property holders and taxpayers of the city, and therefore are entitled to some consideration. A recommendation is made that the Council provide a fine of from $100 to $300 for violators of the proposed ordinance.

The House Committee on Ways and Means of the New Hampshire Legislature has finished its labors in the matter of a bill regulating automobiles in thta State, and will report a new draft. But the committee has failed signally in its attempt to prepare a favorable measure, inasmuch that it gives the local authorities privilege to make further regulations in this regard to certain streets or to exclude automobiles entirely from certain streets not a part of through highways.

The maximum speed limit has been placed at twenty miles an hour outside of village limits, and eight miles an hour within the city or village. Each car is required to be registered, one registration being sufficient, as long as the car remains the property of the same owner. The operator is required to pay a license annually.

With the signatures of over three hundred farmers gracing it, a petition for a law restraining the speed of automobiles in North Dakota has been presented to the legislature of that State, now in session. The few automobilists in North Dakota have no cause for complaint, however, as the farmers want the maximum speed on country roads fixed at twenty-five miles an hour, and ten miles an hour in cities.

This year, for the first time, automobiles are to be taxed as personal property in Milwaukee, Wis. They are mentioned on the official tax rolls, and an income of several thousand dollars for the city treasury will be the result.

The Detroit (Mich.) City Council has passed an ordinance restricting the speed of automobiles on streets traversed by streetcars to eight miles an hour.

ELECTRIC HEADLIGHTS

Why They are Not More Generally Used—Efforts Making for their Increase.

Attempts galore have been made to utilize electricity for operating the now large and elaborate searchlights used on cars, but thus far acetylene is practically without a rival for this purpose. One of the principal reasons for the failure of electric current to score in this field has been the absurdly diminutive proportions of the generator usually employed—in fact, the utter inadequacy of the entire outfit put forward by some makers to perform a task far beyond its capacity. Acetylene doubtless has its drawbacks in the form of clogged pipes and other minor accidents that readily serve to disable it, so that the small generator in connectiton with a set of accumulators would apparently prove a natural solution of the difficulty. And it will, if properly installed, but this means a very much larger generator, a good governor and gearing to the motor. This represents not alone considerable more expense that has ever been lavished on anything of the kind here, but likewise greatly increased weight, added complication in its application and the absorption of one or more horsepower—insignificant in the case of the high powered car, but not so with the smaller, particularly where trouble is experienced in hill climbing. The ever varying speed of the engine is a constant source of trouble, as in the absence of an automatic cut out, the battery may overpower the generator at a very low speed, reversing its polarity and quickly discharging through it.

A system is now about to be placed on the market in England in which the centrifugal governor employed will actuate the arm of a rheostat as the speed varies, thus providing an automatically fluctuating resistance in place of the usual speed control. The dynamo of this system, as illustrated in The Car, a line reproduction of which is shown here, is apparently of sufficiently generous proportions, and with such a machine but a comparatively small set of accumulators in parallel with the generator would be necessary. By this means the latter would always be fully charged, and would only be called upon when the dynamo was stopped. The headlight employed consists of the usual parabolic reflector, with a 10 volt 10 candle power lamp, which also may be utilized as a hand lamp when necessary.

No smell, no heat, no more choked burners or jolting or blowing out are a few of the advantages which its supporters claim for the electric light over its rival, gas. And it has them—in theory, but like all other things theoretically perfect, practical drawbacks have often caused it to fail to make good. Nevertheless, the solution of the problem of lighting the car will sooner or later be found in the mysterious fluid which has been steadily displacing gas for years, even on railroad trains. The generator set described above is a step in this direction, and a new incandescent lamp recently brought out by Dr. Auer, the well known German physicist, whose invention of the incandescent gas mantle has made him famous. The new lamp is, in fact, merely an extension of the latter principle to electric lighting. Instead of the usual carbonized paper or wood filament ordinarily employed for this purpose, rare chemical earth oxides, such as ceria and thorim, or those used in incandescent gas mantles, are substituted. With

this aid the usual 4, 6 or 8 candle low voltage lamp which usually belies its rating, but must perforce be used, owing to the limitations of the supply, is said to give a brilliant light with great economy in current consumption. The inventor is reported to have made an exhaustive study of the subject before placing the results of his labors on view, so possibly there may be more in the usual first reports of a "revolutionizing" discovery that is to shelve present methods than is ordinarily the case.

How Mrs. Gould Fooled the Ferrymen.

Despite the fact that the amendment to the ferry bill, permitting cars to run on and off ferryboats under their own power, passed both houses, the Long Island Railroad ferry has chosen to exercise its prerogative in not allowing automobiles to board or leave under their own power. When Mrs. Howard Gould's automobile reached the ferry the chauffeur attempted to pass the gates under the car's power, but was stopped by a gateman. The party was holding up traffic at the gate, and a hackman offered to do the towing for $2. On reaching the other side the hackman wanted $2 more for towing the automobile off the ferry, which Mrs. Gould refused to pay, saying that she would not be imposed upon. For some time the automobile was left standing on the boat directly in the way of vehicles which were waiting to go on board. Through this action on the part of the ferryboat officials one trip was lost, and they finally had to push the car off the boat without any compensation.

Blacksmith to Build Garage.

Blacksmiths are not usually given to constructing additional garages for automobiles; still this is what a Michigan smith has decided to have done. He has discovered the difficulty experienced by automobilists in finding suitable accommodation for their cars when staying over night in small towns.

For Sweet Charity's Sake.

C. E. Haskell, of Cedar Rapids, Iowa, has gone on record as being the first man in that State to give an automobile for charitable purposes. The car will be raffled to help pay off the mortgage on the Sunshine Mission, in that city.

RACING SITUATION CLEARS

Middle West Thinks Everything Now Serene and a Prosperous Year Ahead.

According to Western Opinion, the trend of thought in the Windy City, where racing matters are concerned, recent events which have occurred subsequent to the Florida races have smoothed out all the kinks. The following from The Chicago Evening Post may be taken as indicative of the opinion entertained generally in the Middle West:

"It is now generally believed that nothing will come of the attempt to get control of automobile racing from the A. A. A. William K. Vanderbilt, Jr., William Wallace and H. L. Bowden have withdrawn their resignations from the racing board, and with the election of Elliot C. Lee, of Boston, to the presidency, the A. A. A. bids fair to have a more prosperous year than ever before. The first sign of dissent from the authority of the A. A. A. was seen at Ormond. Here a certain coterie availed themselves of the disadvantageous conditions of weather and of tide to raise the cry of "inefficiency." Looking at the affair from this distance, it is now seen that the leaders in the rebellion, in a covert way, put more than one obstacle in the way of a successful meet. A number of those who at first lent their support to the new movement have reversed their position, as they now appreciate that they were misled by certain persons who, in the various positions they have held in the industry, have gained the reputation of "working both ends against the middle.

"It is the prevailing sentiment that automobile racing should remain in the hands of those who are in the game for sport alone. There is no question that those who have expended their time and money freely to develop racing in this country should not be compelled to step aside to make way for those with other motives. Aside from these considerations, there is the all important question of the attitude of the European racing bodies. Abroad, the control of racing is in purely amateur hands, and it is quite certain that they would not recognize any body in this country which savored of professionalism."

How the King Expressed His Displeasure.

To demonstrate his opinion of the badly regulated traffic in Brussels, King Leopold twice visited the Automobile Salon there with his carriage and horses. This caused considerable comment, and when approached on the subject the King gave as his reason that the conditions of traffic were so bad and progress so slow through the crowded streets, that it made automobile travelling in town very unsatisfactory.

As an Aid to Smuggling.

French customs officials at Hallium are reported to have captured an automobile containing four hundredweight of smuggled tobacco. The movements of the car had for several days attracted attention of the customs inspectors, as trips were continually being made across the Belgian frontier and back.

MASSACHUSETTS CLUBS PROTEST

President Lee of the M. A. A. and Others Succeed in Softening Drastic Bills.

Daniel E. Leary, of Springfield, appeared on behalf of the Springfield Automobile Association before the committee on roads and bridges Tuesday morning at Boston, together with a number of other attorneys, on three automobile bills. He advocated slight amendments in the bill submitted by the highway commissioners, covering revocation of licenses and punishment for violators of the law, while he heartily indorsed the bill to permit the commissioners to raise the speed limit for certain roads after public hearings on the cases as they came up. Those present in favor and in opposition to this second bill finally agreed to accept a bill to permit an appeal to the highway commissioners, over all local unreasonable speed restrictions. Some such bill may be reported.

On the first bill, providing for revocation of a license on three convictions; for the carrying of only one registration number, and that a Massachusetts number by every automobile, and for increased penalties, Lawyer Leary argued that it should be amended so any one number, Massachusetts or otherwise, should be carried. He stated it as his opinion that the present trouble is the fact that some automobiles carry half a dozen numbers, rather than any trouble over telling what State the registration is in, for all the States have distinctive styles of numbers. President Elliott C. Lee, of the Massachusetts Automobile Association, sustained Mr. Leary in his point that a law requiring solely a Massachusetts number would be burdensome in the neighborhood of State boundary lines.

Chairman William McClintock, of the commissioners, made it plain that the board wants to hit at reckless foreign operators. Everyone present appeared to favor more drastic punishment, and an amendment, generally approved, was submitted calling for a fine of not exceeding $25 for first violation of speed laws, $50 for second offense and $500 or six months' imprisonment or both for subsequent offenses.

On the bill to abolish all local speed laws, thus establishing the State laws of ten miles an hour in cities and fifteen outside, and to permit the highway commissioners to make special rules for special roads after proper hearings, Chairman McClintock said: "If the State has paid $75,000 to build a good road which happens to pass through Russell, and that town fixes a limit of four miles on that road, the authority for fixing the rate should be put in the hands of someone else. Perhaps half a dozen towns in the State have unreasonable rules, while the great majority have none at all." This provision to allow local authorities to make rules will be struck out, and the State will have sole power to fix the speed limit.

No one at all appeared in favor of the freak bill to require automobile machinery to be so constructed that speed laws could not be broken, and the committee will recommend leave to withdraw in this case.

Pennsylvania's Law Ridiculed.

Defects in the automobile laws of Pennsylvania had an airing last Saturday night at a reception given by the Automobile Club of Philadelphia to members of the Pennsylvania Legislature, the American Automobile Association and other men who are interested in the progress of the automobile.

The present Pennsylvania State law, which permits many townships, cities and boroughs to reduce the speed limit of twenty miles fixed by the State, was the target of most of the speakers. Winthrop E. Scarrett, of New York, former president of the Automobile Club of America, was the most bitter in denunciation of the "short-sighted legislation of benighted communities which make ten miles the limit of speed for an automobile."

There was a sign of a little commotion when Mr. Scarritt referred to the "benighted communities" where automobilists are limited to a speed of ten miles an hour, for this is the limit permitted in many of the townships near Philadelphia. Lower Merion Township, where this law is in effect, was represented by State Senator Roberts, who winced a little at the carefully measured words of the New Yorker, but took them in good parts, as was shown by his subsequent speech. Mr. Scarritt's speech was essentially the same as the one delivered before the Automobile Club of America, New York City, last week, and the speaker advises the revocation of license of wealthy car owners of "harum-scarum, dare-devil chauffeurs, who drive through the streets recklessly, and seem not to mind in the least punishment by fines."

Mayor Weaver, of Philadelphia, was the principal speaker of the evening, and he put himself on record promptly as the friend of the automobilist and promised emphatically to do all in his power to aid them in Philadelphia. The feature of the Mayor's address was that an automobile going at the rate of twenty miles an hour is even more tractable than a horse going eight miles an hour, and, if possible, fairer laws should be made for the automobilists.

After listening to Mayor Weaver, Mr. Scarritt and Secretary Gillette, of the A. A. A., Toastmaster Chandler introduced State Senator Algernon B. Roberts. Mr. Roberts said that, after listening to the defense of the automobile by Mr. Scarritt, he had recognized that much injustice had been done the automobilist. He prophesied, however, that a new era in automobile legislation was dawning, and that by the co-operation of the automobilists with the State Legislature a more acceptable law would undoubtedly be placed on the statute books of the State.

NEW JERSEY STILL AT IT

Scovel Bill and Amendments to Supersede Gibbs's Creation—License Fee $5.

Assemblyman Harry S. Scovel has introduced in the New Jersey Legislature several amendments to the present Scovel automobile law, and Representative Gibbs' bill will likely be tabled, and the Scovel amendments passed in its place.

Section 2 of the act, entitled "An act defining motor vehicles and providing for the registration of the same and uniform rules regulating the use and speed thereof," is amended so as to read as follows:

"Every resident of this State who is the owner of a motor vehicle, and every non-resident owner whose motor vehicle shall be driven in this State, shall file in the office of the Secretary of State a declaration duly verified that such owner is competent to drive the motor vehicle for which application for license is made, and a written statement containing the name and address of such owner, together with a brief description of the character of such motor vehicle, including the name of the maker and the manufacturer's number of the motor vehicle, if number there be, and the rated horsepower of the motor vehicle, and shall pay to the Secretary of State an annual registration fee of $5 for each motor vehicle; the Secretary of State shall issue for each motor vehicle so registered a certificate, properly numbered, stating that such motor vehicle is registered in accordance with this section, and shall cause the name of such owner, with his address, the number of his certificate and a description of such motor vehicle, or motor vehicles, to be entered in alphabetical order of the owners' names in a book to be kept for such purpose; this section shall not apply to manufacturers or dealers of motor vehicles in this State, except as to vehicles kept by such manufacturer or such dealer for private use or for hire."

Section 3 is amended so as to provide that no license number except that issued by the State of New Jersey shall be carried on machines, and another amendment provides that any owner displaying a fictitious number shall be liable to a fine not exceeding $50 or imprisonment for not more than thirty days.

It is provided in an amendment to Section 9 that any person driving an automobile on public highways in a race or on a bet or wager shall be subject to a fine of not more than $50 or imprisonment for not more than ten days.

An important proposed amendment is that which provides that any constable or police officer may arrest persons charged with violation of the automobile act without warrant. The last amendment provides for the amount of fine which shall be inflicted for violations of the various sections of the proposed statute.

The present speed limit of twenty miles an hour on the highways of the State will not be changed, but the license fee will be raised from $1 to $5.

Successful Car Building.

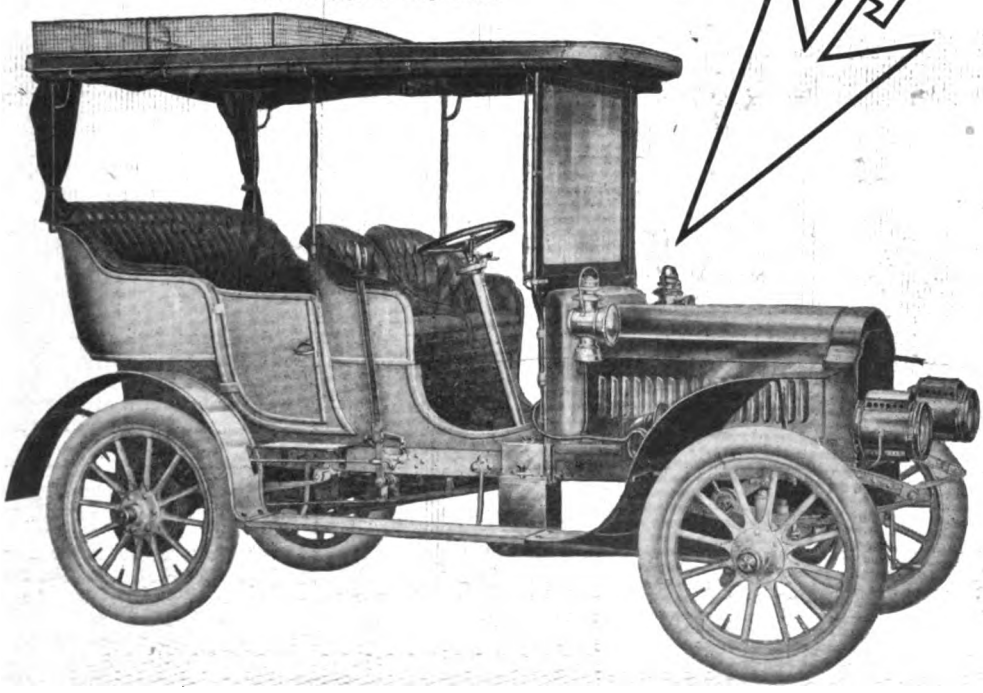
WE are this year standing firmly on the fact that we have built a real car, because we have built a car adapted to American conditions, American roads and the American temperament. We know our American market as no French builder can know it.

We have surmounted the problems of car-building this year as we never surmounted them before, although our progress has been steady and on right lines.

We believe the Pierce car to-day expresses the best that can be had in car-building, and we are willing to abide by the result of actual experiment.

Booklet describing the six 1905 cars of the George N. Pierce Company, with special booklets describing the mechanism of each, will be sent on request.

The George N. Pierce Company,



BUFFALO, NEW YORK.

Manufacturers of Pierce Cycles.

Members of the Association of Licensed Automobile Manufacturers.

The 24-28 horse-power Pierce Great Arrow Car, King of Belgium Tonneau, with side entrance, equipped with full canopy top, with sliding glass front and drop curtains side and rear.

PRICE, $3,500. Top extra.

FRICTION CLUTCH REVERSE

Combined Clutch and Reversing Mechanism—Much is Claimed for English Invention.

Up to the present writing the principle of the friction clutch has apparently not been taken advantage of for any other purpose than connecting the engine with the transmission, a role in which it has proved eminently successful and a method so generally in vogue as to be denominated standard. An English inventor, however, has recently devised a combined clutch and reversing gear, both employing friction as the holding power. According to the Cycle and Motor Trader, a British contemporary, from which the following description is taken, the invention "is designed with a view to enabling motor cars to be reversed much more quickly than by the methods commonly in use."

The gear complete with its encasing is shown in half section in the larger sketch, while the smaller illustrates the detail of the connection of the manipulating lever and its collar. In brief, the device consists of a male member revolving between two female members, with either of which it is adapted to be readily interlocked by means of the lever in question. On the forward drive the clutch D, which is the central male member provided with diverging leather covered faces, engages the clutch B, and thus rotates the transmission shaft F without any intermediate mechanism exactly as in the usual type of flywheel clutch. When it is desired to reverse, the central clutch D, which is in reality in the nature of a flywheel, is engaged with the opposite member C, by means of the striking lever actuated by the usual foot pedal, and the shaft is then driven through the pinions H, I and K. The engine shaft G is rigidly connected with the clutch B and the pinion H. The latter meshes with I, an idle pinion mounted on a stud bolt attached to the gear box. The pinion I also engages the teeth of the double pinion K, mounted on a shaft extending across the end of the gear box over all the clutch members, and its second teeth mesh with those of a pinion mounted on the reversing clutch C. The transmission shaft runs in a bearing on the end of the engine shaft G, the sleeve M being so placed as to take the end thrust of C when in operation. The tension of the spiral spring shown serves to keep the clutch B, or the forward drive, normally engaged.

The meeting edges of the clutch members are so shaped as to prevent the entrance of oil, and projections are further provided to throw off by centrifugal force any oil that drops upon them. The clutch D is intended to slide on the usual square shaft. One or more sets of the pinions for the reverse may be used, and the size varied so as to make a convenient ratio of speed between the forward and reverse. Thus with the clutches geared in the ratio of 4 to 1, the forward speed would be four times that of the reverse, or twenty miles ahead and five backward, or in like proportion. Releasing the pedal half way when on the forward speed places the engaging clutch in a neutral position and cuts off the power, then depressing the other end would reverse at a slow speed, thus obviating the necessity of shifting the change speed lever when necessary to reverse quickly.

Without taking into consideration the difficulties to be met with in its application to prevailing methods of sliding gear transmission and reverse, the device in question is deserving of attention, but as a substitute for the present combined transmission and reverse it falls far short of compensating in added effectiveness for the simplicity it displaces with uncalled for complications.

Automatic Road Making.

In Austria all vehicles built for a load of more than two and one-quarter tons must have wheels with rims at least 4 1-3 inches wide, and if built for more than four and one-half tons or more than three and one-half tons the rims must be at least 6¼ inches broad. In lower Austria a width of rim of 4½ inches is required for loaded wagons drawn by two or three horses. In Bohemia the same regulation applies.

In France every freight and market wagon is a road maker. The tires are from three to ten inches in width, usually from four to six. With a few four wheeled vehicles used the tires are rarely less than six inches in width, and the rear axle is about fourteen inches longer than the fore axle, so that the rear, or hind, wheels run about one inch outside of the level rolled by the front wheels.

In Germany the rule prescribes that all the wagons drawing heavy loads, such as coal, brick, earth, stone, etc., must have tires at least four inches wide.

"Motorcycles: How to Manage Them." Price $1. The Goodman Company, 154 Nassau Street, New York. •••

NAPIER AS AN ORIGINATOR

S. F. Edge Thinks Six Cylinders an Ideal That All Will Follow in Time.

It will doubtless come as a surprise to the automobile world in general and in this country in particular, to learn that the French makers are copying their English cousins across the Channel, but, as S. F. Edge, of Napier fame, is sponsor for the statement, it must at least be credited with some foundation in fact. In a letter to a foreign contemporary the authority in question states that he has more than once pointed this out, and as hostile criticism has resulted, he takes an extract from an article in L'Auto on the Gordon-Bennet Cup race to support his contention:

"Our readers cannot fail to be struck with the fact that the majority of competitors for the 1905 cup have fixed their choice on six cylinder motors. We will explain the reasons which militate in favor of this choice.

"From the augmentation of the number of cylinders we get two improvements, first better balancing, second no dead centre in the motor.

"If we compare motors of the same power but with a different number of cylinders revolving at the same speed, and if we take as similar the weight of the flywheel of the single cylinder motor, the weights of the flywheels of the other motors will be as follows:

"For two cylinders set at 180 degrees, 0.63; for two cylinders set at 360 degrees, 0.39; for three cylinders set at 240 degrees, 0.20; for four cylinders set at 180 degrees, 0.07; for six cylinders set at 120 degrees, 0.01.

"Thus the weight of the flywheel of the six cylinder of equal power is scarcely the hundredth of the weight of that of a single cylinder motor; moreover, such a motor having no dead centre, can work without a flywheel. In addition to this, the six cylinders realize a perfect balance from the point of view of vertical efforts, and, as M. Drouin has remarked, there does not exist any dead centre in the plan of cylinders, and the perpendicular dead centre being very slight, the car acquires exceptional flexibility. Does this mean to say that it would be interesting to carry the number of cylinders above six? No; for the increase of this number would bring forth no improvements as regards balancing; as to the reduction of the flywheel which might result therefrom, it is practically nil, and would be far from being compensation for the greater complications and the increase in length.

"This is most interesting to me, as it is due to the careful thought and brains of Mr. Napier that England has initiated a six cylinder motor car, which, although expensive to make, is to-day the motor car de luxe, and, as I have said from the commencement, it will only be a matter of time before the whole world of motor constructors for their best carriages follow the British lead and use six cylinders, which for any given horsepower are infinitely smoother and quieter than a four cylinder car."

HINTS ON VARNISH.

Some "Dont's" and Various Precautions Necessary in Finishing.

The varnish room should be partitioned off from one end of the paint shop. Paint the floor, paper the ceiling and walls with white paper to reflect the light, and have wide sliding doors.

Keep the varnishing shop clean. Do not sweep while a job is on hand. Steam heating for winter is best, but if a stove is used let it be in the paint shop, with pipe running into the varnish room. Have a thermometer in the room, and at the end of the room furthest from the source of heat. Keep it about 70 degrees Fahrenheit.

It is very important to keep the temperature of the varnish room even. Varnish applied while the temperature is low will flow and cause trouble if the temperature be raised before the job is dry. If the room be warm, then allowed to become cool, the brilliancy of the varnish will suffer.

A fresh can of varnish should be opened a day or so before being used to allow the gas to escape and sediment fall to the bottom. The varnish should be kept in the varnish room, at the temperature of the room and the job.

All the brushes needed in the varnish room should be kept in a closet in that room. The varnish cans may also be kept there.

If you do not allow varnish coats and filling proper time to dry you will have trouble with the finish, as the soft undercoats will absorb the oil from the varnish, cause sinking in, sweating, etc. Moisture, greasy fingers, temperature variations, etc., produce their crops of varnish troubles. Be attentive to small details.

For varnish blooming try washing it with cold water. If this does not cure it, flat and revarnish surface.

Rubbing out the rough stuff should be done in the paint shop, and the way to do it is to begin at the upper panels, one at a time. Rub with an even and gentle pressure, using pumice sparingly. Start from the outside edge of the panel, rubbing toward the centre. Wash off the panel as rubbed off, clean out the corners and dry with a clean chamois. When done with the rubbing, run the job into the varnish room. Have a clean pail, sponge and chamois, and with clear water wash off the job thoroughly. Then touch up any cut edges with dead black color. You are now ready for varnishing.

See that the varnish pot is clean. See that the varnish brush is right. Have the best you can get. Have a second varnish pot to scrape the varnish brush into. A half-elastic brush is good. If too stiff of bristle the varnish will show up rough. If too soft of bristle, the varnish will not spread well.

Always varnish those parts first that are the most inaccessible, so that you will not get in contact with them afterward. When doing the panels, flow the edges with the small flat brush, being careful not to overflow those parts which were finished when the job was first coated. The edges done, take the oval brush, of a size to suit the panel, then flow the varnish all over. Flow it on more with the sides than with the end of the brush, the idea being to lay it on rather than to brush it on.

The less varnish is brushed out the more brilliant will be the gloss. Spread it evenly with as little working as possible. If it is a small panel, do not finish up at once, but go on to the next panel, after which come back to the first panel, which then will have a little tack and will take and retain more varnish. A large panel is best done at once.

When doing the small panel in the way indicated, clean out all the corners with the tip of the small flat brush. With the large brush lay off the panel from left to right, and at once finish it, up or down. See that the corners are all right. This method applies to all kinds of coach varnish. Some workmen reverse this operation; they lay off either up or down, and finish horizontally, either from left to right or right to left, but never both ways. They clean the corners very carefully. But this method is only possible with finishing varnish, as a harder varnish has not elasticity to flow out right.

The handling of carriage varnishes is one of the most delicate operations connected with the trade, and while rules or methods carefully described have their value, it takes, after all, years of careful experience to enable the workman to do a job successfully, says "The Wheelwright." Experience steadies his nerves, it teaches him the nature of the different kinds of varnishes used, and in time he can handle them easily and successfully. He finds that a hard varnish sets more quickly than the elastic sorts, and will not flow out the same, hence requires different handling. The elastic varnish flows well and flows down over the panel, making a smooth, even surface.

A Dashboard Reminder.

A manufacturer of automobiles on the other side is having placed over the dashboard of every car sent out a card with the following list of maxims for the benefit of the driver:

"Passing cyclists and horse drawn vehicles, give the maximum space possible.

"Passing restive horses, use the utmost consideration, even to stopping the engine, if necessary, although no hand may have been held up. On narrow parts of roads, crossroads, corners and bridges, drive slowly and with caution.

"Passing through towns and villages and at roadside residences, go slowly, so as not to fill houses and cottages and cover gardens with dust, as well as for the safety of the inhabitants and their dogs, etc.

"Passing pedestrians in wet weather, take care not to splash them."

The Fairbanks-Grant Mfg. Co., Utica, N. Y., is pushing its motor lawn mower, and reports quite a number of orders for this energy saving machine.

Frenchmen Impolite?

Although Frenchmen are generally considered the quintessence of politeness, Englishmen and Americans are complaining vociferously of the lack of courtesy shown by automobile salesmen during the past year. One American who had met with gruff treatment said: "Often I have been kept waiting half an hour before receiving attention, and even then I was frequently treated by the employes with an abruptness and lack of courtesy as unbusinesslike as it was ill-bred. Agents should realize that even the best informed automobilists cannot know everything about all the chassis, and that it is but natural for a customer to wish to know something about the article he intends buying, especially when it involves an expenditure of three to six thousand dollars.

"This arrogant way of treating customers has already placed two formerly well known firms in the background commercially, and will certainly relegate others to a similar obscurity unless they learn the elements of ordinary business—courtesy and fairness toward customers."

A foreign publication, in attempting to solve the origin of this newly developed antithetical characteristic of the nation suggests "the 'offhand' manners sprang up with the great rush of prosperity which swept over the automobile market a year or two ago."

Scared the Blacksmith.

The other day Sporty Smith, of Talequah, who owns an automobile and works for the Dawes Commission, decided to run over to Muskogee to spend the afternoon. He expressed a desire to have several congenial spirits accompany him, and they consented.

"Everything ran along well," says the Muskogee Democrat, "until the party reached Eureka, a crossroads blacksmith shop, when the machine went to the bad. The local blacksmith was induced to conduct an examination. He lighted a big torch and crawled under the 'devil' to examine its workings. His torch burned the hose coupling connecting the gasolene tank, there was a 'pouff,' and the blacksmith wriggled out like a snake just as the explosion came. The last seen of him he was going over the hill, wildly waving the torch, and no one has heard of him since. The gasolene burned most of the 'works' off the machine. Homer Needles' expert opinion is that it will cost a hundred to repair the machine, but he says the fun was worth it."—(Kansas City Journal.)

Another Factory for Port Huron.

Judge Goodson, of Detroit, is spending a week in Port Huron, Mich., in the interest of the Kansas City Motor Works. It is understood that a number of Port Huron people have announced their intention of taking stock in the concern, and it is hoped that $25,000 can be raised. If this is done the company will begin the erection of the buildings at once and employ several hundred men at the start.

MORE ABOUT AIRSHIPS.

Geer Co., of St. Louis, Says Not the Motor—the Motorman to Blame.

While the contribution "Why Airships Don't Fly," which was published in the Motor World of January 12, was designed primarily to prove the importance of motors that "mote" not for a part of the time, but for all of the time, it apparently struck home in St. Louis, where airships that flew once in a while were conspicuous during last summer. It brought from the H. R. Geer Co., of that city, the following communication:

"We note in your issue of January 12 an article signed 'Ariel,' which goes very much into detail as to why airships do not fly. We venture to say, however, that Ariel never visited the Aerodome at the World's Fair, or he would not have written in the way he did. We had during the World's Fair every opportunity of knowing why airships do not fly. Ariel blames the motors. In this he is mistaken. It was not the fault of the motors, but in the way they were handled and equipped. Only one airship that flew or tried to fly had its motor arranged in such a way that it was under control of the operator. It was merely a case of start your motor on the ground and trust to your luck in the air. Thus Baldwin had the most luck.

"Another airship maker we know of had no more idea of a gasolene motor than a pig has of Sunday; it took him a week to find out that he could not start his four cycle 5-horsepower motor with a wipe spark coil while his motor was fitted with the jump spark system. This particular man was a saving sort of a genius, and fed his motor through a Lunkenheimer mixing valve from a quart tomato can wired to the uprights of his machine.

"We know of another case where a 5-horsepower motor was used, but there was no way of cranking the engine except by turning a large fan wheel which was part of the airship. The airship was fitted with a small vibrating coil and two No. 6 Columbia dry cells. The coil buzzed; this was enough. Neither of these airships flew.

"So it is not necessary, as Ariel says, to look to the stars for an answer. As to engine speed, we would be more than pleased to show him at any time motors that are identical to those used by the airship men running at from 2,000 to 3,000 r. p. m. in our shop. They are not 20 or 30 horsepower engines, however, but just plain two cylinder 5-horsepower engines, no masses of iron and aluminum thrown together and no paper and pencil figures that will not hold water, but a good, honestly built engine that will show its rating by a brake test.

"Ariel will have to go further than to the motors to find out why airships will not fly. He is right, however, in saying that the hard earned experience of the motor car builders should be taken in, but this is to be applied to the airship men and not the motor builders.

"Now as to the plum hung out by the World's Fair management: They hardly expected it to be plucked. Suppose the railroads in this country in their infancy were put under the same rules as airships are—neither would they have taken the plum. It was quite a while before they could maintain a speed of from eighteen to twenty miles an hour, certainly not in the first year. If Ariel will wait until airships have been in existence as long as the railroads have, perhaps then they will know how to operate their motors. In the meantime let us help them all we possibly can and quit 'knocking.'"

The Geer Companys' experience is not at all contradictory of, but in large part substantiates, the reasons therein given as to why the airship won't fly. Its designer in the majority of instances rigged up a contrivance that would put a schoolboy to shame—in other words, he went ahead utterly regardless of what any experienced motor builder or runner could have told him. It will further be noted that no statement is made to the effect that it is not possible to build a motor to run 2,500 or 3,000 r. p. m., nor that motors of this type have not been built and run successfully—but not by aeronauts. More light may be shed on the question if it be taken into account that the figures of most of the latter necessitate large powers to overcome wind resistance, as in the case of huge balloons, or to give sustaining power, in the case of aeroplanes, and particularly the latter. And that in attempting to gain this every ounce of superfluous as well as much absolutely essential weight is sacrificed.

One man can lead an ass to knowledge, but ten men can't make him think, and it is not alone an impossible but a thankless task to attempt to help the man who believes himself beyond assistance. "Knocking" will, on the other hand, lead him in the fulness of time to see the error of his ways, and, coincident with this, will help the man who has been trying to help him all along—the motor designer and builder. It was in no disparaging spirit of the latter that one of the thousand and one reasons why airships won't fly was attempted to be set forth, and there was certainly no necessity to duck or take the blow home.

Lunnon's Ancients To Go.

The ancient, time honored and advertisement plastered 'Lunnon' 'bus is finally to give way to its motor driven superior. Already the motor vehicle is plying for hire in the main thoroughfares, and crowds are gathering at the termini for the chance of a ride, says one of our English contemporaries.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Goodman Co., 154 Nassau street, New York. ***

Another "Revolutionary Invention."

A Western crank has invented an automobile hobby horse to be hitched in front of a car so that, to quote the inventor, "horses will not be frightened by seeing automobiles going along the street without any visible means of propulsion." This wonderful genius, with rare acumen, has foreseen that this arrangement might meet with some objection on the part of automobilists, and he thinks to atone for any inconvenience, real or imaginary, by making the dummy equine the receptacle for extra tires, gasolene and other essentials. The dummy animal is made of metal, and is supported by a swivel wheel secured under the fore parts of the animal. The hindquarters of the steed have attached thereto a pair of plates, which are to be fastened to the rear axle of the car. By raising the tail of the dummy access may be had to the interior of the body, which space offers a place for storage. A lamp is fitted in the head, with the light rays shining through a lens in the animal's forehead. A pair of reins must be held by the chauffeur, "else the real horses on the street might think the automobile steed is running away and become frightened." Verily, the inventive genius should be awarded a life membership in Elbert Hubbard's Philistinic Academy of Immortals, at Aurora, N. Y.—then his ideas might have a chance to develop.

Automobile Now French for Wealth.

"In France wealth formerly meant a box at the opera, but now it is quite as likely to mean a winter automobile tour along the Riviera," says R. L. Hartt, in the Boston Transcript in alluding to the automobile as being the cause of a considerable reduction in the receipts at the Paris Opera. He claims to have seen a good many automobiles outside the opera, but infers that the owners pass only a few minutes in the building.

This state of affairs has practically brought about what Paris has wanted for some time—a popular theatre where the great operas may be heard by the masses at prices ranging from 10 cents to 40 cents, thinks Mr. Hartt. However, he laments over the fact that in the richer and more or less aristocratic circles music is losing the spell it held prior to the advent of the automobile, and sums up his article by disfiguring the Scriptures in saying, "Almost thou persuadest me to be a Paris workman."

New Garage for Minneapolis.

H. S. Haynes, of the Haynes Automobile Co., has closed a contract for the construction of a new garage to be located at the corner of Third avenue and Sixth street, Minneapolis, Minn. The building will have a depth of 165 feet, with a 40-foot frontage. In the front of the building will be the showroom, offices and women's waiting rooms. In connection with an ample storage for cars there will be a first class repair shop. The building will be steam heated, and will have a compressed air blower for dusting out cars and inflating tires. It is expected to be ready for occupancy by June.

SPRINGS VS. AIR

Inherent Defects of Metal Cause Insurmountable Difficulties.

The problem of finding a substitute for the pneumatic tire that will have all its advantages of resiliency and attendant comfort without its disadvantages is seemingly centring itself on the spring wheel for the time being, and there are those who confidently believe that in this device will ultimately be found the equal of the rubber confined air cushion.

English, German and French inventors have, to judge from the number of spring wheels constantly appearing on the market abroad, given the subject a great deal of study, while in this country mention of the device merely seems to call forth a smile. Serious attention does not appear to have been accorded it to any appreciable extent thus far, although it possibly merits attention, at least to a degree sufficient to make it patent that further investigation would be an utter waste of time. Of course, nothing has been thus far evolved that has the same resilient and shock withstanding properties as the air cushion, and its application on principles worked out as the result of many years' experience leaves nothing to be desired where effectiveness is concerned; but the necessity of using rubber as a confining material make it such an expensive adjunct of comfort that until a more economic method of attaining the same end is reached investigation along this line will be unceasing.

Whether the inherent defects of metal as a shock absorbing medium can ever be overcome to a degree that will place it on a level with air for this purpose is indeed questionable. Even should such a thing as an automatic tension spring, to which a smooth pavement or a rough, rocky road would be the same thing, ever become a practical possibility, there is the further difficulty of rapid crystallization of the tempered steel, with its consequence of brittleness and frequent breakages to be taken account of, on the one hand, and the loss of power in the springs themselves, or "flabbiness," on the other. And the spring that will soon fracture or lose its power to absorb the shocks transmitted to it by the rim will be equally useless in either case.

It will doubtless come as a surprise to many to learn that the spring wheel is not the result of attempts to replace the pneumatic tire with something better and cheaper, but that the latter's appearance and its rapid rise to a high state of efficiency soon after its invention put an end to investigation where the former was concerned for the time being, and that the present experiments are indicative of a strong revival of interest in the subject. Inventions looking to this end which utilized the properties of the spring date back to the early 30's, and it would be difficult to enumerate the long succession of patents granted on them in the interim.

In its attempted application to the needs of the bicycle and the automobile the spring wheel has assumed every imaginable form, combining devices ranging from absolute simplicity to utter and inexplicable complexity, and many or both of doubtful merit. The fact that the aspects of the problem are not identical, though the end in view is the same, in the case of the pneumatic tire and the hard tired spring wheel, must be taken into consideration, the chief difference being in point of power absorbed. It is a generally recognized fact that the pneumatic tire does not heat to anything like the same degree that a solid tire will under the same circumstances, and the generation of heat is, of course, the only visible indication of lost power in a tire. An understanding of the cause of this difference is necessary to a proper comprehension of the problem.

The internal pressure of the pneumatic tire increases in proportion to the weight of the load to be borne, and the total pressure distributed throughout the air space of the tire will be equal on the total bearing surface in contact with the road to the total weight of the load divided by the number of bearing surfaces or wheels. To illustrate this, a 1,600 pound four wheel car would, if an absolutely even distribution of the weight were a possibility, present a load of four hundred pounds on each wheel, and when pumped up sufficiently to support this load easily the air cushion will then hold the wheel in equilibrium.

But the internal pressure in the tire has been considerably increased by the flattening of the tread where it comes in contact with the road, and this factor, remaining constant on a perfectly smooth road, the only work to be performed by the tire continually would be that due to the bending of the rubber in the side walls. This is practically lost energy, but the fact that the air is continuous all round the wheel, and the pressure is in consequence constant, tends to minimize this. The air is, of course, constantly being displaced as the wheel rolls around, but as there can be no further compression this does not represent any appreciable work, and its effect is overcome almost entirely by the rapidity with which expansion follows compression as each portion of the tire rolls under.

This explanation applies equally to any yielding tire in which the effect of the load must be compression, except that in a solid rubber tire the compression must of necessity be more local, as the continuous and movable air cushion is absent, likewise its resistance to the shocks. As in the modern jacketed gun, the pneumatic tire combats outside forces by a constant internal pressure, except that the proposition is reversed, and it is in the lack of this provision, except as limited by the compressibility of the rubber itself, that the solid tire is at the greatest disadvantage. In consequence, the amount of lost energy is very much greater and manifests itself in the shape of hysteresis-molecular friction in the rubber itself, caused by its repeated compression and expansion and its attendant heating. On a rough road the obstructions causing momentary compression of the air filled tire beyond the normal tend to do this also, but the rapid expansion of the air robs it of its heat in turn to an extent that one practically counteracts the other. Under the same conditions the solid tire is at a disadvantage in that both the operations of compression and expansion generate heat, and in this respect springs present the same drawback, so that it is evident at the outset that the later can never equal the pneumatic.

There are numerous other principles in a wheel's action which must be taken into consideration and the action of a solid tire compared with a pneumatic in detail before all the requirements to be met will be evident. But, as will be apparent from the foregoing explanation of the principle of the pneumatic and its action in use, no one point of the tire carries the entire load or absorbs the shock, and accordingly no series of independent springs, no matter how arranged between the rim and the hub, can accomplish the same result. The initial compression of the spring itself is relied upon to absorb the shock imposed by the jolting by opposing its force against the compression exerted against it, and in order to most closely simulate the continuous air cushion a compensating system of springs must be employed. In this way each bears the same relation to the rim and the hub, but is at the same time so interconnected that the load received by one is transmitted to all the others.

A brief resumé of the numerous different wheels of this type now claiming attention on the other side will suffice to show the extent to which the subject is at present claiming attention there. In one of these, the Empire, a complete equalizing system is employed between the hub and rim, a five pointed star shaped piece of metal being interconnected with both through the medium of moving plates, pins and springs. At first sight this wheel appears extremely complicated; the entire mechanism is inclosed, so that in use the wheel appears to be solid. The Halford is another, but goes to the opposite extreme in the point of simplicity, as it consists of nothing more than three spirally arranged heavy plate springs, each of which includes almost a complete convolution in its spiral. Guide rings are used in this instance to prevent the springs from flying out through lateral shock. Another form utilizes small spiral springs around telescoping sections of the spokes, in addition to a set of plate springs, both of which are located between an auxiliary inner and the outer rim. The three above mentioned are of English origin, and represent but a fraction of the number put forward in that country. The German wheel, or rather several of them, are somewhat similar, and, while utilizing the telescoping principle referred to, seem to rely more for their efficiency on independent units than any corelated system

Digitized by Google

such as is essential to success. In France also the subject has come in for attention at the hands of various inventors, but has not reached the same advanced stage of development. It is to be noted that in every instance a solid rubber tire of generous proportions is used as a shock absorber in addition to the mechanical action.

For purely pleasure purposes there is very little prospect of the spring wheel meeting with any great favor, even though it should reach a state where its employment would be good commercial practice, and in regard to the latter smooth pavements are coming to be so universally laid that there is no crying demand for it here either.

Oldsmobiles to Fight Japs.

Six automobile railway cars, which are to be mounted with rapid fire guns, have been ordered by the Russian government for use in the protection of the Trans-Siberian railway. The representative of the Czar who placed the order was Nicholas Summerfeld, of Moscow. The Olds Motor Works have agreed to replace the 8 horsepower motor by one of 30 horsepower, and the cars have been promised, ready for shipment to Russia, within fifteen days from the date of the order.

A seven and a half kilometre straightaway automobile course is being constructed in Germany. The location is about eight miles south of Munich, in the direction of Starnberg, in the Furstenried Park.

As an Aid to Science.

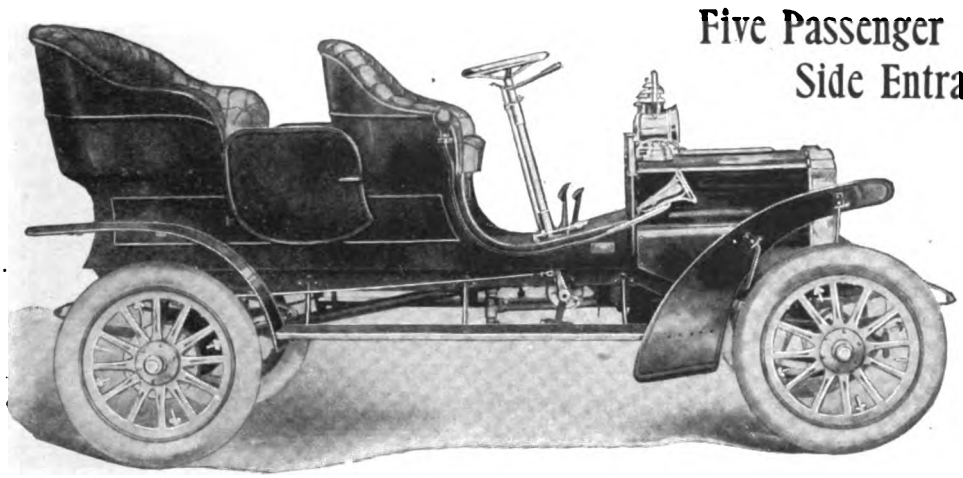
Mingling automobiles with the science of astronomy sounds peculiar, but nevertheless it is being done abroad, and to good purpose. It appears that the secretary of the Paris Astronomical Society has recently employed automobiles for the purpose of transporting observers and material to some point where it is desired to take observations during a limited time, as in the observation of shooting stars. In pointing out the usefulness of the automobile in this science the secretary of the society says:

"It is easy to understand the difficulties encountered in the practical organization of a system of stations for the study of shooting stars, having at once the proper conditions of distance, orientation and comfort, especially as very often the observers have occupations that require them to be absent daily.

"It may be seen thus why, in view of all these contradictory requirements, the plan was formed of using, for the organization of temporary stations, automobiles in which could be quickly transported to the proper localities observers furnished with the necessary apparatus."

Russian Motor Postal Service.

Though backward in pretty much everything else, Russia's postal department has recognized the advantages of the automobile for facilitating the handling of mail, and has in one city, Odessa, adopted a motor service on a small scale, apparently as an experiment. Three automobiles are now employed in this service, two small cars, with a capacity of five or six hundred pounds, and one to carry double this weight, in addition to the chauffeur and two postmen, this one having an 8 horsepower engine. They are geared for a speed of fifteen to eighteen miles, and are designed to mount the heavy grades encountered in that city without any difficulty. The cars in question were "Made in Germany" by the Union Works, of Nuremberg, and are fitted with what is known as the Maurer frictional gear.



Mrs. Cherry Wants Financial Balm.

A "Green-Cherry" damage suit is occupying the attention of a body of Christian County (Ill.) jurors. Mrs. Margaret Cherry, of Morrisonville, has brought suit for damages in the sum of $2,000 against E. D. Green, a prominent farmer of Ricks township. The plaintiff states in her bill that an automobile carelessly handled by Green caused a horse she was driving to run away, which resulted in painful injuries to her.

Stevens-Duryea Working Overtime.

Orders for the new Stevens-Duryea touring cars have come in with such rapidity since the New York show that the plant in Chicopee Falls, Mass., has been run until 9 o'clock at night. Even by working overtime to this extent cars cannot be manufactured quickly enough, and arrangements are now being made to run the factory all night.

NORTHERN

Five Passenger 18 H.P. Touring Car, with Side Entrance. Price, $1700.

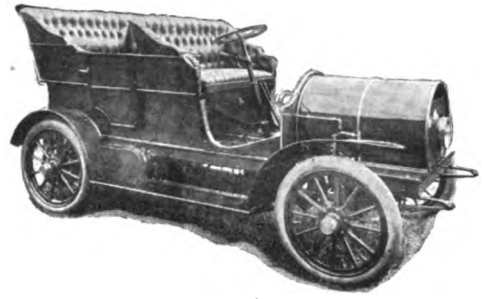
Weight, 2000 lbs.

Wheel Base, 100 inches.

"No expense but the gasoline."

The value of any car cannot be based on any one particular feature. The general construction must and does decide whether or not the car has been built to do the work.

Some manufacturers build a part of their machines and buy on the market a stock construction, to which they adapt the parts they have built. Others buy all the parts and merely assemble them.



We design **NORTHERN** cars throughout, and every detail of construction, every minute point, is designed with due regard to the requirements of the whole.

If you are interested in a car which meets American road conditions more perfectly than any other car on the market, write for Catalogue 16.

PRICE $1500.

THE EXCELLENT

GROUT

No Noise. No Vibration. Will not Freeze in Zero Weather. Climb Any Hill. Speedy, Reliable. Simple in Operation.

GROUT BROS. AUTOMOBILE CO.,
87 Main St., ORANGE, MASS.

BOSTON BRANCH: 151 Columbus Avenue.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about Feb. 1st, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

The 1904 edition is now out of print.

Sent upon receipt of 6 cents in stamps for postage.

The Week's Patents.

780,722. Internal-Combustion Engine. Patrick F. Maccallum, Helensburgh, Scotland. Filed May 7, 1901. Serial No. 59,128.

Claim—1. The improved internal combustion engine, comprising, in combination, an expansion cylinder, a piston reciprocating in said expansion cylinder, a combustion chamber located alongside said expansion cylinder, a passage connecting said combustion chamber with said expansion cylinder and a grate adapted to move vertically in front of said passage, substantially as described.

780,798. Automobile. Arba Holmes and Albert Holmes, Carroll, Iowa. Filed August 22, 1904. Serial No. 221,721.

Claim—1. The combination of the ball-and-socket joint, the shafts projecting from the sections thereof, the casing sections, the radially projecting arms on one of said sections, the said arms being rounded in cross-section, the radially-projecting arms on the other section grooved in their inner ends to receive the rounded arms of the first section, and provided at their outer ends with laterally-deflected portions lapping against the ends of the arms of the first section and pivot-points carried by the said deflected portions and projecting into the ends of the arms of the first section, substantially as set forth.

780,812. Explosive Motor. Andreas Radovanovic, Zurich, Switzerland. Filed February 16, 1904. Serial No. 193,834.

Claim—1. In combination, a cylinder having midway of its length internal peripheral exhaust ports, a piston controlling said ports, a piston extension, a mixing-chamber therein having ports adapted to place the cylinder in communication with said chamber, the latter provided with air and gas admission ports and means to supply air and gas to said ports, respectively, said supply and the admission of the mixture to the cylinder controlled by the movements of the piston extension, for the purpose set forth.

780,949. Carburetter for Hydrocarbon Engines. Emil Huber, Detroit, Mich., assignor of two-thirds to Henri G. Ide, Oxford, Mich., and Edmund Sprung, Detroit, Mich. Filed July 8, 1903. Serial No. 164,654.

Claim—1. In a carburetter, the combination of a reservoir for containing gasolene, a rod provided with a longitudinally extending groove in its side communicating with the gasolene in the reservoir, and a wall inclosing a part of said rod and adapted to cover said groove at one position of the rod, said rod being adapted to be moved longitudinally to bring a greater or less part of said groove outside of said walls.

780,969. Acetylene or Other Lamp. James Bartlett, South Tottenham, England. Filed August 27, 1903. Serial No. 170,949.

Claim—1. The improvements in acetylene gas lamps comprising the combination of an outer case and an inner chamber provided with openings for admitting water thereto from said case, a carbide holder formed with a solid conical bottom, a perforated plate provided with a conical chamber, forming the cover of the same and the inner chamber, a curved pipe coupled to the conical chamber and to the lamp case and a purifying chamber at the bottom of said case to which chamber the said pipe and the burner are connected, substantially as described.

780,983. Vehicle Tire. Charles W. Faitout Summit, N. J. Filed June 15, 1904. Serial No. 212,621.

Claim—1. In a vehicle tire, the combination of a flexible tubular casing with a plurality of projecting bosses from the outer surface or tread thereof, a series of yielding supporting members so located on the inside of said casing as to form alternate supports for the same, substantially as described.

781,064. Explosive Engine Crank Casing. Edward R. Hewitt, New York, N. Y. Filed March 23, 1904. Serial No. 199,657.

Claim—1. A two-part casting forming a casing, one part thereof forming the cover, having a compartment for a shaft and having a separate compartment for a generator.

781,065. Clutch. Edward R. Hewitt, New York, N. Y. Filed March 23, 1904. Serial No. 199,658.

Claim—1. A clutch mechanism comprising a set of shoes, means connecting each shoe to the next and comprising a pair of toggle links and an intervening yoke to which said links are separately pivoted, a radial link passing between and outwardly beyond the link pivots in each yoke and pivoted at its outer end to the yoke, and a common controlling member to which the inner ends of the radial links are pivoted.

781,066. Engine Crank Shaft. Edward R. Hewitt, New York, N. Y. Filed March 23, 1904. Serial No. 199,660.

Claim—1. The combination of a shaft having a crank thereon and a passage in said crank leading to the parts to be lubricated, the said passage having an enlarged mouth at its outer end, a crank pit containing free lubricating material, and an inwardly opening valve in said passage adapted to be thrown outwardly and closed by centrifugal force.

781,068. Metal Frame. Edward R. Hewitt, New York, N. Y. Filed March 23, 1904. Serial No. 199,662.

Claim—1. An angle formed by the meeting of two strips, each substantially L-shaped in cross section, both of the webs of one strip being overlapped upon, and directly secured to, the respective corresponding webs of the other strip.

781,069. Control Gear for Automobiles. Edward R. Hewitt, New York, N. Y. Filed April 8, 1904. Serial No. 202,276.

Claim—1. A band brake comprising a pulley, a band thereon, one end of the band having an elongated eye, a fixture to which said end is attached, a cross pin fixed in said eye, a lever consisting of a pair of plates pivoted upon said pin within said eye, a pivot journaled in said plates, and provided with a transverse opening, a tip attached to the other end of the band and passing through the opening in said pivot between said plates, and a nut threaded upon the projecting end of said tip.

781,070. Self-Propelling Vehicle. Edward R. Hewitt, New York, N. Y. Filed April 8, 1904. Serial No. 202,277.

Claim—1. In a self-propelled vehicle, the combination of a body frame supporting a power driven shaft, two axles, spring connections between the frame and axles permitting the axles to approach and recede from each other during the vertical oscillations of the body, a power transmitting chain whose tension is altered by said movement of the axles and means acting upon said spring connections for limiting the approach of the wheels.

781,071. Automobile Body. Edward R. Hewitt, New York, N. Y. Filed July 16, 1904. Serial No. 216,832.

Claim—1. An automobile comprising a running gear, an engine, and front and rear body portions, one of which covers the engine and is mounted to slide to expose the engine.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—4 passenger side-entrance car bodies, in good condition at considerably reduced price. DETROIT CARRIAGE CO., Detroit, Mich.

WANTED—Second hand automobiles at right prices; one 1902 Knox. CANFIELD'S AUTOMOBILE STATION, Canaan, Conn.

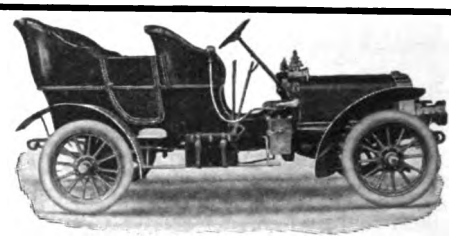
PIERCE-RACINE

4 MODELS



$750. $850. $1,100. $1,250.

PIERCE-RACINE Cars are good cars. *Guaranteed* for one year. They are fast and great hill climbers. Let us send you our printed matter which tells all about them. They are the best for the price.

PIERCE ENGINE CO., 1300 Clark St., Racine, Wis.

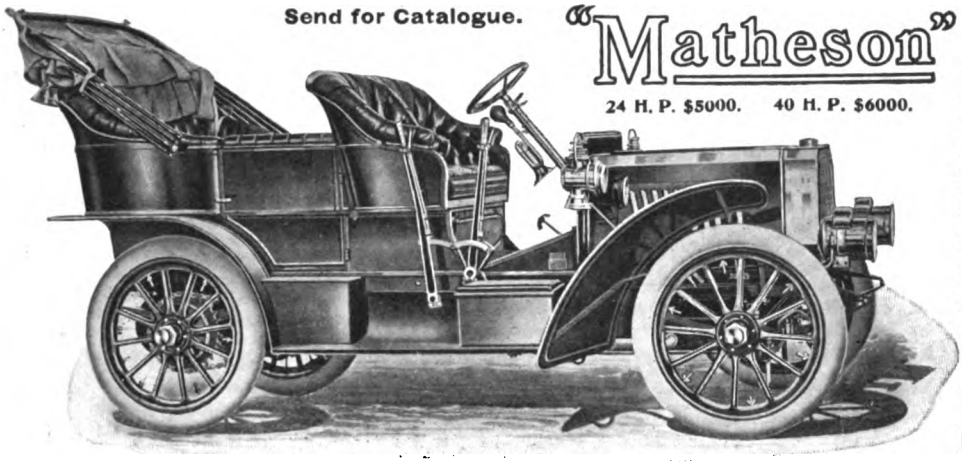
A WORD PICTURE OF THE YALE FOR 1905. $1,000.00.

SIDE ENTRANCE, $1,100.00.

Imagine to yourself the prettiest touraround that ever dashed down a road—a flash of gold and blue, whizzing by with no more noise than a mere musical whirring of the wheels.

Try to conceive a car so filled with power that it is like a living thing; and so instantaneously responsive that it can be controlled by a touch of the thumb and index finger. When you've formed this mental impression you've only begun to get an unexaggerated notion of the thousand dollar Yale for 1905.

The new double cylinder Yale weighs only 1400 pounds, with over a full ounce of continuous power for every pound. Seats four and even five and takes the meanest hills at high speed. You mustn't even think of considering any other car at anywhere near the price before you've read, heard and seen more of the thousand dollar Yale for 1905.



Write for our new catalog—out January First—no charges.

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

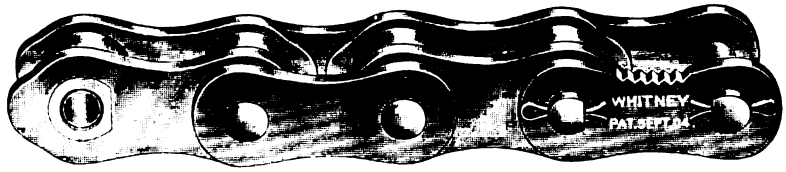
STRONG AND SERVICEABLE.

Strength is needed in Automobile Rims in order to give satisfactory service. STANDARD RIMS excel in strength—hence are serviceable. They are just the Rims you need.

THE STANDARD WELDING CO., Cleveland.

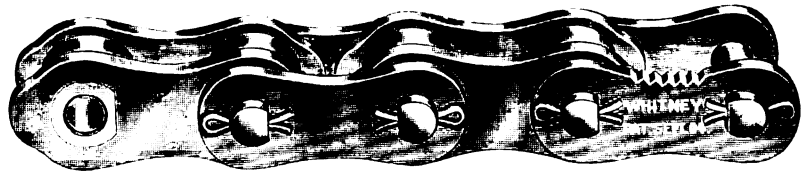


These are **"WHITNEY" STANDARDS** for Roller Chains.

PITCH.	Diameter of Roll.
1 in.	5/8 in.
1¼ in.	¾ in.
1½ in.	⅞ in.
1¾ in.	1 in.
2 in.	1⅛ in.

The PITCH SIZES and DIAMETERS advance uniformly in perfect proportion.

They have broken all records for efficiency, and have been adopted for most of the leading American Cars, including



"ACME" "AUTO-CAR EQUIPMENT" "BAKER" "BRAMWELL" "CADILLAC" "COLUMBIA" "CORBIN" "CHAMPION" "ELWELL-PARKER" "FORD" "FRANKLIN" "GROUT" "GAETH" "GIBBS" HARTFORD MOTOR STREET SWEEPER" "KNOX" "LENAWEE" "MITCHELL" "MOLINE" "MATHESON" "MANHATTAN" "OLDS" "POPE-HARTFORD" "PIERCE-RACINE" "PRESCOTT" "QUEEN" "RAMBLER" "STEARNS" "SOMMER" "SNELL" "THOMAS 50 & 60 H. P." "TOURIST" "WAYNE" "WESTERN ELECTRIC"

"Whitney" Roller Chain

RIVETED TYPE.

All links on both sides are Riveted, with exception of one Connecting Link shown.

"Whitney" Roller Chain

COTTER DETACHABLE TYPE.

All links on one side are Riveted and all links on opposite side are Detachable. One link only is considered the Connecting Link, this being distinguished from the others by notches in the top surface.

PITCH.	Diameter of Roll.
1 in.	9-16 in.
1¼ in.	5/8 in.
1½ in.	¾ in.
1¾ in.	1 in.
2 in	1⅛ in.

These are the OLD or COMPETING Standards.

The PITCH SIZES advance uniformly, but the DIAMETERS are irregular and not in perfect proportion.

All Chain Manufacturers have adopted "WHITNEY" Standards for these new sizes 1¾ in. and 2 in. pitch.

State salary expected. Address B-2, care The Automobile. 3-10

WANTED.—1901 Oldsmobile in exchange for large standard make touring car. Write for particulars, stating condition of your car. Dr. C. S. Morsman, Peru, Ill. 10

"Straws tell which way the wind blows."

ADVERTISEMENTS LIKE THE ABOVE SHOW THE TRUE VALUE OF THE

OLDSMOBILE

This Ad. appeared a short time ago in one of the motor papers, and is especially interesting, because Dr. Morsman drove a 1902 Oldsmobile many thousand miles, and exchanged it in 1903 for a larger car. He writes us that he is now going back to the Oldsmobile for the following reasons:—

"Your car represents the maximum of road efficiency, economy in operating expenses, including repairs, simplicity of construction, insuring least amount of care, and ease of control."

His trouble with the large car was excessive wear and tear due to complication of parts and weights, increased operating expenses, and impossibility of a lady successfully operating a large machine.

We all like variety, we like to have some experience with all automobiles, but the Oldsmobile owner, if he ever takes up another type of machine, usually retains his Oldsmobile or buys another one at no very distant date. In the light car line, our machines are typical motor cars, and from $650 to $1400 we can supply a car which will surely suit not only your requirements, but your pocketbook. To our old users the word Oldsmobile spells not only economy, but utility and reliability. The quickest way to discover the truth of our assertions is to own one of our cars. Here is our complete line. Can we not send you a catalogue and full information?

Oldsmobile Standard Runabout,	**$650**	**Oldsmobile Touring Car, - -**	**$1400**
Oldsmobile Touring Runabout, -	**$750**	**Oldsmobile Light Delivery Car, -**	**$1000**
Oldsmobile Light Tonneau, -	**$950**	**Oldsmobile Heavy Delivery Car, -**	**$2000**

We have left a few of the booklets, "The Rolling Peanut," by George Ade, and "Goop Talk." Copies free.

"The Maxwell"

There is not one complicated detail throughout "Maxwell" construction. The number of parts has been cut down to a minimum, and each part has been treated as a special problem and carefully worked out to perfection. It is fundamentally a car easy to explain, easy to understand and easy to operate.

The owner of a "Maxwell" is absolutely sure of two things.

First, that no car in the market AT ANY PRICE is more reliable than his, and, second, that he owns the one car before the public to-day in which, through its rare simplicity of construction, there is nothing to do but ride.

The "MAXWELL" cars have no pump (thermo-siphon). Their double opposed motor is in front under the hood and accessible in every part. They have Bevel Gear Drive. METAL BODIES. Transmission Case and Crank Shaft cast in one Aluminum casting. "Perfectly simple and simply perfect."

16 H. P. TOURING CAR, $1400. 8 H. P. TOURABOUT, $750.

MAXWELL-BRISCOE MOTOR CO.
TARRYTOWN, N. Y.
New York City Salesroom, 317 W. 59th Street.

Two Impulses with Every Revolution

This is the famous Elmore Pathfinder, which has demonstrated beyond a doubt the superiority of the two-cycle engine over the four-cycle engine. The most significant feature of the American Automobile situation to-day is the complete triumph of this impulse-every-revolution idea, or, with two cylinders, two impulses every revolution, as exemplified in the Elmore. That the Elmore does produce a constant torque; that it does utilize every particle of power and put a stop to waste energy; that it will take the steepest hill or roughest road at high speed, and that it has the most reliable self-starting engine in the world—for each and every one of these claims overwhelming proof has been produced.

The whole trend of expert and popular opinion is rapidly being directed toward the two-cycle engine.

You owe it to yourself to see this car, which will astonish you, not only by its fine appearance, but by its excess power and its extraordinary control on the high speed.

Send for our full line of literature, the booklet illustrating the 6,000-mile trip, our catalogue, explanation of our engine, and the opinions of people who have used our cars, all sent free, or, if you wish, we will send a 10x12 photograph of the Pathnder on receipt of 10 cents in stamps.

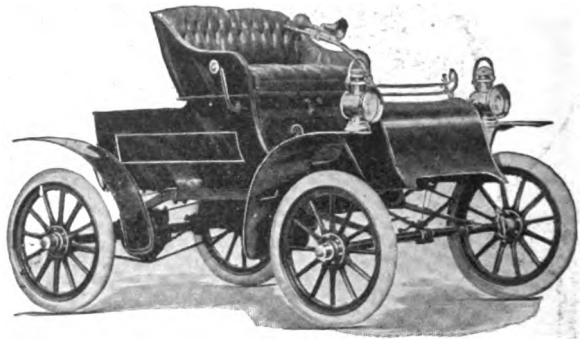
NORTHERN

Five-passenger, Side Entrance Northern Touring Car, 18 h. p., 100 inch wheel base, Price, $1700.

The chief reason that automobile tires wear out, is that automobile manufacturers do not furnish tires large enough for the machines.

Undersized tires cannot be expected to last.



They do not last, because they are not selected with proper regard to weight, speed and power of the car.

The Northern is the only Touring Car at the price equipped with 4-inch tires.

Every other part of the **Northern** is equipped in the same generous way. This has much to do with **Northern** success.

1905 ANNOUNCEMENT

The Autocar

A NEW TYPE.

We believe that the Autocar in all its types represents the highest excellence in automobile design, workmanship and material. Every Autocar is built on honor. We feel, therefore, that our new type will meet with a cordial reception.

This car, **Type XI.**, larger and more powerful than the other types, has a four-cylinder vertical engine of 16-20 horsepower. The body is built on the newest and most approved French lines. The front seat is divided and both front and rear seats are large and comfortable.

While this car is built upon the tried Autocar principles which have been so splendidly proven, it shows a number of very important improvements making for increased simplicity, ease of operation, safety and comfort.

In fact, though Autocars have always been noted for absence of bewildering intricacy of mechanism, yet no one can but be impressed with the extreme simplicity of this new car. It is a triumph in scientific construction and arrangement.

This car has more than met our highest expectations in the road test. In fact, its performance has been a surprise to experienced automobile men. The power of the car carries it, fully equipped and loaded with five passengers up, tested 12 per cent. grades, for instance, at 20 to 25 miles per hour on the direct drive, while on the level the car attains a speed of 40 to 45 miles. The car is a superior climber on any hill.

Altogether our eight years' experience has enabled us to produce in this type, a four cylinder car we are assured cannot be surpassed by any similar car at any price.

The price of Type XI. is $2000. Ready for delivery January 16.

Type VIII.—Four-Passenger at ($1400.) and

Type X.—Runabout at ($900.)

have made *Autocar Reputation*. Each stands at the head of its class for value and efficiency.

Catalogue descriptive of the 1904-05 types will be sent free upon request. This catalogue contains also addresses of our dealers throughout the country who will be glad to give demonstrations to prospective automobile purchasers and explain in detail the merits of our cars.

TOURING RUNABOUT, with Semi-Racing Body, 16 H.P., Price $1500.

A SEMI-RACER.

This car is a beauty. A 16 H. P. Touring Runabout, it is designed on the swellest lines, with semi-racing body. The motor is the Positive Air-cooled Orient, a 4-cylinder, vertical fore-and-aft, with special flange system, and direct air-blast from a powerful four-bladed fan. The cylinders of this motor run uniformly cool under all conditions of weather and climate, and the car will make 40 miles an hour over ordinary roads.

Same Car—with Detachable Tonneau.

We have arranged to put out this same model with detachable tonneau, thus providing an ideal car for business and professional men who want to use a Runabout most of the time, but need the tonneau for family use on Sundays and in the evenings.

The price of Model E without tonneau is $1500—with tonneau, $1650.

It is one of the strongest features in the Orient line. Full details and catalogue if you wish.

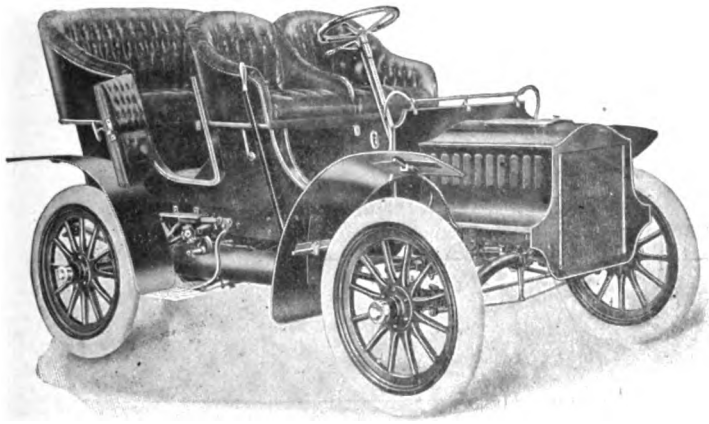
Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about Feb. 1st, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

The 1904 edition is now out of print.



Sent upon receipt of 6 cents in stamps for postage.

Rambler

SURREY, TYPE ONE.

$1350.

18 H.P. Immediate Delivery.

This vehicle has no superior for general use. It is a fine car sold at a low price, because of the exceptional facilities of the largest automobile plant in the world. This vehicle combines beauty, speed and reliability.

The RAMBLER engine is so powerful in comparison with the weight of the car that it is seldom necessary to use the low speed. When running on high speed, the power is transmitted direct to the wheels without the mediation of gears and with absolutely no frictional loss. Vibration is almost entirely eliminated by the engine being rigidly braced, and the reciprocating parts exactly balancing each other.

OTHER MODELS, $750, $850, $2000, $3000.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, February 23, 1905. No. 22

GET YOUR MONEY FIRST

If You Permit Use of Repaired Car, You Forfeit Your Lien, Says the Court.

Justice Clark, sitting in Trial Term, Part II, of the New York Supreme Court, has rendered a decision in the case of Smith vs. O'Brien, of interest to repairers and garage owners not alone in New York State, but throughout the country wherever the common law has not been changed by special statute. As the question involved is a new one, created principally by the automobile itself, it is extremely doubtful if any legislation on this point has been enacted.

The Smith in the case, or the plaintiff, is of the firm of Smith & Mabley, who sued one O'Brien for a storage bill and for the enforcement of their common law lien on the latter's car for which the bill for services was incurred. The keeper of a garage, or bailee, as he is technically termed in the law, is entitled to his common law lien for services which attaches to the bailor's property so long as the latter remains in his possession, but, according to the decision in question, loss of control over it, even temporarily, as in the present case, where the owner was permitted to use the automobile on which repairs have been made before the bill is paid, causes the garage owner to lose his lien.

The judge further states in his opinion that without a statute in favor of garage owners they will have no lien for storage or repairs after the car for which the charge of repairs is due has left the garage, no matter for how short a space of time.

Coliseum Bound Up by Contract.

It is going the rounds that the independent manufacturers have secured an option on the Coliseum, Chicago, and will turn the tables on the Licensed Association of Automobile Manufacturers by denying its members space at the 1906 show in that city.

This makes it appear that it is not to be generally known that a three years' option on the Coliseum Building is held by Samuel A. Miles, who, before or after becoming manager of the National Association of Automobile Manufacturers, entered into a contract with that body to hold all shows under its sanction. As this contract does not expire until after the 1906 exhibition, it is manifest that the rumors that the independents have secured the Coliseum lacks substance.

Railroads Advance Freight Rates.

An advance in the classification of the freight of automobiles has recently been announced by the freight departments of Eastern roads.

As far as Chicago the second class rate is based on a 65 per cent. rate from New York, and the first class rate on a basisof 75 cents. Automobiles have been averaged at 5,000 pounds in weight, which means under the new classification an increase of $5 in freight charges from any point east of Chicago. The rate further west, however, remains the same.

Licensed Makers Discuss Show.

At their regular meeting yesterday in their New York offices, the Association of Licensed Automobile Manufacturers devoted a great deal of discussion to the show subject, but evolved nothing for publication.

"The show is a big subject," replied General Manager Day when pressed for information, "and its affairs cannot be settled at one meeting, or at several. It necessarily will form a subject of discussion at many of our meetings before anything is ripe for publication."

Fire Destroys Spark Coil Factory.

Fire of unknown origin on Sunday morning last, 19th inst., totally destroyed the plant of the Pittsfield Spark Coil Co., Pittsfield, Mass. The loss is estimated at $42,000. The insurance was but $12,000. The directors of the company immediately held a meeting and hope to effect such arrangements as will make delays in deliveries merely nominal.

To Handle Diamonds in the South.

The Diamond Rubber Co. will open a new branch in Atlanta, Ga., about March 1. The building, No. 94 North Pryor street, is being remodelled for the company's occupancy, and a salesroom and repair station will be established, in charge of a thoroughly experienced force.

ST. LOUIS MYSTERY DEEPENS

Mister Steinmeyer, Gentleman and Contractor, Explodes with Wrath at Mention of it.

St. Louis, Mo., Feb. 18.—The million-dollar automobile factory, which is supposed to be building at Kirkwood, St. Louis County, is still very much a mystery. After several attempts, a Motor World man yesterday obtained access to A. L. Steinmeyer, of the Peyton Investment Company, who is credited with the promotion of the big project.

When Steinmeyer was informed of the purpose of the visit, he appeared startled; when he learned that his visitor represented the Motor World, he exploded.

The Motor World is the only publication which said anything about the project, and the fact seems to have jarred Mister Steinmeyer's nerves. For some reason or the other, he denounced the paper roundly, and heatedly declared that he would give it no information whatsoever. He also found it necessary to emphatically assert that he considered himself a gentleman, and appeared to fancy that he had been grossly insulted by being referred to in the Motor World's story as plain "Steinmeyer," without the prefix "Mister."

Between explosions Mister Steinmeyer let fall, however, a few grains of information. He stated that he is not only a gentleman, but a real estate man and a contractor, and that, as such, he was out to make money; that he had sold the ground for the factory, and had the contract for the erection of the necessary buildings. He absolutely declined, however, to give the name of any of his associates, or the name of the company that will occupy the plant after it is completed.

He said that the man who knew all about the car that is to be built in New York, but he (Mister Steinmeyer) refused to give his name or address, or any inkling concerning him. He said also that nothing ever would have been known of the project but for the action of a St. Louis paper in publishing some information concerning it, despite his earnest pleadings that the matter be suppressed. In fact, whatever Mister Steinmeyer said was said so vociferously and

Digitized by Google

vehemently that it seemed as if the other occupants in the building in which his office is located might have been justified in sending in a police call.

It will be recalled that the only information concerning the million-dollar factory that has leaked out makes it appear that the structure is to be of three stories, 300 by 300 feet, and that the plans also include the erection of 140 cottages for the workmen.

Kirkwood, which is to be the site of Mister Steinmeyer's factory, is a residence suburb about thirteen miles west of St. Louis. There are at present no factories there, but only groceries, meat shops and such other stores as are required for the necessities of suburban life. It is also a prohibition town, the saloon question having been for years the leading one in all municipal elections.

Hanlon Itching to "Do Things."

St. Louis (Mo.) automobilists, or at any rate Eugene Hanlon, of St. Louis, are wroth, and because they, or he, cannot have an automobile show this year. According to the garbled reports that come from St. Louis, it seems that Hanlon went to Chicago to get the sanction of the National Association of Automobile Manufacturers for the affair, and was unsuccessful. The board stated that, inasmuch as there was an automobile show in progress all last summer at the St. Louis World's Fair, the Mound citizens ought to be satisfied and give other cities a chance.

Mr. Hanlon thinks St. Louis needs a show, a series of races or "something" to stimulate the local trade. There are at present only eight hundred cars in St. Louis, which means that only eight persons out of every seven thousand own automobiles. Hanlon has dreamed that in most of the Eastern cities one person out of every two hundred possesses a car, and therefore, like a good citizen, who, of course, don't care a rap about gate receipts, etc., he wants to see St. Louis higher up on the list.

Duerr Adds Queen to his Line.

C. E. Duerr & Co., New York, have taken on the Queen, made by the C. H. Blomstrom Motor Co., of Detroit, Mich., and, with the Royal Tourist and the Pungs-Finch, another Detroit product, which is new with them this year, are now in a position to show cars ranging from $800 to $4,000. "The Queen is simply a wonder for its price," said one of C. E. Duerr's men to a Motor World representative. "We've tried it on 'Duffy's Hill,' anad it went up in a manner befitting its name. Why, just think of it, a light touring car with 5x5 cylinders."

Davis Goes to the Coast.

Charles Davis, who formerly travelled Ohio and Michigan for the G & J Tire Co., has been transferred to San Francisco, and will henceforth cover California in the interests of the "original clincher." Davis has a reputation for energy and geniality, and it would seem that he cannot fail to do well.

The Week's Incorporations.

New York, N. Y.—Christie Direct Action Motor Car Co., under New York laws, with $300,000 capital. Incorporators: C. G. Christie, D. H. Haywood and N. T. M. Melliss.

New Haven, Conn.—The New Haven Automobile Corporation, under Connecticut laws, with $3,000 capital. Incorporators: Herbert E. Doolittle, Robert R. Doolittle and Sarah S. Handy.

Cincinnati, Ohio—American Auto Car Co., under Ohio laws, with $200,000 capital. Incorporators: M. M. Robertson, A. J. Smith, N. L. Emerson, W. F. Hanna and E. T. Horstman.

Hartford, Conn.—The Capital City Automobile Hack & Livery Co., under Connecticut laws, with $9,000 capital. Incorporators: Wilbur Tewksbury, William F. Dahill and John L. Carroll.

Jersey City, N. J.—The Commercial Electric Vehicle Co., under New Jersey laws, with $1,000,000 capital; to operate vehicles, etc. Incorporators: Dwight W. Bowles, Thomas P. Ford and Frank P. Slade.

Chicago, Ill.—Monarch Metal Co., under Illinois laws, with $2,500 capital, to manufacture and repair automobiles. Incorporators: Godfrey Johnson, Charles C. Stilwell and C. C. Bowersock.

Boston, Mass.—Biograph Automobile Sign Co., uider Massachusetts laws, with $40,000 capital, to deal in advertising devices. Officers: Richard S. Barrett, Melrose, and Chas. C. Corbett, treasurer.

Detroit, Mich.—The Massnick Mfg. Co., under Michigan laws, with $7,000 capital, to manufacture machinery, tools, automobile parts, etc. Incorporators: Fred C. Massnick, Paul F. Kellogg and William J. Sparks.

In the Retail World.

George Blaisdell has taken the Rockford, Ill., agency for the Cadillac cars.

At Michigan City, Ind., Brinckman Bros. are establishing a garage and automobile livery.

Guy R. Mathis, Springfield, Ill., will act as agent in Sangamon County for the Winton and Cadillac.

The White steam cars will be handled at Buffalo by Walter Hayes, who secured the agency last week.

The Western Automobile Co., No. 1,409 Michigan avenue, Chicago, Ill., has taken the Western agency for the Maxwell cars.

The Maxwell-Briscoe Co. will be represented in Boston by Ralph E. Coburn, who has taken the agency for the Maxwell cars.

Benjamin Smith has taken the Boston, Mass., agency for the Studebaker cars, and will open headquarters on Columbus avenue.

The Greer Motor Car Co., No. 1,421 Michigan avenue, Chicago, Ill., will handle the Michigan and St. Louis cars in Chicago this year.

Humboldt County, Cal., is the territory to be covered by Healy Bros., Eureka, Cal. They have taken the agency for the Olds and Winton cars.

The store at No. 163 Columbus avenue, Boston, Mass., is being remodelled for J. M. Linscott, who will handle the National and Reo cars this year.

William Galloway, of Waterloo, Iowa, has taken the agency in that city for the Cadillac car, and will establish quarters in the Equitable Building. He will also carry a full stock of accessories and conduct a garage.

A. R. Bangs, Boston agent for the Baker electrics, has opened his new salesroom, at No. 801 Boylston street. Harry W. Doherty will manage the new salesroom, and Bangs will continue in charge of the garage on Brimmer street.

Articles of incorporation will probably be filed by the recently organized Minneapolis Automobile Dealers' Association. A committee has been appointed to consider the advisability of incorporation, and will report at the meeting next Tuesday, February 28.

J. J. Barclay, a Minneapolis (Minn.) dealer wants to erect a new garage, but as yet is at a loss to know just where to build. Barclay had planned locating on Sixth avenue, between Second and Third avenues, but H. S. Haynes, of the Haynes Automobile Co., stole a march on him and secured the lease of the ground first.

W. C. Doddridge, former president of the Missouri Pacific Railroad, and W. Duncan will incorporate the Missouri Valley Motor Co., Kansas City, early in the spring. The company will conduct a general livery and sale business in automobiles, and will be capitalized at $50,000. The business will be managed by a son of Mr. Doddridge.

The Standard Automobile Co., of New York City, has leased for a period of twenty-one years the plot, 75x185 feet, on the north side of Fifty-fifth street, just west of Broadway, together with a lot 25 feet wide extending to Broadway. The company will erect a building to be used as an automobile salesroom and garage. The aggregate net rental under the lease amounts to about $250,000.

Big Fire in London.

Cables from London, under date of Wednesday, the 22d inst., state that the centre of the district given over to the automobile business was swept by fire on that day, resulting in the loss of hundreds of new cars just returned from the Olympia show, which closed on Monday. The damage is estimated at $1,250,000. The extent of the conflagration may be imagined from the fact that it was necessary to call out no less than forty-eight engines.

Wagon Company's First Car.

The Harrison Wagon Co., Grand Rapids, Mich., will make its debut in the automobile building world on March 1, when its first car will be ready for the market.

SCARING AWAY BUSINESS

How Too-Industrious Insurance Agents Ply Their Trade to Detriment of Dealers.

"One of the drawbacks to the automobile dealers are the fire and life insurance agents who work on a commission basis," said a New Jersey dealer who was in New York this week to the Motor World man. "The insurance men have knocked several 'sure' sales sky high for me, and I naturally do not feel in a very peaceful frame of mind over it. But what are we agents to do?

"The insurance sharks employ underhand methods to further their designs. No doubt they think they are acting with good intent, but they play havoc with us just the same. For instance, an insurance agent with lots of time to spare will hang around a garage until a prosperous looking individual comes in to inquire about a machine. Then when I take the prospective buyer out for a trial spin the insurance man will bribe one of my employes—which is an easy thing to do if the latter knows—to tell him the name of my prospective customer. If this method fails to give him the desired information he waits until we come back from the demonstration, and as soon as the man leaves the garage the overzealous insurance agent nabs him. My man had probably just about agreed to take a car when the agent solicits him to take out some insurance.

" 'But what do I want with insurance?' the former demands.

" 'Oh, didn't you promise Mr. So-and-So (meaning me) to buy an automobile?' queries the agent.

" 'Well, yes, I did; but what has that got to do with insurance?'

" 'They all take it out,' says the slick, oily tongued insurance man. 'You need fire insurance for your automobile and accident insurance to indemnify you in case you kill or maim yourself or somebody on the street and get stuck on a damage suit.'

"And in many cases," added the dealer, "my prospective customer later sends me a polite little note, saying that he has decided not to get an automobile, as there is so much extra expense attached thereto and he has already purchased a span of horses. So I lose a sale.

"If somebody will suggest a way to get ahead of the insurance agents I will be thankful, as I have lost several good sales in just the manner I have described. They simply scare trade away."

"Butted in" to Winton's Factory.

Workmen in the polishing department of the Winton Motor Carriage Co., at Cleveland, Ohio, thought the end of the world had surely come one day last week, and some of the more pious workmen began to mumble long forgotten prayers, while others executed a series of rapid leaps for the doors. The cause of the commotion was a coal car of the Lake Shore Railroad. The train crew were switching cars around the yards of the Winton company, when of a sudden the switch engine gave one of the cars a "kick" which sent it speeding down the track parallel with the polishing shop. Striking an obstruction on the rails, it jumped the track, and, turning partially around, rammed through the foot-thick brick wall of the automobile factory and did not stop until half its length was inside. The damage is estimated at $1,000.

Second-Hands Affecting City Trade.

"Bad weather naturally accounts for any dulness that may be felt in the New York trade just at the present moment," said Percy Owen, manager of the Winton branch, to a Motor World man. "Of course, no one wants to go out in a foot of snow or over a frozen road that resembles a washboard, but, in my opinion, that's not the one and only reason. I believe the bulk of the city business will be unusually late this year, and this is to be accounted for almost entirely by the fact that so many people are now possessors of second hand cars. Until they can get rid of them they will not buy, and that's all there is to it.

"Did you notice that fellow just a moment ago," referring to a caller; "that was his proposition—wanted his last year's car taken in trade. It's a wonder to me that more people don't go into the business of handling second hand cars, for there certainly should be plenty of money in it. They could, no doubt, make good, and a few large houses of this kind would relieve the pressure, because it is certainly the problem to-day."

Thomas Buys More Land.

The E. R. Thomas Motor Co., of Buffalo, has purchased a hundred feet of ground on Niagara street, adjoining factory No. 1, and plans are being prepared to enlarge that plant as soon as the frost is out of the ground. Incidentally, the one hundred and tenth car of the 1905 model was shipped to New Orleans last Saturday. There are 350 more of them to be manufactured.

Denver Show in April.

The first automobile show to be held west of Chicago is scheduled for the first week in April at Coliseum Hall, Denver, Col. G. A. Wahlgreen, who is also promoting the Pikes Peak climb, is the manager.

Coey to Enter Jobbing Field.

C. A. Coey & Co. who handle the Thomas cars in Chicago, are enlarging the supply department of their business, and will actively enter the jobbing trade. They have a catalogue well under way.

Hart Becomes Corbin Officer.

M. S. Hart, of New Britain, Conn., has been elected vice-president and treasurer of the Corbin Motor Vehicle Co., of that city.

RULES FOR CHAUFFEURS

California Organization's Comprehensive Regulations that Should Serve to Good Purpose.

In view of the recent automobile accidents occurring in the Golden Gate Park, San Francisco, Cal., due to inexperienced drivers, the Automobile Club of California now proposes to keep a blacklist of chauffeurs found guilty of careless driving. The California Association of Chauffeurs has more than promised to work in conjunction with the club to this end, having sent the following communication to the automobile club:

"We, the undersigned, hereby petition your association to expel any driver who, on being tried by your examining board, is found guilty of reckless driving, either by excessive speed or improper handling of his machine, thereby endangering the lives of the occupants of the machine or those upon the highways, and we hereby agree not to employ drivers who are expelled from your association for the above causes."

In the bylaws of the association several good clauses are evident:

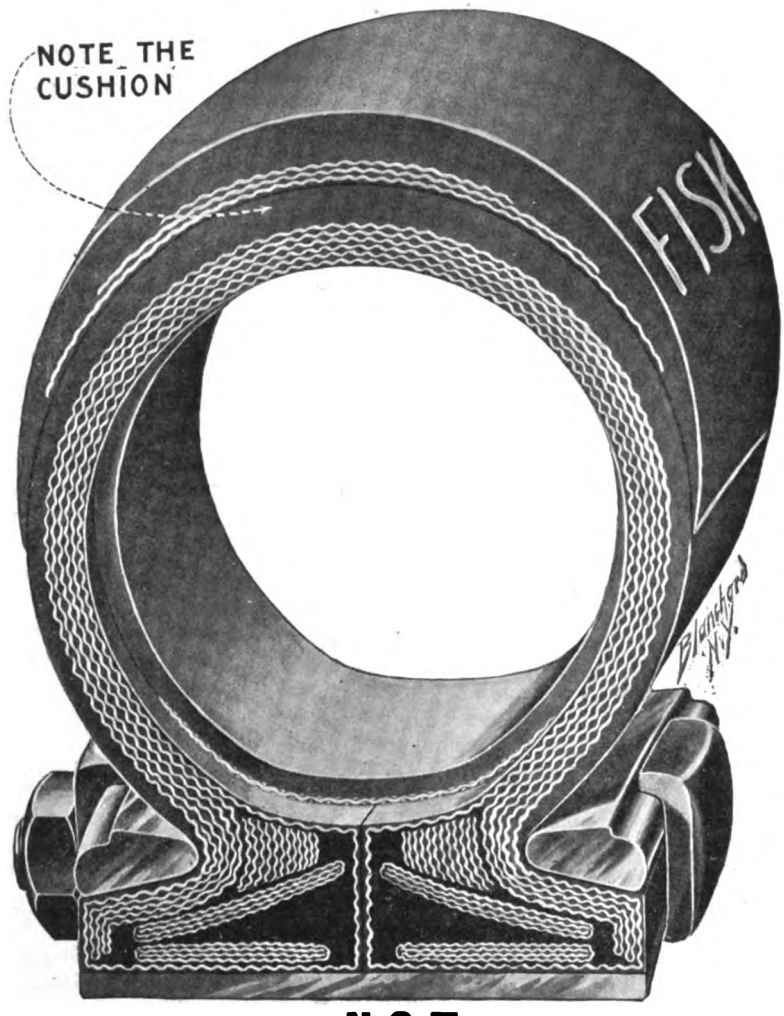
"Any member of this association found guilty of intoxication while in charge of a machine shall, upon being found guilty, be fined or expelled, as the association may see fit.

"Any member of this association found guilty of dishonesty toward his employer or the association or its members shall be expelled.

"Any member found guilty of using an automobile in a reckless manner, or of being responsible for the injury or destruction of a machine through carelessness shall be fined, suspended or expelled, as the association may see fit.

"Every member of the California Association of Chauffeurs must undergo a strict examination as to the knowledge of the car he is in charge of, and must carry a certificate of qualification, properly signed by the examining board and the president and secretary of the association."

Offering Premiums for Packards.



There are a number of Packard agents who now realize that "delays are dangerous." They hesitated to place orders, and as the demand for the Packard cars now exceeds the supply and the factory is "sold up," they are in a pretty pickle. As a way out they have been offering premiums of as much as $400 to secure cars and going to the factory at Detroit to dangle the bait. These facts are vouched for by the Packard people themselves.

Kimball is Coming Back.

E. P. Kimball, of the Central Automobile Exchange, New York, is to re-establish himself, but on the Thirty-eighth street "row." He already has secured the agency for the Corbin car.

The Only Real Automobile Tire.

NOT MERELY AN ENLARGED BICYCLE TIRE,

but a tire designed, developed and constructed specially for use on automobiles, and supplied with a flat rim (don't overlook that), and a fastening in keeping with the design of the tire. And what is very much to the point, it is a tire and a fastening that have been tried ruthlessly for two years and found not wanting.

If you would know more about it, permit us to mail you a copy of our booklet.

CABLE ADDRESS, "MOTORWORLD," NEW YORK

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, FEBRUARY 23, 1905.

Pocket Picking in New Jersey.

In the riot of automobile legislation that is now more or less convulsing this country, nothing stands out more disgustingly than New Jersey's attempt at legislative pocket-picking.

The doughty Senator Grady, of New York, who would place all automobile accidents without distinction in the category of man-slaughter, and the fanatical Brower, of the professional grievance committee of the West End Association, who would not give offending automobilists the option of a fine, are suffering from overheated imaginations, but the New Jersey proposal to alter the present perpetual registration fee of $1 to a tax of $5 per annum is a cold blooded species of robbery.

There is no excuse, and less reason, for it. It is not presented even in the usual guise of "protection to the public." It is merely placing a legislative blunderbuss at the heads of a selected class of New Jersey citizens and those of other States who desire to use the roads of the State—for New Jersey has always mulcted residents and non-residents impartially—and ordering them to throw up their hands while their pockets are being picked of $5 each. It is an indecently contemptible proposal, actuated by the equally contemptible sentiment, "We got $1 so easily, we may as well squeeze $5 out of them."

It was a State official who last summer gave voice to this utterance. It was not accepted seriously at the time. It was not believed that the manhood of New Jersey would permit descent to such methods of the pick-pocket and highwayman, but it is now seen that too high an estimate was placed on at least certain members of the legislature.

There ought to be decency enough in the State of New Jersey to defeat this miserable attempt to wring blood money from certain of its citizens and its visitors. The amount is small; the principle is great.

The Searchlight Evil.

Great credit must certainly be accorded the lamp manufacturers for the state of perfection and efficiency to which they have brought their product in the short time that experiments have been making with acetylene, but the question arises, Has not the mark been overstepped?

And it is one well worthy of consideration, for is not the blinding glare of the now huge searchlights with which heavy touring cars are equipped far more dangerous than the absence of a light? True enough, speed requires that the road been seen for quite a length ahead in order to insure safety, but night speeding over unknown, or over well known roads for that matter, is not a a particularly safe practice under any circumstances.

What is it to become when everything on the road moving in the opposite direction is to be rendered helpless by the sudden flashing of an overpowering glare in the eyes, and left to flounder, blind and bewildered, in midroad during the moments of the car's approach? By actual count many of the powerful cars now carry no less than six lamps, two oil headlights, a tail light ditto, a pair of acetylene headlights of no mean illuminating power, and, to top on all, a hand controlled searchlight that would do credit to a torpedo boat. The last named were to be seen on previous occasions, but their use was not general by any means, and it is not difficult t prophesy that they will be responsible i some measure for accidents during the com ing season.

That this is not a theory but a condition, a the Motor World remarked several month since, is well illustrated by the fact that i revealed itself immediately upon the adoptio of high powered electric searchlights by th Western railroads, and at first the evil ef fects of rendering the engineers helpless fo the time, and the fact that regardless of it power the light could not be seen around curve were thought to nullify its advantages A remedy was found, however, in the use o a deflector which throws a good fraction o the light skyward at a slight angle and th remainder on the ground not too far in ad vance of the engine. By means of the uppe light the approach of a train is visible tw or three miles distant, despite intervenin cuts or curves, and the small fraction of ligh —many times that of the old headlight, de flected to the ground, does not bother the en gineer of a train in the opposite direction.

The Casting of Cylinders.

It may appear strange at first sight tha the idea of casting the four cylinders of th engine in one piece integral with the wate jacket, now being put forward in Englan as marking a decided advance over "foreign methods, has not come in for more attentio at the hands of designers and builders in thi country.

The advantages of accomplishing in on operation what now requires four are ob vious, as is also the increased economy re sulting from the necessity of handling an finishing but one casting. Saving of spac and great reduction in the number of fitting required to fasten the single casting in place as well as the ease of accurately alignin all the cylinders, constitute items of impor tance to the builder which also make for sim plicity in the finished engine.

The practice in vogue here of casting th cylinders of the usual four-cylinder engine i pairs has obtained to an extent that entitle it to be denominated standard. This was half-way step toward the one-piece four cylinder casting, but advances have bee made in exactly the opposite direction, i that those who have dropped the twin-cylin der casting have come to make each cylinde of the four entirely independent.

The gain resulting from this in the way o added interchangeability, ease of repair an

Digitized by Google

replacement is self-evident, but they are only obtained at a much greater first cost both in manufacture and fitting, as it is much more difficult to align the four independent cylinders on the crank case to which they are bolted as a foundation. As to any difference of efficiency in operation this may well be said to be a mooted question which can only be determined after experience with the one-piece casting. Certain it is that the integral water jacket surrounding all the cylinders, while not open to the evils of leaky joints to the same extent, can scarcely lay claim to greater cooling powers than the independent copper jackets, in spite of slightly additional area. But its permanency of alignment is indisputable. Nor can there be any question as to a slight saving in space as well as absence of vibration due to the lack of necessity for bolting. In addition to this our contemporaries of over the water call attention to the fact that both are prone to go down before the same ills, that freezing will have an equally pernicious effect on either and that it will be equally expensive to replace the one independent cylinder as it would to supply another unit of four.

The question resolves itself into a very simple matter, for the advantages are chiefly in favor of the maker and against the user. And with this in view, it may well be asked will the advantages of economy in production be sufficient to compensate the user for any slight difference in first cost that he may have to pay, for all roseate over-the-water opinions to the contrary notwithstanding the car owner who has to replace the four cylinders, and one means all in this case every time—will find it very much more expensive than if they were independent.

Further, present gas engine design in casting the cylinders independently is held up to ridicule in that it is totally at variance with long established steam engineering practise, but to those who have been instrumental in bringing the automobile motor to its latter day state of efficiency this will have no great weight, as the lesson that the internal combustion motor is a totally different proposition and that steam engine lore, of no matter how many years' standing, doesn't apply to it, was long since well learned.

There is a big season before the automobile manufacturer all over the world, and its practical results will doubtless do much toward settling controversies over the advantages of disputed points in construction, as did the last twelve months, and the method in question is one that will either prove its worth in that time or go down before its superior rivals.

The Second-Hand Problem.

According to the manager of the metropolitan branch of a prominent manufacturer the second-hand car will be responsible for a change in trade conditions, more noticeable this season than ever before. In his opinion, the bulk of city business must be deferred pending the intending purchaser's disposal of his last year's mount, and until this is accomplished satisfactorily buying will hang fire. As none of the manufacturers' agents of branch houses are at all keen about entering this field, in fact, quite the contrary, nor, for that matter, the garage keepers as a general rule, the problem must depend for its ultimate solution on a large increase in the ranks of second hand specialists—dealers who handle nothing else.

That this business can be made lucrative and still be kept legitimate goes without saying, for there is an inbred desire in a very large portion of the race to acquire a bargain at second hand, and it is a trait in human nature that it pays to cater to. Of course, the second hand dealer who publishes glowing descriptions of cars that are not only hopelessly out of date, but have in addition been done to death by their prior owners, has in the past given this aspect of the trade a mighty shady reputation that will naturally be hard to live down. As a matter of fact, a "second hand" demonstration was a performance long a laughing matter with the legitimate trade. If the machine managed to go a block or two, execute a few turns in the roadway in front of the establishment and get back without a break down, that was as far as the seller's guaranty went.

Caveat emptor applies with no uncertain force to all dealings in second hand automobiles, and the buyer usually has no one but himself to blame for being saddled at the outset with a repair bill that is a respectable fraction of the purchase price, and in the end with a cast-off fit only for the junk heap before it reached his hands. But the supply of "suckers" is unfailing, and no one realizes this better than the crafty and not overscrupulous second hand dealer in automobiles. He angles for them accordingly.

There are two classes of cars which find their way into the hands of this gentry—first, those that by some chance have managed to survive dissolution at the hands of utter ignorance and recklessness, and those that have been given careful attention, often not driven for more than a season and are disposed of in favor of a later model. It would seem in the natural order of things that the latter would preponderate, and they are numerous, but, judging from the tales of woe of those who have bitten at the former type, they are not vastly in the minority by any means. But there are enough of the right kind to make legitimate dealing profitable without the necessity of palming off candidates for the scrap heap, and an increase in the number of such dealers will alleviate the burden of the manufacturers' selling forces all over the country. There is room for a few reputable men to increase their reputations and bank accounts in this direction.

Moral of the Boy and his Sled.

If proof is really needed that love of speed is inherent it is embodied in the small boy and his sled.

In city and in country, and whether an aristocratic West Ender or the scion of the humblest farmer, he seeks the steepest, smoothest, longest hill that he may attain swiftest flight and sustain it as long as possible. On the country roads and in the heart of big, bustling New York he is now omnipresent. He cares not a rap for speed laws, and without brake, bell or ability to control his vehicle, and wholly regardless of all forms of travel, he whizzes downhill at the rate of fifteen, twenty, even thirty miles an hour, and, happy lad, with none to say him nay or threaten him with arrest. Like as not his proud sire, if he himself is not steering a bobsled or fracturing the law with a cutter, looks on admiringly.

But the same father as likely shouts himself hoarse at the sight of an easily controlled and quickly stopped automobile moving at half the pace and vociferously calls for law and more of it.

It merely goes to show not merely the unreason of some men, but that, given the vehicle, indulgence in swift motion is wellnigh universal.

Senator Grady has craftily cut some of the ground from under the automobilists' feet by making his bill apply to all forms of vehicles, but when his horsemen friends and the streetcar drivers and truckmen who follow Tammany Hall awaken to the fact that he is putting them in peril of heavy fine and imprisonment for the merest accident there will be "something coming to" the Senator. The truckmen and streetcar drivers cause twenty accidents where the automobile causes one.

CLEVELAND'S FULL HOUSE

Its Annual Show Crowds the Hall—All the Old Familiars in Evidence.

Cleveland, Ohio, Feb. 21.—It almost goes without saying that the show which opened in the Cleveland Grays' Armory last night was inaugurated auspiciously.

Like Detroit, Cleveland and the adjacent territory possesses so many factories making cars and wares relating thereto, that even without outside assistance, the local trade could promote a show of its own that could not be sniffed at; in fact, the congested appearance of the hall suggests that something of the sort may become necessary if another year brings with it an increased demand for space. The armory really is crowded—too crowded, perhaps, for effective display, but despite the fact the array of cars and sundries in evidence is impressive. Of course, with the exception of two little known cars, there is nothing staged that was not shown at the national show, but most of the large crowd that attended last night was none the wiser. It was all new to them, even if to the exhibitors it was an old story. There is one convenience that the exhibitors enjoy, however, that was lacking at even the big shows. Nearly all of them have telephone service in their booths.

Whites, Wintons, Royals, Peerlesses, Clevelands and Bakers, Cleveland's own productions, are naturally very much in evidence. Even "Standard Oil" is here—the home of "the" Rockefeller. Nearly all of the better known outside cars are displayed, and, almost needless to add, the tire makers, who are following each other like hawks, are on the spot. Solar lamps, Gray & Davis lamps and Twentieth Century lamps and Veeder odometers, without which no Cleveland show could be called complete, are here as in the "days of yore."

Those who are exhibiting are as follows:

Automobile Garage & Repair Co., Cleveland, Ohio—Agents for Packard, Autocar and Cadillac cars.

Booth Automobile Co., W. N., Cleveland, Ohio—Agents for Pope-Hartford and Pope-Tribune cars.

Badger Brass Mfg. Co., Kenosha, Wis.—Solar acetylene gas lamps.

Bowser & Co., S. F., Fort Wayne, Ind.—Gasolene outfits.

Cameron Motor Car Co., Cleveland, Ohio—Cameron cars.

Chisholm & Phillips Automobile Co., Cleveland, Ohio—Agents for Peerless, Knox, Stevens-Duryea, Northern and National cars.

Cleveland Tanning Co., Cleveland, Ohio—Upholstery leather.

Cleveland Motor Car Co., Cleveland, Ohio—Cleveland cars.

Diamond Rubber Co., Akron, Ohio—Diamond detachable clincher tires.

Electric Storage Battery Co., Cleveland, Ohio—Storage Bateries.

Fisk Rubber Co., Chicopee Falls, Mass.—Fisk Tires.

Gabriel Horn Co., Cleveland, Ohio—Gabriel horns.

Goodrich Co., B. F., Akron, Ohio—Goodrich detachable clincher tires.

G & J Tire Co., Indianapolis, Ind.—G & J detachable clincher tires.

Gray & Davis, Amesbury, Mass.—Headlight, side and tail oil and acetylene gas lamps.

Gaeth Automobile Works, Cleveland, Ohio—Gaethmobile cars.

Hussey Drop Forge & Mfg. Co., Cleveland, Ohio—Steering gears and wheels, circulating pumps and radiators.

Hartford Rubber Works Co., Hartford, Conn.—Dunlop detachable and Hartford and Turner tires.

Lorain Automobile Co., Lorain, Ohio—Elmore Pathfinder cars.

Morgan & Wright, Inc., Chicago, Ill.—Clincher detachable tires.

Moore, H. S., Cleveland, Ohio—Agent for Queen cars.

Magoon Car Co., C. H., Cleveland, Ohio—Agent for Pope-Toledo gasolene and Pope-Waverly electric cars.

National Carbon Co., Cleveland, Ohio—Columbia ignition apparatus.

Ohio Motor Car Co., Cleveland, Ohio—Agent for Columbia and Buick cars.

Ohio Oldsmobile Co., Cleveland, Ohio—Agent for Olds cars.

Parson Electric Motor Carriage Co., Cleveland, Ohio—Parson car.

Price Bros. Carriage Co., Cleveland, Ohio—Baker electric cars.

Rose Mfg. Co., Philadelphia, Pa.—Neverout gas and oil lamps.

Royal Motor Car Co., Cleveland, Ohio—Royal cars.

Reo Motor Car Co., Lansing, Mich.—Reo cars.

Sprague Umbrella Co., Norwalk, Ohio—Canopies.

Standard Oil Co., Cleveland, Ohio—Gasolene.

Stearns Co., F. B., Cleveland, Ohio—Stearns cars.

Twentieth Century Mfg. Co., New York City—Lamps.

Veeder Mfg. Co., Hartford, Conn.—Veeder odometers, tachometers, etc.

Winton Motor Carriage Co., Cleveland, Ohio—Winton cars.

White Sewing Machine Co., Cleveland, Ohio—White steam cars.

Zorn, W. M., Cleveland, Ohio—Accessories.

The members of the Board of Review, Cleveland, Ohio, are of the opinion that automobiles are worth more than $100, the amount for which most are listed for taxation. Therefore many automobile owners have been notified by the board to personally come and explain why several hundred dollars should not be added to the returns to cover the machines.

CANADA'S INTERESTING TEST

Railway and Farmers Join Forces to Learn Motor Wagon's Value as a "Feeder."

An interesting trial of commercial vehicles has been made to test the posibilities of automobile trucks for collecting and distributing heavy traffic in remote agricultural districts in connection with railways in Yorkshire, Canada, by the North Eastern Railway, in conjunction with the Agricultural Organization Society, on behalf of the Brandeby Dairy and Trading Association. The railroad authorities have established an automobile service between their station at Tollerton and Brandsby, eleven miles distant. The cars run in each direction daily. Each steam truck has a carrying capacity of five tons of freight, and is capable of hauling at least one trailer carrying two and a half tons. On the outward journey the truck carries limestone, provisions, etc., and distributes the same around the various farms in the district. Simultaneously the cars collect any produce that is to be forwarded by rail. By this system not only is transport facilitated, but the farmers in districts distant from the railway are brought into closer contact with the markets, and the service will prove a considerable saving to them in the cost of haulage. If successful, similar services will be inaugurated elsewhere.

Provides a System of Lights.

Among other bills pending in the Connecticut Legislature is one requiring all vehicles without exception to display lights after nightfall. Another one provides that all automobiles in use at night on the public highways shall have a light on each side, that on the right side to show red in front and white from the rear, that on the left to show white in front and red from the rear. Any other vehicle than an automobile is forbidden to arrange lights similarly subject to a fine of $3. For failure to have lights so arranged a fine of $3 may be imposed for the first offence and $5 for each subsequent one.

Wants to Regulate Garages.

In Minneapolis, Minn., the fire chief is of the belief that managers of automobile shops are careless in handling gasolene. He has therefore requested the Council that an ordinance be passed regulating these institutions and giving members of the fire department power to arrest for violation. He also suggests that in drawing up the ordinance the underwriters be consulted.

Adverse Report on Lamp Law.

Only automobiles will be required to display lights in Massachusetts. Although undoubtedly making for the protection of the public and for the safety of travel on the roads, the bill seeking to have all vehicles save merchandise wagons carry lamps after nightfall has been unfavorably reported by the committee on roads and bridges, which will almost certainly give it its quietus.

SENATOR GRADY; HIS BILL

Aimed at Automobilists, it Makes Even Tammany Truckmen Subject to "One Year and $1000."

Senator Grady, of the New York Legislature, and a leader of Tammany Hall, recently had to hurry out of the way of an automobile. Although the Senator has driven behind a fast horse on numerous occasions, and, like nearly all other New Yorkers, has dodged street cars and wagons almost daily, the automobile incident aroused his ire and inspired a feeling of revenge by which statesmen are theoretically supposed not to be swayed.

Grady, however, decided that the "public needs protection," and that the only way to afford it is to prejudge not only all automobilists, but the users of all other vehicles, and to not only throw them in jail for long terms, but inflict also inordinately heavy fines. Accordingly, he framed and introduced the following bill, entitled, "An act for the protection of persons on public highways, roads, streets, avenues and places."

It begins with a declaration of rights, reciting that "All lawfully disposed persons have an equal right to be upon, use and traverse the public highways, roads, streets, avenues and places, in the State, and no person has a right to drive or ride thereon at a rate of speed that may be dangerous to others."

The provisions of the bill are as follows:

"All persons driving or riding in carriages, wagons, automobiles, or other vehicles or conveyances, or on bicycles, must regulate their speed so as not to endanger other persons who are or may be upon, traversing or crossing the same highway, street, avenue or place, in any city, town or village, or upon any country road, and no provision of law fixing any speed limit for automobiles or other conveyances, shall be construed as giving the right to anyone to operate or ride or drive an automobile or other conveyance at any speed that is dangerous to others, or which at all times and in all places is not regulated and controlled by and adapted to the conditions of the traffic then and there existing with regard to the number and proximity of vehicles and persons, and as to whether or not pedestrians are liable to be endangered while crossing the streets or roadways.

"Every person who rides, drives, operates, controls or directs any carriage, wagon, automobile, or other vehicle or conveyance, or a bicycle, upon any public highway, road, street, avenue or place, going at a speed which is then and there dangerous to other persons, shall be guilty of a misdemeanor, and upon conviction shall be imprisoned for not less than thirty days and fined not less than $100. And if any injury to any person be caused by or results from such dangerous speed, the person or persons convicted of so causing such injury shall be imprisoned not less than one year or more than two years, and fined not less than $1,000 or more than $2,000. And if such injury so caused to any person shall result in death of that person, the person convicted of so causing such injury and death shall be guilty of manslaughter in the second degree.

"Every person who rides, drives, operates, controls or directs, any carriages, wagon, automobile, or other vehicle or conveyance, or bicycle, on any public highway, road, street, avenue or place, who refuses to decrease the speed thereof, or to stop when called upon to do so by any policeman, constable, or other person authorized to make arrests for violation of law or ordinance, or who attempts by increasing speed to escape or avoid arrest for a violation of this act, shall upon conviction be imprisoned for not less than 30 days, and fined not less than $1,000, in addition to the penalties imposed by Section 3 of this act."

Illinois Adapts New York's Law.

In the Illinois Legislature, Representative Heine has introduced a measure that is almost a counterpart of the New York law. It provides for the erection of sign posts on the highways, denoting the speed changes at curves, descents or approaches to towns, registration with the Secretary of State by the owner of the machine on payment of $2 fee, registration by manufacturers or dealers on payment of 50 cents, and chauffeurs are required to take out a license, paying $2 each, and wear the number issued to them on their caps. Three lamps are to be carried by the car, on the glass of which the word "Illinois" must be displayed.

The speed clause in Heine's measure differs from the New York law in that it limits a motor vehicle to six miles an hour in closely built up sections; ten miles an hour within cities or villages, or elsewhere at a rate of fifteen miles an hour. On meeting horses which show a tendency to frighten, the automobile must come to a full stop, if necessary, to quiet the animals.

The penalties vary according to the nature of the offense. The maximum fine is $250, with a possibility of imprisonment for thirty days, at the discretion of the magistrate.

The passage of the six-mile clause would make it almost impossible to operate cars in cities or villages.

Kansas for 20 Miles per Hour.

The McBride bill introduced in the Kansas Legislature, which specified that "All automobiles must carry a bell or horn that can be heard a quarter of a mile, a light which can be seen half a mile, and a system of brakes which can bring the machine to a stop within 100 feet," was recommended for passage by the House committee, but the speed limit was raised from twelve to twenty miles an hour.

The next annual meeting of the board of directors of the New York State Automobile Association will be held in Buffalo, N. Y., on March 10.

FERRY BILL BECOMES LAW

President Signs the Measure Passed Unanimously by Congress and Ends Era of Vexation.

It is now possible for automobiles to go on and off ferryboats under their own power, thus eliminating the vexatious and somewhat expensive method of hiring men or horses to push or haul them on and off.

The Platt-Goulden amendment to Section 4,472 of the United States Revised Statutes, permitting it, and which was passed by the Senate and House of Representatives without a dissenting voice, was signed by President Roosevelt on Monday, thus making it a law. The new law is a successful culmination of the movement inaugurated by the Automobile Club of America. As amended, the law now is as follows:

"Nothing in the foregoing or following sections of this act shall prohibit the transportation by steam vessels of gasolene or any of the products of petroleum when carried by motor vehicles (commonly known as automobiles) using the same as a source of motive power; [provided, however, that all fire, if any, in such vehicles or automobiles be extinguished immediately after entering the said vessel, and that the same be not relighted until immediately before said vehicle shall leave the vessel;] provided, further that any owner, master, agent or other person having charge of passenger steam vessels shall have the right to refuse to transport automobile vehicles, the tanks of which contain gasolene, naphtha or other dangerous burning fluids."

The clause in brackets is the addition to the act.

Oregon to Require Fees and Tags.

Automobiles and motor bicycles will hereafter be licensed and tagged in Oregon, if a bill of Representative Jagger, passed unanimously by both houses, meets with the Governor's approval, of which there is scarcely a vestige of doubt.

Speed is to be limited to eight miles an hour in municipalities and to twenty-four miles an hour on country roads. Each machine is to be licensed, the fee for which is $3, and to display the number. It must be equipped with lamps, and if run by gasolene, must use mufflers in municipalities.

On country roads machines must be slowed down when approaching any vehicle drawn by a horse, if signalled to do so by the driver. Violations of the act are punishable by a fine of not more than $25 for the first offence, $50 for the second and $100 for the third.

Club Backs Up Pattee.

The Kansas City Automobile Club is behind Fred Pattee, of that city, in his fight against the city to prove that the officials illegally arrested and fined him $10 for driving a car without a license. The case will be taken to the Court of Appeals, and, if necessary, even higher.

BENNETT CUP IS SAVED

France Backs Down and Relieves the Situation —Conditions to which Trouble was Due.

Sportsmanship has triumphed over commercialism and the Bennett cup race will not be soiled by contact with the Grand Prix, that "consolation race" projected in the interests of the French industry and designed to be won by the "also rans" of the French eliminating trials.

Cables from Paris dated Monday last convey this welcome information. They report a complete backdown on the part of the Automobile Club of France, which, indeed, was the only procedure possible to save either or both races. It means, of course, that the Bennett race and the Grand Prix will be run separately and on separate dates.

Germany, England, Austria, Switzerland, Belgium, Italy and America were represented at the meeting of the international commission, the speakers for the French Club being Baron de Zuylen, Marquis de Dion, M. Rene de Knyff and Comte R. de Vogue.

Both parties had thoroughly made up their minds before the proceedings began.

All the delegates from outside of France had come with one message and with no thoughts of compromise.

It was decided that a fortnight shall elapse between the two events, and that they shall not be mixed in any way whatever; that the Bennett Cup race shall be run as it has been run for two years past—as a separate event —and that all the participating clubs shall share in defraying expenses of the contest. The representatives of the various nations promised, on the other hand, to do their best for the success of the Grand Prix.

Count Sierstopff, who represented the German Club, was also the American representative, acting as proxy for Clarence Gray Dinsmore.

Paris, Feb. 10.—There is so much uncertainty about the position of the Bennett Cup and the Grand Prix that the whole affair has become a perfect imbroglio, from which it is difficult to see how the French and foreign clubs will be able to escape unless they give in to one another.

The position created by this dispute between the French and foreign clubs is a very peculiar one. Makers in this country have so long been accustomed to think that they hold absolute supremacy on the international market that they are somewhat alarmed at suddenly finding that the foreign industry is making considerable headway. But they are even now by no means aware of the full extent of the progress that has been made abroad, although they are beginning to see that their position is by no means so secure as they thought it was in view of the wonderfully fine exhibits of foreign productions which have been shown in New York and Berlin, as well, probably, as at the Olympia show, which opens to-day in London, which the English trade asserts is likely to stagger the French makers. Not only are the French becoming alive to this formidable foreign competition but their action in trying to control the sport for the benefit of the French industry has awakened a feeling abroad which clearly shows how determined foreign manufacturers are to fight the competition of French vehicles in their own markets. The foreign trade has now entered upon a period of active and systematic competition, when all the European countries, as well as the United States, are doing their level best to keep out French cars by producing vehicles that will give equal satisfaction to buyers. The present friction between the French and foreign clubs has not only revealed the full extent of the organized antagonism against French vehicles abroad, but it is also certain to increase this feeling by enabling foreign manufacturers to make this a patriotic question for the furtherance of their own interests. An example of this is seen in the formation of the British Empire Alliance, which aims at carrying on a propaganda in favor of British vehicles.

The struggle now going on is confined entirely to the manufacturers. The buyers are after all the most important part of the automobile community, and it does not matter much to them whether foreign makers take part in the forthcoming races or not, so long as they can buy good vehicles. They are always looking out for the best at the lowest possible cost, and they will not pay more for a home made article if they can get something quite as good abroad. It is here that the strength of the French competition chiefly lies, for with the increasingly heavy production of cars in this country the prime cost of such vehicles is being steadily reduced, with the result that French vehicles are sold at prices appreciably below the figures that can be accepted by foreign makers, unless, of course, the foreign markets are protected by almost prohibitive tariffs. So far as England and Germany are concerned, it is certain that it will take many years before makers will find themselves under the same conditions as the French for turning out cars at low cost, and, singularly enough, the British firms are actually handicapped by the considerable amount of English capital that is going into the French industry. Quite a dozen factories in this country are now owned partly or wholly by English capital, and so marked is this preference for French automobile undertakings that it seems as if more British capital is invested in the French industry than in the automobile industry in England. All this, of course, places France at a considerable advantage, in the sense that, while there is plenty of money for building cars cheaply in large numbers, the various Anglo-French concerns will have a sort of privileged situation in England, as is the case at present with Darracq and one or two other firms.

A. A. A. A $125,000 CORPORATION

"Takes Out Papers" in New Jersey—Action Follows Meeting Fraught with Importance.

If you please, the American Automobile Association is now a corporation operating under the laws of New Jersey, with an authorized capital of $125,000. Its articles of incorporation were filed on Monday last, 20th inst., and state the purposes of the corporation to be "to aid in the establishment of a uniform and stable system of laws relating to the regulation of automobiles and the privileges of owners, to promote the construction of good roads, to improve existing highways, to facilitate the organization of clubs and to enter into contracts to effect any of these objects."

Elliot C. Lee (the president), Charles H. Gillette (the secretary) and George E. Farrington (the treasurer) are named as incorporators.

The stock of the corporation is of par value $1 per share, one share being allotted to each member on the roll of the association.

Incorporation, which has been hanging fire for some time, followed a meeting of the board of directors on Friday last, 18th inst., at the Automobile Club of America, New York. At this meeting, which proved an important one, the president, Elliot C. Lee, presided and demonstrated his grasp of affairs. Others present were Secretary C. H. Gillette, Treasurer George F. Farrington, Dave H. Morris, of New York; Windsor T. White, of Cleveland; R. L. Lippitt, of Providence, and John Farson, of Chicago.

It was essentially a meeting of strong men, and it was made plain that they mean that the A. A. A. shall be the dominating organization in this country, and that, while seeking the support of all, it will brook no interference, either in the matter of race control or anything else. That the fact may not be understood, a declaration of its principles and purposes was drawn up and made public "for the benefit of whom it may concern." It seems to leave nothing unsaid, being as follows:

First—To unite in one national body the automobile clubs of the United States, and through them the individual automobilists.

Second—To promote and further all matters of a national character in which automobilists are interested, and particularly these: (a) Legislation, (b) good roads, (c) control of racing.

Third—To provide for its members actual benefits, and particularly these: (a) Reciprocal club privileges, (b) bureau of information concerning laws, touring routes, road maps, racing statistics and similar subjects; (c) a medium for the exchange of ideas and information of value to clubs in furthering their promotion and usefulness and of value to individual automobilists.

Following out the last provision, the secretary was instructed to prepare a list of road

Digitized by Google

maps already published for the use of clubs and individual members.

The plans for the next Vanderbilt Cup race were briefly touched upon. It was the opinion of the directors that active work should begin as early as possible, as the coming race will probably be a greater undertaking in many ways than was the first contest. The secretary was instructed to call a meeting of the Race Committee as soon as possible for the discussion of a plan of action. The date for the closing of entries forthe race has been extended from March 15 to April 15. In the original deed of gift it is stipulated that entries must close on the earlier date.

Just before William K. Vanderbilt, Jr.'s, departure for Europe his consent was obtained to prolong the time one month. There is, however, a strong sentiment among the directors that additional time is needed, and word has been sent to Mr. Vanderbilt asking if he will advance the time to May 15, at least. If he returns a favorable reply, as is confidently expected, the board of directors will be able to fix the May date at the regular meeting on March 9.

No entries have yet been received and none is expected until a few days before the closing of the lists. Many prospective entrants have not completed arrangements for their racing cars, and there will be plenty of time to arrange all details for the race after May 15, as the event will not be run until September or October.

The legislative committee, of which James B. Dill is chairman, was empowered to proceed with the matter of incorporation, and promptly did so, as has been stated. It was also decided that the A. A. A. be represented at the public hearing on the Saxe bill at Albany, which occurs on the 28th inst.

The chairmanship of the racing board is in doubt, as W. C. Temple, who was asked to withdraw his resignation, is touring in the South, and has not yet been heard from. If he should not accede to the request, it is practically certain that William Wallace, of Boston, will be named as his successor at the directors' meeting next month.

Bates Appeals from $15 Fine.

An appeal has been filed by A. J. Bates in the case of the city of Joliet, Ill., against A. J. Bates for driving his automobile faster than the law allows. The case is the outgrowth of an accident which occurred last summer, when Bates's car and a farmer's wagon came into sudden collision at a cross street in Joliet. Bates was arrested and fined $15 and costs at the time, but appealed the case, and will fight it in the higher courts to secure vindication.

Mobile to Have Flower Parade.

The Automobile Club of Mobile, Ala., will give an automobile flower parade on March 6, the Monday preceding Mardi Gras. At least thirty cars will enter the parade, and the makers of the various cars to participate have donated prizes, besides those offered by the club.

NEW ORLEANS STARTS SEASON

First Meet Attracts Big Crowd and Bad Track Contributes a Spectacular Spill.

A large crowd—several thousand at least—saw the first race meet of the year—that at New Orleans, La.—given by the New Orleans Automobile Club on Sunday last. A chilling east wind and a muddy track soon convinced the watchers that no records would be broken. While the upper surface of the track was dry, it was a mere crust, and when the heavy machines struck any spots where there had been mud holes, the wheels sank deep in the mire beneath the buckshot upper-crust. It provided a sensational accident.

The first event was a one mile race for runabouts, weighing under 1,000 pounds. Out of nine entries, only three cars lined up for the stort. M. D. Bringer, driving a 10 H. P. Pope-Hartford, won easily in 2:33; F. S. Warmouth, in a St. Louis car, crossed the line second, and Palmer Abbot, driving an 8 H. P. Oldsmobile, third.

Only two machines started in the two-mile event for White steam cars. W. C. Faust, driving a 10 H. P. car, won the race in 7:34 3-5. Samuel Stone, driving a car of the same horsepower, was the other entrant.

The two-mile race for touring cars of 20 horsepower or under, each carrying three passengers and a driver, was won by Guy Stone, in a 16 H. P. Rambler. Stone literally ran away from the rest of the field,winning in 4:27, with about a hundred yards to spare. Palmer Abbot, in a 20 H. P. Oldsmobile, crossed the tape second, and J Mehlig, driving a 14-16 H. P. Knox, came in third. W. F. Pettit, in a 16 H. P. Rambler, was fourth.

Barney Oldfield next worked the Peerless "Green Dragon" around the track for a three-mile exhibition, making the distance in 3:30. The fourth race was a free-for-all, at three miles, for the Good Roads cup, donated by the Orleans Parish Good Roads Association. W. Philip Johnson, driving a 40 H. P. Thomas, led for over a mile, but Theodore Grunewald, in a 24 H. P. Locomobile, passed him like a flash at the second mile post and maintained the lead to the end. The only other starter, a 30 H. P. Pope-Toledo, driven by William Luck, finished last, of course. Time, 5:58.

Barney Oldfield, with his 60 H. P. Peerless, was down on the programme to meet Otto Maya in a special match race. Maya, perceiving the bad condition of the track, flatly refused to compete, and in order to carry out the event, Albert Bechold, who is travelling with Oldfield, offered to drive the "Blue Streak," a 24 H. P. Peerless. He fired up and started out to warm up, but at the three-quarters pole hit one of the soft spots. The front wheels sank in the mud and the machine turned a complete somersault, totally wrecking it. Bechold was thrown from the car and escaped with a few bruises. Oldfield tried the track for five miles against time, but finding it too heavy, quit at the end of four miles. The first mile was covered in 1:15, the second in 1:10½, the third in 1:13 and the fourth in 1:13½. The total for the four miles was 4:52.

The last event was a five-mile match race for $500, between Philip Johnson, in a 40 H. P. Thomas, and William Luck, in a 30 H. P. Pope-Toledo. Johnson won the event handily in 9:13 4-5. Summaries:

One mile, for runabouts under 1,000 pounds—M. D. Bringer, 10 H. P. Pope-Hartford, first; F. S. Warmouth, St. Louis, second; Palmer Abbot, 8 H. P. Oldsmobile, third. Time—2:33.

Two miles, for White steam cars—W. C. Faust, 10 H. P. White, first; Samuel Stone, 10 H. P. White, second. Time—7:34 3-5.

Two miles, for touring cars under 20 horsepower—Guy Stone, 16 H. P. Rambler, first; Palmer Abbot, 20 H. P. Oldsmobile, second; J. Mehlig, 14-16 H. P. Knox, third. Time—4:27.

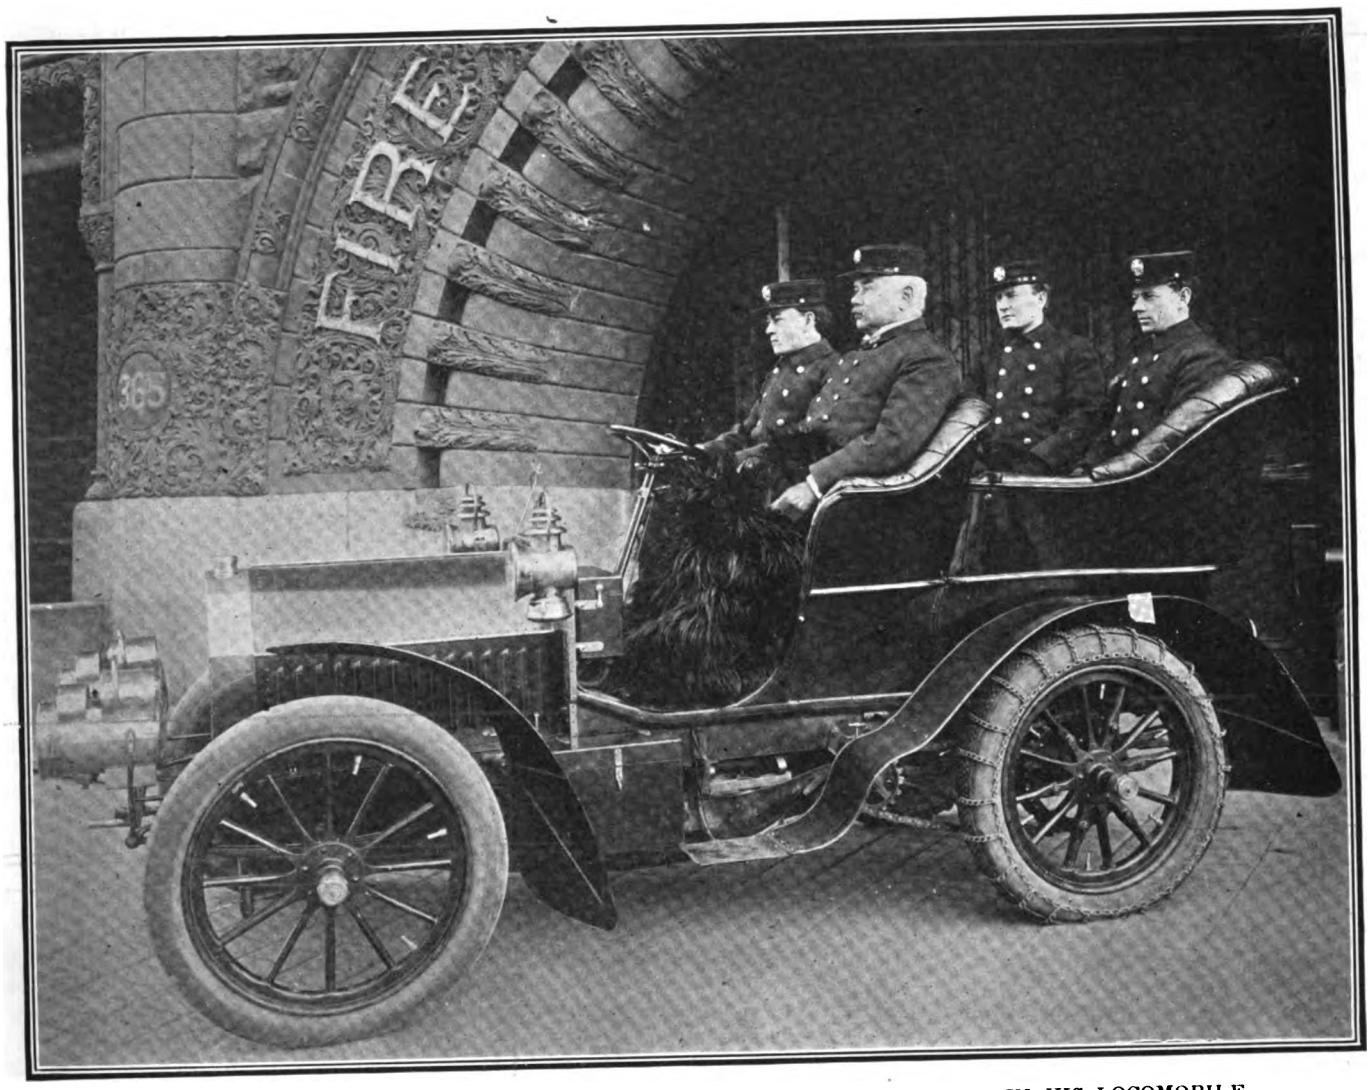
Three miles against time—Barney Oldfield, 60 H. P. Peerless. Time—3:30.

Three miles, open, for Good Roads Cup—Theodore Grunewald, 24 H. P. Locomobile, first; W. Philip Johnson, 40 H. P. Thomas, second; William Luck, 30 H. P. Pope-Toledo, third. Time—5:58.

Four-mile exhibition against time—Barney Oldfield, 60 H. P. Peerless. Time—At first mile, 1:15; second mile, 1:10½; third mile, 1:13; fourth mile, 1:13½; total, 4:52.

Five-mile match race, for $500—Philip Johnson, 40 H. P. Thomas, first; William Luck, 30 H. P. Pope-Toledo, second. Time—9:13 4-5.

Lakewood to Defy the Law?



Although the New Jersey law specifies that any person engaging in an automobile race on the highways in the State shall be fined $50, that fact apparently has not phased the Lakewood Board of Trade. As evidence, the Lakewood folk are making preparations for six days of racing, beginning April 10.

The programme of events has not yet been determined, but will embrace contests for both racing and stock cars. According to newspaper reports, the course will be triangular, twenty-five miles long. The course would probably be from Lakewood, east to Spring Lake, through lower Squankum, about twelve miles; from Spring Lake south through Manasquan to Point Pleasant, five miles; thence west through Burrsville to Lakewood, ten miles. The road is one of the finest in New Jersey, especially from Point Pleasant to Lakewood. If this course is followed there would be several dangerous curves. The first one would be at Lower Squankum, where the road turns at right angles. The Spring Lake curve is even sharper, almost doubling on itself; across the 'Squan River is a drawbridge nearly a mile long; at Manasquan, Point Pleasant and Burrsville are sharp curves, but from Burrsville in the road is straight and level.

Lakewood also possesses a speedway nearly two miles long, where the short races would be held. There also is a five-mile road around Lake Carasaljo.

The Up-to-Date Fire Chief Ready for Duty's Call.

DEPUTY CHIEF LALLY, OF THE BROOKLYN (N. Y.) FIRE DEPARTMENT, IN HIS LOCOMOBILE.

MINOR MENTION OF MOTORING MATTERS AT HOME AND ABROAD.

Cablegrams from Melbourne, Australia, state that Charles J. Glidden, the globe girdler, has covered 462 miles in Tasmania since landing, making his total mileage on the automobile tour of the world 21,900.

The French Automobile Club has decided to issue a wall chart for school use, depicting a modern automobile. With this is given a brief description and also instruction how to avoid accidents possible in automobile traffic.

According to more or less veracious reports in Fargo, N. D., a prohibition town, automobiles are doing a thriving business in transporting thirsty ones across the border. An automobile line has been established between Fargo, N. D., and Moorehead, Minn., for this convenience the latter town being the nearest "wet" place.

William Olhaver, a wholesale ice cream manufacturer at Aurora, Ill., has decided that the old-fashioned method of horse and wagon delivery is too slow for up-to-date business transactions. Accordingly, his ices will henceforth be delivered by automobile wagons.

Another person who wants $5,000 damages because his horse became frightened at an automobile is Delascus Mercer, a farmer, living near Bowling Green, Ohio. Mercer has filed a suit for this amount in the court of that city against Captain L. A. Black, of Bowling Green.

The Elmira Automobile Club was organized last week with twenty-nine members and these officers: President, Frederick H. Richardson; vice-president, Carrol D. Smith; secretary and treasurer, E. W. Gleckler, and captain, Guy W. Shoemaker.

Sir Thomas Lipton has presented a claim to the Southampton (England) corporation for $827 as compensation for damage recently caused to his automobile. The accident, it is stated, was due to the negligence of the local authorities, and the Works Committee, realizing their culpability, have recommended the payment of $625 in full settlement of the claim.

Municipal authorities in Monrovia, Cal., are going to take rather unusual and drastic measures to subdue the automobile scorcher, and, incidentally, to make travel generally on White Oak avenue uncomfortable. The authorities propose to grade and oil the avenue its length of two miles, and to build seven swales at intersecting streets. These swales are broad, shallow ditches, and a car will have to go over them at a snail's pace to avoid being bumped skyward.

CASTING OF CYLINDERS

Appearance of a Four in One Gives Rise to Some Interesting Discussion.

When the four cylinder vertical idea first came into favor in this country it was considered standard practice to cast the cylinders in pairs in order to minimize the extent of accidental injury and guard against primary defects in the casting rendering the entire engine hors de combat.

In the furtherance of this same principle several manufacturers have gone a step beyond and made each cylinder individual, with an independent water jacket subsequently applied.

An English manufacturer has, on the other hand, attained the opposite extreme by producing the four cylinders with jackets integral, entire in one casting, and a discussion of this new departure, its disadvantages as contrasted with what in this connection is dubbed the "foreign idea,' is now going the rounds of the English press.

Where such radically differing ideas are presented for comparison, it is essential to sum up the advantages and disadvantages of each at length and carefully weigh the difference, then leave it to the "enlightened mind of a jury" of experts, and what is best in theory may probably be arrived at, but the test of six months' experience with both and a comparison of the results would probably be productive of a totally opposite conclusion. Here are some of the points urged for and against the single casting method:

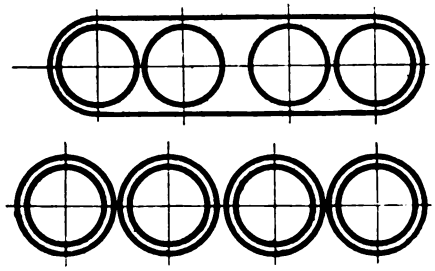
"The whole of the cylinders being in one casting, one cylinder naturally supports another. The whole mass stiffens the crank case, and the strongest engine for the weight is produced.

"In separate cylinders the water jacket wall must completely encircle each cylinder. All cylinders cast together, water jacket wall only circles the ends of the outer cylinders and goes straight alongside the others, thus saving 50 per cent in weight of needless water jacket walls.

"By casting all cylinders in one piece it is possible to get the engine much shorter, as there need be only one water space between each cylinder, whereas with separate cylinders there are two water spaces, two cylinder walls and a small air space.

"The four cylinders being in one are bored upon the machine at one setting, and are bound to be in line with one another.

"A great number of water pipes with their nuts and unions are eliminated, the water being put in at one place at the back of cylinders and taken out at one place in the front.



"The cores and patterns being larger, a clear, clean casting is assured. As shown above, this is easily machined correctly, thus a perfect set of cylinders is easily produced.

"A far larger body of water can be carried round the cylinder than is possible in any other four cylinder type without an excessively long and heavy engine. The engine therefore shows no signs of overheating, even under very trying conditions."

Now, coming to the defendant's side of the case, it will be noticed that in summing this up the same advocate has been retained, and disadvantages are only pointed out to call attention to the corresponding superiority of the single piece method.

"Should the piece be spoiled, either in the casting or machining, the whole four cylinders are spoiled instead of one only. As a matter of fact, the cores are so large that there is no difficulty, as in the single cylinder, of producing a thoroughly sound casting, and there is, therefore, no waste, so far as the maker is concerned.

"It may be argued that if a driver neglected to oil his engine and spoiled a cylinder all four or six would be spoiled, but as arrangements are made in most engines that each cylinder gets an equal amount of oil lubricant, if such gross neglect were made it

COMPARISON OF COOLING AREA AND SPACE ECONOMY.

would be impossible to spoil one cylinder without spoiling the lot, and therefore independent cylinders would have no advantage, but would, in fact, have the disadvantage that four or six separate ones would cost much more than the one piece casting. The same remarks apply in regard to frost. Water allowed to freeze in cylinders would almost be as certain to crack all four or six independent cylinders as to crack only one of them, but if one independent cylinder only were to be cracked, the cost of this, with the combustion head, etc., all in one piece, would be as costly to replace as the single piece method of construction.

"Careful experiments and tests have shown that the contraction and expansion is on the whole more even in the one piece construction than where independent cylinders with copper jackets or with one piece combustion heads are used.

"Independent cylinders were first used because it was thought that steel cylinders were preferrable to cast iron, and it was impossible to get steel made into pair cylinders or one piece cylinders. This fallacy has now been exploded, and it has been proved conclusively that, whether on a hundred-ton locomotive or a twenty-five-pound bicycle engine, fine gray cast iron is the very best possible material for use in cylinders, and this is proved by the fact that all the leading makers are abandoning steel for this purpose, but, inconsistently enough, are still retaining independent cylinders for no reason whatever. Fancy a marine engine or a high speed steam egine for electric lighting purposes being constructed with all its cylinders independent and bolted each of them separately on to the engine base! Such a design would invoke the ridicule of the engineering world, but for the moment its equivalent is tolerated on a motor car."

Effect of an Elmore Cocktail.

"Elmore cocktail" is the name of a new fluid to be used instead of gasolene as motive power for automobiles! The formula is composed of equal portions of gasolene, kerosene, alcohol and whiskey—"that's all." The mixture was fed to an Elmore car at Detroit last week, and it "worked," too.

The demonstration, which was given at Young & Miller's garage, No. 127 Grand River avenue, before the students of the Y. M. C. A. motor school, was a success. A single cylinder Elmore was used in the demonstration. Through a funnel gasolene was first fed to the engine, followed in order by kerosene, alcohol, whiskey and then a mixture of all four—an "Elmore cocktail," as some one dubbed it. With the gasolene the engine attained the usual speed, but the kerosene, it is stated, added still greater speed. The machine continued to run with half a pint of alcohol, and then with the same amount of whiskey. Then came the surprise of the test—a combination of all four worked as well as any of the other fuels, and a speed of 1,500 revolutions a minute was obtained. Another feature of the workings was that no readjustment of the carburetter was required when the fuels were changed.

Deals with an Illuminating Subject.

Amesbury, Mass., the home of Gray & Davis, the automobile lamp manufacturers, on a crossroad's signboard surmounted by the illuminating information that the "hub of the universe" is but forty miles distant, all showing brightly under the glare of a G. & D. searchlight, forms the introduction to the story of their pathfinders for 1905. Effective halftones, showing every detail of their lamps against a dead black ground, with descriptions in white, combine to give a strikingly artistic result. The mechanism of their generator, as well as its modus operandi, are clearly illustrated. It is a booklet that should help to spread the fame of its originators, and where it goes G. & D. lamps ought soon to follow, for it is a selling proposition.

Tells a Tale of Tires.

Of the publications dealing with the subject of tires none is more directly to the point, or more instructive, than the booklet of the Fisk Rubber Co., a revised edition of which has just been issued. The story of "The Fisk and Its Fastening" is interestingly told, and in the telling is let fall much that is not generally known concerning tire designs and materials and the matters of tire troubles and the cost of maintenance. It is one of those trade publications that is more than a mere circular; it is an informing booklet that informs whomsoever may possess it.

LITTLE NOVELTY APPARENT

London Show Not Fruitful of Ideas—Napier Shows New Clutch—Small Cars Predominate.

Early reports of the Olympia show, which opened in London on February 10, are not indicative of any great amount of novelty in construction and equipment of the English cars being put forth for the coming season. One thing very noticeable is that the designers have evidently not thought it necessary to increase powers to any considerable extent, as cars of 8, 9, 10, 12 and 15 horsepower, many of them in the four cylinder class, predominate.

A new design in clutches, the product of the Napier works, is a departure from recognized standards, in that it does away with the usual leather facing and brings metal to metal, running in oil, in a cone clutch of the regular type. This in itself is not particularly new, as it has long been a feature of the Winton cars, but in the shape of individual clutches, its novelty lies in its application to the flywheel clutch. It consists of the usual cone, in this case of aluminum armored with a cast iron rim as a bearing surface, and so fastened as to be readily detachable for repair or replacement, the corresponding female member of which is bolted to the periphery of the flywheel. The principal claims of its designer are its ability to run in oil, simplicity and compactness of design, quick change of speed through the employment of light revolving parts, and the fact that all end thrust is obviated. In order to accomplish this last a powerful spiral spring is fitted on the inner face of the cone, so that when the clutch is engaged this is entirely inclosed within and exerting its pressure against the flywheel; when disengaged the pressure of the spring is taken up against a ball thrust bearing especially provided for the purpose. In action the lubricant is forced from between the engaged faces into deep grooves cut in the rim of the cone. It is further claimed that this clutch enables the car to get away from a stand still without a jerk, and as it has doubtless been made the subject of study and experiment long before being placed on view, its performance during the coming season will be watched with interest.

One of the greatest novelties of the show—to the Englishman—is a light car with horizontal opposed motor of the type now so familiar here. It is the James & Brown car, the builders of which, to quote one report, "have always been identified with the production of heavy cars of the horizontal engine type, and the car under notice is a very favorable specimen of original design." Three point suspension is employed, and the engine placed longitudinally directly under the centre of the car. The transmission is evidently a combination sliding gear, for the two lower speeds, with an individual clutch on the high, although a flywheel clutch, is also employed, drive being by a single chain. This is apparently the first of its kind to be seen in the "tight little isle."

The use of a tubular supporting axle, bearing the weight of the car body and containing the live axle, as embodied in the "New Orleans" car, is put forth as a novelty that calls for no comment. Artillery wheels with staggered spokes are a feature of the Argyll car, covered by patent and for which much is claimed by its builders. The spokes are staggered from the vertical plane, alternate spokes passing to the right and left of the iron hub. The chief advantage claimed for the arrangement, in addition to greater strength, is that it permits of tightening by drawing together the hub flanges by means of the bolts holding the hubs together should the wheel become loose through drying out.

The Stepney is a new form of supplementary wheel, which, according to its sponsors, is designed to enable the unfortunate who has damaged his tire to get home. It consists of a metal rim, to which is applied, in the usual manner, an inflated pneumatic tire, and fitted with three special clamps easily bolted to the wheel of the car itself. This lifts the latter very slightly and brings the car home on the new tire.

Without any attempt at disparagement, from what can be noted of the great English show at the present writing, it is seemingly a strange mixture of ideas, French and American, some of both long since tried out and discarded.

To Free Fuel from Water.

The "Eureka" Separator is a device designed especially as a preventative of the ills arising from the presence of water in the gasolene. The two will not mix, owing to the difference in specific gravity, and trouble invariably arises when they come together, particularly when the fuel in the tank runs low. In very cold weather a cake of ice may form in the bottom of the latter or burst the supply pipe. To guard against this or any of the other mishaps growing out of the same cause, the supply pipe from the tank is run into the bottom of one of these separators, while the delivery to the engine issues from the top. The separating material is placed in the centre of the device, which may readily be dismounted for examination. The arrangement of the lower half does not permit the incoming gasolene to agitate the separated water, which is contained in a pocket by itself, while in the upper the passage leading to the delivery pipe extends far enough below the level of the gasolene to provide an air or vapor cushion in the chamber above the latter, resulting in a uniform pressure at the carburetter. This attachment is being placed on the market in three sizes by the Eureka Separator Co., of Rockford, Ill., and applications have been made for patents to cover it.

The chief of the St. Louis Fire Department will henceforth "do duty" in a motor car. He has selected a Locomobile for the purpose.

MEANING OF EFFICIENCY

The Many Attributes of which it is Made Up and How they are Co-related.

The term efficiency, like the much abused term horse power, may mean a great deal or nothing at all. It depends on the man who uses it.

In the engineering of great power plants it has a powerful significance, and its value, coupled with the frequency with which it is used, has given it an important sound, and, naturally enough, a not infrequent use in a loose sense with no reference to its true meaning.

Taken in its purely generic use, it is a measure of the relative usefulness of a process which converts energy in one form to another better suited to the needs of man; it is an abstract expression of the unavoidable losses which such conversion entails. It may be called an expression of the toll extorted by nature for the performance of any task, and is applicable to any process involving such transformation or to the machine which does the work. For example, the heat energy of the sun, feeding that mysterious existence which we call life, the plant life of a bygone age, is stored up in growing vegetation and there retained till centuries later; it is reconverted into heat by the process of combustion—the burning of the coal fire. But not all of the energy originally given to the plant life is to be reclaimed. A certain amount has been lost in the double transfer, a portion of which is concretely represented by the ash, and an expression for the loss is found in the ratio of heat applied to heat given up—the efficiency of the process.

So in the steam boiler and engine, a certain amount of the heat of the coal is available in the form of work, and a certain amount is to all intents and purposes lost, not lost to the universe, but lost to man; and the ratio of the power equivalent of the heat of the coal to the mechanical power available at the driving shaft of the engine is called the efficiency of the plant. Or, again, the engine alone being considered, the ratio of the power represeneted by a given quantity of steam at a stated pressure and the work which is developed and transmitted to other machines is termed its efficiency.

But efficiency may be of various sorts. It may embrace the process as a whole and involve merely the two energies, impressed and delivered, or it may refer to any one step in the process or to several steps taken together. The efficiency of a plant involves many factors of loss and a number of different processes, while the efficiency of a turning shaft is merely an expression for the frictional loss of its bearings. Thus, in an engine, the term may be applied in its thermal sense to a consideration of heat alone; mechanically, with reference to frictional losses and work absorbed by internal stresses; or, loosely, as a measure of its comparative value as a ma-

Digitized by Google

chine, powerful, serviceable, successful, merely as a statement of its ability to perform the various demands of its usage.

A serious consideration of the efficiency of a motor is, then, an investigation into its economy; and the relative value of the factor increases with the increase of the expenditure involved. In a large machine, whose consumption is by far the greatest factor in the expense of its operation, it becomes of very great importance, while in a smaller affair, whose consumption is limited, it may shrink to insignificance when compared with other factors which bear more directly on its utility. In the automobile motor, while it is actually just as important to get as great a proportion of work from the fuel as it is in a large lighting plant, still the cost of the fuel is so slight as compared with other factors, and the difference in cents or in distance travelled on one charge, between an engine of high and another of low efficiency, is so slight that it may well be set aside for other considerations.

The object of the designer in building a motor is to secure one of ample power for the car; one which is capable of doing its work under a wide variation of conditions; one which will carry approximately its full load throughout its speed range, and one which is silent, vibrationless, simple and not liable to get out of order. Of these, next to the desideratum of ample power, which is to be presupposed, the more important considerations are those which contribute to smooth action and simplicity of parts. The difference one way or the other of a penny-'orth of fuel is so slight as to come in for but a small share of consideration, if any at all. And a machine which is referred to as being "highly efficient," while satisfactory in every way, may yet be wasteful of its fuel.

The factor of mechanical efficiency, involving as it does the friction of moving parts and their balance as well, is of far greater importance than that of the whole motor, or of the heat alone. And, although the factor is seldom, if at all, reduced to figures, it is to its increase that the designer's effort is largely bent at the present time. The improvements in lubricating devices, the increase in length of bearings, in some cases the application of ball bearings to the motors tending, as they do, to reduce the power lost in turning over the motor itself and subscribing to its smooth running qualities, serve to decrease its internal losses.

The better knowledge of the requirements of the cooling system which is gained by each year's experience is tending to bring up the efficiency from a thermal standpoint. Other improvements which look directly toward better service—that is, better ignition, better carburation and better control—also tend to bring down the fuel consumption as well. But the present objective of the maker is not to reduce the cost of operation as affected by the fuel consumed so much as it is to reduce the cost of maintenance, which has been the greatest cost, next to that of manufacture. It is to build a motor which will be cheap to construct and cheap to operate; easy to control and easy to get at; one which will be simple, silent and sure. But whether it be economical or wasteful of its fuel is of comparatively minor importance at the present stage of the industry. P. O.

The Farmer Brought Up to Date.

The farmer, bag, baggage and family, from the youngest up, in all the unaccustomed finery and discomfort of Sunday-go-to-meetin' togs, slowly plodding townward or home again in a bumping wagon drawn by the patient plow-pullers, is a sight so familiar on country roads as to form part and parcel of the scenery.

FARMER ELLIOT AND HIS FAMILY.

But the same aggregation, likewise on pleasure bent, but now speeding along in a gasolene runabout, is a vision to make the average inhabitant sit up and stare. This, in short, is what a Minnesota farmer does—one R. E. Elliot, of Litchfield, in that State, is the pioneer who is showing his brother agriculturists in his locality and at the same time demonstrating to the world at large that the automobile is the farmer's best friend and not his enemy.

The proud possessor of a Northern runabout, which he has, by the way, readily converted into a family car, as will be noted in the illustration. Mr. Elliot does not confine himself to town jaunts, but frequently makes the 100-mile run to Minneapolis with his family, and has taken them on many long trips besides, in all of which he has never had a breakdown. He is firmly convinced that the automobile is a necessity for every farmer, and in time the latter will appreciate the advantage of owning his own "trolley car."

Some Motor Stage Lines.

A. C. Brewster, of the Williams House, Williamsburg, Mass., will run an automobile stage route between that place and Goshen next summer. It is thought that better facilities for reaching Goshen will make it more popular as a summer resort, hence the use of automobiles.

The New York Zoological Garden is to have automobiles, not for the use of the inmates, but more particularly for the visitors. The board of managers has authorized the construction of a motor road equipped with automobiles to carry visitors to any point in the extensive grounds.

The fact that Coshocton, Ohio, has no streetcar service has not caused the citizens of that place much worriment. An automobile stage line will be in operation in every street in the city by April 1. A six cylinder engine will be used to drive the cars, and each car will have a seating capacity of twenty passengers.

F. W. Vogeler, general traffic manager of the Salmon River Stage Co., at Salt Lake, Utah, is preparing to inaugurate an automobile stage service between Las Vegas and Bullfrog, with the object in view of affording better communication between the mining towns that are being developed along the proposed route. The car used will be a Peerless.

One of the most recent automobile passenger transit lines has just been organized in Rhode Island, to run between Westerly and Weekapaug. Arrangements have been made to use touring automobiles, and F. C. Buffum, of the Weekapaug Inn, will have charge of the transportation.

ONE MORE WONDER WORKER

It's Hatching in Wrightsville and Will Make All Other Motor Cars "Back Numbers."

From Wrightsville—it is too well known to call for any more definite location on the map—comes the startling news that "there is in store for the automobile world a surprise that may shake the industry to its foundations."

If this be not sufficient to cause manufacturers who have large amounts of capital invested in the production of automobiles of the usual complicated standard of perfection, just listen to this: "C. H. A. Dessingner & Bro., the well known gas engine men of this place, have been for some time perfecting an engine that will make an automobile as simple as a bobsled." Now get ready to stand from under. "It is a chain transsion, an entirely new manner of controlling the speed of the machine, backing it, applying the brake," etc.

To convince the doubting Thomases that this is not all but more than is claimed for it, hear the latter: "Both of the men are inventors, but they are so thoroughly practical and so entirely free from dreams and delusive theories that they are not to be placed in the same class with experimenters." And then, as a further recommendation: "They are mechanics who work on mechanical principles which they fully understand." But it is in the description of the new invention that the cub reporter, for it must have been him, or the editor, does himself proud.

"The chain transmission is a little simple thing which is incased in a steel box but twelve inches square. The angle lever which operates it is the only one needed to steer the car, start it, stop, back it up or apply the brakes. All other levers, such as other automobiles which are now on the market, are done away with.

"Within a few weeks the Dessingers will have a complete automobile ready for the test," with its one wondrous lever should here be interpolated, but of that more anon. If it gives the result the men expect York County may look out for an automobile works that will turn the eyes of the world this way. Last year the Dessigners built an automobile, but it was simply as a guide to the perfect one which they had in view,"

But now sit up and really listen: "The perfect one is coming." All hail.

It won't be necessary to rub your head and wonder if it can all be true; just listen to the wisdom condescendingly given up by one of the soon to be far famed inventors.

"The vital part of an automobile," said C. H. A. Dessigner to the Gazette to-day—we wronged the cub reporter, it's the editor, after all—"is the engine. We do not have to experiment with our engines. We now have the simplest, strongest and most durable gas and gasolene engines in the world. We have studied engines as mechanics for fifteen years. We know their weak points and we have labored diligently to make the weak points strong. We have a perfect sparker. The only way to get it out of order is to break it with a hammer." He must have been a patent medicine advertiser before he became an inventor. "Our engines turn gasolene into gas in the easiest, simplest manner in the world. There is not a single weak point in our engines which is due to a lack of understanding of the making of engines. Now, considering these things, we have come to the conclusion that we can put out an automobile that will be the result of knowledge and experience. That is what we are going to do."

Take warning all manufacturers who are now turning out four cylindered, automatic carburetted, direct driven, pneumatic tired imitations of an automobile, for the great inventor spurns your products one and all! He says:

"I have examined many of the automobiles now on the market. Bicycle houses, etc., that don't know a gas engine from a dynamo went into the automobile business because they saw it was profitable and their cycle trade was waning. We realize that the engine is the whole car, so to speak, and we can make the engine. The chain transmission will make the machine nearly noiseless. There will not be a cog wheel about the car to wear out and grind like an ice cream freezer."

And all this for a "medium price"—seemingly philanthropy and startling inventions are the simultaneous product of the great cerebrum. "We have never tried to get an abnormal price for our work. We know that automobiles are too high, and we will not attempt to rob the public. We will ask a price that will give us the right sort of a profit, and we will deliver a car that will stand the knocks. Until we can do this we will not go into the automobile business." Not so bad as it looked at first, if they keep their word.

As a matter of information, it is added that the Dessigner Bros. build gasolene traction engines, and that there are only two or three other manufacturers in the same line in the country. It is to be hoped there are no more, if all are to be afflicted with the same aspirations.

An automobile as simple as a bobsled, with an absolutely perfect engine, a simple little thing in a small steel box, one lever to do all the business, and not the slightest resemblance to an ice cream freezer; a sparker that nothing short of the gentle attentions of a hammer will cause to knock off work. What would you have, what more could mortal man desire in exchange for a medium amount of the coin of the realm? How on earth has York County escaped the eyes of the world thus long?

Purdue to Teach Motor Mechanism.

Purdue University, Lafayette, Ind., has added the study of automobiles to its curriculum. Motors, transmission gears and ignition comprise the first subjects for discussion.

TEST OF ANTI-SLIP DEVICES

Tried in Slimy Mud and Soft Soap with Varying and Interesting Results.

It is evident after a perusal of the reports of the recent side slip trials held at the Crystal Palace, London, that one of the principal reasons for the existence of such a great number of anti-skidding appliances on the market simultaneously is not alone the fact that there is a real demand for something of the kind, but that the article that can prove its worth beyond peradventure has not been invented.

Of the half dozen contrivances tested out before the judges four were the familiar metal studded bands, the Sawyer, Samson, Grose and Watkins; one of chains, the Parsons, and the Empire, "back pedalling support" for motor bicycles.

The prepared course was a smooth concrete way, forty feet broad, with a fair gradient. As it was treated to a generous layer of slimy mud and soft soap preparatory to the trial, there can be slight doubt but what it represented the extreme of actual wet weather road conditions. The first heat was running over this surface making slow turns at the rate of twelve miles an hour. The Sawyer bands were fitted to three wheels of the car, while the Watkins had them only on the drivers. Then came the crucial test of making a sudden right angled turn at six miles an hour, and in spite of locking the steering wheels the Watkins travelled straight ahead, as the front wheels could not take hold. The Samson car was the more boldly driven, and came off with flying colors in both tests. The remaining cars proceeded with undue caution, and though successful on the grease, some slipped a little on the dry concrete.

In the brake trials the skidding was most noticeable on the dry concrete. The Samson and Sawyer both slipped there, while the Parsons and Grose skidded somewhat in the grease. The Empire motorcycle got through this trial with credit, but in the sharp turn at six miles an hour went down the moment the curve was attempted, giving its rider a bath in the grease and mud. In the final restarting test all performed satisfactorily. The Samson device was awarded first prize and the Grose second.

Pope Pius Order Two Cars.

Pope Pius X has recently ordered two automobiles, which it is stated seem to have the effect of causing a black look on Cardinal Ferrari's face. This cardinal embraced the idea some time ago of paying visits in an automobile, but it did not meet with the approval of the other members of the Sacred College. They therefore gave no votes to Ferrari's name, thinking he would never remain in the holy precincts of the Vatican when he had experienced the joys of automobiling. And now the Pope himself has "fallen"!

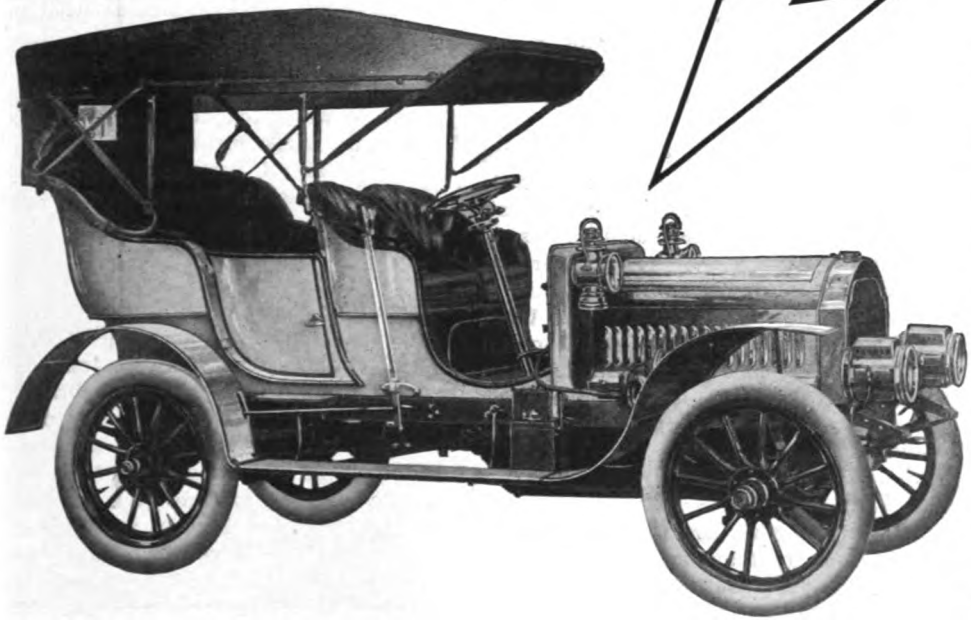
Successful Car Building.

WE are this year standing firmly on the fact that we have built a real car, because we have built a car adapted to American conditions, American roads and the American temperament. We know our American market as no French builder can know it.

We have surmounted the problems of car-building this year as we never surmounted them before, although our progress has been steady and on right lines.

We believe the Pierce car to-day expresses the best that can be had in car-building, and we are willing to abide by the result of actual experiment.

Booklet describing the six 1905 cars of the George N. Pierce Company, with special booklets describing the mechanism of each, will be sent on request.



The George N. Pierce Company,

BUFFALO, NEW YORK.

Manufacturers of Pierce Cycles.

Members of the Association of Licensed Automobile Manufacturers.

The 28-32 horse-power Pierce Great Arrow Car, King of Belgium Tonneau, with side entrance, equipped with cape top, extending well over front seat, drop curtains to completely enclose sides and rear. **PRICE, $4,000.** Top extra.

The Week's Patents.

781,088. Anti-Friction Bearing. Charles Opp, Brooklyn, N. Y. Filed March 30, 1904. Serial No. 200,707.

Claim—A spindle which is of less diameter than the bore of the hub or box through which it passes, said spindle being provided in the opposite sides and in the bottom thereof with longitudinal grooves, the grooves at the opposite sides of the spindle being deeper than that at the bottom thereof, and bearing rollers placed in said grooves and whereby the spindle is supported eccentrically in the hub or box and bears thereon only at the top thereof, all of said rollers being of the same diameter, substantially as shown and described.

781,116. Motor Car. John Wilkinson, Syracuse, N. Y., assignor to H. H. Franklin Manufacturing Company, Syracuse, N. Y., a Corporation of New York. Filed May 17, 1904. Serial No. 208,465.

Claim—1. In a motor car, the combination of a frame, and a hood at the front of the frame hinged at its front portion, substantially as and for the purpose described.

2. In a motor car, the combination of a frame, a dashboard, and a hood in front of the dashboard having its front portion hinged and its rear portion contiguous to the dashboard, substantially as and for the purpose specified.

781,214. Motor Plough. Samuel E. Kurtz, Sac City, Iowa, assignor of one-half to Albert E. Cook, Odebolt, Iowa. Filed September 9, 1902. Serial No. 122,700.

Claim—1. A motor driven agricultural machine, comprising gang frames inclined to the line of travel and reversely arranged with relation to one another, driven shafts journaled in the respective gang frames and arranged for their longitudinal axes to lie in planes inclined equally and reversely to the line of travel, gangs of ploughing and propelling members mounted on the respective shafts, the oblique members of one gang being reversely disposed to the members of the other gang, a main frame supported by the gang frames and the gangs of members, a motor on said main frame, and counter shafts driven by the motor and geared to the gang shafts for driving the reversely arranged members of the gangs positively and at uniform speeds.

781,218. Adjustable gear. George M. Mills, Jersey City, N. J. Filed April 12, 1904. Serial No. 202,838.

Claim.—1. In adjustable gearing, the combination with parts constituting a hub and a gear-section, respectively, of an eccentric device revolubly bearing in one part and having a sliding engagement with the other.

781,245. Device for closing the Longitudinal slits in pneumatic tires. Richard J. Voss, Davenport, Iowa, assignor of one-half to Frank S. Harding, Davenport, Iowa. Filed Nov. 2, 1904. Serial No. 231,144..

Claim.—1. A device of the class described, comprising a plurality of plates, arranged in pairs and adapted to be secured to the tire on each side of the longitudinal opening in the latter, laterally extending marginal flanges carried by the plates, and a slide provided with inwardly projecting flanges adapted to engage the marginal flanges of each pair of plates for closing said longitudinal opening.

781,262. Vehicle wheel. Zachariah Xevers, Santa Cruz, Cal. Filed June 24, 1904. Serial No. 213,944.

Claim.—1. The combination with a rim having a channeled seat about its periphery, of a channeled metallic strip and a corrugated seat confined within said channeled strip, and the whole confined within said channeled seat and having flanges extended above the rim and against which sides of the tire are designed to abut.

781,265. Variable-speed gear. William O. Brown, Chicago, Ill., assignor to Appleton J. Pattison, Toronto, Ontario, Canada. Filed April 29, 1904. Serial No. 205,588.

Claim.—1. Variable-speed gearing of the character described comprising a driving part, a driven part and two sets of gears of different predetermined ratios adapted to act independently and in co-operation with one another to impart different degrees of speed

ROBERT VOLT-AMMETER

DOES ALL THE WORK—Not Half.

Registers accurately both volts and amperes. A necessity to every owner of a gasoline or electric vehicle.

Price, $6 00 (inc. leather case). Sample instrument forwarded pre-paid, on receipt of $5.00

ROBERT INSTRUMENT CO.
56 Shelby St., DETROIT, MICH.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.

In capitals, 25 cents per line.

FOR SALE—4 passenger side-entrance car bodies, in good condition at considerably reduced price. DETROIT CARRIAGE CO., Detroit, Mich.

FOR SALE—1904 WHITE touring car in excellent condition; has not been run since being overhauled; baskets, lamps and canopy top. Price, $1200.00. Address, Mr. A., care of THE MOTOR WORLD.

FOR SALE—1904 24 H. P. PEERLESS touring car; has been thoroughly overhauled and painted and not used since. Price, $2300 00, net cash. This car cost as it stands over $4300.00. Has a canopy top and baskets, and is undoubtedly a better proposition than any 1905 model listing at this price. Address Mr. B., care of THE MOTOR WORLD.

FOR SALE—1904 8 H. P. PIERCE stanhope, with top, in A-1 condition throughout; will carry four people if desirable. Price, $800.00. Cost $1300.00. The best machine of its class in the world. Address, C., care of THE MOTOR WORLD.

FOR SALE—1904 Model L PACKARD in excellent condition; painted and overhauled and not used since; three extra inner tubes; two extra covers; side baskets. Price, $2200 00. Address, Mr. D. E., care of THE MOTOR WORLD.

FOR SALE—A limited supply of wire wheels for 1901 and 1902 Oldsmobiles, $5.00 per set, net. Mud guards, complete, for the same machines, $6.00 per set, net. Rubber mats for the same, $1.25 each, net. These prices will hold good only as long as the material lasts. OLDS MOTOR WORKS, Detroit, Mich.

to the driven part, substantially as described.

781,299. Switch system for electric vehicles. Ferdinand Porsche and Ludwig Lohner, Vienna, Austria-Hungary. Filed Aug. 5, 1902. Serial No. 118,486.

Claim.—1. The combination of a dynamo, a motor, an open electric circuit comprising the dynamo elements and motor, a variable resistance, and a common means of making the circuit and for switching the resistance parallel with the dynamo field and varying the same during the maintenance of the circuit, substantially as described.

81,304. Variable driving mechanism. Carl C. Riotte and Eugene A. Riotte, New York, N. Y. Filed March 29, 1901. Serial No. 53,415.

Claim—For driving gear, a shaft, a gear carrier, having a hub for revolubly engaging said shaft, a body, a wall spaced apart therefrom, and braces connecting said wall and body at separate points, the parts being arranged with a space between said wall, body and braces, for receiving a gear to be held in juxtaposition to said shaft, all formed in one integral piece.

81,318. Grip tread for rubber tires. Harry D. Weed, Canastota, N. Y. Filed July 8, 1904. Serial No. 215,812.

Claim.—1. A grip-tread for elastic tires comprising a series of cups removably applied to the outer surface of the tire, and means to hold said cups in operative position.

2. In a tread for elastic tires a series of cups, each having its base detachably applied to the tire.

81,484. Rotary Internal combustion engine. Thomas Wright, Jersey City, N. J. Filed October 13, 1902. Serial No. 127,066.

Claim.—1. In an internal combustion engine the combination of a stationary shaft, a group of cylinders mounted to move around the centre thereof, pistons in the cylinders, eccentric connections between the pistons and shaft, means for controlling and igniting the cylinder charges, a continuous annular drum extending around and inclosing the outer ends of the cylinders, a plurality of spring seated closures commanding exhaust openings from the drum, and connections passing laterally from the ends of the cylinders to the drum.

781,523. Release power clutch. Edward Huber, Marion, Ohio. Filed April 25, 1904. Serial No. 204,820.

Claim.—1. In combination with a revoluble driving element and a driven element revoluble independently thereof and having a clutch member, an element driven by the driving element and having a stop and a detent, a dog adapted to engage the clutch member of the driven element and adapted to be engaged and released by the detent, a pivoted element connecting the dog to the element, a spring coacting with the stop, and elevent, a spring coacting with the stop, and a detent to normally maintain the latter in such relation to the dog as to keep the dog in engaged position with reference to the driven element, the said spring being adapted upon an overload to release the detent from the dog and permit the latter to disengage the driven element, substantially as described.

781,533. Brake mechanism. Peter M. Kling, Elizabeth, N. J. Filed Aug. 5, 1904. Serial No. 219,611.

Claim.—1. In a brake mechanism, the combination of an operating device and winding spindle, of inverted cones mounted on said spindle and operating device, and a cable connecting the opposite ends of said cones.

781,553. Lubricator. Henry Ritter, Cincinnati, Ohio, assignor to the Lunkenheimer Company, Cincinnati, Ohio, a corporation of Ohio. Filed Oct. 10, 1904. Serial No. 227,870.

Claim.—1. In a lubricator of the character described and in combination with the body of the cup and its appurtenances, a discharge nipple opening into a sight-feed chamber, said sight-feed chamber having a discharge aperture leading to the parts to be lubricated, a check-valve in said discharge aperture, and an aperture adjacent to the sight-feed chamber and communicating therewith, leading from said discharge aperture to the body of the cup, substantially as described.

781,565. Seat connecting appliance for vehicles. Hinsdale Smith, Springfield, Mass. Filed May 17, 1904. Serial No. 208,416.

Claim.—1. The combination with a vehicle body and a pair of seats having seat bottoms and rounded backs with forward upright continuations arranged side by side, of a rigid metallic part overlying the edges of said seat-back continuations, and having an angular projection extending from its inner side between said formed continuations, and means for fastening said projection and said upright continuations together.

781,584. Lubricator. Jerome J. Aull, Cincinnati, Ohio, assignor to the Lunkenheimer Company, Cincinnati, Ohio, a corporation of Ohio. Filed Oct. 10, 1904. Serial No. 227,843.

Claim.—1. In a multiple self-feeding lubricator, the combination of an oil-reservoir divided into a main compartment and an auxiliary compartment communicating therewith, a series of valve controlled sight-feeds opening from the bottom of said auxiliary compartment, from which extend chambers, pumping mechanisms automatically actuated and communicating with said chambers, check-valves in discharge outlets from each of the pumps and sight-feed mechanisms and leading to the parts to be lubricated, substantially as described.

781,585. Lubricator. Jerome J. Aull, Cincinnati, assignor to the Lunkenheimer Company, Cincinnati, Ohio, a corporation of Ohio. Filed Oct. 10, 1904. Serial No. 227,844.

Claim.—1. In a lubricator of the character described and in combination with the body of the cup and its appurtenances a discharge-nipple opening into a sight-feed chamber, there being a discharge aperture leading from the sight feed chamber and a baffling device within said sight feed chamber, whereby back shots or back pressures are prevented from interfering with the proper formation of the drops and discharged the oil in dropping from the nipple, substantially as described.

781,604. Lubricating system for explosive engines. Peter C. Hewitt and Edward R. Hewitt, New York, N. Y. Filed June 18, 1904. Serial No. 219,293.

Claim.—1. A lubricator comprising an oil supply tank and provided with passages ramifying therefrom to the various points to be lubricated, and pumping devices of different capacities respectively located in the branches of said passages.

781,607. Rotary explosive engine. John W. Kales, Franklinville, N. Y. Filed Sept. 30, 1902. Serial No. 125,424.

Claim.—1. In an explosive-engine, a turbine wheel having open-ended and otherwise closed pockets bowed transversely outward across the wheel, and a casing inclosing the wheel and closing the ends of the pockets, and also provided with a feeding port, disposed to discharge longitudinally into the pockets.

781,648. Casing for Compound Motors. David F. Graham and Frank A. Fox, Stamford, Conn., assignors, by mesne assignments, to The Eisenhuth Horseless Vehicle Company, Middletown, Conn., a corporation of Maine. Filed April 1, 1903. Renewed November 10, 1904. Serial No. 232,138.

Claim.—A crank-shaft chamber or inclosing casing for combustion motors, comprising as an entirety an upper section and a lower section, said sections detachably secured together, the upper section being provided with longitudinal extensions at its ends adapted to receive bearings for the crank-shaft, whereby the said crank-shaft may be placed therein before the lower section is secured to the upper section, and said lower section being also provided with longitudinal extensions and bearings clamped between said extensions, comprising a sleeve provided with interior screw threads engaging screw threads on the crank shaft by which it can be adjusted thereon, means for securing it on said shaft, and a bushing on said sleeve held in fixed relation to the casing, substantially as described.

781,677. Gearing for Automobiles. Orlando Richards, Bristol, Wis. Filed October 20, 1903. Serial No. 177,785.

Claim.—A tubular axle including a central hollow section having internally-threaded collars, tubular sections engaging said threaded collars, end casings, each consisting of a pair of pivotally-connected members, the inner members being provided with internally-threaded collars engaging the outer ends of the tubular sections, internally-threaded collars upon the outer ends of the outer members of the end sections, tubular spindles engaging said internally-threaded collars, and wheels journaled upon said spindles with the inner ends of their hubs contacting with the outer ends of the internally-threaded collars in which the tubular spindles are mounted; in combination with a drive-shaft disposed within the axle and having its extremities fixedly connected with the hubs of the wheels; said drive-shaft being composed of two inner and two outer members, the inner and the outer members being connected by universal joints disposed within the end casings of the tubular axle, internally-toothed gear-casings secured upon the inner shaft sections near the inner, adjacent ends of the latter, a sprocket wheel, journaled loosely upon the adjacent ends of the inner shaft sections which are thereby maintained in axial alignment, and gears disposed within and meshing with the internally-toothed gear-casings and connecting the latter with the sprocket wheel.

781,682. Gearing for Motor Vehicles. Charles Schmidt, Warren, Ohio, assignor to Packard Motor Car Co., Warren, Ohio, a corporation of West Virginia. Filed November 20, 1902. Serial No. 132,112.

Claim—1. In a transmission gearing for motor vehicles, the combination of a motor shaft, a driven shaft, a clutch block arranged to turn with and slide on the motor shaft, a counter shaft provided with gears of different sizes, a clutch member geared to the counter shaft and normally disconnected from the motor shaft, gears mounted to slide on the driven shaft and to engage with the different sized gears on the counter shaft a clutch member connected to said gears on the driven shaft, a rod adapted to slide said gears and their attached clutch member on the driven shaft, and means actuated by said rod for sliding the clutch block on the motor shaft.

781,687. Former or Mold for Making Pneumatic Tires or the Like. Thomas Sloper,

Digitized by Google

Devizes, England, assignor to Christian Hamilton Gray, Silvertown, Essex, England. Filed March 12, 1904. Serial No. 197,868.

Claim—1. In a "former" for tires, the combination with a circular support having a series of perforations, of movable pins carried in these perforations and adapted to project from the face of the support or to be withdrawn so that they do not project, substantially as set forth.

781,745. Negative Pole Plate. Paul Seeliger, Hagen, Germany, assignor to Electric Storage Battery Company, Philadelphia, Pa., a corporation of New Jersey. Filed June 18, 1903. Serial No. 162,036.

Claim—1. Negative pole plate active material possessed of loose structure and being the product derived from expansion and disintegration induced by reducing and discharging a mixture of active and inert materials, substantially as described.

781,751. Gas Engine. Elliott J. Stoddard, Detroit, Mich., assignor to The Free-Piston Gas Engine Company, Detroit, Mich. Filed December 10, 1900. Renewed July 8, 1904. Serial No. 215,728.

Claim—1. In a gas engine, the combination of a cross-head, a connecting rod pivoted to said cross head and to the engine crank, a piston rod arranged to slide through said cross head, a clutch upon said cross head adapted to prevent a motion of said piston rod in one direction relative to said cross head, but to permit such motion in the other direction, and means for lifting said clutch out of engagement with said piston rod during the motion of said cross head in one direction, substantially as described.

781,789. Brake and Motor Controlling Mechanism for Motor Vehicles. Charles Schmidt, Detroit, Mich., assignor to The Packard Motor Car Company, Detroit, Mich., a corporation of West Virginia. Filed July 5, 1904. Serial No. 215,272.

Claim—1. In a motor vehicle, the combination with a frame and a motor supported thereon, a drive axle and a transmission shaft extending between said motor and said drive axle, of a clutch for coupling said motor to said transmission shaft, a foot lever for operating said clutch, a brake mechanism, an operating lever therefor, a connection between said brake-operating mechanism and said foot lever, whereby the operation of the brake will release said clutch, and means for limiting the movement imparted to said clutch to the initial movement of said brake-operating mechanism.

781,795. Storage Battery Electrode. Elmer A. Sperry, Cleveland, Ohio, assignor to National Battery Company, Buffalo, N. Y., a corporation of New York. Filed January 27, 1904. Serial No. 190,878.

Claim—1. A storage battery electrode, consisting of a frame having openings containing electrode sections, each section comprising a support carrying active material secured to said frame by a rigid union along the middle of its upper edge, but free at its ends, as set forth.

781,802. Valve and Valve Gear for Explosive Engines. William Barber, Brooklyn, N. Y., assignor to Ada S. Barber, Brooklyn, N. Y. Filed February 24, 1902. Serial No. 95,662.

Claim—1. In an explosion motor, the combination with an explosion chamber having an inlet orifice formed in the wall thereof, of a bushing secured in such inlet-orifice provided at one side with means for connecting the same with an explosive vapor supply pipe, a normally closed inlet valve located in such inlet orifice, and a removable plug secured in the bushing so as to close the outer end thereof and secure the valve in position in such manner that the valve may be removed without disturbance of the bushing upon removal of the plug, substantially as shown and described.

781,804. Lubricator. Edouard Berger, Jersey City, N. J.. Filed December 24, 1903. Serial No. 186,456.

Claim—1. In a device of the kind described, the combination of an exteriorly-threaded receptacle, a tube communicating therewith to deliver lubricant to a bearing, a plunger, a flange on the plunger screw-threaded on its interior to engage the threads in the receptacle, a stem on the plunger, a pivoted yoke carried by the receptacle having a bearing for the plunger stem, and a spring-stop carried by the yoke to engage the flange of the plunger and hold the same in adjusted position, as set forth.

781,825. Automobile. Frederick W. Hedgeland, Chicago, Ill. Filed November 10, 1904. Serial No. 232,067.

Claim—1. The combination with the driving shaft and the driven member of an automobile, of a clutch actuated longitudinally by the shaft to positively drive the member in either direction, and to permit the driven member to revolve faster than the shaft in either direction.

781,854. Cooler. Richard Thomas, Bayonne, N. J. Filed March 16, 1904. Serial No. 198,348.

Claim—1. A cooler comprising, in combination, a series of closed cooling compartments, the top and bottom of which are composed of cooling plates, an injector operating in each compartment between said cooling plates and passages whereby said compartments are connected through said cooling plates, the passage in each plate being at a different angle from the passage in the other plates to form a progressive series of passages around the center of the cooler; said cooling plates being hollow and provided with connections for the circulation of a cooling fluid through the series.

781,889. Two-Cycle Motor. Ernst Korting, Kortingsdorf, Germany. Filed October 5, 1901. Serial No. 77,657.

Claim—1. In an internal combustion engine, the combination with the working cylinder, of a pump for air, a pump for gas, a pressure chamber connected with the cylinder of the gas pump, a mixing chamber connected with the working cylinder and the air pump and said pressure chamber, a valve for the admission of gas to the gas pump, a by-pass between the end of the cylinder of the gas pump and the pressure chamber, and a throttling device located in the by-pass and controlled by the governor, substantially as described.

781,894. Method of Vulcanizing Leather Covers to Rubber Tires. Arthur M. E. De Montureux, Paris, France. Filed November 7, 1904. Serial No. 231,797.

Claim—1. The method of uniting leather covers or armors to rubber tires, which consists in roughening the surface of the leather, degreasing it, and applying thereto a rubber solution, roughening the rubber, then applying to the surface so treated a solution consisting of tetrachlorid of carbon and protochlorid of sulphur and then uniting the parts, substantially as described.

Another Southern Rebellion Quelled.

A war that has been waging in New Orleans, La., between the chauffeurs of the sightseeing automobiles and the cabmen of that city has been settled, and, quite naturally, the chauffeurs were victorious. The dispute arose as to whether the chauffeurs or cabbies should take their stands in front of the St. Charles Hotel. A New Orleans city ordinance states that permission must be obtained from the tenant before a cab, carriage or automobile can be placed in front of any property. J. K. Ridgeley, general passenger agent of the Louisville & Nashville Railroad, which has its offices in the corner of the hotel building, gave the chauffeurs the preference, which resulted in several fights. The cabmen's association took the matter to court, and Judge Fogarty has decreed that the Jehus must not interfere with the chauffeurs.

A Benzine Bug Killer.

The only automobile sterilizer in the United States was given its official test last week at San Francisco. The foreword does not imply that this machine alluded to is one to sterilize automobiles—for they do not need it—but it is an automobile to kill germs.

The patent on the automobile sterilizer is owned by P. F. Dundon, of San Francisco. It weighs four tons, and uses oil, instead of gasolene, for fuel. The maximum speed is a fraction over five miles an hour, but the inventor claims it can climb hills as fast as it can travel on the level. The body of the car consists of an immense sterilizing chamber. During the test three pieces of soiled clothing, containing diphtheria, anthrax and strathylococci germs were put into the chamber, in which a vacuum was created and filled with formaline gas. The bacteria were destroyed immediately.

The reason the sterilizer is constructed on the plan of an automobile is because in case of an epidemic of some contagious disease in the city it could be moved quickly from house to house and the city disinfected within forty-eight hours.

Do Jehus Make Best Chauffeurs?

When Stephenson got his first railway working he advocated the employment of the stage coach drivers for the post of engineer, and recently at a lecture before a coachman's club in Dundee it was said that the latter made the best driver for the automobile. The lecturer was of the opinion that chauffeurs did not require to be engineers, but men with a good general knowledge of traffic. There seems to be a general opinion that the man of engineering experience is not always as careful of external appearances as is the coachman, whose work in this direction is mainly confined to cleaning the carriage work. These are points on which opinion may well differ radically, according to whether it is the coachman or the engineer who looks at it.

Left Him Only an Automobile.

It was somewhat disappointing to Louis Grover Vogel to discover that on his wife's death only an automobile was bequeathed him. He is now suing his wife's sister, contending that she appropriated more than her share of the estate. He values the estate at $20,000, while the deceased wife's sister insists that the property is not worth more than $1,500, and that he has by far the "lion's share" in the possession of the automobile.

Auto Traffic the Safest.

Statistics from Berlin show that the motor car is about the safest vehicle operating in the streets of Germany's imperial city. During the years 1901, 1902 and 1903 streetcars killed 83 persons in three years, while only one person was killed by a motor car. Heavy horse drawn vehicles caused 55 deaths, while cabs and such killed 17, and all other sorts of vehicles, 71.

During the three years 24 persons were severely hurt by motor cars, 532 by streetcars, 281 by cabs, 384 by heavy commercial cars and 498 by all other commercial cars. Streetcars were also responsible for the slight injury of 4,874 persons, while during the same period motor cars injured 47 persons.

Suggested D. T. for B. F's.

When the automobilists of Dorset, England, filed their complaint about carrying the letters B. F. on their license plates, an imaginative genius suggested taking the first and last letter in the name of the county. But the graduation from B. F. ("bloody fools") to "D. T.'s" was as indignantly rejected. However, the motorists' wrath has been calmed by having one letter changed, although they apparently cannot get away from "F."

The Up-to-Date French Cabby.

Realizing doubtless that Anglo-Saxons were his best customers, a Paris chauffeur has supplemented the words "English spoken" to the number on his lamp. In view of the not unusual difficulties experienced by English and Americans with the French "cabby," this man has made his number sufficiently prominent in order that satisfied customers may recommend 13,179, knowing that he has the best of intentions and is a polyglot.

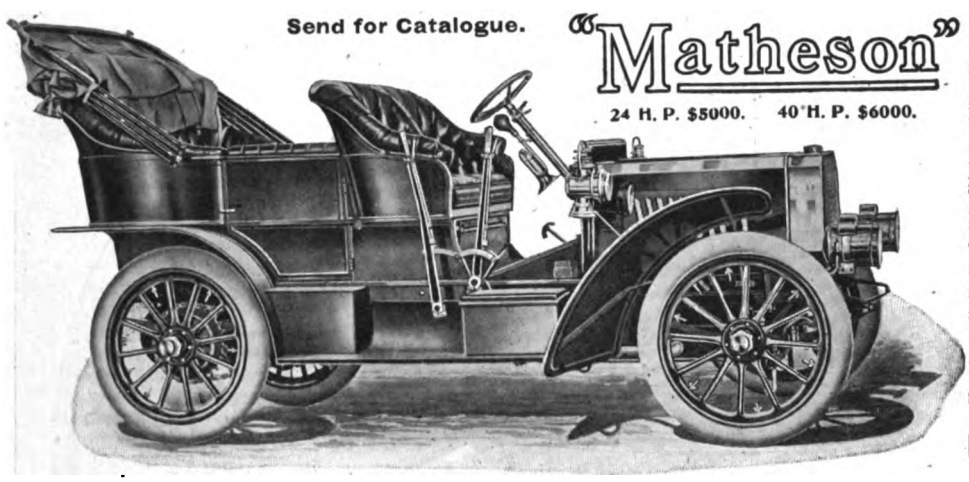
A WORD PICTURE OF THE YALE FOR 1905. $1,000.00.

SIDE ENTRANCE, $1,100.00.

Imagine to yourself the prettiest touraround that ever dashed down a road—a flash of gold and blue, whizzing by with no more noise than a mere musical whirring of the wheels.

Try to conceive a car so filled with power that it is like a living thing; and so instantaneously responsive that it can be controlled by a touch of the thumb and index finger. When you've formed this mental impression you've only begun to get an unexaggerated notion of the thousand dollar Yale for 1905.

The new double cylinder Yale weighs only 1400 pounds, with over a full ounce of continuous power for every pound. Seats four and even five and takes the meanest hills at high speed. You mustn't even think of considering any other car at anywhere near the price before you've read, heard and seen more of the thousand dollar Yale for 1905.



Write for our new catalog—out January First—no charges.

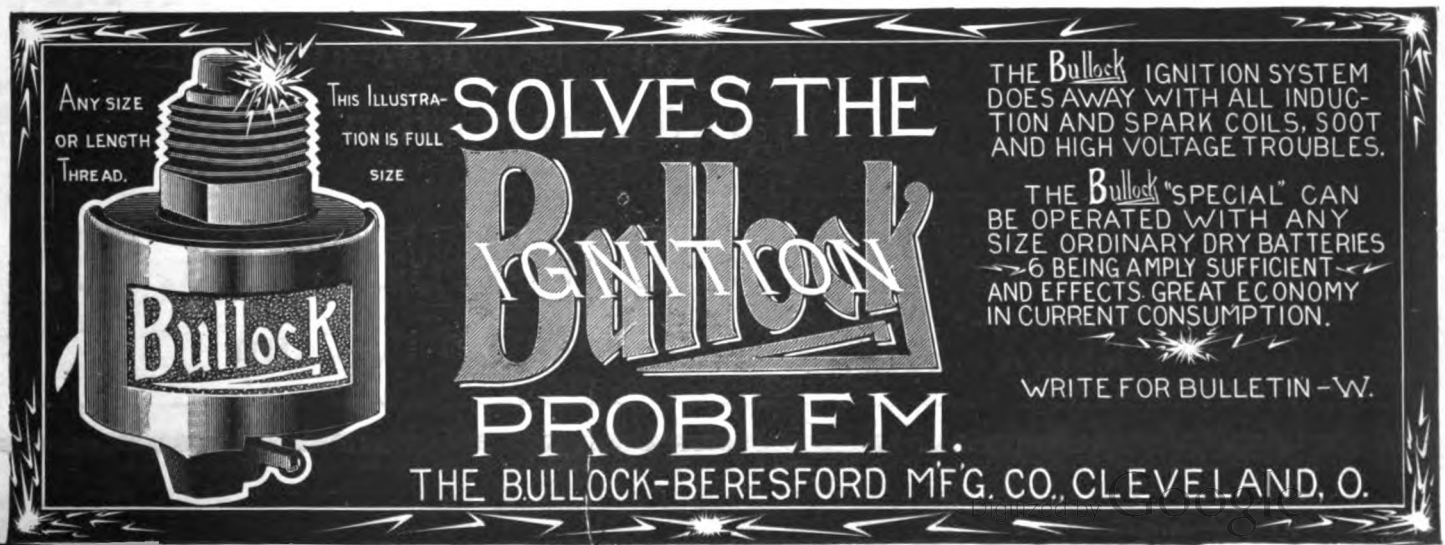
DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pero Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 38 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.



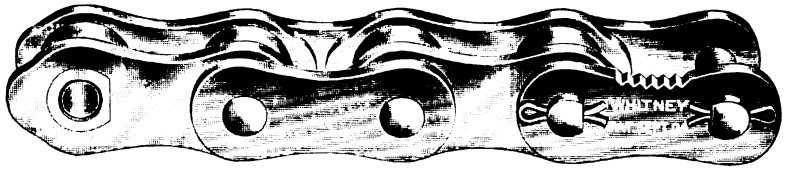
In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

GRAY AND DAVIS

"Makers of Smart Automobile Lamps."

Be Sure YOUR CAR is Equipped With Them.

AMESBURY, MASS.

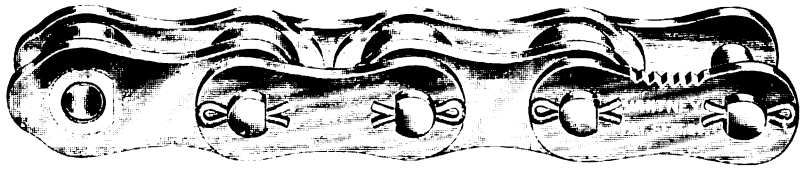


These are "WHITNEY" STANDARDS for Roller Chains.

PITCH.	Diameter of Roll.
1 in.	5/8 in.
1¼ in.	¾ in.
1½ in.	⅞ in.
1¾ in.	1 in.
2 in.	1⅛ in.

The PITCH SIZES and DIAMETERS advance uniformly in perfect proportion.

They have broken all records for efficiency, and have been adopted for most of the leading American Cars, including



"ACME" "AUTO-CAR EQUIPMENT" "BAKER" "BRAMWELL" "CADILLAC" "COLUMBIA" "CORBIN" "CHAMPION" "ELWELL-PARKER" "FORD" "FRANKLIN" "GROUT" "GAETH" "GIBBS" HARTFORD MOTOR STREET SWEEPER" "KNOX" "LENAWEE" "MITCHELL" "MOLINE" "MATHESON" "MANHATTAN" "OLDS" "POPE-HARTFORD" "PIERCE-RACINE" "PRESCOTT" "QUEEN" "RAMBLER" "STEARNS" "SOMMER" "SNELL" "THOMAS 50 & 60 H. P." "TOURIST" "WAYNE" "WESTERN ELECTRIC"

"Whitney" Roller Chain

RIVETED TYPE.

All links on both sides are Riveted, with exception of one Connecting Link shown.

"Whitney" Roller Chain

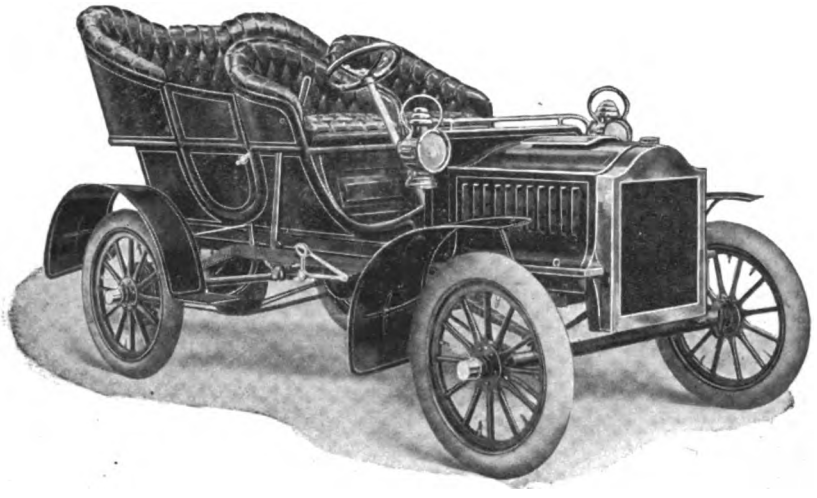
COTTER DETACHABLE TYPE.

All links on one side are Riveted and all links on opposite side are Detachable. One link only is considered the Connecting Link, this being distinguished from the others by notches in the top surface.

PITCH.	Diameter of Roll.
1 in.	9-16 in.
1¼ in.	5/8 in.
1½ in.	¾ in.
1¾ in.	1 in.
2 in	1⅛ in.

These are the OLD or COMPETING Standards.

The PITCH SIZES advance uniformly, but the DIAMETERS are irregular and not in perfect proportion.



All Chain Manufacturers have adopted "WHITNEY" Standards for these new sizes 1¾ in and 2 in pitch.

NORTHERN

Two-passenger NORTHERN Touring Car with rear luggage platform; 18 h.p.; 100 inch wheel base; 4 inch tires. Price $1500.

NORTHERN construction is absolutely unique. It stands apart. It is a marvel of simplicity, compactness and strength.

The word "simplicity" has been much abused by automobile manufacturers.

When used in connection with NORTHERN machinery, it means **exactly** what it says. No other car made demonstrates to such a degree the merit of real simplicity.

All machinery is instantly accessible. There is only one universal joint. There are no belts, chains, or gaskets. No strut rods or truss rods. No confusing array of wires, etc. Power is applied **direct** to rear axle.

The sturdy NORTHERN Runabout. 7 h.p. **Strong,** speedy and reliable. The handsomest and best finished machine of its class. Now sells for $650.

Are you interested in cars that bring the buyers "no expense but the gasoline?" Write for Catalogue.

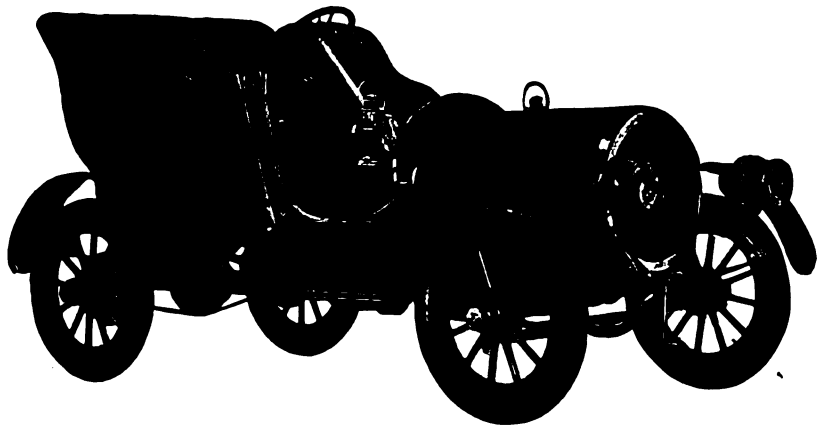
POPE Waverley ELECTRICS

A very prominent man who owns a large number of motor cars of almost every conceivable size, style and type, recently summed up the whole situation in the following words: "The Electric is pre-eminently THE automobile for all general utility purposes. Were it necessary for me to sell all but one of the cars I own, I would retain the Pope-Waverley Electric."

MODEL 36.

MODEL 36, Speed Road Wagon. Price, without top $900, with top $950. Our aim has been to so design and equip it so that it will travel more rapidly than the regulation electric carriage. We have succeeded in producing a carriage that will do 18 miles an hour.

MODEL 26-C, COUPE TOP CHELSEA. Price $1,450. Coupe top is easily removed, making an open carriage for summer. This is particularly an all the year round automobile.



MODEL 26-C.

No matter what your wants are in an electric motor car, we believe we can supply them. We make Delivery Wagons, Trucks on specifications, and many others not shown here.

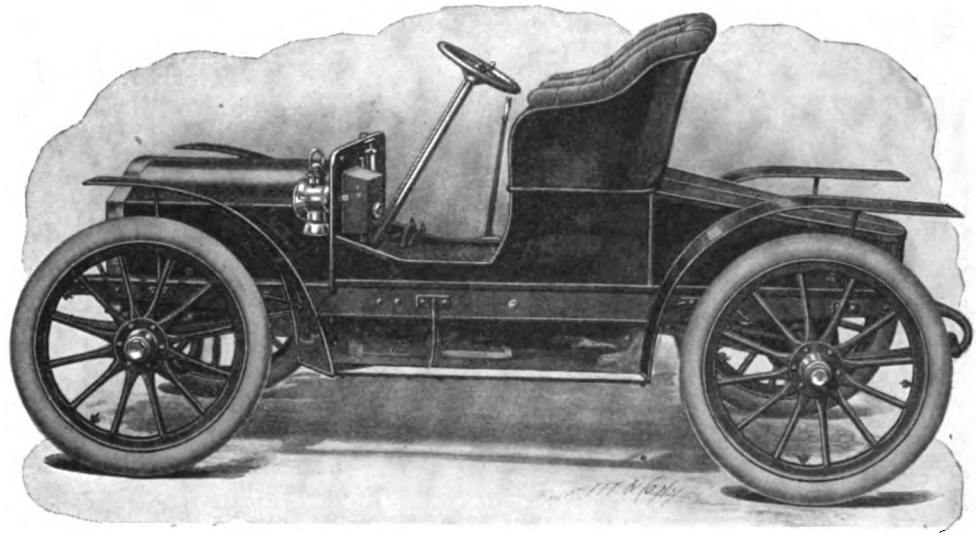
TWO ORIENT BEAUTIES.



ORIENT MODEL DE LUXE TOURING CAR. 20 H. P. Price $2250.

For the last two or three weeks we have kept the wires pretty hot telling you about our new Touring Runabout with the semi-racing body and the improvements we are putting on the 1905 Buckboards. This week we want to get back to the Model de Luxe long enough to remind you that there is no other car in America under $4,000 or $5,000 that even approaches it in beauty of design and luxury and elegance of finish and upholstering.

It sums up the entire situation to say that the Model de Luxe Orient is as fine a car as any one really has use for. Its 20 H. P. positive air-cooled motor of the 4-cylinder vertical fore-and-aft type is the finest piece of air-cooled mechanism that has ever been put into an automobile. It will drive the car 35 miles an hour and is so simple in operation that any owner can take his car out with the reasonable certainty that no complications are going to arise which will be beyond his understanding.

Just A Word About Model E.

THE TOURING RUNABOUT AT $1500.

ORIENT TOURING RUNABOUT, with semi-racing body. 16 H. P. Price $1500.

This is the semi-racing model—very light and fast, capable of doing 40 miles an hour easily. It has exactly the same engineering features as our Model de Luxe, and in design easily surpasses any other American Runabout, having the massive, powerful, clean-cut lines of the finest French Cars. It is furnished with detachable Tonneau for $1650.

ORIENT TOURING CARS		ORIENT BUCKBOARD LINE

"The Maxwell"

There is not one complicated detail throughout "Maxwell" construction. The number of parts has been cut down to a minimum, and each part has been treated as a special problem and carefully worked out to perfection. It is fundamentally a car easy to explain, easy to understand and easy to operate.

The owner of a "Maxwell" is absolutely sure of two things.

First, that no car in the market AT ANY PRICE is more reliable than his, and, second, that he owns the one car before the public to-day in which, through its rare simplicity of construction, there is nothing to do but ride.

The "MAXWELL" cars have no pump (thermo-siphon). Their double opposed motor is in front under the hood and accessible in every part. They have Bevel Gear Drive. METAL BODIES. Transmission Case and Crank Shaft cast in one Aluminum casting. "Perfectly simple and simply perfect."

16 H. P. TOURING CAR, $1400. 8 H. P. TOURABOUT, $750.

MAXWELL-BRISCOE MOTOR CO.
TARRYTOWN, N. Y.
New York City Salesroom, 317 W. 59th Street.

Two Impulses with Every Revolution

This is the famous Elmore Pathfinder, which has demonstrated beyond a doubt the superiority of the two-cycle engine over the four-cycle engine. The most significant feature of the American Automobile situation to-day is the complete triumph of this impulse-every-revolution idea, or, with two cylinders, two impulses every revolution, as exemplified in the Elmore. That the Elmore does produce a constant torque; that it does utilize every particle of power and put a stop to waste energy; that it will take the steepest hill or roughest road at high speed, and that it has the most reliable self-starting engine in the world—for each and every one of these claims overwhelming proof has been produced.

The whole trend of expert and popular opinion is rapidly being directed toward the two-cycle engine.

You owe it to yourself to see this car, which will astonish you, not only by its fine appearance, but by its excess power and its extraordinary control on the high speed.

Send for our full line of literature, the booklet illustrating the 6,000-mile trip, our catalogue, explanation of our engine, and the opinions of people who have used our cars, all sent free, or, if you wish, we will send a 10x12 photograph of the Pathnder on receipt of 10 cents in stamps.

The Only Clincher Tires that Don't Require Lugs.

Where wheels have been drilled for lugs, we will supply free, with tire orders, special brass capped bolts to fill the lug holes, to prevent moisture from getting into the tires.

All G & J Tires are fitted with flaps, giving a perfect seating to the Tube. No danger of cutting tube on lugs, or pinching between edges of case.

All G & J Tires are of thread fabric construction—giving the greatest resilience and durability to the tires: and making them easy to handle. The G & J Tire is the easiest tire in the world to remove from and place on the rim.

The 1905 G & J Tires embody all the features of

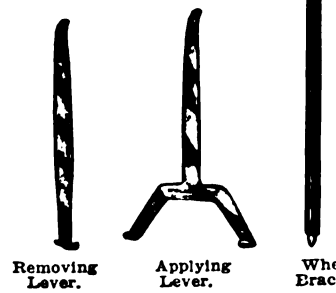
Merely a Matter of Choice

"Every man to his way of thinking."

The Morgan & Wright Clincher

has backed up every good thing we have said about it. It has given the kind of every-day, every-mile service that tire-users everywhere are looking for. Nothing but the best-grade, most durable stock enters into its construction, and it is made by experts who know how to use such material. Its best recommendation is not what we guarantee to do, but what we can prove it has done. Used in connection with our recently-invented tire tools, it is an extremely easy tire to manipulate.



The Perfected Dunlop Detachable

is generally admitted to be the most satisfactory mechanically-fastened tire on the market. The simple, effective method of its construction strongly recommends it to those who prefer this type of tire; and in addition (which is highly important to the prospective tire-buyer) it has every advantage which experience gives to prove that the principle of its construction is correct. It occupies first place among mechanically-fastened tires because it belongs there. Made of A1 stock all the way through.

OUR LINE

Four Cylinder Cadillac Touring Car. Price, $2,800. (Without Lamps).

for the year is motor car perfection. It is the result of careful thought and intelligent effort. We made a GOOD BEGINNNING—and we have now a line of cars second to none. In 1903 we brought out our Model A—single cylinder motor, planetary transmission, wheel steer, detachable tonneau. This car was a continual surprise to our customers, to our competitors—even to ourselves. It not only showed itself the peer of any at ascending grades, but won road and track races when pitted against cars of several times its RATED power and price.

In 1904 we introduced Model B—a car having identically the same power plant as Model A, but a little heavier—pressed steel frame, storage room in front, and a bit larger tonneau. Both these models found instant favor with the discriminating class of auto users.

FOR 1905

we offer you in addition to our lighter cars a FULL POWERED, FOUR CYLINDER TOURING CAR. Thirty horse power—three speed, planetary gear transmission, handled by one lever—shaft drive, side entrance body of either aluminum or wood. And WE make it—isn't that sufficient guarantee of its excellence?

Cadillac Automobile Company, - - Detroit, Mich.

Rambler

SURREY, TYPE ONE

$1,350

18 H.P. ***Immediate Delivery***

This is pre-eminently a family car. Marked provisions for comfort, safety, reliability and ease of operation make it so.

The ignition of the spark is automatic. The brakes are operated by pedals, not by levers. With the steering wheel and throttle attached to it, operabel by one hand, the other is always free to manage the clutches by the single lever, and no confusion is possible.

Each working part is readily accessible and so simple that adjustments can be made without the help of a mechanic, and without crawling under the machine. Vibration is almost entirely eliminated by the long wheel base, full elliptic springs, large tires, the rigid bracing of the engine and the balancing of all reciprocating parts.

Furnished with big luxuriously upholstered seats, and finished in olive green and brass trim which, with the graceful lines of the body, make it one of the three most beautiful cars on the market.

When delivered, it is equipped with a brass side, tail and two gas head lights with separate generator, brass horn, drop-forged wrenches, oilers, pump and repair kit. In fact, ready for use with the filling of the gasoline and water tanks.

If the price was not so conspicuously featured, it would easily be considered a $2500 to $3500 car.

Other Models $750, $850, $2,000, $3,000.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, March 2, 1905. No. 23

INDEPENDENTS UP

Organization is Completed and Officers Chosen —Will Not Engage in Patent Litigation but Will Indulge in Show Affairs.

It is the American Motor Car Manufacturers' Association, if you please. It was formally introduced at Detroit on Friday last, and represents a close welding of the independent trade; that is, those makers who are not members of the Association of Licensed Automobile Manufacturers.

It grew out of the quiet meeting held during the Chicago show, and explains the jealously guarded document which was circulated for signatures during that function. Its officers are:

Chairman—James Couzens, Ford Motor Company, Detroit, Mich.

Vice-Chairman—A. C. Newby, National Motor Vehicle Co., Indianapolis.

Treasurer—J. B. Bartholomew, Bartholomew Co., Peoria, Ill.

Secretary—William Mitchell Lewis, Mitchell Motor Car Co., Racine, Wis.

Auditor—Benjamin Briscoe, Maxwell-Briscoe Co., Tarrytown, N. Y.

Counsel—Job E. Hedges, 141 Broadway, New York City.

It transpires, indeed, that the organization was really completed, and that its officers were elected at Chicago, but the secret was so well kept that not an inkling of the facts escaped.

The officers named were constituted a committee to select a location for the association's offices, and at the meeting in Detroit last Friday they selected that city as headquarters.

The following are the members of the organization, eight other applications being in hand:

Maxwell-Briscoe Co., Tarrytown, N. Y.
Bartholomew Co., Peoria, Ill.
Duryea Power Co., Reading, Pa.
Reliance Motor Car Co., Detroit, Mich.
National Motor Vehicle Co., Indianapolis, Ind.
Ford Motor Co., Detroit, Mich.
Premier Motor Mfg. Co., Indianapolis, Ind.
Mitchell Motor Car Co., Racine, Wis.
Dayton Motor Car Co., Dayton, Ohio.
Moline Automobile Co., Moline, Ill.
Jackson Automobile Co., Jackson, Mich.
Nordyke & Marmon Co., Indianapolis, Ind.
Austin Automobile Co., Grand Rapids, Mich.
Union Automobile Co., Union City, Ind.
Ardsley Motor Car Co., Yonkers, N. Y.
Phelps Motor Vehicle Co., Stoneham, Mass.
Acme Motor Car Co., Reading, Pa.
Gas Engine & Power Co. and Charles L. Seabury Co., Consolidated, Morris Heights, N. Y.
Wayne Automobile Co., Detroit, Mich.

Any idea that may have existed that the primary purpose of the association is to contest the Selden patent was fully exploded by Mr. Hedges on Monday last.

"The association was not formed to fight the Selden patent, or any other patent," said Mr. Hedges when questioned by a Motor World man on that point. "I myself am not a patent lawyer, and know nothing about patent law. The Ford Motor Co. itself will attend to the Selden suit, and neither asks nor desires any assistance from any source."

The objects of the organization were reduced to writing by Mr. Hedges, and are as follows:

First—To arrange for suitable public exhibitions of their products, race meets and other means of publicity and advertisement.

Second—To increase the interest of the public in the purchase and use of motor cars, and to confer and discuss periodically the best means to effect that result.

Third—To fully and properly advertise the respective merits of the cars manufactured by themselves, and secure the most desirable rates of transportation and shipment for themselves and their patrons.

Fourth—To furnish to their respective agents, at regular and convenient intervals, full information regarding the trade in motor cars and the newest information regarding the construction and merits of the motor cars manufactured by themselves.

Fifth—To promote public interest in good roads and to arouse public opinion to oppose legislation which discriminates against the proper use of motor cars.

Seventh—To further the exchange of scientific information by the constructing engi-

A. C. A. HATCHING A SHOW

Nest is Well Hid But Everything Indicates that the Egg Has Been Laid.

Despite previous denials, the direction of certain straws indicate with reasonable clarity that the Automobile Club of America will promote and conduct a show next year. Other straws indicate that it will have the support of the new American Motor Car Manufacturers' Association, and that licensed manufacturers will not be debarred if they also choose to exhibit.

"What do you suppose the public will say if a certain portion of the industry is invited to participate in an exhibition and refuses the invitation?" was the hypothetical question put by a man in position to know and who then laughingly but resolutely shook his head and refused to be "drawn out."

At the Automobile Club, mum is very much the word, but it is uttered in such a way as rather to lend color to the other indications. Despite most persistent efforts, no one will confirm or deny anything regarding the mooted show.

S. M. Butler, secretary of the club, upon being appealed to by a Motor World representative, would only say:

"We are not in a position to give out any information on the subject," and forthwith he diverted the conversation to the Saxe bill. "It was a hard fight," he observed, "but we think we have succeeded in killing it. It will not be reported for a week or more, and probably not at all."

"Is it to be inferred from your statement that there is no information to be given out concerning the show situation that there has been a meeting of the committee, and that they have taken definite action, but that the time is not ripe for announcing it?" was asked, but only to elicit the same response.

"Well, how about the other members of the committee? Will they say anything for publication?"

"You might just as well save time and trouble by not calling on Colonel Smith, for he will say nothing, and Mr. Shattuck has not returned from Albany," was Butler's response.

INDEPENDENTS UP.

(Continued from preceding page)

neers employed by the parties hereto to the end to improve the manufacture and standardization of motor cars.

"These objects make plain," said Mr. Hedges when questioned further, "that it is the purpose of the American Motor Car Manufacturers' Association to promote a show, and you may quote me as saying," he added, "that the show will be held in New York, and that it will be promoted by men whose standing in the social, financial and automobile worlds will be recognized the moment their names are made public. You may also say that every one will be invited to exhibit at this show. The officers of the association are constituted a committee of arrangements, and have ample power to proceed in the matter."

That the association is meant to stiffen the backbone of the independent agents is patent on its face, and that it will serve its purpose cannot well be doubted. That its cards will be diplomatically played the selection of Mr. Hedges as its counsel and spokesman is evidence, and that publicity will play a conspicuous part in disseminating the independents' propaganda readily will be assumed by all who are acquainted with Mr. Hedges. He is one of the most urbane and approachable of gentlemen, and a speaker of rare ability, being much in demand as a post-prandial orator. He is also high up in the world of politics, having served a term as private secretary to the late Mayor Strong and filled other important political offices. During his service he made himself quite popular in newspaper circles by his clever treatment of all who approached him. He is also a member of the Automobile Club of America.

New Men on Corbin Board.

The Corbin Motor Vehicle Co., New Britain, Conn., has selected the following officers for 1905; President, Philip Corbin; vice-president and treasurer, M. S. Hart; secretary and assistant treasurer, Paul P. Wilcox; directors, Philip Corbin, M. S. Hart, Charles Glover, Paul P. Wilcox, Andrew J. Sloper, Robert C. Mitchell and Jacob S. Bretz.

M. S. Hart and Jacob S. Bretz are new members of the board, taking the places of C. M. Jarvis and H. S. Hart. Mr. Hart was formerly in charge of the rolling mill at the Stanley works.

Jury Gives Verdict for Premier.

A verdict for the defendants was returned by a jury in the Superior Court at Indianapolis, Ind., last week, when the suit of James J. Foster against the Premier Motor Mfg. Co. was heard. Foster's team was frightened by an automobile belonging to the defendant company on April 9, 1903. He estimated the injuries resulting at $15,000.

Goodrich in New Quarters.

The B. F. Goodrich Co.'s Boston branch is this week taking possession of its new quarters at No. 161 Columbus avenue. It is a roomy, glass front establishment that has been completely remodelled for the use of the Goodrich people.

DEALERS "DO THINGS."

New York Tradesmen Adopt Novel Policy to Assure Maintenance of Schedule Rates.

At a meeting of the New York Automobile Trade Association, held in this city on Thursday last, an agreement, the provisions of which are outlined below, was drawn up and ratified. It provides for the appointment of a committee, to consist of a chairman and secretary-treasurer, and further comprises a general counsel in the shape of a member of the New York bar and an auditor, who is to be a certified public accountant. The duties of the committee will be to take in hand the matter of formulating a business policy for the members of the association and enforcing the schedule of rates promulgated in detail at a prior meeting. Instead of the cash bond, which was previously thought to be the only method by which obedience to the schedule could be obtained, a system of cash deposits is provided for by the agreement in question. The latter is now in the hands of a special committee, composed of Elliot Mason, William P. Kennedy and C. Andrade, for execution, and is to become effective upon receiving the signatures of three-fourths of the members. As soon as the required number have certified their intention to uphold the agreement, the president of the association will appoint a committee, holding office for one year, to carry out its provisions. In substance it is as follows:

Each member shall pay $10 per annum for each car on storage in his garage, with a minimum fee of $100 and a maximum of $500, to be paid at the beginning of each year, but if at the end of that period it is found that the average number of cars stored during that time exceeds the number paid for over the minimum, such excess shall then be paid for at the same rate.

Any member of the committee or of the association shall have the privilege of complaining of a violation of the agreement on the part of any other member to the general counsel, and in so doing is to present such evidence in support of his complaint as is obtainable. It will be the duty of the auditor to investigate such complaints, giving the member in question all reasonable opportunity to defend and report his finding to the committee. Should the latter body decide by a two-thirds vote that there has been a violation, the offending member is to be fined $100 in the first instance, $250 in the second and $500 for the third and every succeeding breach of the agreement. Money paid into the treasury from this source will be divided among all the upholders of the agreement ratably, according to the amount of their respective deposits.

Another important provision of the agreement is aimed at the rebate evil, and, if properly enforced, should certainly be instrumental in subduing the grafting chauffeur, so far as the association members are concerned. It is as follows: "Members or their agents, employes, etc., are absolutely prohibited from giving, loaning, paying, offering or promising any compensation, gift, rebate, money or anything of value to any chauffeur or any person storing a car, on any pretext, except commissions paid for the direct sale of cars." The agreement is limited to garage owners within the confines of greater New York, and is to continue in force for three years from date. It is to take effect as soon as signed by three-fourths of the members of the association, and by a vote of the same number it may either be modified or annulled.

Approval was also given at the meeting in question to a memorial to be forwarded to the President of the Senate and chairman of the Committee on General Laws at Albany, requesting the passage of a bill for the protection of garage keepers, owing to the decision of Justice Clark, handed down in the Supreme Court last week, that the latter loses his lien on a car for an unpaid storage or repair bill by permitting the owner to take it away from the garage for no matter how short a time.

Boston's Licensed Dealers Organize.

There is "something doing" in licensed circles in Boston. Just what, it is carefully guarded, but there are some grounds for believing that it has chiefly to do with the Boston shows of the future. Although it has been kept very quiet, it is known that the Boston Licensed Automobile Dealers have been organized, and that they have or will apply for a charter under Massachusetts laws.

Those who figure as its organizers or incorporators are among the best known of the Boston tradesmen, viz.: George H. Lowe, White Sewing Machine Co.; W. W. Burke, Columbia Motor Vehicle Co.; A. R. Darling, George N. Pierce Co.; J. H. McAulmann, The Locomobile Co. of America; W. J. Foss, Pope Motor Car Co.; A. R. Underhill, Knox representative; J. Breed, Haynes-Apperson Co.; A. R. Bangs, Franklin agent.

American Wins $10,000 Suit.

In the suit of the American Ball Bearing Co., Cleveland, Ohio., vs. the United States Ball Bearing Co., a verdict for $10,000 was last week rendered in favor of the plaintiff. The case was in the United States District Court at Cleveland, Judge Robert W. Taylor presiding.

Linscott Gets Big Territory.

The newly incorporated Linscott Motor Co., which has secured a splendid location, at No 163 Columbus avenue, Boston, Mass., will handle considerable territory in the interests of the National and Reo cars. Eastern Massachusetts, Maine, New Hampshire and Vermont are included in its domain.

FOG BEGINS TO LIFT

Disclosure of St. Louis Car Co.'s Plans Lets Light Into Steinmeyer's Mystery.

St. Louis, Mo., Feb. 25.—One thing is certain, the Steinmeyer "million-dollar automobile factory," which may be built at Kirkwood, a residence suburb of this city, has no connection with the St. Louis Car Co.

As the Motor World stated at the time the deal was consummated, the St. Louis Car Co., one of the biggest builders of railway coaches in the country, will manufacture practically a replica of one of France's famous cars, the Mors, have effected the necessary arrangements with M. Mors, when he was here in December last. The news of the Steinmeyer project came out soon after, and although that "gentleman contractor" has vociferously refused information and made a mystery of the affair, there have been quite a few persons in the trade who fancied that the Motor World was barking up the wrong tree. They were of opinion that Steinmeyer's factory was to be occupied by the St. Louis Car Co.

Yesterday, however, the Motor World man saw H. F. Vogel, vice-president and general manager of the car company, and settled all doubts on that score. When the question was put to him, he laughed a sort of reminiscent laugh. He admitted that he had been approached by Steinmeyer.

"But it is immaterial to us," said Mr. Vogel, "whether one or ten other concerns start manufacturing next door or on the next block to us. We have plants and facilities of our own, and would not buy out any of them. We purpose making automobiles, not bubbles."

This sheds at least a side light on Steinmeyer's Kirkwood mystery.

Mr. Vogel said further that the St. Louis Car Co. is spending upward of half a million dollars in making ready for the manufacture of motor cars. Two two-story buildings, one 50 by 400 feet, the other 60 by 200 feet, and both located at 5200 North Second street, are being remodelled and equipped for the purpose. It is here that the mechanical work on the "St. Louis Mors," as the car will be styled, will be done, while the bodies and other woodwork will be turned out at the plant of the Laclede Car Co., 4500 North Second street, which is a part of the St. Louis Car Co. It is expected that active operations will commence in about six weeks with 400 men, which number will be increased to 600 by July 1, and before the end of the year to as many more.

Work will be at first concentrated on the "St. Louis Mors," but a runabout is included in the company's plans for the near future. Later it is proposed to build motor vehicles of all types, and with the wealth, facilities and reputation of the concern, it will command immediate and general attention seems to go without saying.

The Week's Incorporations.

Roswell, N. M.—Roswell Automobile Co., under New Mexico laws, with $10,000 capital.

Detroit, Mich.—Detroit Automobile Co. has increased its capital stock from $2,000 to $25,000.

Bay City, Mich.—Smalley Motor Co. has increased its capital stock from $60,000 to $80,000.

Chicago, Ill.—Adrian Automobile Co., under Illinois laws, with $5,000 capital. Corporators—Thomas Singleton, W. T. Lambert and W. Black.

Augusta, Me.—Excelsior Steam Car Co., under Maine laws, with $500,000 capital, to deal in automobiles. Corporators—L. C. Cornish and N. L. Bassett.

Chicago, Ill.—Branstetter Automobile Co., under Illinois laws, with $1,000 capital. Corporators—John J. Symes, Thaddeus O. Bunch and Jonathan G. Latimer.

New York City, N. Y.—Auto Mail & Delivery Co., under New York laws, with $150,000 capital. Directors—Charles J. Warner, John Finck and Frank H. White.

Newark, N. J.—Reo Automobile Co., under New Jersey laws, with $50,000 capital, $3,000 paid up. Corporators—Frederick E. Hodge, Thomas P. Gould and Isaac D. Clark.

New York City, N. Y.—Leavitt Motor Car Exchange, under New York laws, with $1,000 capital; to deal in automobiles. Corporators—R. J. Leavitt, M. P. Leavitt and M. R. Leavitt.

Newark, N. J.—Simplex Co., under New Jersey laws, with $10,000 capital; to deal in all kinds of electrical apparatus. Corporators—Maurice C. Rypinski, John M. Lansden and Charles Nilsson.

Trenton, N. J.—Porcelain Electrical Mfg. Co., under New Jersey laws, with $25,000 capital; to manufacture all kinds of electrical appliances. Corporators—Charles A. Secor, William L. Peacock and Frederick R. Brace, Jr.

Detroit, Mich.—Stirling Automobile Co., under Michigan laws, with $25,000 capital; $6,440 paid in in cash, $6,000 in personal property. Corporators—John R. Stirling, Alexander M. Alexander and Robert B. Alexander.

More Room for Diamonds in New York

Because of the rapid increase in their business, the New York branch of the Diamond Rubber Company has been obliged to seek larger quarters. The seeking has led to the lease of the premises 78 Reade street, where a plentitude of the necessary elbow room will be asured. The removal from their present headquarters, at 7 Warren street, will not occur, however, until May 1.

To Enter Jobbing Trade.

The Boston Cycle & Sundry Co., Boston, Mass., has added an automobile supply department to its business, and will job accessories throughout New England. Peter Semmering is the manager of the department.

STORY OF SCRAP HEAP

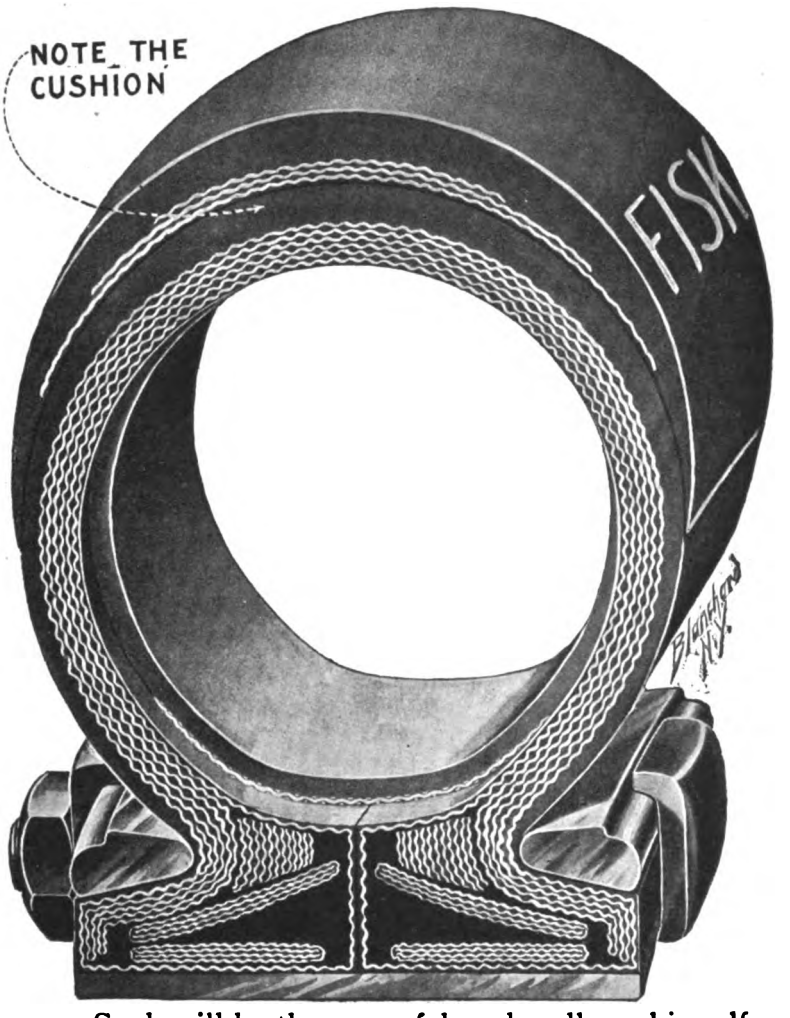
Showing How Metal Thrown Away Sold Several Cars for One Concern.

"Talk about 'casting bread upon the waters,'" said John A. Kingman, of the Locomobile Co. of America, one day last week—and he was not talking for publication either—"but we made one mighty good customer last year by casting metal into the scrap heap. The gentleman was being shown through the factory, and it just so happened that he came upon Engineer Riker while the latter was putting a lot of metal to the test. It proved not up to our standard, and Riker, boiling mad, was ordering it thrown into the scrap pile.

"Our visitor said nothing of the incident at the time, and nothing more was thought of it, not even when we booked the gentleman's order. But that it made a deep impression we discovered during the year, when on three separate occasions this particular purchaser sent to us an intending buyer, each of whom remarked that his friend had emphasized the scrap heap incident in recommending the Locomobile. We got their orders in every case, too," added Kingman.

"Indeed, we do test every piece of metal that goes into our cars," he said in answer to a question. "It has been a hard task to impress on those of whom we buy our material that it simply must be of certain compositions and standards, but I believe the results justify the trouble and expense, and those who sell to us have come to realize that we mean what we say and do not deviate from our policy in this respect. I have seen Mr. Riker reject an entire lot of axle forgings, for instance. They stood the bending test when hot, but when tested cold they developed a crack and promptly were rejected. The crack was so minute that the average man never would have detected, but Riker simply would not accept them, and they were thrown back on their maker's hands. It required a lot of correspondence and travelling to and fro to settle the matter, but—well, we are now getting the material we want and must have, and the makers appreciate that we will take no other."

Pennsylvania Gets More Time.



The answer of the Pennsylvania Rubber Company to the suit filed by the G & J Tire Company for infringement of the latter's clincher patents, which was due to be filed on Monday next, will not be then filed. By consent of the plaintiffs, an extension of time has been granted.

The suit, which was filed in the United States Circuit Court for the Southern District of New York on December 23 last, of course, involves the several patents under which the G & J detachable tire is manufactured, which are as follows: 454,115, June 16, 1891; 466,565, January 5, 1892; 466,789, January 12, 1892; 493,160, March 7, 1893; 523,314, July 71, 1894, and 588,956, April 28, 1896.

NEW YORK, MARCH 2, 1905.

Quality in Raw Materials.

Something approaching a standard type of car in each class having been put forth by the majority of makers in this country for the present season's business, attention can be devoted to investigation and experiment, more with a view to improvement in the quality and fitness of the materials employed than in the direction of engineering design, though this feature will naturally always be first.

The salient features of design, such as suspension, transmission, motors, clutches and the like, best adapted to the touring car and the runabout, have now been tacitly recognized by makers to such an extent that a composite of all the cars of each class exhibited at the recent shows would reveal marked departures but in isolated cases. Some of the latter are confined to more or less unimportant detail, while others, as outlined in the Motor World's show number, are somewhat bold conceptions, the trying out of which will be followed closely during the coming season. Apart from this, quality must henceforth be the prime requisite of improvement.

Few things have been more productive of advances along this line than the various endurance runs held during the past year. Of these, probably the one to Pittsburg proved the most prolific in results. Failure to complete the run was not in every instance the only indication of defect, for luck was a potent factor in getting through, and even the successful cars revealed their weakness to the practiced eye during the run and afterward. As a result, better materials have been adopted by some makers in the comparatively short time intervening between the event in question and the present year's show. Quality in this connection can, of course, mean nothing more or less than metal—steel and iron. Both are coming in for no small amount of attention where intrinsic betterment is concerned; better steel for gears, transmission and driving for shafts and frames, better iron for cylinders.

The Classes of Purchasers.

Automobiling has progressed, is still progressing by levels and, as in mining, the course of progress is downward. First the richest subsoil deposits, then well paying lodes, decreasing in richness as greater depths are reached, until finally strata are found where nothing but the economical methods of production brought about by organization and the use of the best modern machinery will show a profit.

The millionaire buyer of automobiles who sports a "stud" of anywhere from six to a dozen cars, and keeps it up to date by purchasing several new models each year, represents the first level in the comparison, except that he is not apt to play out so soon, as this, his latest, is no passing fancy of the hour to be cast aside and forgotten in a short time. But, on the other hand, it takes more than one swallow to produce a man-sized feeling of hilarious prosperity in a poor man's mind, and a handful of "mums' is certainly not sufficient to generate this and keep it alive, where an industry is concerned.

The next levels represent everything from an extremely comfortable state of solvency down to the poor cuttings that have to be worked economically in order to show a dividend—probably the man who manages to buy a car on his friends' money and becomes hopelessly involved in debt trying to keep it out of the repair man's hands corresponds to the latter simile as well as anything.

But neither of these extremes will support a large and constantly growing industry—it pays to cater to both, because what the latter lacks in funds it makes up in numbers; the crop is unfailing. The man who can afford to buy a car and can afford to run it if it is not going to run him straight into bankruptcy in the course of the first season is the one that the manufacturer has to depend upon when all is said and done. His name is legion, but having in the majority of instances had to earn the money he is about to spend, he is likewise a canny individual. Not racing records, but endurance records, appeal to him, for what he wants to know most is not the first cost of the car—advertisements tell him that—but the cost of maintenance and repairs, particularly the latter, and nothing short of experience forms a foundation upon which to base such knowledge.

"Repair records" is an apt term to express the qualification the manufacturer has to prove in order to satisfy this type of buyer, and it is safe to say that more makers are giving attention to this phase of the business at present than are building high powered racing cars to cut fifths of a second off the mile record. How to build a car that will, if necessary, stand the hardest kind of work for the longest time with a minimum of repair, and that will endure ordinary service indefinitely without being laid up except for minor derangements, is the question. Merely because "repair records" are not made on tracks in the presence of enthusiastic thousands is no reason to doubt the striving for them that is constantly going on. Every manufacturer, every agent, and every repairer is keenly alive to their value, and it would not be difficult to mention cars the popularity of which is undoubtedly due to their achievements in this direction.

Improving the Small Car.

Across the water they are still discussing "the car for the man of moderate means." One of the parties to it goes unusually deep into the matter, and treating with the cheap machine, he outlines the salient features of what he terms the ideal low priced car. In this, though he goes about the proof of his assertions in a loose fashion, he brings out several noteworthy points which are fully as applicable here as they are abroad. After limiting the cost of such a car to a maximum $1,000, he goes on to say, in part:

"The great mistake made by designers in the past has been that of slavishly copying the big car and endeavoring to bring out a

Digitized by Google

miniature edition at a lower price, so that in many cases it is to be feared that the retention of features usually found in big cars has been made possible only by a falling away in quality of workmanship or material, or both."

He concludes, quite rightly, that this is not ruleable in any sort of machine and points out the necessity of absolute interchangeability of parts in such a car, since the average owner, being a man of limited means, is often obliged to be his own mechanic, though he be not a skilled workman; hence the need of fitting in the replacement of parts becomes a burden and an added source of expense.

Descending to particulars, this contributor advocates the use of the single cylinder horizontal slow speed motor of about 8 horsepower. His objection to the single cylinder vertical type is that its large size, or else the excessive speed required to secure sufficient power, render it inapplicable, while the double cylinder construction practically doubles the cost, so he contends. As to transmissions, the Panhard type of sliding gear is too costly, he thinks, while the planetary form lacks the requisite durability. He suggests instead of either the use of a very simple form of sliding gear, giving three speeds, with direct connection on the highest. As to the body, he says that "this is the last place in which to attempt to copy the big car, and especially if of the tonneau type, as the length of wheel base cannot possibly afford sufficient roominess at the back, otherwise than by building beyond the rear wheels—an unsightly and unmechanical way out of the difficulty.' Among the few luxuries of the expensive car which should, he thinks, be copied in the smaller machine, are double ignition, force feed lubrication and automatic carburetion.

A very common criticism of the low priced car in this country is its apparent effort to imitate the larger machines. In many cases this is true not only of the external parts, but of the mechanism as well, and it is quite true that the reduction in price carries with it often a lowering in the grade of workmanship and material. The latter is a natural result of the reducing process—if you choose to consider the small car as a derivative of the larger—because though a reduction in the size of the parts which contribute to weight and power, or which, roughly speaking, determine its size, must induce an approximately proportionate reduction in the cost of manufacture. Still, the net profit being comparatively small, the maker must either assure himself of a great number of sales or else still further reduce the cost in order to secure his due returns. And a certain reduction in quality is perfectly legitimate, so long as it is applied only to such non-essentials as the external finish of parts and the substitution of lower grade materials in places where they cannot jeopardize the safe working of the car. But many cars are marketed in which unfortunately this tendency has been allowed to have a preponderating influence on the design itself, and in which certain of the most essential elements have been grossly cheapened. Such cars, even though they be few in number, go far to condemn the whole class. So long as the reduction in cost is carried on reasonably, it is perfectly proper, but once it is permitted to encroach on the essential, it is grossly inexcusable, and can never contribute one iota of repute to the industry nor fail to react harmfully on those who sanction it.

The harmless imitation of purely external characteristics of the expensive machines is entirely apart from this main consideration. For there are those in plenty who crave the false bonnet and baby tonneau simply because they "look real," who, so long as they cannot afford diamonds, are perfectly content with paste.

For Commercial Usage.

The wise heads have prophesied all along that some day the automobile industry would cease to derive the bulk of its returns from purely pleasure vehicles, and would, instead, depend chiefly on commercial types. The adaptation of auto propulsion to the haulage of all sorts of goods, and the use of cabs and 'bus lines for the transportation of human freight, will, once the proper degree of mechanical perfection is attained, bring about a veritable 'horseless age"—so they say. However that may be, there is as yet no apparent diminution in the use of the horse, nor any indication of his place being immediately usurped.

The attention of the public and that of the average maker as well is almost wholly focused just now on the pleasure vehicle in its wonderful popularity. The great preponderance of this side of the business, coupled with certain rather dubious results of experiments hitherto made, lead to an impression that the more practical phase of the business is being neglected. But all the time a steady advance movement is going on, not so marked as in the other line, but none the less hopeful because of its conservative rate of growth, and one which, for this very reason, augurs a stronger future than is assured its fellow, whose rise has been more meteoric.

Certain firms in various parts of the world have adopted commercial motor car service, and, after a more or less impartial test, have discarded it. Others, better satisfied, are continuing it, fully convinced of its utility. Of these some are working on a paying basis, others at a loss; of the latter, some are being continued in the hope of ultimate betterment, and others simply as an advertisement. In cases where failure has occurred the cause is almost always attributable to mechanical imperfections in the equipment. The high cost of upkeep, the chief factor of expense, has been due largely to design which must be considered as being in a measure experimental. But this drawback and that of uncertainty of action, which is allied to it, must decrease with time. The development in the other line, rapid and forced as it has been, is highly beneficial to its more staid relative, in that it has evolved in a short time the laws of structural formation which would not otherwise be brought out in years of slower growth, of milder rivalry and the struggle against the prejudice of the very conservative.

That there is a steady growth in this line cannot be gainsaid. The most casual observance of the traffic of the larger cities proves it; trade returns prove it. There are a considerable number of practical vehicles in use to-day in all parts of the world—vehicles which are practical in the sense of yielding a practical return for a cash outlay—and their number is constantly increasing. Reports are continually coming in from here and there of the inauguration of new lines and new systems. Frequently, too, there come reports of their discontinuance. But this is of no significance in a broad sense, since the imperfections of a newly made machine, and the factor of uncertainty in operation due to the fallibility of human nature—the purely personal equation—involve just such results in any new line of business. For the introduction of a new process, or system, or method involves a twofold educational process—the designer must learn to create, and the user to operate to advantage.

"We have read with a good deal of interest the Motor World's comments on the Chicago show, and so far as we have seen they comprise the only real statement of the facts. The others evidently were fearful of saying what they think or to give the facts."—Extract from a letter from a Western exhibitor.

FOR AN AMATEUR RULE

A.A.A. Takes First Step Toward One—Changes Made in Vanderbilt Cup Conditions.

At a special meeting of the racing board of the American Automobile Association in New York on Tuesday last, there was taken the first step in the direction which the Motor World has advocated since the formation of the organization, i. e., the drawing of a line between the amateur and the professional.

It took the form of the appointment of a special committee, composed of T. N. Hilliard and H. L. Bowden, of the racing board, and E. T. Birdsall, of the technical committee, who will revise the racing rules, and not only present an amateur definition, but recommend such other changes as experience has shown to be necessary. This committee will report directly to the racing board, and the racing board, in turn, to the board of directors, at a meeting on March 9, before any recommendations that may be made will be embodied in the rules.

It is understood that the racing board inclines strongly to an entire separation of amateurs and professionals, and that no halfway definition is likely to be recommended. The great stumbling block in formulating a definition is the manufacturers who themselves engage in racing. It is said that, while it is realized that some benefit may thereby accrue to the respective businesses of these gentlemen, sportsmanship is the underlying principle of their competition, and that, accordingly, they will be included in the amateur class. There is said to be no disposition to establish an intermediate class

Important action was also taken in respect to the Vanderbilt cup race. By permission of Mr. Vanderbilt, the date for the closing of entries was extended to May 15, and two changes of moment in the conditions also were made. First, that henceforth the number of cars representing any one country in the race will be five instead of six, as heretofore, and, second, that the entry fee will be $500, with no rebate to either starters or non-starters. Last year the entrance fee was $300, one-half of which was returned to the entrants who actually started. The deed of gift has also been so altered that, by consent of the A. A. A., the winning club may take the cup abroad without depositing a cash bond.

The race will be held between August 15 and October 15 next, and the course will probably be the same as last year—Long Island—unless a more suitable one is presented. It is said the supervisors of Nassau county are favorable to again having the contest held there.

As tacitly agreed at the close of the recent speed tournament on the Daytona beach, the Florida East Coast Automobile Association was granted the reservation of a single week between January 22 and February 19, 1906, for the promotion of automobile races. Technically no sanction can be given until a programme of races is submitted, but a reservation is equivalent to a sanction. The F. E. C. A. A. will be asked to select its week as soon as possible.

An application for reservation had also been asked by the Ormond Racing Association from January 22 to 27. Pending the definite selection by the F. E. C. A. A. the Ormond application will not be acted upon. Though the members of the board who attended the last Florida meet had practically agreed not to recognize the Ormond claims, it is possible that reservation of a single week may be given the Ormond association, following that of the Daytona organization. May 30 was also reserved as a date for a race to be held at Empire City Track, Yonkers, N. Y.

The application of Walter Christie for a sanction for private time trials in Florida was denied. Mr. Christie was informed that he would not be disqualified for making such trials, but that no records claimed would be recognized. This establishes an important precedent.

The meeting was held in the rooms of the Automobile Club of America. Those present were George Isham Scott, T. F. Hilliard, E. T. Birdsall, A. L. Riker and C. H. Gillette, the secretary of the A. A. A.

Bowden Likely to Become Racing Head.

W. C. Temple, of Pittsburg, who resigned the chairmanship of the A. A. A. racing board immediately after the Florida Speed Carnival, has declined to reconsider his action, which will make necessary the selection of a new head. William Wallace, of Boston, who was prominently mentioned for the position, and who is still a member of the board, will not become chairman, because, as he will be a competitor in the Vanderbilt Cup race, he does not deem it proper that he should be chairman of the committee in charge of the event.

The most likely man for the office is understood to be H. L. Bowden, of Waltham, Mass. The office is to be formally tendered to that gentleman to-day, but there is no certainty that he will accept it. A secretary of the racing board will also be named. He will most certainly be either a New York or Boston newspaper man.

France to Throttle Bennett Race.

Cable advices from Paris state that the Automobile Club of France has abandoned the Grand Prix, and this year, at least, that "consolation race" for the French trade which came so near to "queering" the Bennett cup race, will not be run. That the Frenchmen's commercial instincts wholly possess them, however, is indicated by the further fact, conveyed by the cables, that the club has decided practically to throttle the Bennett races, the throttling being encompassed in an agreement that, beginning with 1906, French automobile manufacturers will be invited annually to participate in but one big race, and that the Grand Prix, which will be made an open event.

A. C. A. SELECTS A SITE

Big Club to Build on Fifty-fourth Street—Plans of the Structure.

Announcement is made that the Automobile Club of America has finally chosen a site for its new home, and that building operations will be begun at once. The choice is the result of a careful study of the present needs of the club, and has been made with due reference to the trend of the city's growth.

A canvass of the location of the resident members, made some time ago, showed the present location to be quite central, and accordingly an effort was made to secure land in the immediate neighborhood of Columbus Circle, but the prices asked for the most desirable lots were wellnigh prohibitive, and it was only after a deal of skilful negotiation on the part of Bryan L. Kennelly, through whom the purchase was made, that favorable terms were secured. The lot chosen is in Fifty-fourth street, just west of Broadway, and is particularly advantageous not only on account of its proximity to the park and the residential district uptown, but because it is in the very heart of the new retail automobile section.

The work of designing the structure is already under way in the offices of the architect, Ernest Flagg, who is preparing to submit the preliminary drawings to the building committee at a special meeting called for next Saturday.

Although it is early yet to predict definitely the style or arrangement of the house, it is understood that the specifications call for a thoroughly modern building six stories in height, fireproof and substantial. As it must serve the twofold purpose of clubhouse and garage, it will be in some respects unique. The upper and lower floors will be used for the storage of cars, while the basement will be fitted up as a complete repair shop, where will be facilities for doing all sorts of work. A special feature, promised some time ago, will be a dynamometer, for testing the power delivered at the wheels of cars. The facilities for handling and recharging the cars will be entirely new in design; every device which experience can dictate or ingenuity devise will be supplied for the convenience of the car owner. The floor space, which will be nearly thirteen thousand feet, will give ample room for storage of upward of two hundred cars on the two floors, and no effort will be spared to make the equipment complete in every detail.

The clubrooms will be arranged in befitting style, and will include, beside the executive offices and a large assembly hall, a library, parlors, reading and lounging rooms—for the accommodation of the "rockingchair fleet"—and a restaurant, to say nothing of lockers and baths galore.

It is understood that work on the ground will be begun as soon as the houses now standing can be cleared of their tenants, and it is hoped to have the work completed within a year.

RIDDLED SAXE BILL

Motorists Bring Strong Arguments to Bear While Only Chronic Reformers Speak for It.

The flower of New York State automobiledom, representing millions of capital and an industry employing thousands of men arrayed against a few malcontents from a spot on the map comprising possibly less than a square mile on Manhattan Island, and known as the West End, was the sight presented at Albany on Tuesday last, when the obnoxious Saxe amendment to the present automobile law came up for discussion.

The hearing was held in the Senate chamber, William H .Hotchkiss, president of the New York State Automobile Association, acting as master of ceremonies. Winthrop E. Scarrit, former president of the A. C. A., led the opposition. His speech, which covered the entire ground, was in part as follows:

"The fate of the pioneer is always a hard one. Morse walked the streets of New York despairing and penniless; Whitney, with his cotton gin, and McCormick, with his reaper, were denounced by the laboring men. The first locomotives which ran through the Mohawk Valley were denounced. What a terrible outcry was made against the trolley car and the bicycle. And now the last target of abuse from an indignant, if not altogether thoughtless, public is the automobile.

"Let us analyze the situation and see whether these drastic and repressive measures which are now proposed are sensible, necessary or reasonable.

"The automobile, according to a ruling by Judge Cooley, has rights upon the highway of which no Legislature has the right to deprive it.

"We object to the Saxe amendment because it is so tyrannical, unfair and unjust, in that it puts it within the power of any petty, prejudiced magistrate to send an automobilist to jail for violation of the speed law, no difference how slight or unintentional that violation may have been.

"The present law is a compromise and works out in practice fairly satisfactory to everybody. The Automobile Club of America has used its influence among its members to have them obey this law, and to use their cars on the highway with care and consideration for the rights of others. The same club has offered a reward for a gross violation of the present law. We are as anxious as you, or any other gentlemen, to stamp out reckless and dangerous driving on the highway. We object, however, to having the public put us altogether in one class and condemn the many for the sins of the few.

"We submit that nine months is not sufficient time in which to test the merits or demerits of any new law. Thus far the present law has worked satisfactorily.

"We do not believe the legislators of the Empire State, pricked and prodded by a few motor-phobiacs, will permit themselves to enact legislation, which, five years from now, they will be heartily ashamed of."

James Carr, president of the West End Association; A. L. Blauvelt and J. L. Brower, "chronic agitators," as they were dubbed by the opposition, spoke or rather denounced the automobile and its owner, and the first named quoted a record of five and a half seconds per block taken by himself on Broadway. One J. C. Coleman said he represented 350,000 to 400,000 people, in addition to the West Enders. but wasn't particular about mentioning who they were.

A. R. Shattuck, also a former president of the A. C. A., also spoke, and said in part:

"I have driven thirty thousand miles and have never been arrested. The danger from traffic in our city is very great, but is it due wholly to the automobile? In 1904 seven persons were killed by automobiles. It is too many, but in some instances it was due to the fault of the victims. In the same time, sixty-two persons were killed by horse drawn vehicles, fifty-seven by the cars of the Interurban company, twelve by the cars of the Interborough company and twenty by steam cars running in the city."

Speaking for the New York Motor Club, Charles Hyde said the chief fault was in the non-enforcement of the present law.

In closing the argument in opposition to the measure, Mr. Hotchkiss, of Buffalo, said that the law in relation to horse vehicles was not enforced.

"Which is better for the Legislature and the people you represent," Mr. Hotchkiss asked. "To have the support of the motorists in the enforcement of the law or their opposition to such enforcement? It will be our duty to attack such a law as is proposed."

Charles T. Terry, of counsel for the N. A. A. M. legislative committee, and who submitted a brief with which many of Mr. Scarrit's arguments coincide, when seen by a Motor World man the following day, said the sum and substance of the West Ender's argument is, "there must be something wrong with the law because automobilists violate it."

"That's genuine, for those are the very words," he added, "and this profound reasoning was supported by letters of a few ministers in New York City and a school principal, who said he wrote in behalf of two thousand children. With this strong foundation of logic, the plea of the West Enders, in effect, was "because the law has not been enforced, pile up the penalties." Among others who spoke in favor of the bill, Senator Armstrong—a gentleman with a well filled stable, by the way—argued along this very line, and in consequence played directly into the hands of the opposition in everything he said, which was nothing more or less than a plea for the enforcement of the law. "Why don't your automobile associations enforce the law, instead of coming here to oppose legislation?" he asked, to which answer was made that if the State found itself too poor to enforce its own legislation, that the asociations might consider the project of getting up a subscription for the purpose, but otherwise did not think themselves particularly concerned in the enforcement of laws.

"That Popular prejudice, nothing more or less, is at the root of the whole matter, may be seen at a glance, from a perusal of every automobile bill that has ever been presented to the Legislature, as well as the manner in which it has been brought before that body," said Mr. Terry, in conclusion. 'Bill Jenks. up in Squedunk, is scared half to death through an automobile frightening his team, and in the heat of his wrath makes his sentiments known to his representative at Albany. The latter has to make good to keep in with his constituents. Just alter that a bit to suit city conditions and you have it all."

Senator Armstrong, chairman of the committee which has the Saxe and Grady bills under consideration, said that an executive session would be held the day following, and that the bill would not be reported until next week. In the opinion of some of its opposers, it may not be reported at all; it may be allowed to die a natural death in the committee, as is so often the case when the proper wires are pulled. If it is, it will be nothing more or less than the result of this unreasoning prejudice on the part of those opposed to the atuomobile.

To Enlighten Illinois Legislators.

Country legislators at Springfield, Ill., will have the time of their lives this week when the legislative committee of the Chicago Automobile Club takes them out in a big touring car equipped with a speedometer to demonstrate a few points about the speed of an automobile.

The demonstration is designed to find support for the bill which will be presented by the club committee, and which provides for the State control of automobiles and specifies that the State shall issue licenses in the form of a tag two inches in diameter, with the number stamped on it.

The measure specifies that a speed limit of ten miles an hour in congested districts, fifteen miles in sparsely settled parts and twenty miles in the open country be allowed.

The bill will be presented to the legislative Committee on Roads to supplant the measure introduced by Representative Heinl.

Club Dines City Officials.

The Mayor, members of the Board of Supervisors, police authorities and Park Commissioners graced the festive board on the occasion of the first annual banquet of the Automobile Club of California in San Francisco last Saturday night. An apparent spirit of good feeling prevailed. The club members told the public officials what automobilists needed in the matter of protection and better roads, and the city's officers promised to co-operate with the club in securing needed improvements.

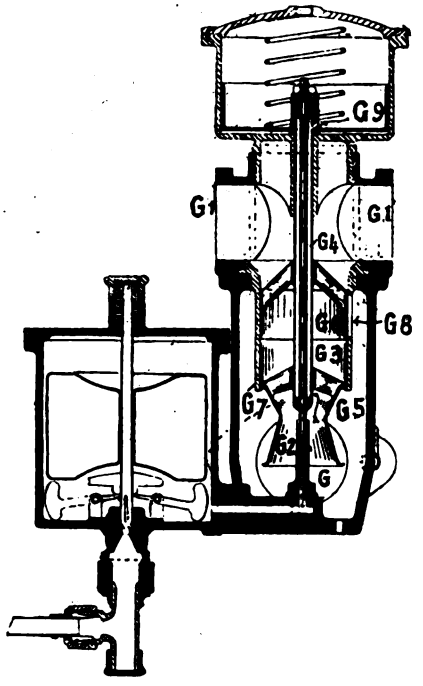
OF ENGLISH ORIGIN

New Developments in Carburetters and Ignition that Appeared at the London Show.

If not productive of anything else of great importance in the estimation of the outsider, the recent Olympia show in London, which closed on the 20th of February last in London, brought out one fact so clearly that even the man with but half an eye can scarcely have failed to see it. And that is that American manufacturers have not been slow to realize that England is going to prove an excellent market, and almost half a dozen of them are now represented on the ground by some of the best agents in the country. These are the White, Cadillac, Winton, Oldsmobile and Orient—all were very much in evidence in well filled exhibits at the show.

Where advances are concerned, the greatest amount of novelty, as is to be expected,



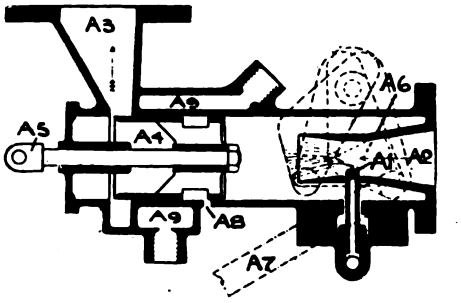
Brotherhood Carburetter Showing Location on Engine.

has to do with the motive power, and is centred for the greater part about the two all absorbing features of carburetion and ignition.

In the former the automatic type of carburetter is now prominent, improvements in the main being more with a view to better air regulation. The carburetter fitted to the Brotherhood car, shown by the accompanying illustration, was an instance of the sort. As will be noted, it is of the usual float feed arrangement. The intake faces the exhaust pipes and is in close proximity to them, quite a departure being noticeable, however, both in the location of the carburetter, this being practically on a level with the intake valves of the engine, also the fact that a lead is taken from each side of the carburetter for the different pairs of cylinders. This arrangement will be noticed in the second sketch.

In the second illustration the spray jet, G2, has a hole of comparatively large diameter drilled through it, and it projects upward from the base of the mixing chamber in much the usual way. Fitting down inside the spray jet is a long needle valve, G3, which has two flats filed on opposite sides, to form tapering faces along that portion of it which fits inside the spray jet. The needle is adjustable with relation to the containing tube, G4, by means of a nut at its upper end, this tube carrying a conical and a cylindrical sleeve, G5 and G6, in such a manner that these and the needle travel upward or downward together with it. The conical sleeve surrounds the spray jet, G2, and is contained in a stationary cylinder, G7, that acts as a guide for it. The cylindrical sleeve, G6, slides in the same cylinder, and normally covers the ports, G8, cut through the cylinder wall, but these are uncovered as soon as it begins to move upward with the tube, G4.

This tube and the auxiliary parts moving in conjunction with it are all carried on a rod rigidly affixed to the piston, G9, moving in a chamber surmounting the carburetter just above the double outlet, G1. This piston is normally held down by a spiral spring, but is actuated by the suction in the mixing chamber and is then raised to a greater or



Brotherhood Carburetter.

less extent by atmospheric pressure, as it is open to the latter beneath through small perforations and connects with the mixing chamber from above through other small holes leading into the tube, G4.

The function of this piston is to provide an auxiliary supply of air by opening the ports, G8, in its travel in order to prevent the mixture becoming overrich in consequence of the throttling action of the sleeve, G5. But the latter rising simultaneously thereby increases the amount of annular space about the jet, and the effective area of the jet itself is increased at the same time, though the suction should not fluctuate. By this arrangement it is claimed that the capacity of the carburetter increases proportionately with the speed of the engine or the lift of the intake valves, though the character of the mixture is maintained uniform. In practice this carburetter is said to have given excellent results.

Another method of accomplishing the same result was in evidence in the new type of carburetter fitted to the Albion car. It has two auxiliary air valves, but, unlike the majority of these devices, both are mechanically operated. The accompanying illustration is of a sectional view of the mixing chamber, the float feed, which is of the usual type, being omitted. The main air supply is also patterned after recognized standards, a coned intake facing and close to the engine being employed. But, as will be noted, the throttle, though also of the piston type, lies horizontally, and is mechanically actuated. It is provided with a port cut in its wall for the purpose of admitting an auxiliary supply of air at full load. This port is brought opposite to a similar opening, A8, in the wall of the mixing chamber, which communicates with the atmosphere, but these ports only coincide and admit air when the engine is working with an open throttle. Originally the whole supply of auxiliary air was taken through another port, A6, which is directly controlled by the governor through the link, A7. This valve is still retained, and admits auxiliary air automatically in proportion to the speed of the engine. As first fitted, however, it was found that the range was too limited, for

Albion Carburetter.

at high speeds and light loads the mixture became too weak, and in "speeding up" it was found that the engine received insufficient air in the initial stages. To remedy this, the auxiliary air port, A6, was reduced in area by one-third—which got over the difficulty of weak mixtures at high speeds—and a port, A8, equal in area to the reduction made in the port, A6, was introduced into the throttle—which successfully overcame the other trouble of insufficient air in the initial stages of speeding up the engine.

The same car also embodies a rather unique feature in its ignition system, which is of the low tension magneto type—unique in the fact that, though advocated in several instances in this country within the last two or three years, it has aparently never been tried in practice. It consists in making the magneto an integral part of the engine itself and as predicted in the Motor World show number, it is only a matter of time when this will come in for the share of attention it deserves, for it is a long step in the direction of simplicity and efficiency.

The magnets are carried by a brass spider, which is mounted directly on the front end of the crank shaft, and thus forms the only moving member of the whole aparatus; for the armature is held stationary by a bracket fixed to the crank chamber. The magnets consists of two flat steel bars parallel to one another on either side of the crank shaft.

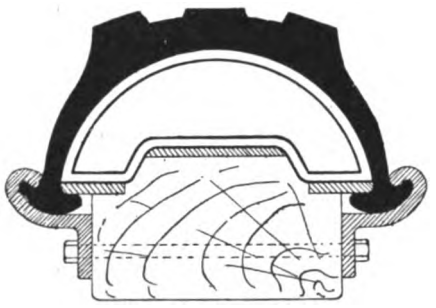
Digitized by Google

The pole pieces are of cast iron, and are bolted directly to the ends of the magnets, and they are so shaped that they project backward and overlap the full width of the armature core. The latter is of laminated construction, built up of a number of thin insulated soft iron plates stamped in the form of a circular horseshoe. Directly opposite the gap in the armature core is the armature coil, and in this position it comes exactly under one of the pole pieces, when the other pole piece bridges the gap. At this instant the magnetic "lines of force" are reversing their direction through the iron core of the coil at the greatest rate, and consequently the magneto is then generating to its fullest capacity, and at or about that position the spark is "timed" to take place. The magneto itself is not "timed," but sufficient latitude is allowed to permit it to be effective at all positions within the "timing" range. Being keyed directly to the crank shaft, there is no trouble in resetting it in the event of removal, and the fact that the magnet is the only moving part renders the apparatus particularly simple.

The Ears as Trouble Detectors.

A well-trained ear as a qualification for the practical chauffeur, whether the latter be the typical "hired man in a leather suit" or the owner who depends upon his own mechanical ability to keep things going, will probably not appear particularly essential at first sight. But many of the ills that the motor is heir to will in their inception be revealed by its noises in operation, the smooth, steady rythm of exhaust and intake mechanism and the breathing of the former, blend with the transmission in the perfectly operating engine to a soft purr which means contentment to its owner so long as it continues.

Of missing explosions little need be said, for until he can recognize this the instant it occurs, the chauffeur's education has not begun, should he be unable to progress past this stage, he is beyond all hope and had better grace an ash cart. None short of a dumb man can fail to recognize the symptoms of missing fire. However, it is not such patent evidence of something wrong, but the faint variation in the steady hum, frequently only discernible by the trained ear which calls for skill in this direction. For in the majority of instances this indicates not that something has gone wrong, but that it is on the road to breakdown, and heed given to its incipient complaint when first heard will often prevent damage.



Theoretically the perfectly designed car makes no noise, and this holds good in practice, more this year than ever before—to the man on the sidewalk—but to the man at the wheel the clicking of the cams and the drone of the gears unite to form a steady hum, only varying with the speed, and any interruption of which is a certain indication of something out of place.

The internal combustion engine is not such a novelty after all; one was in operation in Cambridge, England, in 1820.

Air Tire for Three-Ton 'Buses.

London's motor 'buses, or some of them, at least, will possess the unique feature of being pneumatic tired, contrary to the usual practice where such heavy vehicles are concerned. The impracticability of fitting a pneumatic tire of the usual type to such conditions is self-evident, so the makers—the Palmer company—have not only designed a tire of a peculiar cross section, specially adapted to bear a heavy load, but also a felloe to correspond.

The peculiar shape of the inner tube when inflated will be noticed by reference to the illustration, this odd form resulting from the contour of the felloe, which it partly surrounds. The latter is composed of three steel rims, the central one of which is on a curve of larger diameter than that of the

outer two. This enormous tire, probably the largest pneumatic yet attempted, has a tread of ten inches, this being reinforced by three heavy parallel ribs on the outer cover. The heads, of the usual Palmer construction, are secured to the felloe by flanges and bolts. The construction in other respects is along the lines developed by the same firm in their tires for touring purposes, the "airless cord" fabric being employed.

This huge tire is designed to carry a load of three tons per wheel when inflated to a pressure of 100 pounds per square inch. Though approximately semi-circular in section, the latter is apparently flattened to an extent that will cause the slightest amount of deflation to permit the tread and rim to come together under shock. The experiment of adapting the pneumatic tire to such heavy service seemingly does not hold forth sufficient promise of improvement to offset the additional expense incurred, so that its performance in the case under consideration will be watched with interest.

Ball Bearings for Heavy Loads.

One of the shortcomings of the ball bearing when used for heavy work arises from the fact that the balls comprising the friction absorbing element have but one point of contact. When the speed attains a certain velocity the amount of friction centred on this small surface is apt to cause abrasion, resulting after a time in loss of the exact globular form essential, by a flattening at the point in question. On a bicycle this is practically a negligible quantity in well designed and properly constructed bearings, owing to the small load, but in a heavy car it is apt to be more noticeable.

A modified form of ball bearing, designed with a view to overcoming this objection, is the subject of a recent German patent. In this the balls do not come in contact, but are separated by intermediate pieces composed of spiral springs and end plates, upon which the balls bear. In order to make this bearing surface as large as possible these end plates are recessed to correspond to the end segment of the ball, the centre of this recess or cavity being eccentric to that of the end plate itself.

But it is very difficult when assembling the intermediate pieces so to connect the ends of the springs with the plates that the ends of the springs placed in the spaces, or openings, provided for this purpose, and the centres of the recesses shall lie in the same vertical plane; moreover, in consequence of the compression of the springs in action slight distortion and consequent injurious twisting of the springs would be unavoidable, so the device has been adopted of attaching one or both ends of the springs to the plates to allow for a certain amount of torsion with relation to each plate, so that the turning of the latter will not affect its counterpart. This is accomplished by providing a longer slot in one or both end plates for the reception of the end of spring.

Countryman's "Horseless Carriage."

It is a well known fact that the great bulk of patents in this country originate in the backwoods and country districts. Unfortunately, however, few of these devices are of any importance. Most of them are for trivial devices or for impracticable ideas bred from the narrow lives of the patentees and their limited experience with the mechanical appliances of the day. A case in point is a horseless carriage—it could hardly lay claim to the name automobile—in which the motive power originates in the muscles of its occupants. As the inventor explains, his object is to provide "a vehicle that is easily controlled and one which is adapted to be propelled by one or two persons." With seeming ingenuity he has embodied in his invention adjustable seats to facilitate "the simultaneous effort of two persons of different sizes in the propulsion of the vehicle." Except for this feature and the gearing of the foot propelled crank shaft with the rear axles by means of a bicycle chain device, the buggy sized vehicles does not differ essentially from an enlarged edition of a baby's tricycle. It might be added, the inventor does not expect to make a fortune by his invention.

Brewers to Use Motor Wagons.

"Horseless vehicles will mean a considerable saving in expense to the company" is the opinion of the Furniture City Brewing Co., of Grand Rapids, Mich. In future four motor wagons will be used by the company for the delivery and hauling of its product.

SPOILED COL. GREEN'S RACE

Crankshaft Breaks on "Other Fellow's" Car and Oldfield and Lesser Lights Shine.

Owing to the breakage of the crank shaft of J. Howard Hughes's Peerless car, the feature of the Dallas meet—the fifty-mile race between Hughes's Peerless and Colonel E. H. R. Green's Pope-Toledo, scheduled for last Saturday at Dallas, Texas—had to be called off. It will be held this week, Saturday, March 4. Barney Oldfield appeared, however, gratuitously, it is stated, and attempted to reduce the record, but failed.

The events were run at the Fair Grounds track. Oldfield's trial with his 60 H. P. Peerless was at three miles against time. The first mile was made in 1:08 3-5, and the second mile in 1:07 3-5. In the third mile the engine started to miss explosions, and the time was much slower—1:09 1-5. Later Oldfield tried again and made the first mile in slightly better time—1:06 2-5. In the second and third miles the engine missed badly, and the total time for the three miles was run up to 3:25 2-5.

The interesting event was a five-mile handicap, in which three cars started. Ollie Savin, with a handicap of 0:35, driving a 35 H. P. Pope-Toledo, was the winner, in 6:33 1-5. J. Howard Hughes, driving a Peerless touring car, was second, and Barney Oldfield brought up the rear. Summary:

Three miles, open—S. H. Boren, Franklin, first; Dr. E. E. Wilson, Franklin, second; George A. Titerington, Ford, third. Time—6:29½.

Three miles against time—By Barney Oldfield, in 60 H. P. Peerless. Times—First mile, 1:08 3-5; second mile, 1:07 3-5; third mile, 1:09 1-5.

Five-mile, Texas Handicap—Ollie Savin (0:35), Pope-Toledo, first; Howard Hughes (1:00), Peerless, second; Barney Oldfield (scratch), Peerless, third. Time—6:33 1-5.

Three miles, "filler-in"—S. H. Boren, Franklin, first; E. E. Wilson, Franklin, second; G. A. Titerington, Ford, third. Time not taken.

Three miles against time—By Barney Oldfield, in 60 H. P. Peerless. Times—First mile, 1:06 2-5; second mile, 1:09 3-5; third mile, 1:09 2-5.

Louisville Calls for Numbers.

Louisville (Ky.) aldermen have an ordinance under consideration regulating the speed of automobiles within the district bounded by the river, Preston and Fifteenth streets to eight miles an hour. Beyond this district twelve miles an hour will be tolerated within the city limits. The ordinance further provides that all automobiles carry a number prominently displayed on the machine corresponding to the number of the license required before he is allowed to operate the car on the city streets.

Each automobile is to carry a white light in front and a red light in the rear when being run on the streets at night, and while a car is standing unattended on the streets the motor must be stopped. It is stipulated in the ordinance that the section referring to license numbers does not apply to machines owned by non-residents.

Briggs, of Maine; His Bill.

Representative Briggs has introduced a bill in the Maine Legislature providing for the registration of automobiles and motor bicycles. The bill provides that no automobile or motor bicycle shall, after June 1, 1905, be operated on any public highway unless registered, and the registered number shall at all times be plainly displayed on the car. Registration shall be made at the office of the Secretary of State, and the fee shall be $3. The certificate shall not be transferable, and a new registration shall be required upon the sale or transfer of ownership of any automobile or motor bicycle.

The act shall not apply to machines owned or operated by non-residents of the State. Penalties for the violation of the act shall not exceed $25 for the first offence and not exceed $50 for any subsequent offence.

Non-Residents Worry Cleveland.

New automobile laws will be passed by the City Council of Cleveland, Ohio, if City Clerk Witt has any voice in the matter. Under the existing ordinance a visitor coming into the city pays $1 and gets a local license. Generally when he leaves the city, it is alleged, he turns it over to some one else, which has occasioned considerable confusion. Witt will ask that the ordinance be amended so that a non-resident automobile owner be compelled to pay $5 for a license, the money to be returned when he leaves the city, if the license and number are returned. He will also ask that the carrying of two numbers on a car at the same time be prohibited.

Dewar Cup in a Whiskey Shop.

It may be that love of sport inspired Sir Thomas Dewar's gift, but, if so, his American representatives are turning it to the advantage of his business. The $2,000 cup which was won by Lewis S. Ross at the Florida speed carnival now forms the centrepiece of the display in the window of the Dewar whiskey shop on Broadway, New York. The facts that it is the gift of Sir Thomas and that it cost $2,000 are duly placarded that none may overlook them.

Prince Offers a Prize.

One hundred dollars reward has been offered by the Prince of Arenberg for the best arrangement for protecting the head from cold when driving. Those intending to compete must send in the design to the Automobile Club of France. No scheme will be considered which prevents the driver from hearing or giving signals to other drivers.

St. Paul Automobile Club, of St. Paul, Minn., has elected the folowing officers for the present year: President, L. A. Wood; vice-president, George E. Knocke; secretary, B. A. Ledy; treasurer, J. S. Bryant; trustees, T. W. Short, R. C. Wright and R. M. Neeley.

SCOVEL BILL STRIKES SNAG

New Jersey's Pickpocket Measure Sent Back to Committee and Public Hearing Ordered.

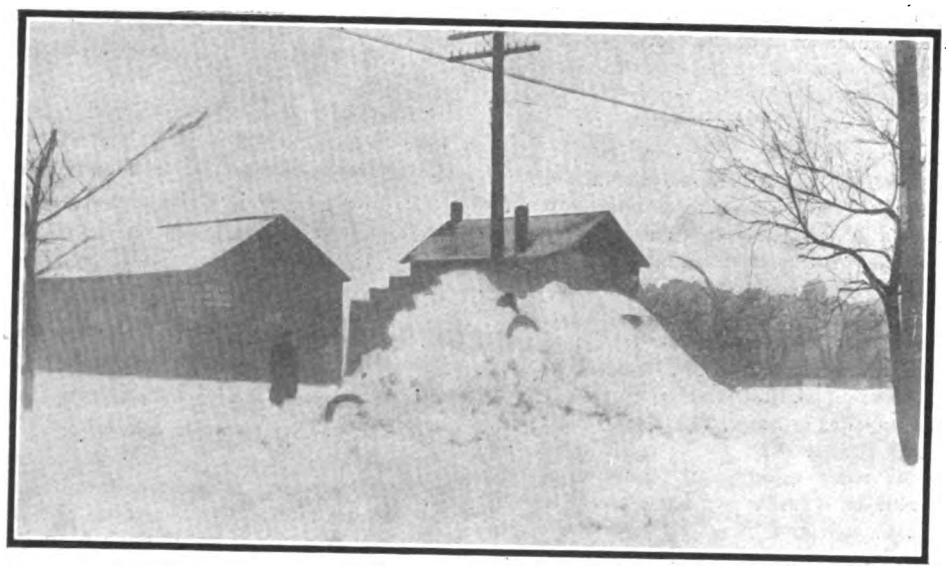
Assemblyman Harry S. Scovel's plan to pick $5, in the form of an annual license fee, from the pockets of all automobilists who use New Jersey roads, and to force them to plaster their cars fore and aft with conspicuous numbers, and to permit any old constable to haul them before a magistrate at any time, without a warrant, and get "soaked" $50 or imprisonment, or perhaps both, as "his judicial highness" prefers, struck a snag when it tried to pass the Assembly on Tuesday morning. The opposition was such that the measure was recommitted to the Committee on Municipal Corporations, which will give the automobilists a chance to defend themselves at a public hearing on Tuesday, March 7, at noon, at the State Capitol, Trenton, N. J.

Mr. Scovel thinks his constituents are demanding the passage of such a law, and he is using every means at his command to gain the votes of the fellow-solons to gratify his rural constituents' desires. Although lawmakers from other sections of New Jersey are less interested in automobile legislation than is Mr. Scovel, yet they are willing to vote for the obnoxious measure in exchange for assistance to some of their own pet schemes. Therefore Scovel may be able to force the measure to an issue by this power he holds over his associates.

The opponents of the bill, however, are determined to bring about its defeat, if not in either the House or Senate, then by the veto of Governor Stokes. Apropos of this, the Governor has received a deluge of protests from automobilists, real estate owners and brokers and manufacturers from all sections of the State, imploring him to veto the measure if it works through both houses.

Tales of Queen Margaret.

The Dowager Queen of Italy has lately given proof of her passion for automobile riding by making a trip from Rome to Turin, a distance of four hundred miles, for the purpose of viewing the automobile show.



The interior of the car shows the Queen's devotion for the saint credited with being "the protector of automobilists." In the carriage is a large silver medallion of St. Christopher crossing a river with the child Jesus on his shoulders.

Queen Margaret has had several gold medals bearing the same figure made, and has distributed them to the royal chauffeurs and the members of the royal family who are automobilists.

Twelve men are employed as chauffeurs in the garage, under the personal supervision of an experienced director, and each wears a blue uniform designed by the Queen. She encourages home industries by having six different Italian types of cars.

Packard Car With a Snow Plough Clearing the Road Near the Factory in Detroit.

Owner Not Liable for Chauffeur.

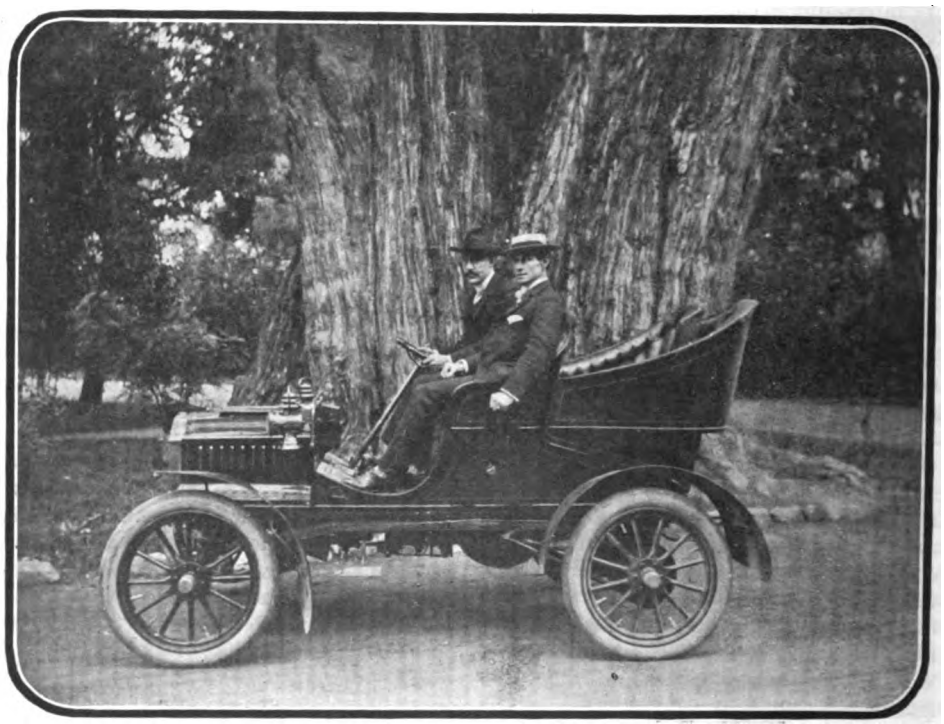
The idea that the principal is responsible for the acts of his agents received a setback last week. The point is of special interest to automobile owners because of the too prevalent practice of chauffeurs using their employers' cars without permission, and too frequently of using them to indulge in midnight carousals.

The case in point is the decision of Judge Walsh, in the Gates avenue municipal court, Brooklyn, N. Y., who on Saturday last dismissed an action against Charles B. Dillingham by Louis Reuge. Reuge's son was knocked down and injured by Dilingham's car while it was in charge of his chauffeur, E. Ganley, who was taking some of his friends for a spin. The number of the car was taken at the time of the accident, and later a suit for damages was instituted against Dillingham as the owner of the car which ran down the lad.

Dillingham testified that Ganley had taken the car without his permission or knowledge; in fact, he had not even heard of the accident until he was served with a summons in the suit. Judge Walsh ruled that the owner of an automobile cannot be held responsible for damages when the car is in charge of a person or persons without the authority of the owner, and accordingly dismissed the suit.

Doctors at Dinner Discuss Autos.

The automobile as an auxiliary to the successful physician was exploited at the annual banquet of the Practitioner's Society of the Oranges, held last Friday night in Newark, N. J.



Winthrop E. Scarritt, former president of the Automobile Club of America, declared in his speech, which was the principal address following the dinner, that in the course of a few years the physician who does not own an automobile will be as much out of date as the surgeon who does not use aseptic methods.

Mr. Scarritt spoke on the subject "The Doctor on Wheels," He said that in these days all is motion, all is action, and the automobile was indispensable to the physician in making his hurry calls. He closed his address with the prediction that within a year one out of every twelve hundred persons in the country would own an automobile.

For a Tug-of-War Between Cars.

Minneapolis (Minn.) dealers are planning a novel contest—an automobile tug-of-war—in connection with the annual Kenwood hill climb. A discussion between A. C. Bennett and Harry Pence last week concerning the relative pulling qualities of the cars they represent ended in both men agreeing to a pulling contest between a Winton and a Packard car. Other dealers, learning of the plan, thought it a good one, and the contest will become general. The terms of the match call for the disconnection of brakes, for tires without non-skid covers, and for each car to be equipped for touring. The contest is to be held on a level piece of ground, the cars to be tied back to back by a cable to each rear axle. The start will not be made by a jerk, the match not being declared on until both machines are pulling steadily.

And Then on This One.

Demonstrating an Oldsmobile in Mexico City.

Cincinnati Outlines a Busy Show.

A clubhouse and garage, an automobile parade, a series of races and a hill climbing contest figure in the plans of the Automobile Club of Cincinnati, Ohio. The clubhouse will cost, approximately, $100,000, if the dreams of the members are converted into cash. It is planned to erect the garage on Seventh street, between Main and Walnut streets. The automobile parade is booked for April, but the dates for the races and hill climb have not been set.

The Automobile Club of Leroy, N. Y., has been organized, with these officers: President, Harold B. Ward; vice-president, D. C. H. Prentice; secretary and treasurer, Dr. Lee Skinner.

SPARK PLUG STABILITY

The One Part of the Ignition System that has Defied Radical Change.

One of the few important things about the motor that has seemingly both been let severely alone by the car builders and also has succesfully resisted every effort to improve it out of all semblance to its original is the spark plug. How small an item of the completed engine's make-up it is, but how helpless the most perfect motor ever made is without it!

The engine builder has known all along exactly what was required to make a perfect spark plug, has realized only too well just what its elements should be—impervious, non-breakable insulation, absence of sooting, oil proof and of reasonably long life; but in the light of his many troubles it is not at all to be wondered at that he has left the solution of the problem almost entirely in the hands of the specialist. The latter was familiar with the electrical side of the question, and, so far as theory went, encountered no difficulty in producing a perfect article right from the start—that is, where design was concerned, for in this respect the plug of to-day does not differ in any essential from its earliest predecessors. But conditions prevailing in practice were such as had never previously come in for attention; vibration, oil and soot were factors, the destructive qualities of which had been very much underrated. The first frequently succeeded in giving a new plug its quietus in a very short time by cracking the porcelain, and when the latter broke and dropped into the cylinder there was trouble, unless that cylinder head came off—and many then didn't have that kind—getting a view of the inside of the cylinder meant starting from the other end and practically dismantling the engine. Oil has two effects, both equally pernicious and productive of cuss words. Au naturel it is a most efficient insulator, and a few drops of the lubricant on the points make no end of trouble for the man who doesn't know where to look for it. Carbonized, there are few better conductors, and a short circuit is far worse than none, for the dry cells or accumulators are prone to give up their life during the course of the investigation. If the latter consumes a great deal of time they have "laid down" completely, and consequently will not respond when the trouble is finally located, so of the three evils, sooting doubtless gives rise to the greatest amount of wrath and hard feeling on the part of the man who has to toil at the crank.

Unconsciously perhaps, but, nevertheless, quite as effectively, the man who drives the car is responsible in large measure for this greatest of evils, for it can almost invariably be traced to the lubricating oil—too often it is not of the right quality and begins to carbonize as soon as the motor is well under way. Continuing to feed it to the cylinder sooner or later cakes up everything, and this effect will be most noticeable in the exhaust passages and muffler, which gradually become obstructed. The only remedy is a thorough cleaning of the accessible portions and flushing with kerosene or gasolene if the cylinder is not opened. But it is not necessary to wait until such a condition has been brought about before applying the remedy—it will reveal itself from the start in the black smoke emitted at the exhaust, and can be prevented before harm is done.

Porcelain is without a superior as an insulator, and has survived to this day in the plug despite the tendency to fracture, though the latter is no longer the constant source of annoyance it once was. Mica has, however, come into very general use during the last two years, and has many advantages to recommend it. Following the lead of foreign makers in this respect, plugs insulated by layers of mica transversely placed, put together under very heavy pressure and then turned true in a lathe are now very common here. They are generously shellacked as a finishing touch, and this, together with the great pressure under which the insulating core is formed, tends to reduce the amount of moisture absorbed to a negligible quantity. A capacity to withstand shocks fatal to the porcelain plug often before it is put on the engine is probably one of their chief virtues.

Despite the thousand and one so-called improvements that have been brought forth during the last five years in the way of "an always sure-fire, last forever plug," the simonpure article of original design still reigns supreme, and it would be a difficult matter to find anything else on this year's best cars, small or large. Of course, important innovations that merit attention have been introduced and have stood the test of time, but they are one and all little more than additions to the old groundwork, adopted principally to aid in the prevention of sooting.

The perfect plug, like the perfect man, is not yet, so the shortcomings of the present day article should be recognized, and, instead of howling against it, tie a rope around the finger as a reminder to put an extra one in the tool box before starting on a tour, or, as a humorist has it, invent a phonographic attachment to the car which calls the driver's attention to this little essential at the right time.

Widow Wants Large Mite.

As a sort of afterthought of the fire which destroyed the assembling rooms at the Cadillac Automobile Co.'s plant at Detroit, Mich., on April 13, 1904, Margaret E. Overbrook, a widow, who was employed in the factory at the time of the fire, has brought suit against the Cadillac company for $25,000 damages for injuries received. The plaintiff, who was working on the third floor of the building when the fire started, claims that her life was saved by her brother, who dropped her to the ground from the third story window. She claims to be permanently injured, and therefore holds the automobile company responsible.

STEEL FOR TRANSMISSIONS

The Efforts to Find Most Suitable Material—Frenchman Evolves a New Compound.

Of all the problems which confronted the pioneers in automobile building, the question of transmission long proved a stumbling block and the crude methods—or possibly the great difficulty—in obtaining metal which would withstand the strains imposed upon it by the new hand at driving, who would insist upon reversing without freeing the engine, was one of the most prolific sources of discouragingly high repair bills. Transmissions have been improved wonderfully since that day, and there are likewise now men who would not think of trying to reverse at full speed with the clutch in, no matter what the emergency, but probably the improvement in the quality of the steel used is responsible to a greater extent for the routing of the bugbear of stripped gears than any other.

The sliding gear transmission is a piece of mechanism at which the engineer has held up his hands, but, all theories to the contrary notwithstanding, it has survived despite its latent defects and until something which holds promise of very much greater efficiency appears, will doubtless hold first place in the estimation of a majority of heavy car builders. It is interesting to note the various stages which transmission gears have passed through before reaching their present state, and in this connection to advert to the new steel for this purpose recently placed on the market by a French inventor.

The ordinary cast gear very soon proved itself to be utterly inadequate for the purpose, and was shortly followed by the use of machine-cut gears of mild or cast steel, and while this probably marked a step in advance, it, too, fell far short of the unusual requirements. Probably just what the latter were had not been fully recognized up to that period—except that the gear that would not chip was from the first the great desideratum. It was then seen that not alone a hard surface was essential, but also a yielding interior, and to attain this end case hardening was resorted to, but results, owing to an imperfect knowledge of the best methods of performing this operation, were far from uniform or satisfactory. However, the drawback was soon found not to consist solely in the handling, but in the steel treated, and some classes of nickel chrome steel were produced that seemed specially fitted for the case hardening process, while others did not require it at all.

The most remarkable characteristic of the new French steel referred to is that it combines exactly the qualities sought for all along—the property of becoming harder and tougher with wear, strain and friction invariably resulting in crystallization and fracture in the ordinary metal. In the process of manufacture, this steel is carburised in the ordinary manner by heating in boxes

Digitized by Google

with the usual case hardening substances, a temperature of 1470 F. being maintained for about seven hours. The greatest advantage of the process comes in here, as there is no necessity for quenching in water, and the distortion incident thereto is avoided. The parts are allowed to cool slowly, when they become quite hard. The physical tests of this steel are as follows: Tensile strength, 33.4 tons per square inch; elastic limit, 24.8 tons per square inch; elongation in 2 inches, 31 per cent., and contraction of area, 69.5 per cent. The sole rights for France have been purchased by one of the leading automobile makers of Paris, and the performance of cars fitted with gears of this new material will doubtless be watched with interest during the coming season.

Farson Out; Police Get Busy.

Convinced that the uncompromising hostility of its president to the numbering and licensing of automobiles would put the Chicago Automobile Club in an unenviable position when it begins its campaign for State registration of cars, the board of directors of the club last week accepted the resignation of John Farson as the president, to take effect March 1.

At the beginning of the year Farson filed his resignation with the board of directors, to take effect March 1. Ordinarily the board would have taken no action in the matter until the latter date, but, convinced that the attitude of he club should be fully understood by the public at once, the directors on Wednesday decided to accept the resignation without delay.

To succeed Mr. Farson, Ira M. Cobe, who is described as a "cool, level headed man," was chosen, W. G. Lloyd, the second vice-president, was elevated to the first vice-presidency, and the office of second vice-president was left open.

In view of the fact that the directors of the club expect the legislature to pass a bill removing the control of automobiles from the jurisdiction of municipalities to that of the State, they are little concerned about the decision of the Appellate Court dissolving the injunction recently issued by Judge Hanecy, in the Superior Court, restraining the city from enforcing its ordinances concerning the licensing and numbering of automobiles. As a matter of fact, about 97 per cent of the members of the club have taken out numbers from the city, although the injunction issued by Judge Hanecy prevented the city from compelling them to do so.

As the result of quashing the Hanecy "midnight injunction," the police were notified to look for all unlicensed cars. A. C. Banker, who was one of the most strenuous in opposing the original ordinance, happened by chance to be the first man caught. He was fined $10. Four others who had probably not heard of the quash were also caught the first day, but after that the police could not find a single car without a license.

Automobilists of New Orleans, La., will soon have a new country club and garage if plans of the automobile club do not go amiss.

WANTS A CLUBHOUSE

Movement Started at Newark Club's Banquet —Scovel Bill Discussed and Denounced.

Transmission gears and sprockets, brakes and spark plugs, motors and carburetters and all the other intricacies which make automobiles go were relatively discussed at the second annual banquet of the New Jersey Automobile and Motor Club at Newark last Thursday night. Later more serious speeches were made upon topics of interest—the Scovel bill, now pending in the legislature, and a new clubhouse.

After the feasting Frederick Platt, president of the club, who acted as toastmaster, made an address of welcome. His speech was in a reminiscent vein, and as he told of his first automobile and the experiences he had with it he was greeted with sympathetic laughter. Mr. Pratt's stories about the first chauffeur whom he engaged, who knew absolutely nothing about the workings of a motor, but was an expert at cleaning the brass work and tooting the horn, seemed to find favor with his hearers. The club had shown a remarkable increase in membership, the president said, and was now the third largest in the country. At this time last year 139 members were on the rolls, and up to Thursday night it was announced that the number had been increased to 425.

Richard C. Jenkinson, who was the next speaker, devoted his time to a criticism of the Scovel bill. The deepseated aversion to automobilists which country constables and their colleagues, the rural justices of the peace, entertained, the speaker declared, would make the power of arrest without a warrant a dangerous one and would threaten the welfare of the sport in the State. Mr. Jenkinson urged that the club itself adopt speed regulations, with a severe penalty for their violation. If the citizens saw that the club was acting in good faith in the matter the attempts of the rural classes to secure the passage of more stringent laws would cease.

Dr. H. Crittendon Harris spoke in a similar vein. He suggested that a circular letter, signed by the twenty-five hundred registered automobilists, all intelligent voters of the State, be sent to the legislators.

A new clubhouse was the theme of Bernard M. Shanley's talk, and he put in a vigorous plea for a place where the members could meet and talk over their pleasures and troubles. The club, the speaker said, was larger in point of numbers than many clubs owning houses, and he urged that the same enthusiasm be shown in carrying out the clubhouse movement which was manifested in the efforts to increase the membership.

As B. M. Shanley owns a large portion of Newark, the selection of a suitable site for building purposes ought not to bother the building committee.

Hunter Heads New Jersey Club.

At the annual meeting of the Automobile Club of New Jersey, on Friday last, the following officers were chosen for the ensuing year: President, W. B. Hunter; vice-president, C. E. Reiss; secretary-treasurer, G. Franklin Bailey; governors, Winthrop E. Scarritt, James B. Dill, Dr. W. Quivey, Isaac H. Blanchard, A. J. Lamme and George H. Jacobs.

As an effort is making to organize a State association of automobile clubs, the New Jersey club appointed President Hunter as its representative to attend any meeting for the purpose that may be held. Also as the club was one of the founders of the American Automobile Association, and has always been one of its most loyal supporters, and having recently acquired clubrooms in Brick Church, East Orange, which have garage facilities, it voted to extend the privileges of its quarters to all other A. A. A. clubs.

Janesville Organizes a Club.

The Janesville (Wis.) Automobile Club has started well. Over fifty men signed the charter roll last week, when the following officers were elected: President, Dr. R. W. Edden; vice-president, A. G. Anderson; secretary and treasurer, F. H. Blodgett. The object of the new club, as outlined by its president, is "to promote good fellowship among automobilists, but more particularly to foster good feeling between them and others with whom they share the use of the public highways."

"We recognize the fact that the only way to accomplish this end is to unite with all the horse owners in seeing that the laws governing the speed of automobiles are carefully observed," says Dr. Edden. "Each member of the club has pledged himself to observe the laws, to be courteous to the horse drivers and to do all in his power to avoid accidents. Any member who does not live up to these standards will be expelled from the club."

How They Stopped the Horse.

Here is a brand new stunt, and none the less interesting because the story emanates from Brooklyn. As a man and woman were driving along Coney Island Boulevard the other evening their horse suddenly took fright at an automobile which was approaching from behind, and bolted, tearing the reins from the driver's hands. The motorists, seeing the imminent danger, raced the maddened animal for some distance, till, running along beside him, one of them managed to grasp his bridle and hold it until machine and horse could be brought to a standstill. Neither of the occupants of the carriage was injured and no damage was done to the outfit. Surely this should be handed down to posterity as a bit of very clever car handling and an heroic act.

Thief Steals an Electric.

Indianapolis, Ind., had its first automobile theft last week, and Dr. C. B. McCullogh is the loser. He left his electric runabout in front of his office, from where it was taken and the police have since been unable to find a trace of it.

Digitized by Google

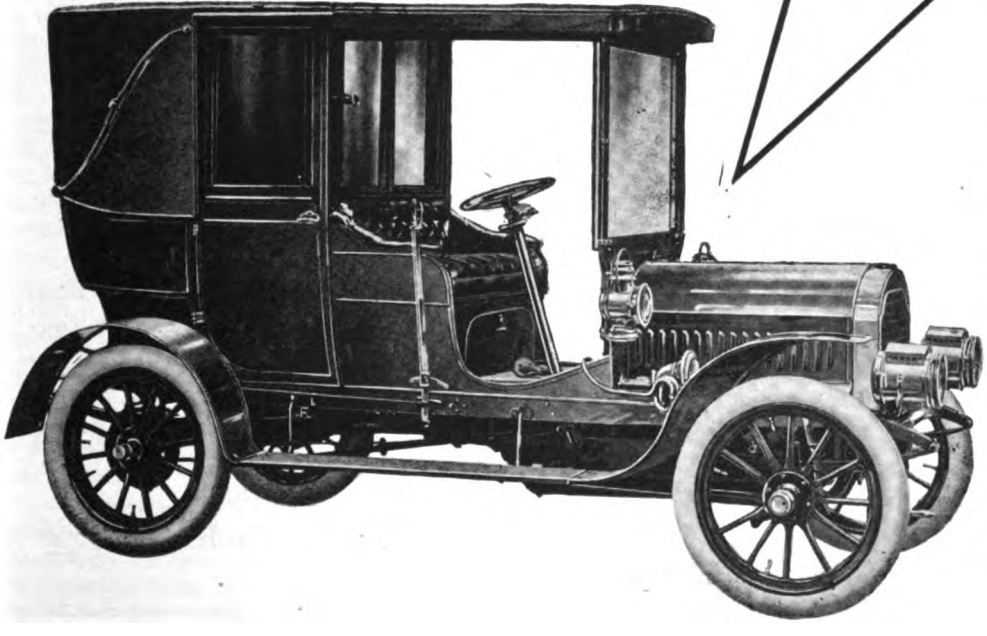
Successful Car Building.

WE are this year standing firmly on the fact that we have built a real car, because we have built a car adapted to American conditions, American roads and the American temperament. We know our American market as no French builder can know it.

We have surmounted the problems of car-building this year as we never surmounted them before, although our progress has been steady and on right lines.

We believe the Pierce car to-day expresses the best that can be had in car-building, and we are willing to abide by the result of actual experiment.

Booklet describing the six 1905 cars of the George N. Pierce Company, with special booklets describing the mechanism of each, will be sent on request.



The George N. Pierce Company,

BUFFALO, NEW YORK.

Manufacturers of Pierce Cycles.

Members of the Association of Licensed Automobile Manufacturers.

The 28-32 horse-power Pierce Great Arrow Landaulet body by J. M. Quinby & Company. **PRICE, $5,000.**

PIERCE

In the Retail World.

L. W. Welch has taken the Grand Rapids, Mich., agency for the Thomas cars.

Russell Dricks has taken the Boston, Mass., agency for the Stevens-Duryea cars.

Harry Pence, of Minneapolis, Minn., has opened a branch store and garage at Fargo, N. D.

Frank Anderson, agent for the Rambler cars at Aurora, Ill., has removed his salesroom and garage to No. 113 Main street, to secure much needed elbow room.

W. D. Vandecar has withdrawn from the Richmond-Vandecar-Jarvis Automobile Co., Grand Rapids, Mich., and will embark in business for himself in that city.

Thomas B. Jeffery & Co., Kenosha, Wis., will build a two story salesroom and garage, 60x111 feet, on Sheridan Road, near Wilson avenue, Chicago, Ill. The structure will cost $20,000.

Altoona Motor Car Co. is the name of Altoona, Pa.'s., first automobile company. Ralph Rohrer, Harry Morgan and M. C. Sperry, the organizers, have opened a garage at No. 712 Breen avenue.

Following in the footsteps of Eastern cities Minneapolis is to have an automobile livery. H. G. Gooseman is the promotor of the enterprise. The garage will be located at No. 6 East Grant street. Eight large touring cars will be in use during the summer, and in the winter limousines will be employed.

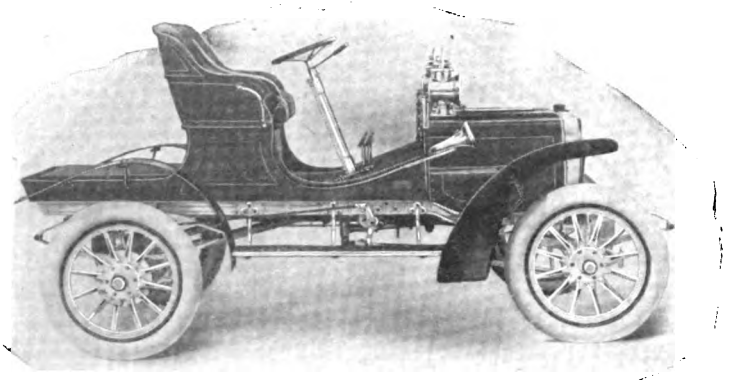
The Winton Motor Carriage Co. has leased for a period of ten years the property No. 1,253 to 1,261 Michigan avenue, Chicago, Ill. The rent will not be less than $6,000 a year nor more than $10,000, and in addition the Winton firm agrees to pay 8 per cent on the total cost of a new building, not to exceed $63,750.

Need of a larger establishment has forced Moulton & Jordan Co., Minneapolis, Minn., agents for the Peerless cars, to lease a site on Fourth street, between Second and Third avenues, south, where a new garage will be erected for their use. It will be a two story brick building, 160 feet long, with a frontage of 40 feet, and will cost, approximately, $15,000.

Here's the "One Man Show."

Here is a story of a "one man show" with an automobile as its only excuse for existence. It comes straight from France, the proud owner of the car being a French theatrical man who "does the provinces." During the day the automobile carries the properties and the company, manager, electrician and lecturer—all one, by the way—and at night the motor is pressed into service to run a small generator which supplies sufficeint current for an arc and several incandescent lamps to illuminate an impromptu theatre and the cinematograph as well, which is the whole show, and that it is an economical one is plain.

Test of Tire Detachability.



Both an interesting and instructive feature of the London and Berlin shows was a tire fitting contest inaugurated by the makers of a particular tire. Needless to add, it proved a drawing card that banked the spectators ten deep around the booth while going on.

Primarily its object was to demonstrate the ease and rapidity with which a punctured tube of the make in question could be replaced on the road by a spare. To this end several prizes were offered, and the competition was open to all chauffeurs. The only requirements were extracting the punctured inner tube, replacing it with a new one and inflating in the shortest time. There was no lack of contestants, and on the average ten minutes was consumed in the operation. The record for the English show was 6 minutes 41 4-5 seconds and at Berlin 6:30.

Londoner's Bid for Business.

An English builder of commercial gasolene vehicles has devised a unique moving exhibit to advertise his wares in London. A heavy car was fitted with a box stall, bearing the sign, "Unemployed. Passing of the horse," and in it was placed a specimen of the equine race, known to automobilists as a "corn beef" motor, and which scientists tell us is bound to become extinct in the future; just when is not certain; probably it will be coincident with the exhaustion of the coal supply, which is definitely predicted by the Sunday newspapers for five million years hence.

NORTHERN

Two-passenger NORTHERN Touring Car with rear luggage platform; 18 h.p.; 100 inch wheel base; 4 inch tires.
Price, $1500.

NORTHERN construction is absolutely unique. It stands apart. It is a marvel of simplicity, compactness and strength.

The word "simplicity" has been much abused by automobile manufacturers.

When used in connection with NORTHERN mechanism it means **exactly** what it says. No other car made demonstrates to such a degree the merit of real simplicity.

All machinery is instantly accessible. There is only one universal joint. There are no belts, chains, or gaskets. No strut rods or truss rods. No confusing array of wires, etc. Power is applied direct to rear axle.

The STURDY NORTHERN Runabout. 7 h.p. **Strong,** speedy and reliable. The handsomest and best finished machine of its class. Now sells for $650.

Are you interested in cars that bring the buyers "no expense but the gasoline?" Write for Catalogue.

ABOUT ROTARY ENGINES

Why they Hold Fascination for so Many Inventors—The Promise Held by Turbines.

Ever since the days of Hero's engine, inventors and engineers have been striving to devise some practical form of motor in which the turning effort should be uniform and free from intermittent pulsations. This will-o'-the-wisp whose torque or drag on the driven machinery is unvarying throughout each revolution and from revolution to revolution, and which is at the same time entirely practical, compact and durable, has led many a persistent investigator a merry dance to no purpose. But others have been more fortunate, and their labors have been well rewarded.

One of the most primitive forms of the steam engine consisted of a spherical vessel mounted on horizontal trunions over a fire. From opposite sides extended two tubes which terminated in jets turned at right angles to them. When filled with water the reaction of the steam escaping from the jets caused a rapid rotation of the affair by its reaction. A mere toy in itself, it was the archetype of the most efficient of all steam engine, the turbine.

The principles of impact and reaction were studied for centuries in the windmill and the water wheel, until at last motors were produced which satisfied the demands made upon them. And the laws developed in their making have since been turned to the more difficult application of elastic heated vapors.

Meanwhile, the reciprocating piston engine was developed, and its improvement kept pace with the needs of the world, until the evolution of electrical science brought forth a motor whose compactness and handiness, as well as its smooth action, recommended it at once to all sorts of uses. It seemed that nothing more was to be desired. But a serious drawback presented itself in its dependability. It must be connected with a source of supply at all times. There was no such thing as a storage of electricity. An approximation to it, an apparent storage of the fluid, was presented in the accumulator. This, efficient and serviceable though it be, has yet to be reduced to an ideal form. For some uses its value is indisputable, but for those involving considerations of its weight and bulk, even leaving out the all important item of cost, it is at present far from satisfactory. Its extension to its broadest field of usefulness is held in abeyance for the coming of certain much needed improvements.

Not until within a very few years was any form of rotary engine made practical. But to-day the turbine stands in ever increasing utility, a monument to scientific mechanical evolution. Its best form, however, is adapted to heavy work, for it has yet to be produced in a practicable form for small powers. And here it falls short of the demand, for all along the effort has been to secure a motor of even torque which should be neat and simple and thoroughly adaptable for small powers in a variety of ways. The needs of small, isolated plants, the well defined advantages of the multiple-unit system of power supply, in which several machines are driven independently of one another at a saving of the energy used were they handled as an aggregation, and last, but not least, the need of a compact, independent engine for the motor vehicle, have created a growing demand for such a motor. And, instant though the demand may be, it has yet to be fully satisfied.

Considering the proposed solutions of the problem, the forms already in use, the best results so far obtained have been from the two and four cylinder compound steam engine, commendable for its smoothness of action and control, and from the four cylinder gasoline engine, which has the advantage in points of bulk and fuel economy. But, no matter how well balanced are the moving parts, no matter how well chosen the flywheels, the impulsive effort of the reciprocating pistons, particularly noticeable when the motor is overloaded, has a continual wear and tear effect on all the subjoined mechanism, which necessitates added weight and strength in all its parts.

Of the forms of rotary engine, there are five, all more or less practicable for the purpose. There are; the turbine, a derivative of the water wheel; the rotary piston engine, which may be compared to a single bladed impulse wheel; an inversion of this, in which the piston is stationary and the cylinder rotates about it, the internal action being the same; and the hybrid rotary reciprocating, in which several cylinders fitted with reciprocating pistons are arranged radically about the crank shaft. In this, as in the preceding type, either the shaft rotates or the whole cylinder casing turns about a stationary crank; the principle is the same in either case. These parent forms have given rise to almost numberless experimental models which have been worked up with more or less skill, and have yielded correspondingly successful results. In nearly every case the mediocre success or absolute failure of the affair has been due to purely mechanical difficulties. The theoretical considerations involved are at the present time pretty well understood, but their practical application must be worked out by rule of thumb in many cases. It must be a purely experimental result.

Now, the balance between drawback and advantage of any one of these types, the criterion of its adaptability, depends for the present on the results obtainable from it. For the future, it is largely a matter of conjecture.

As has already been said, the steam turbine in its best form is more efficient than the compound reciprocating engine. Records of authentic tests show, in many cases, an advantage of nearly a pound of water consumed per horse power. This, though comparatively slight, together with the advantages of its simplicity, diminutive size, and even action, place it on an equal footing with the older forms. As installed in lighting and power plants in several of the larger cities, it is yielding good results from the mechanical standpoint of reliability. But its action demands an enormous velocity—the present commercial forms running at speeds varying from 20,000 to 30,000 revolutions per minute—and this must be increased as the size of the engine decreases, since the peripheral speed bears a fixed relation to the velocity of the working vapor. Hence, it would be extremely difficult to construct a small sized machine which would work to advantage, because of the necessary speed reduction, and the tremendous centrifugal force which must be dealt with. Besides these, certain purely thermodynamic considerations make it seem impracticable to construct a small motor whose consumption would be at all rational. The low, or medium-powered, steam turbine is a thoroughly possible development of the present forms, but just when it will ripen, or whether a more satisfactory engine will appear before it is ready, cannot be foretold.

The gas turbine, occupying with regard to the steam turbine a position analogous to that of the two forms of reciprocating engines, is an inventor's dream. In theory it is wholly plausible. The subject has been well studied and considerably discussed in scientific circles from the standpoint of the ideal. But of practical results nothing has yet appeared. The high working temperature of the gas, coupled with the high speed required, make the problem very difficult to solve. And, again, considerations relative to its thermodynamics point to a probable poor rate of economy.

The rotary piston engine and its converse type is simpler than the turbine, in a way, since it deals with the direct impulse of the gas, and not with its reactionary effect. The steam is admitted behind the piston and forces it around until at a certain point it is cut off and a period of expansion allowed till the opening of the exhaust. The cycle is precisely that of the reciprocating engine. An engine of this sort is very compact, runs smoothly, and by coupling several cylinders together may be made to yield a uniform torque. But its drawback lies in the mechanical faults, due to leakage and excessive friction set up in an effort to reduce it. Of the numerous forms of rotary impulse engine which have been proposed, several have used a shaft eccentrically set in the casing. This necessitates some form of sliding piston, together with its attendant packing, and adds an internal mechanism which is likely to get out of order.

A like form of motor, usable for gas, either on the direct combustion plan or on the commoner two or four cycle order, may be produced at some future time. The difficulties against which it must struggle are, of course, dependent on the high temperatures and pressures involved. And they seem well-nigh insurmountable. However, the small motor

Digitized by Google

of the future may come from this very source.

As to the rotary reciprocating type, the Brotherhood engine, an old leader, has been followed by many variously successful models of similar principle. Good results are obtainable, even in small motors; their turning effort is fairly even, and with the evolution of perfection in mechanical detail, they may ultimately rise to a position of importance.

In the gas field the same idea has been applied to air-cooled motors, in which the cylinders rotate about the crank shaft, and thereby receive a cooling effect, which is directly in proportion to the speed, and serve also as a fly wheel to balance the effort of the explosions. Of this type there is but one at present in the market.

The ideal requirements of the automobile engine are best expressed in the electric motor, which combines with its smooth working qualities a compact simple form, and a method of control which does not demand skillful handling. The steam turbine and that using gas as well would probably compare very favorably with it in weight and size, and also in control, except for the fact that the gear reduction would be greater and the reverse would have to be accomplished by some form of gearing. The rotary piston and rotary reciprocating forms would approach the ideal in lesser degree because of their added complexity.

Although it is satisfactory in many ways, the power plant of the average car of the day occupies an enormous amount of space. To one accustomed to the older forms of machine, this fact is not surprising. But he cannot but be impressed with the wonderment of the layman on seeing for the first time a car stripped of its outer covering. There is so much mechanism; there are so many delicate adjustments to be made, and there is such a multiplicity of levers and handles, that he is quite confused by the jumble of parts. The control alone involves the use of a number of levers, or else a few with complicated mechanisms, and hence the manipulation of a car demands a certain amount of technical knowledge and skill of hand which absolutely prohibits driving to some persons, and is to all an attainment of practical experience. Hence any simplification becomes a boon, both to the builder and the user.

The makers are working toward this end, and every year marks a step here and another there toward the the ideal machine. But there is a limit to useful improvement. A point may be reached where further refinement of detail would bring so slight an increase in returns as to make its adoption unwarrantable. Thus, from time to time, factors are being reduced to their lowest terms, and the designer turns from them to others which exhibit a greater need of improvement. After a time, however, other changes bring about different demands on the part, and it is no longer "good enough." So development goes on, as it were, by a succession of tentative steps. And the motor which satisfies the present need will not suffice for the car of the future. For this use the rotary engine, using steam or gas, may be regarded as an altogether attractive possibility. N. B.

Another Point to Oil.

"Lubricate wisely but not too well" is such trite advice as now to suffer by further repetition, though its value is only too often overlooked, until the damage is done. But in the infinite variety of directions on this important point few have ever included an admonition to grease the springs.

The spiral spring is so lively on a rough road that its adoption for automobile use has seldom been attempted, and its limitations in this direction are too great to admit of success. The multiple leaf spring has come to be a universal standard for car suspension, as the friction set up between the plates is sufficient to counteract the plunging characteristics of the spiral type. But despite the close adherence of the leaves, dirt and water find their way between them. Rust will cause the friction to become excessive through the leaves binding, much of the value of the spring thus being lost. To guard against this the leaves should be pried apart and a little heavy grease rubbed between.

The Week's Patents.

781,897. valve Device. James McGillivray, South Chicago, Ill. Filed August 24, 1904. Serial No. 221,973.

Claim—1. In a valve device of the character described, the combination of a casing containing two valve chambers, one of said chambers having a pressure inlet port and a pressure outlet port, and the other chamber having a pressure return port and a pressure discharge port, a hollow valve rotably confined in one of said chambers, having a port to register with said pressure inlet port and a port to register with said pressure outlet port, a hollow valve rotably confined in the other chamber, having a port to register with said pressure return port and a port to register with said pressure discharge port, and operating means for said valves connecting them together to be actuated simultaneously, substantially as described.

781,921. Gas or Fuel Engine. Elihu Thomson, Swampscott, Mass., assignor to General Electric Company, a corporation of New York. Filed February 14, 1898. Serial No. 670,222.

Claim—1. In a gas or oil engine, the combination of a cylinder space, a piston moving therein, an inlet valve for admitting a non-explosive mixture of combustible and air, a heated granular mass in open communication with the cylinder space through which the mixture passes during the compression and repasses during the power stroke of the piston, and an outlet opening from the cylinder for exhausting the burned products, substantially as described.

781,923. Internal Combustion Motor. Adolf Vogt, West Norwood, England. Filed November 4, 1901. Serial No. 81,086.

Claim—1. In an internal combustion motor in which the combustible charges are compressed outside the motor cylinder, and in which a horizontal cylinder with piston has vertical extensions at each end containing columns of liquid forming extensions of said piston, the combination with said cylinder extensions of discharge valves placed near the upper ends thereof in a position in which a portion of the liquid column can escape through it toward the end of the discharge stroke, means for holding said discharge valves open until said portions of liquid have escaped through them, and means for supplying fresh liquid to said extensions to replace the quantity discharged, substantially as described.

781,933. Motor Truck. William O. Brown, Chicago, Ill., assignor to Appleton J. Pattison, Toronto, Ontario, Canada. Filed May 16, 1904. Serial No. 208,264.

Claim—1. A motor truck mounting two axles, internal combustion engines secured at the sides of the truck, a single shaft actuated by the engines, and a flexible driving mechanism for each axle actuated by the engine shaft, substantially as described.

781,936. Carburetter for Hydrocarbon Engines. James J. Cook, Jersey City, N. J., assignor to Cook Kerosene Carburetter Company, a corporation of New Jersey. Filed July 22, 1903. Serial No. 166,630.

Claim—1. In a carburetter, the combination with a casing, of an upright vaporizing post located in the casing, an electrical heater coil wound upon the exterior of the post, and forming a spiral channel for oil projected against the post, and means for projecting oil against the upper end of the post.

781,944. Speed Reducing Gearing. John L. Hall, Schenectady, N. Y., assignor to General Electric Company, a corporation of New York. Filed September 3, 1903. Serial No. 171,718.

Claim—1. In a speed reducing gearing, the combination with a driving worm, of a stationary worm gear, a planetary shaft, a worm carried by said shaft and meshing with said gear, and a worm wheel meshing with the driving worm, and means actuated by the planetary parts for transmitting power.

781,959. Variable Speed Gearing. Stonay L. Langdale, St. Louis, Mo. Filed June 3, 1904. Serial No. 211,044.

Claim—1. In a gearing, a rotatable sleeve, a shaft inserted in the sleeve, a spring, one end of which is fixed to the shaft and the other to the sleeve, and a projection carried by the shaft and engaging a slot in a rigid part on the sleeve, substantially as described.

781,989. Controlling Mechanism for Self-Propelled Vehicles. Augustus A. Ball, Jr., Lynn, Mass., assignor to General Electric Company, a corporation of New York. Filed September 4, 1902. Serial No. 122,066.

Claim—1. In a controlling mechanism, the combination of a lever mounted to turn on either of two axes, a grip thereon mounted to turn with the same and adapted to have an independent movement, and means capable of actuation by the grip when the lever swings about one axis and incapable of actuation when the lever swings on the other axis.

781,990. Frame for Self-Propelled Vehicles. Augustus A. Ball, Jr., Lynn, Mass., assignor

WANTS AND FOR SALE.

to General Electric Company, a corporation of New York. Filed October 14, 1903. Serial No. 177,047.

Claim—1. In a vehicle, the combination of a body, a pair of axles, a frame rigidly attached to each of the axles, pivotal connections between each frame and the body, and pivotally supported arches between the axles and the body which permit each of the frames to oscillate with its respective axle.

782,001. Vehicle Wheel. Joseph N. Byers, Urbana, Ohio, assignor of one-half to William R. Ramsey, Urbana, Ohio. Filed March 12, 1903. Serial No. 147,458.

Claim—1. In a vehicle wheel, a rim, the body whereof is composed of a deep trough-like annulus of sheet metal, U-shaped in cross-section and comprising two parallel portions of considerable depth lying in the plane of thrust, and a connecting arched portion, said metal body being of dimensions such as to form the load-sustaining portion of the rim, and a filling member of light material fitting the inner part of the metallic channel and of less height than the depth of said channel, whereby the space between the outer face of the filling member and the projecting flanges of the metallic member forms a seating space of less depth than the channel of the metallic member to receive an elastic tire, substantially as described.

782,085. Rotary Engine. Charles R. Twitchell, Dayton, Heights, Cal., assignor to Brown-Winstanley Manufacturing Company, Los Angeles, Cal., a corporation of California. Filed March 28, 1904. Serial No. 200,416.

Claim—1. A rotary explosive engine having a plurality of revolving cylinders, a stationary crank shaft to which the several piston rods are secured, controlling valves carried by said cylinders, and a single element common to all the cylinders movable with the latter for acting on the valves of all the cylinders in two revolutions, but not in sequence.

782,128. Wheel. Charles B. Haney, Olex, Oregon. Filed August 2, 1904. Serial No. 219,198.

Claim—A vehicle wheel, comprising a tubular felly having its inner wall perforated, a tubular thimble inserted through said perforation and bearing at its inner face of the outer wall of the felly, said thimble being provided with an enlarged tubular portion forming a shoulder to bear upon the outer face of the inner wall of the felly, and a spoke having its end seated in the enlarged portion of the thimble and provided with a reduced portion designed to enter the thimble.

782,155. Pneumatic Tire. Carl W. Maxon, West Bay City, Mich. Filed July 11, 1904. Serial No. 216,168.

Claim—In a pneumatic tire, the combination with an outer casing of a pair of air tubes inclosed within said casing; an air valve for each tube, an asbestos cushion surrounding said air tubes and inclosed within said casing, said outer casing being formed of a mesh built up of asbestos covered wires, said mesh being coated with rubber, substantially as and for the purposes set forth.

782,205. Gas Engine. Samuel J. Webb, Minden, La. Filed January 14, 1901. Serial No. 43,225.

Claim—1. The combination of an engine, a carburetter, a pump, a casing having an interior partition provided with a port, a pipe leading from the carburetter to the casing on one side of the partition, a pipe leading from the other side of the partition to the pump, a valve to partially, but not wholly, close, said port and normally held away from the port, a combustion chamber into which the pump delivers the combustion mixture from the carburetter, and a diaphragm subject to the pressure of the gas within the combustion chamber and connected to said valve, substantially as set forth.

782,812. Internal Combustion Engine. Joseph A. Arthur, New York, N. Y., assignor of one-half to Isidore Weill and Sanford Wolfe, New York, N. Y. Filed February 15, 1904. Serial No. 193,646.

Claim—1. In an internal combustion engine, the combination with a working cylinder and means for supplying a combustible charge thereto, and a piston for said cylinder, of igniting means comprising an auxiliary compression cylinder, a piston for said auxiliary cylinder deriving its motion from said first named piston, means for admitting a combustible charge to said auxiliary cylinder, said auxiliary cylinder having a passage for connecting it with said first named cylinder, and an outwardly opening valve having a spring arranged to resist outward movement thereof, said valve normally closing said passage, but arranged to be operated by pres-

sure within said auxiliary cylinder when ignition occurs therein.

782,850. Roller Bearing. Frederick P. Hinckley, Jackson, Mich., assignor, by mesne assignments, to George A. McKeel Company, Jackson, Mich, a corporation. Filed January 7, 1904. Renewed January 13, 1905. Serial No. 240,863.

Claim—1. In a roller bearing, spacing rings flexibly connected to each other, and rolls connected to the spacing rings by ball and socket joints.

2. In a ball bearing, spacing rings having yielding ball sockets, radial clamping bolts in the rings, and rolls having ball shaped ends inserted in said sockets.

782,873. Electric Igniting Plug. George H. Oakes, Arlington Heights, Mass. Filed December 8, 1903. Serial No. 184,274.

Claim—1. An electric igniting plug comprising in its construction an insulating sleeve formed of sheet material wound in cylindrical form in layers extending longitudinally thereof, one portion of said sleeve being greater in diameter than the other, said cylindrical portions forming at their juncture a shoulder.

782,886. Gearing. George T. Turner, Philadelphia, Pa. Filed May 6, 1901. Serial No. 58,879.

Claim—1. The combination with the axle and its wheels, one of which is sleeved and the other fast on the axle, of a rotatable support loosely mounted with respect to the sleeve and axle, said support having a rib arranged thereon, a driven member loosely mounted on said support at one side of said rib to coact with the latter, means independent of the support and movable laterally relative thereto for co-operating with the rib, whereby said driven member may be clamped against the rib and released therefrom to render said member fast or loose on said support, means interposed between the rotatable support and said clamping means for maintaining the latter normally in unclamping position, mechanism for driving said member, and differential gearing arranged in said support and connected with the axle and sleeve respectively.

782,898. Automobile Gear. Lee S. Chadwick, Ridley Park, Pa. Filed August 4, 1903. Serial No. 168,138.

Claim—1. The combination with the driving shaft of an automobile and a gear thereon, of a hollow bearing, a gear surrounding said bearing and meshing with the driving shaft gear, said gear having a hollow hub entering the opening in said bearing and an operating shaft having a seat or bearing in said hub.

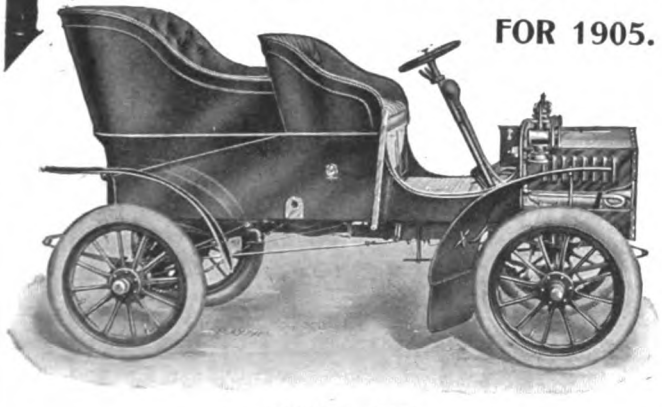
782,912. Tire Casing. John O. King, Racine, Wis., assignor of one-half to Thomas M. Kearney, William D. Thompson, and Peter J. Myers, Racine, Wis. Filed February 23, 1904. Serial No. 194,804.

Claim—A tire casing, comprising sections of flexible leather stitched together to form a continuous annular tube open at its inner circumference, and with the meeting edges there, and at the junction of each two sections skived to insure uniformity of surface and thickness at all points of union, and with the leather of the sections folded and stitched together on each side of the line of the annular opening, in combination with annular angular strips filling the angular spaces back of the said folded portions, and rows of stitching uniting said strips to said casing.

782,913. Tire Casing. John O. King, Racine, Wis., assignor of one-half to Thomas M. Kearney, William D. Thompson, and Peter J. Myers, Racine, Wis. Filed February 23, 1904. Serial No. 194,805.

Claim—1. A tire casing comprising sections of flexible leather stitched together to form a continuous annular tube circumferentially open for the reception of a pneumatic tube, and the annular edges being provided with series of straight bevel faced opposing annular strips, which interlock as the said edges are forced past each other.

782,9[illegible]. Vehicle Tire. Woodburn Langmuir, New York, N. Y. Filed April 14, 1902. Renewed July 26, 1904. Serial No. 218,183.



Claim—1. In a vehicle tire, the combination of an elastic portion having a stiffened base, a rim having inwardly formed recesses and outwardly inclined sides, the rim and tire being so proportioned relatively to each other that the tire is adapted to be inserted in the rim by flexing the stiffened base portion past the shoulder of the undercut portion of the rim, substantially as set forth.

782,952. Wheel. Harris T. Dunbar, Buffalo, N. Y. Filed February 23, 1904. Serial No. 194,673.

Claim—1. A wheel comprising a rim, a hub having its periphery constructed in the form of ratchet teeth so as to produce an annular row of tangential seats and an annular row of abrupt shoulders each of which connects the base of one seat with the crest of the adjacent seat, and a plurality of flexible spokes each secured at its inner end to one of said seats and at its outer end to said rim, substantially as set forth.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Goodman Co., 154 Nassau street, New York.

THE MICHIGAN
LIGHT TOURING CARS
FOR 1905.

MODEL D, $1100.

The Michigan cars are not a brand "new" product—all untried and unknown, like many a "1905" car. Even the best designers are often at fault in their estimates of strength of materials, and some great names in the auto business have produced some very unsatisfactory machines. We have made no revolutionary changes in our 1904 cars—a *few* changes have been made, and those only where we where *sure* of making improvement. Guess work has spoilt many a machine and ruined many a man. Buy a tried and tested car.

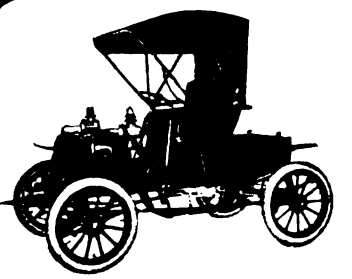
THE EXCELLENT



GROUT

No Noise. No Vibration. Will not Freeze in Zero Weather. Climb Any Hill. Speedy, Reliable. Simple in Operation.

GROUT BROS. AUTOMOBILE CO.,

87 Main St., ORANGE, MASS.

BOSTON BRANCH: 151 Columbus Avenue.

First Impressions are Lasting.

First glance at the "Haynes" and you're impressed with its appearance—it's the equal of cars at higher prices, and it's just as good as it looks. Price doesn't always regulate the value, because we couldn't use better material if paid double the price.

Then in mechanical construction we have the benefit of Mr. Haynes's expert knowledge and extensive experience (as he built the first gasoline car in America), and the many new features adopted are evidence as to his ability to keep "ahead of the times" and give you a car free from troubles, and one that'll add pleasure to your travels and trips.

There are three models described in our catalogue, which you should write for, and carefully study the many "Haynes" improvements and advantages.

PRICES:

Model K, 35-40 H. P., 4 cylinder, 108 inch wheel base, 4½ inch tires..... **$3,000**
Victoria or Folding Extension Top, $200 extra.

Model M, 16-18 H. P., 2 cylinder, double size entrance Tonneau, 81 inch wheel base, 32 inch wheels, 3½ inch tires..... **$1,500**

Model L, 16-18 H. P., 2 cylinder (two passenger, with folding front seat), 81 inch wheel base, 32 inch wheels, 3½ inch tires..... **$1,350**
Regular "Haynes" Three Speeds forward and reverse, controlled by one lever, use in all models.

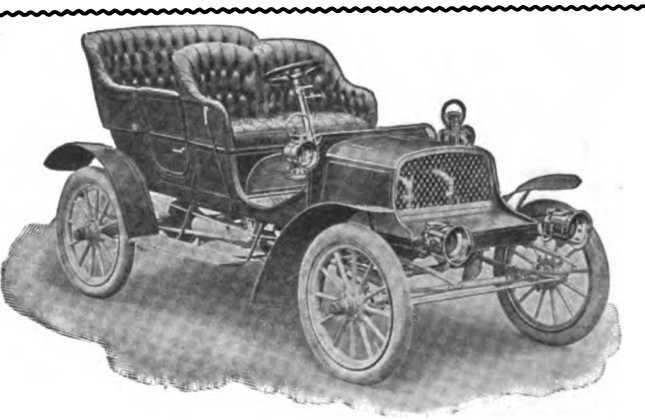
Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.



This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about March 15th, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

The 1904 edition is now out of print.

Sent upon receipt of 6 cents in stamps for postage.

Association of Licensed Automobile Manufacturers,

Room 1009. No. 7 EAST 42nd STREET, NEW YORK.

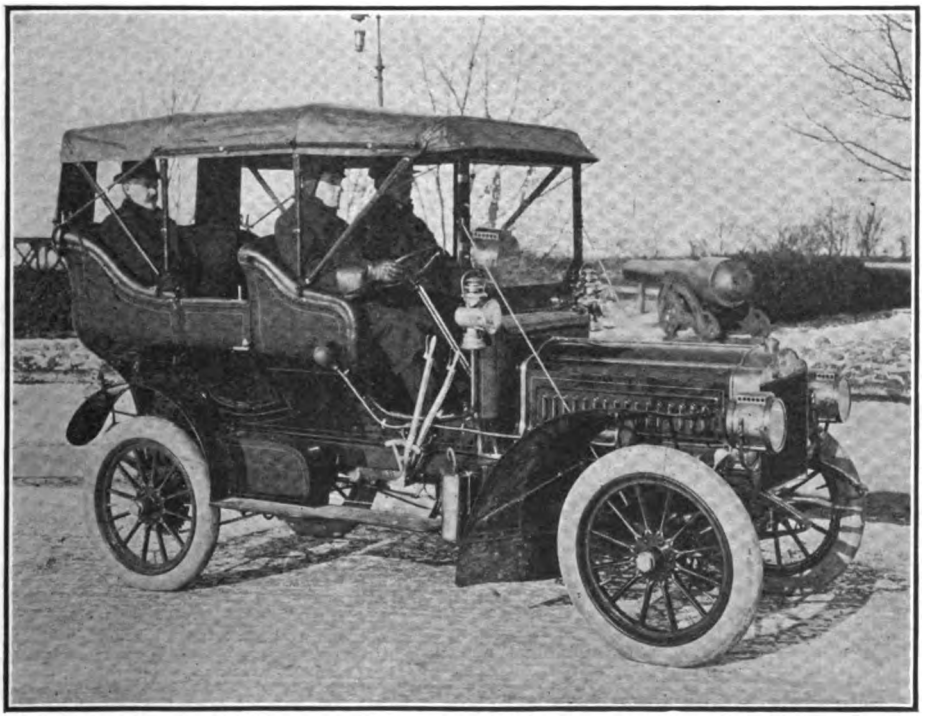
Veeder



"It's Nice to Know
How Far You Go."
Veeder Odometers.

If some one should set up mile-stones for you on every road you were to travel, you would think it a great thing, wouldn't you? For $10.00 you can have a Veeder Form B odometer (the kind that goes on the steering arm) that will not only show the miles, but every eighth of a mile and the total mileage of your car as well. For $25.00 you can have a Veeder Form D odometer right up in front of you on the dashboard, which will show the miles in tenths on two registers at the same time. One of these registers may be set to zero any time, while the other keeps a total record. ***Send for free Catalog.***

DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 38 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is located in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.

The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

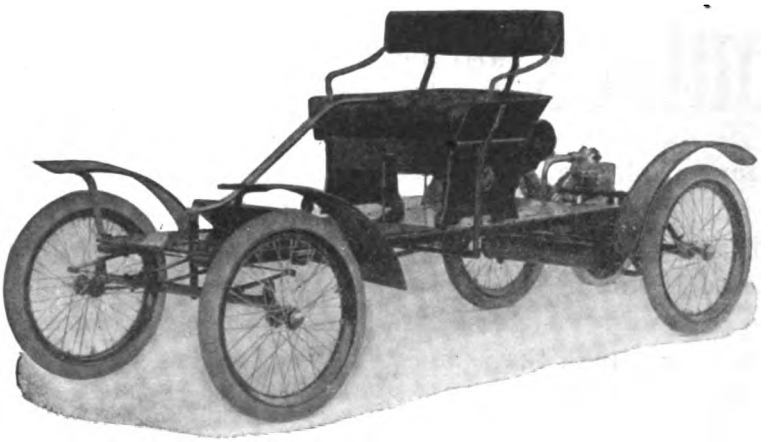
ORIENT LIGHT TOURING CAR, with Tonneau. 16 H. P. Price $1650.

THE AUTOMATIC AUTO



is to some extent a thing of the future—but Orients are very near that stage. They are so simple to operate that the average man can run one in an hour and handle it expertly in a week.

Orients are made for people who want to motor rather than tinker. Their simplicity is a point no better than their absolute reliability.

Orients are air-cooled—hence an Orient Touring Car is 350 pounds lighter than a water-cooled car of the same power. This makes it faster, and saves the tires—cuts down repair bills.

Our great selling plan for Orient dealers will be under way in about three weeks more. When it starts, dealers who have the Orient line will be mighty glad they took it.

Details and catalogue, if you write.

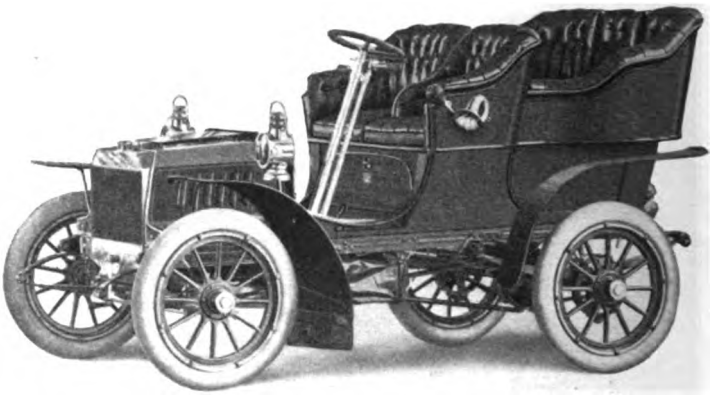
Autocar Type VIII $1400

A Wonderful Value.



Type VIII Autocar at $1400 represents a wonderful automobile value. This type is the foundation of the Autocar's enviable reputation. It is a car built upon honor throughout. There is nothing experimental about it—nothing uncertain in its construction. During 1904 Type VIII was tested on all sorts of American roads—under all kinds of conditions. It has proved its reliability and efficiency so well as to put Autocar Type VIII in the very front of its class.

Last season Type VIII was sold for $1700 and was considered an unsurpassed value. The price of Type VIII is now $1400 because, having built this model for so long we can now build it more economically. For the man who wants a thoroughly reliable four-passenger car at a moderate price, Type VIII at $1400 is his opportunity.

Catalogue giving full description of Type VIII, Type X Runabout, and Type XI Four Cylinder Car, with dealer's name, sent free upon request.

THE AUTOCAR COMPANY, Ardmore, Pa.

Member of the Association of Licensed Automobile Manufacturers.

Specifications, Type VIII:

Horizontal two-cylinder opposed engine—no noticeable vibration. Twelve actual horse-power. Oiled automatically. Water cooled.

Transmission, sliding gear type. Three speeds forward and a reverse. Ball bearing, shaft drive. No greasy, gritty chain. Front and rear construction has ball bearings throughout. Gasoline tank holds 10 gallons—sufficient on good roads for 200 miles.

Tonneau is removable. Front seat divided. Engine and transmission case are accessible from above without disturbing body.

Two Impulses with Every Revolution

This is the famous Elmore Pathfinder, which has demonstrated beyond a doubt the superiority of the two-cycle engine over the four-cycle engine. The most significant feature of the American Automobile situation to-day is the complete triumph of this impulse-every-revolution idea, or, with two cylinders, two impulses every revolution, as exemplified in the Elmore. That the Elmore does produce a constant torque; that it does utilize every particle of power and put a stop to waste energy; that it will take the steepest hill or roughest road at high speed, and that it has the most reliable self-starting engine in the world—for each and every one of these claims overwhelming proof has been produced.

The whole trend of expert and popular opinion is rapidly being directed toward the two-cycle engine.

You owe it to yourself to see this car, which will astonish you, not only by its fine appearance, but by its excess power and its extraordinary control on the high speed.

Send for our full line of literature, the booklet illustrating the 6,000-mile trip, our catalogue, explanation of our engine, and the opinions of people who have used our cars, all sent free, or, if you wish, we will send a 10x12 photograph of the Pathnder on receipt of 10 cents in stamps.

No Lugs Required with G&J Thread Fabric Tires

Our special clincher construction, giving uniform leverage at all points, holds the clincher securely in place.

The flap provides a smooth seating for the inner tube, and removes the possibility of pinched tubes.

The thread fabric construction prevents the heating of the tires in action, hence they are not self-destroying. It also makes the tire so pliable that anyone can easily place it on and remove it from the rim

ISN'T THIS THE TIRE YOU WANT?

Merely a Matter of Choice

"Every man to his way of thinking."

The Morgan & Wright Clincher

has backed up every good thing we have said about it. It has given the kind of every-day, every-mile service that tire-users everywhere are looking for. Nothing but the best-grade, most durable stock enters into its construction, and it is made by experts who know how to use such material. Its best recommendation is not what we guarantee to do, but what we can prove it has done. Used in connection with our recently-invented tire tools, it is an extremely easy tire to manipulate.

The Perfected Dunlop Detachable

is generally admitted to be the most satisfactory mechanically-fastened tire on the market. The simple, effective method of its construction strongly recommends it to those who prefer this type of tire; and in addition (which is highly important to the prospective tire-buyer) it has every advantage which experience gives to prove that the principle of its construction is correct. It occupies first place among mechanically-fastened tires because it belongs there. Made of A1 stock all the way through.

Our Commercial Car

here illustrated is the most practical light car of its class. Five of these cars in constant use the past year at our factory have done the work of fifteen horses, and are still doing it. You can kill a horse but not a Cadillac. As a practical test of what one of these cars will stand, W. V. Snyder & Co., of Newark, N. J., put one of these vehicles in commission July 18; on Dec. 3 they had driven it 6,014 miles, at a total expense for gasoline and oil of only $190.04. The saving over a horse-drawn vehicle those twenty weeks aggregated $567.84, to say nothing of its value as an advertising medium. For light, rapid work, day in and day out, we know of no car at or near the same price that can compare with the Cadillac. **Price $950.**

GOODRICH Tires

Integral Construction vs. Wrapped Tread Construction.

The so-called wrapped tread construction is not new. It is old, and came into existence only as a makeshift.

There are many objections and no advantages to this construction. It was brought about by the necessities of the first builder and has been copied by others.

The Integral Construction (Goodrich), represents the correct and logical method of building tires, and is new inasmuch as we are the first manufacturers in the world to make a success of it.

Many others have tried and after failure, adopted the wrapped tread construction.

We have just completed, by means of an accurate, practical machine constructed for the purpose, a test of each of the leading tires of the world, and against the best, Goodrich showed 50 per cent. greater mileage.

Specify GOODRICH Tires on your 1905 car and get the latest and best construction.

Send for pamphlet describing history of wrapped tread construction and advantages of Integral Construction.

The Bailey "Won't Slip" Tire. Regular Goodrich Construction, but provided with the Bailey "Won't Slip" tread. Prevents slipping, slewing or skidding.

Rambler

SURREY, TYPE ONE

$1,350

18 H.P. *Immediate Delivery*

This is pre-eminently a family car. Marked provisions for comfort, safety, reliability and ease of operation make it so.

The ignition of the spark is automatic. The brakes are operated by pedals, not by levers. With the steering wheel and throttle attached to it, operable by one hand, the other is always free to manage the clutches by the single lever, and no confusion is possible.

Each working part is readily accessible and so simple that adjustments can be made without the help of a mechanic, and without crawling under the machine. Vibration is almost entirely eliminated by the long wheel base, full elliptic springs, large tires, the rigid bracing of the engine and the balancing of all reciprocating parts.

The big luxuriously upholstered seats, olive green and brass trim, and the graceful lines of the body, make it one of the three most beautiful cars on the market.

When delivered, it is equipped with a brass side, tail and two gas head lights with separate generator, brass horn, drop-forged wrenches, oilers, pump and repair kit; in fact, ready for use with the filling of the gasoline and water tanks.

If the price were not so conspicuously featured, it would easily be considered a $2500 to $3500 car.

Other Models $750, $850, $2,000, $3,000.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, March 9, 1905. No. 24

TO CONTROL THE IGNITION

Patent Unearthed and Syndicate Forming to Exploit it—Affects Multiple Engines Only.

While the Selden patent occupies the centre of the stage, there's a "new Richmond" almost ready to make its appearance and to stand in the limelight of basic patents. It is claimed to control the ignition of all motor vehicles having more than one cylinder, and as ignition is very naturally vitally necessary to cars built within and without the scope of the Selden grant, practically the entire industry is involved.

The patent in question is No. 433,551, and covers a gas engine. The application was filed December 12, 1887, and the patent was issued August 5, 1890, to Elmer A. Sperry, of Chicago, who later was of the Sperry Battery Co., Cleveland, Ohio.

It is known that it has been passed on and pronounced sound by several patent experts of note, and that for some time its exploitation has been in the hands of A. L. Garford, president of the Federal Mfg. Co., Elyria, Ohio. Mr. Garford has been seeking to form a $50,000 pool or syndicate of five men to purchase the Sperry patent and to bring it to bear on the industry. He is said to have interested several prominent manufacturers. As the patent has less than three years of life left in it, if the pool is formed, it would appear that the collection of back royalties will be a considerable part of its mission.

The patent, as stated, covers a complete gas engine, the several features of which are, of course, described in detail. That portion of it that refers to the ignition system is as follows:

In a gas engine, two ignitors actuated at the expiration of the stroke thereof from a common source oppositely connected to each other and consisting of moving levers internal to the cylinder.

In a gas engine having more than one combustion cylinder, and in combination with the ignition contact interior to each combustion cylinder, a common source of electricity, and multiple arc circuit connections from said source to said ignitors.

In a gas engine, the combination, with two ignitors, of the generator, spark or self-induction coil, and electrical circuits and moving contact levers interior to the combustion chamber, and consisting of moving levers internal to the cylinder, substantially as and for the purpose specified.

In a gas engine, and in combination with a generator or source of electrical energy, two electrical ignitors interior to two combustion cylinders coupled therewith in multiple arc circuit.

In a gas engine, a generator of electricity and multiple arc circuits, in combination with two ignition contacts interior to two combustion chambers, which make and break the electrical circuit alternately.

In a gas engine, the combination of electrical generator circuits, two ignition contacts interiorly disposed to the cylinder and actuating devices whereby the circuit of the greater is alternately completed through first one and then the other of the contacts.

In a gas engine, an ignitor actuating part sustaining a sliding frictional contanct with the moving parts.

In an ignitor for a gas engine, a vibrating lever, in combination with a rod which sustains a sliding or rubbing frictional engagement with the moving portion of said engine and contact part or parts of the rod bearing such a relation to the lever as to provide a small open space or "lost motion" between the lever and the rod.

Ford Gets More Time.

By order of the court, the Ford Motor Co. has been granted an additional three months in which to complete the taking of testimony in the suit involving the validity of the Selden patent—that is the suit in which the Electric Vehicle Co., acting for the Association of Licensed Automobile Manufacturers, is the complainant. This extension will give the Ford side until May 5 to perfect its case.

The court order further instructs that the testimony submitted shall be limited to that of Professor Rolla C. Carpenter, of Cornell University, and Jesse M. Smith, the Detroit expert witness for the Ford Motor Co.

It is believed that these limitations will result in judgment being rendered before the close of the year.

CUTLER CHOSEN PRESIDENT

Springfield Man Now Heads the N. A. A. M.,—Profits of the Big Shows Disclosed.

E. H. Cutler, of the Knox Automobile Co., of Springfield, Mass., is the new president of the National Association of Automobile Manufacturers. The other officers are: First vice-president, G. W. Bennett, of Thomas B. Jeffery & Co., Kenosha, Wis.; second vice-president, A. L. Pope, of the Pope Mfg. Co., Hartford, Conn.; third vice-president, S. D. Waldon, of the Packard Motor Car Co., Detroit, Mich.; treasurer, W. R. Innis, of the Studebaker Automobile Co., New York, and secretary, Percy Owen, of the Winton Motor Carriage Co., New York. The election took place at the regular monthly meeting of the executive committee at the offices of the association on Wednesday afternoon.

Strong efforts were made to secure the continuance in office of Windsor T. White, the former president, but he persistently declined to accept the honor. It will be recalled that at the January meeting, which was the regular time for the election, Mr. White was kept in office by a timely motion to defer the election and to adjourn. Upon his second refusal, according to the precedent of the association, Mr. Cutler, his vice-official, was elevated to the office.

Next to the election, the most important item of business was the presentation of the reports of the New York and Chicago shows. They threw a strong light on the exaggerated claims set up by too patriotic Chicagoans.

The net profit of the New York show was $59,933.93, of which the N. A. A. M. and A. C. A. get equal shares of 30 per cent., or $17,980.18, and the Garden Company $23,973.57, or 40 per cent. This represents a gain of something above $7,000 over last year's exhibition.

The report showed that although the profits of the Chicago show were nearly 50 per cent. less than New York, it proved a fat plum for Manager Miles. The net proceeds were $30,504.54, of which the first $6,000 go

Digitized by Google

to S. A. Miles, as manager. The remaining $24,504.54 is divided into one-third, which goes to S. A. Miles, and two-thirds, or $8,168.18, to the national asociation. This is an increase of something like $5,000 over last year's total. The Chicago Automobile Club asked for a crumb of $1,000 or so, but as it had done nothing, the crumb was not given.

The association's income from the two shows was therefore $26,148.36, or 20 per cent. more than last year. The treasurer's report shows the total of funds in hand to be $41,000.

Other business consisted of the appointment of a committee composing Messrs. Clifton, Bennett and Innis, to consider and, if approved, recommend a plan of pro rata rebate to the members of a portion of the amount now in the treasury.

The subject of anti-automobile legislation was discussed at some length, but no decisive action was taken. The committee on good roads reported progress in the matter of the Brownlow bill, which is to come before the next session of Congress. Mr. Chapin, who tendered the report, said that up to the present time the committee's efforts had been largely concentrated on the owners of cars and on representatives of the daily press.

Show plans were discussed at length, but no other action was taken than to reject finally the proposition to hold a joint parts and commercial vehicle show in the early fall. Other action was postponed, pending the installation of the new board of officers.

Two new members were elected—the Wayne Automobile Co., of Detroit, Mich., and the Buick Motor Co., of Jackson, Mich.

January Exports More than Doubled.

Export statistics for the month of January last as compared with the corresponding period of the previous twelve months show that the year has started auspiciously. The total for January, 1904, was but $89,535, as against $196,144 for the present year, or something over 100 per cent. increase. For the period of seven months ending with January in three years past the totals show a consistent growth that augurs well for the future of the industry in this country. They are $602,999, $1,014,124 and $1,122,638.

Pontiac Hides its Secret.

Pontiac, Michigan, is possessed of a deep, dark secret. The Board of Trade claims to have received a letter from a Detroit automobile manufacturing concern that wants to locate in Pontiac, because of better freight facilities. The firm claim a business standing of three years, but the Board of Trade refuses to disclose its name until the deal is clinched.

Black Diamond Changes its Stock.

At a meeting of the stockholders of the Black Diamond Automobile Co., at Utica, N. Y., last week, it was voted to retire $125,000 of the common stock of the company and issue in its place $125,000 of preferred stock.

The Week's Incorporations.

Chicago, Ill.—Adrian Automobile Co., under Illinois laws, with $5,000 capital. Corporators—Thomas Singleton, W. T. Lambert and W. S. Black.

Chicago, Ill.—Autocar Equipment Co. changes name to Continental Motor Mfg. Co., and increases capital stock from $25,000 to $100,000.

Kittery, Maine.—Lowell Automobile Corporation, under Maine laws, with $10,000 capital. Corporators—O. S. Paul, Jesse E. Forsythe and Ernest L. Chaney.

Trenton, N. J.—Motor Car Specialty Co., under New Jersey laws, with $70,000 capital; to manufacture specialties. Corporators: Edw. S. Lea, John O. Hart and George E. Dunn.

Cleveland, Ohio.—Central Automobile Co., under Ohio laws, with $12,000 capital. Corporators—T. Long, A. B. Keil, W. S. Furze, B. J. Venning, A. H. Smith and W. J. Knight.

Cleveland, Ohio—Automobile Engineering Co., under Ohio laws, with $50,000 capital. Corporators: R. J. Venning, Fred La Pierre, George H. Carin, F. K. Murks and Joseph Ledwinks.

Chicago, Ill.—Central Automobile Co., under Illinois laws, with $2,500 capital, to manufacture and deal in automobiles. Corporators: John Vennema, H. I. Westphal and C. Stephens.

Newburg, N. Y.—Lackawanna Mfg Co., under New York laws, with $20,000 capital; to manufacture motors and engines. Corporators: T. Caldwell, W. H. Caldwell and A. W. Mapes.

Chicago, Ill.—Superior Automobile Co., under Illinois laws, with $2,500 capital, to manufacture automobiles. Corporators—Richard H. Mather, Willis H. Hutson and Benson Wright.

Columbus, Ohio.—Automobile Engineering Co., The, under Ohio laws, with $50,000 capital. Corporators—R. J. Venning, Breo La Pierre, G. H. Cann, F. R. Marks and Joseph Ledwinka.

Chicago, Ill.—Central Automobile Co., under Illinois laws, with $2,500 capital, to manufacture automobiles. Corporators—Alfred D. Plamondon, James E. Higgins and Benjamin F. Richolson.

Taunton, Mass.—Carlow Automobile Co., under Massachusetts laws, with $9,000 capital, to deal in automobiles. Officers and corporators — President, Fred. A. Shaw; treasurer, Henry Carlow.

Cadiz, Ohio.—Cadiz Electrical Co., under Ohio laws, with $12,000, to deal in electrical apparatus. Corporators—G. B. MacGowan, G. D. McFadden, E. W. Long, J. V. Connor, S. K. McLaughlin and S. R. Cunningham.

Summit, N. J.—Summit Motor Car Co., under New Jersey laws, with $5,000 capital; to manufacture, repair, buy and sell automobiles. Corporators: Cyril G. Smith, Joseph O. Chrystal and Martha A. Chrystal.

Jackson, Mich.—Articles amending the incorporation of the Jackson Engine and Motor Co., by increasing the capital stock from $30,000 to $60,000, and changing its name to Field-Brundage Co., have been filed.

Detroit, Mich.—Detroit Steam Engine Co., under Michigan laws, with $50,000 capital; to make automobiles. Corporators: John D. MacLachlin, Ovid B. Law, William E. Higginbotham and William G. Malcolmson.

Bullock Embarrassment Brings Changes.

While the Bullock ignitor has not exactly "doused its glim," its makers, the Bullock-Beresford Co., Cleveland, Ohio, have developed a bad short circuit. They are in the hands of a receiver, G. A. Paulds, of that city. Their affairs are said to be in very bad shape.

Out of the trouble there has grown, however, two new concerns—the Bullock-Beresford Mfg. Co., incorporated under Delaware laws, and the International Ignition Corporation, in both of which A. R. Bullock figures, in the former as president—although it is added he is taking no active interest—and in the latter as general manager.

The Ignition Corporation claims to be "sole owners and manufacturers for the continent of the Bullock ignitor." Its officers are: J. B. Shields, president; F. J. Roehl, vice-president; A. C. Wertheim, treasurer; M. E. Meisel, secretary, and A. R. Bullock, general manager. In addition to Mr. Bullock, inactive president, the officials of the new Bullock-Beresford Mfg. Co. are Thomas Pettifer, vice-president; G. E. Sherman, treasurer, and W. E. Beresford, secretary.

Death of F. A. La Roche.

After a six weeks' battle with cancer of the stomach, Frederick A. La Roche, president of the American Darracq Automobile Co., succumbed to the disease Saturday at the Presbyterian Hospital, New York City, at the age of forty-three years. Although his death was not unexpected, it came as a shock to his many friends.

Mr. La Roche was a genial man, with a characteristic earnestness of purpose, and whatever he undertook was done with sincerity.

As a racing enthusiast Mr. La Roche was especially prominent. His last racing was done at the Florida meet last year, but his most notable feat was the non-stop run to St. Louis and return last summer.

Besides being president of the American Darracq Co., Mr. La Roche was largely identified with electrical interests and was president of the F. A. La Roche Electric Appliance for Lighting and Power Co.

Mr. La Roche was one of the founders of the Automobile Club of America.

Show in 'Frisco Next Month.

San Francisco's annual Sportsmen's Show this year will be in large part an automobile show, with practically all of the better known cars in evidence. It occurs April 1-14.

Digitized by Google

BUFFALO'S SHOW BEGINS WELL

Everything was in "Apple Pie Order" and Large Crowds Filled the Hall.

Buffalo, March 7.—Buffalo has cause to be proud of the successful commencement of the third annual show given under the auspices of the Automobile Club of Buffalo, and the Trade Association, which was inaugurated last night.

The formal opening took place at 8 o'clock, and, strange to say, every exhibit was in its place and completely in order. There were none of those vacancies, none of that annoyance which has characterized several of the other shows this year. The attendance was good, almost to excess, for Convention Hall was uncomfortably crowded throughout the evening. The exhibits are tastefully arranged, and the hall prettily decorated with flags and bunting, which, as one of the local dailies somewhat floridly expresses it, "hung or was draped from everywhere, while toward every viewpoint glowed the yellow gleam of the incandescent light from the variegated signs of the times, which, however lettered, spelled 'This is the Day of the Automobile!'"

As to business, the first night was, as usual, given over almost entirely to visiting and entertaining. But on Tuesday and Wednesday matters assumed a more businesslike form, and numerous orders as well as many more hopeful prospects have been reported. The "sold" signs have begun to appear here and there, and everyone wears a hopeful optimistic expression.

The souvenir element is quite as much in evidence as at the other shows, nearly all of the fifty or more exhibitors having something besides a catalogue and good counsel to give away. On the opening night several of the local dealers scored by giving away carnations and sachet bags, while the usual quota of stick pins and whistles was not lacking.

On Thursday evening the great event of the week will occur in the banquet to be given by the Automobile Club to the New York State Automobile Association. All the well-known motorists who are here in attendance on the show will be present, and a very joyous occasion is anticipated.

A list of the exhibitors showing at the hall is as follows:

Duquesne Motor Car Co., Jamestown, N. Y.—Duquesne cars.

Knox Automobile Co., Springfield, Mass.—Knox cars.

Denniston, E. E., Buffalo, N. Y.—Tops.

Poppenberg Automobile Co., Buffalo, N. Y.—Agents for Rambler, Marion, Queen and National cars.

National Battery Co., Buffalo, N. Y.—Storage batteries.

Fisk Rubber Co., Chicopee Falls, Mass.—Fisk mechanically fastened tires.

O. K. Machine Works, Buffalo, N. Y.—Parts.

Hartford Rubber Works Co., Hartford, Conn.—Perfected Dunlop detachable and Hartford and Turner tires.

Badger Brass Mfg. Co., Kenosha, Wis.—Solar acetylene gas lamps.

Goodyear Tire & Rubber Co., The, Akron, Ohio.—Goodyear tires.

P. W. Elgner, Buffalo, N. Y.—Agent for Pope-Waverley cars.

Thomas Motor Co., E. R., Buffalo, N. Y.—Thomas cars.

Buffalo Electric Carriage Co., Buffalo, N. Y.—Buffalo electrics.

Roe Automobile Co., West Buffalo, N. Y.—Accessories.

Pierce Co., The George N., Buffalo, N. Y.—Pierce Great Arrow and Pierce Stanhope.

Jaynes Automobile Co., The W. C., Buffalo, N. Y.—Agent for Olds, Winton, Pope-Toledo, Pope-Tribune, Pope-Hartford and Buick cars.

Meadows & Hafer, Buffalo, N. Y.—Agents for Reo and St. Louis cars.

Buffalo Automobile Exchange, Buffalo, N. Y.—Agent for Haynes and Northern cars.

Brunn Carriage Co., Buffalo, N. Y.—Agent for Stevens cars.

Cramer, J. A., Buffalo, N. Y.—Agent for Ford, Mitchell, Matheson and Premier cars.

Centaur Motor Co., Buffalo, N. Y.—Agents for Peerless, Packard, Yale, Cadillac and Columbia cars.

Wayne Automobile Co., Detroit, Mich.—Wayne cars.

Buffalo Gasolene Motor Co., Buffalo, N. Y.—Engines.

Diamond Rubber Co., Akron, Ohio.—Diamond detachable clincher tires.

Ephraim Bros., Buffalo, N. Y.—Continental tires and accessories.

Gray & Davis, Amesbury, Mass.—Headlight, side and tail lamps, oil and acetylene.

Goodrich Co., B. F., Akron, Ohio.—Goodrich detachable clincher tires.

Jackson Automobile Co., Jackson, Mich.—Jackson cars.

Rose Mfg. Co., Philadelphia, Pa.—Lamps.

Standard Oil Co., Buffalo, N. Y.—Gasolene.

Twyford Motor Car Co., Brookville, Pa.—Twyford cars.

Strauss & Sons, Joseph, Buffalo, N. Y.—Accessories.

Ballou, F. A., Buffalo, N. Y.—Motor boats.

Hartford Suspension Co., New York City.—Shock absorber.

Automobile Supply & Repair Co., Buffalo, N. Y.—Agents for Maxwell cars.

Hill Mfg. Co., Buffalo, N. Y.—Tops.

Noonan, A. S., Rome, N. Y.—Repair tools.

Star Automobile Co., Buffalo, N. Y.

Prescott Automobile Co., New York City.—Prescott steam cars.

White Sewing Machine Co., Cleveland, Ohio.—White steam cars.

Knoll & Turgeon, Buffalo, N. Y.

Cornwell, Millard, Buffalo, N. Y.

Ralph, Roger C., Buffalo, N. Y.

Fire in the carriage repository of Charles P. Woolston, at Riverton, N. J., Tuesday destroyed two automobiles; they were valued at $25,000.

A. C. A. SHOW IS CONFIRMED

Former Committeeman Dispels All Doubts—New York Armory to be Secured.

It is now possible to state definitely that the Automobile Club of America will hold a show in New York next year, and that it will be held in one of the National Guard armories.

A. L. Shattuck, who was formely a member of the club's show committee, is the ample authority for the statement.

"I can tell you no more," said Mr. Shattuck, when pressed for further information, "as I am no longer a member of the committee. You will have to see General George Moore Smith, the chairman, for further particulars."

General Smith is, unfortunately, confined to his home by illness.

Corbin to Build Big Garage.

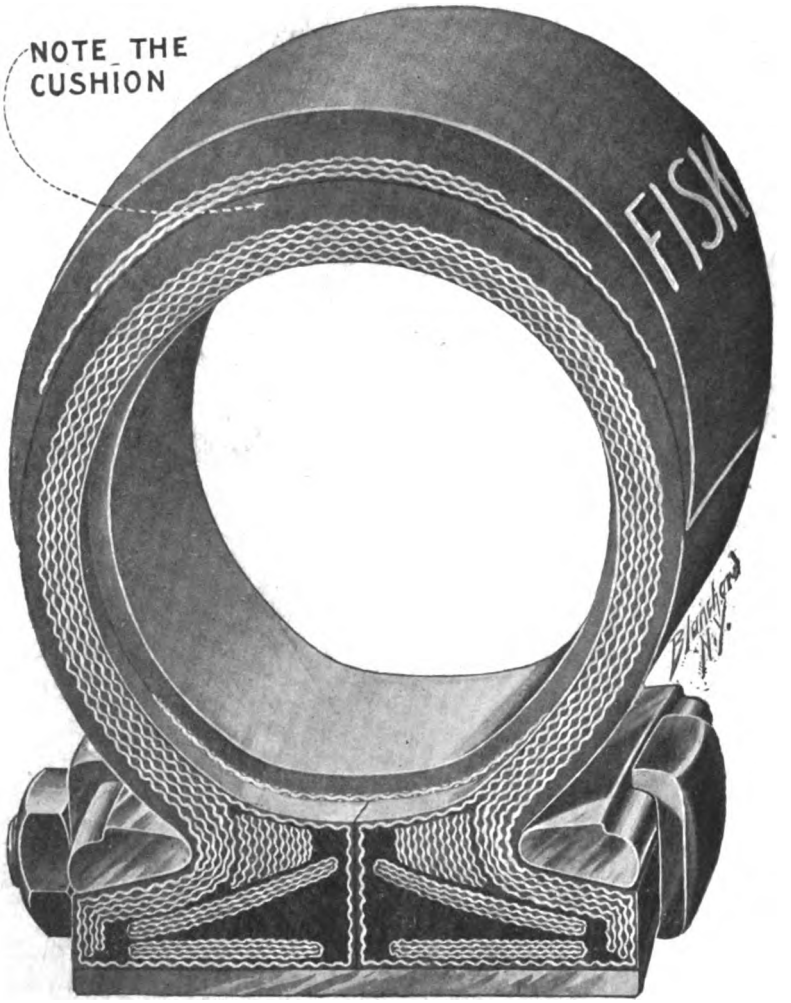
The Corbin Motor Vehicle Corporation, of New Britain, Conn., have broken ground for what will be one of the largest garages in New England; indeed, it is said that it will be the largest fireproof structure of its kind in the country. The dimensions are 47x122 feet, and it is expected that it will be completed and ready for business by June 1. It is situated on the direct line of travel between New York and Boston, and provide storage facilities for fully 200 cars. In addition, there will be a complete repair shop in the building, where the most difficult work will be performed.

Trying a Departure in Carburetters.

Carburetters using "the double float feed principle" are being experimented with by the Eclipse Machine Co., Elmira, N. Y. The first one is being put to the test, and its behavior to date is said to have been such as to practically assure the marketing of the device. It is said to be most ingenious, but beyond admitting that it incorporates a double float, the Eclipse people will say nothing concerning it.

Lions and Lambs in Same Fold.

A rather unusual proceeding has been instituted by two Harrisburg (Penn.) automobile firms, the Central Automobile Co., Inc., and the Harrisburg Automobile Co. The former handles the licensed cars and the latter independent ones, but like the lion and the lamb the two firms have jointly leased the Bailey building, on Market-st., and will sell their respective wares in the same store.



New Garage for Scranton.

H. R. Jadwin, manager of the Scranton (Pa.) Garage and Motor Co., has given out the contract for the erection of a $25,000 garage in that city. The building will be of brick construction, 68x90 feet, two stories high and fireproof.

To Facilitate Matters Our Patrons Should Address us at P. O. Box 649.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, MARCH 9, 1905.

When Haste Makes Waste.

Although it is not generally recognized, this is the time of the year when reputations are made or unmade.

Many factories are long of orders and short of cars. Buyers are clamorous. Their call for the goods is long, loud and persistent. The factory is strained to the uttermost to meet the call, and as so often happens, it is in many instances a case of "the more haste the less speed." The cars are rushed through only to return or at any rate only to bring wails of distress.

The temptation or disposition to "take chances" and to assume that despite hurried assembling all is right and to ship cars without proper inspection and test is great. It is the cause of all the trouble. It is the thing that mars the reputation. Bad news speeds quickly and a half score of balky or otherwise troublesome cars early in the season will cause more gossip and work more injury than a hundred of them later in the year. Whatever may be the case with the actual production of parts, the assembling and inspection and testing of a car is something that simply cannot be hurried. It takes a certain time to perform each of these all important tasks and for the best results the time devoted to them cannot or at any rate should not be less in February or March than in July or August.

Happy the factory manager or superintendent who not only realizes the fact, but who has backbone enough to refuse to be hurried in these respects. His principals and their agents may fret and fume, and even damn him, but his inflexibility means the difference between profit and loss, between reputation and ruin.

The hurriedly assembled, improperly tested car is one of the holes through which not merely the manufacturer's, but the agent's profits have leaked. It means either that the agent must do the manufacturer's work or that the latter must undo what he has done and then do it all over again.

Routing of the Theorist.

It has well been said that the automobile was not designed by an engineer. It might be added that in a great number of instances it was not constructed by an engineer, and in some is not so constructed to-day.

In few other fields of endeavor has theory gone down so often and so conclusively before practice, but the theorist who stands by his colors and will not be convinced, even by actual every day success that goes counter to his own self-created reasoning, should bear in mind that in other lines, notably that of the steam engine, practice prevailed before theory and experience growing out of years of operation came in time to form a basis upon which to formulate theories along advanced lines that would not fail utterly when put to the practical test.

No one will contend for a moment that Stephenson calculated a theoretical compression, stroke and bore before attempting his steam locomotive, and then having figured to a nicety, with all due allowances, the exact power it should produce, went ahead to build an engine that would conform exactly to these preconceived requirements. Nor after having achieved something tangible—a creation of the rule of thumb in its entirety—did he theorize on the increase of power to be gained by a variable cut off and take indicator diagrams to substantiate it. These did not come until later, and they developed solely as the result of practice, because that most expressive phrase of the vernacular applies to these first attempts with great force. They were literally "blind pieces of work," and pioneer models were but efforts on the part of the inventors to feel their way.

The whole trend of development of the automobile, to glance over the comparatively few years consumed in coming this far, has been but a process of feeling blindly in the dark. Had it not been for the fact that one theory, at least, was tenaciously clung to for so long, it is probable that development of the power driven vehicle might have been even more rapid than it has. This was the "horseless" idea, and undoubtedly it was the striving to simply replace the equine motive power without in any way altering the character or appearance of the vehicle itself that gave rise to the saying quoted above. The road roller and the traction engine are but automobiles—ponderous and slow moving, to be sure, but well within the definition of the term—but they bear not the slightest resemblance to a horse drawn vehicle or one of any other kind, for that matter—they are the creation of engineers.

The plan of adapting the power to the vehicle was adhered to in this country overlong, and the freaks and crudities resulting from it were amazing, to say the least. Then there was an awakening, and first theories were cast to the winds. The process was entirely reversed, and the principle that the motive power is first and the vehicle merely a secondary consideration has since been followed, with the result that is evident on all sides. If the result of several years' development under a regime of skilled engineers would to-day have given us anything even faintly approaching a road roller or traction engine, it is probably just as well that the engineer didn't have anything to do with the automobile at the outset. And, on the whole, it is far better that theory has in his field so frequently had to succumb to practice, otherwise what freaks would have survived to this day to the detriment of all concerned!

Striking at the Root.

There is but one way to eradicate an evil and that is to strike at the root of it.

The root of the legislative evil is the registration or licensing system. Without it most of the "statesmen" who are just now given to framing laws for the "protection of the public" would be lost. They are all possessed of the idea that the exaction of a fee and the display of numbers constitute a talisman that magically checks speed and conserves the public safety.

But, strange to say, although life is pre-

Digitized by Google

cious and although it hurts as much to be injured by a farm wagon as by an automobile, the fees and tags are for the latter only, suggesting that the public enjoys, or at any rate does not mind, being maimed or killed by other than the motor cars. If this were not the case and numbered tags really were magical preservers of life and limb, these earnest statesmen would require that they be applied to all vehicles of whatever sort.

However this may be, the fee and the tag are as stated at the root of all the legislative evil levelled at automobilists. As we so often urged to be done, and as we said at the time the appropriation for the purpose was made, the decision of the N. A. A. M. to attack the registration system is in the nature of striking at the root. It is good news that the first blow is about to fall. It is news the importance of which cannot be minimized. It is a blow for that freedom of travel—for that free use of the common roads that is the inheritance and constitutional right of free men in free countries. We will now soon know whether legislatures can convert that right into a privilege which must be paid for.

Tires and Their Selection.

How to buy tires would form a rather difficult subject to give advice on, except to repeat that in this, as in everything else, the old saw applies that the best is far and away the cheapest in the long run. Just as all whiskey is good and all girls are pretty, all tires are some good, but some are better than others. At best it is probably one of the last places on the car on which to attempt to economize, as the owner who undertakes it shortly finds out to his disgust.

Rubber may well be compared with gold—it is sui generis—entirely in a class of its own, and substances which the manufacturers proudly claim to be "near rubber" or some similarly alluring term, which, when said quickly with no great emphasis on the adjective, is misleading, prove their intrinsic worth to be about the same as "near-gold." There is nothing to take its place except where appearance in the finished article is concerned, and as it is expensive, cheapness in the selling price of the tire can only mean one thing—substitutes, ranging downward in inferiority with the decrease in the quid pro quo.

A thousand and one attempts have been made to produce a satisfactory substitute or to manufacture rubber by synthetic processes, and for certain purposes, such as electric insulation, substances have been discovered which fill the requirements, but so far as the subject under consideration is concerned, the countless efforts made and still making have brought the solution of the problem not a whit nearer than at the outset.

Cheapness in bicycle tires was carried to an extent where the only rubber employed was rubber-colored paint applied to papier maché, a bias strip of which was wound into a tube in the same manner as mailing tubes are formed, and reinforced with a layer or two or cheap canvas. There need be little fear that the automobile tire can ever reach this level of degradation, as it could not be made to bear the weight of a car, no matter how light. But competition in the tire field is becoming razor edged, and that portion of the trade to which this means nothing more than price regardless of worth is prone to resort to methods not far short of this in order to be in a position to undersell.

The "something for nothing" desire is a trait of human nature, so strong that it afflicts the millionaire as well as those less well provided with coin—in some cases to a greater degree. But if there is one thing about the car more than any other to which the saying "save a dollar and lose ten" is applicable, that is the tire, and economy here not only means endless trouble, but usually a new set of tires as well, so that probably the best advice where the "footwear" of the automobile is concerned is to buy the best to be had, for the recollection of quality remains long after the price is forgotten.

The American Car Abroad.

American made automobiles, like their predecessors in the same field, the American bicycle, are now steadily encroaching more and more upon the English market. Both the trade and the daily press in Great Britain, while condescending to recognize the existence of an American industry in this connection, and, further, that the same infant is making very sturdy strides—as to admitting that there can be such a thing as a comparison between it and that of England and France, oh, dear, no; simply absurd, old fellow.

Where France is concerned the handicap has been great, but the marvellous manner in which the lead gained by several years' anticipation on the part of the Frenchman, has been cut down by the American is too much in evidence to call for comment. England was backward in seriously taking up the automobile, and can hardly lay claim to any priority in this direction. And now that she has gone in for it heart and soul, British capital is literally being poured into the French industry—the amount of English money now employed in building cars in France is amazing, to say the least, and instead of being kept at home by inducements offered there, it is being increased to an extent that moves the press of the island to cry out against it.

While admitting the existence and rapid growth of the American industry, the English trade, and particularly its organs, balk at believing accounts of it even though related by one of their own and substantiated by photographic evidence. A striking instance of this came to light upon the return home of an English agent from the factory in this country which he represents. The works in question probably turn out more light runabouts in the course of a year than any manufacturer on the globe, and their product is likewise to be found in all quarters of it. What undoubtedly roused the ire of the Englishmen to the greatest pitch was a photograph purporting to show a storage shed containing one thousand cars. One scoffer railed at the idea that a shed large enough to shelter such a number of cars had ever been built, and asserted with great heat that it was extremely doubtful if there were a hundred cars in the storage room—the picture did not give evidence of more than that number, according to his idea. And he was not the only unbeliever to raise his voice at the "ridiculous Yankee exaggeration." Seemingly the shoe must pinch these irate gentlemen, for loud howls are usually a good indication of at least some pain.

In the mind of the hungry legislator the men who use automobiles are all millionaires. In some legislatures the rich man is considered legitimate prey. The way to make him disgorge or purchase "mercy," is to "frame up" a bill affecting his interests or any one of them. These are termed "strike bills." It is a common accusation that there are some very hungry men in the New York Legislature.

The owner of a motor car is about the only man in New-York at this time with license to smile. He is practically the only person who is able to reach his business on time, and who can snap his fingers at the strike on the subway and elevated railways.

SMOTHERING SCOVEL'S BILL

Army of Motorists Invade New Jersey's Capital —Former Governor's Inconsistency Exposed.

It is not probable that much more will be heard of Assemblyman Scovel and his amendments to the automobile law designed to pick $5 per year out of the pockets of all motorists who may use the roads of New Jersey and to place them at the mercy of every crossroads constable in the State.

Following a campaign carried out by W. E. Scarritt and James B. Dill, which simply deluged the Governor and members of the Legislature with protests against the bill, the automobilists, some 200 strong, invaded the capital at Trenton on Tuesday last and presented such a strong front and advanced such strong arguments that if the measure ever issues from the committee room it will cause unlimited surprise.

Tuesday was the date of the public hearing before the House Committee on Municipal Affairs, of which Mr. Scovel himself is chairman.

The speakers were introduced by Wilbur F. Sadler, a Trenton attorney. He desired, he said, to impress upon the committee the fact that there is upward of $10,000,000 invested in this State in automobile interests. The garage interests alone amounted, he said, to $3,000,000. In the manufacture of automobiles there is an investment of $4,000,000.

The automobilists took the position that there is no necessity for any change in the existing statutes and that it is not advisable to change a law which has become a model for adoption by other States. Karl G. Roebling, of this city, made an address showing the various uses to which automobiles are put, laying stress on their adaptability for business purposes and for social enjoyment.

Frederick R. Pratt, president of the New Jersey Automobile and Motor Club, said that his club had been organized for the mutual protection of owners of motor vehicles, and that the club will not in any manner sustain a member who is a reckless driver. An object of the club is to punish any member who violates the law, either as to speed or otherwise.

Richard C. Jenkinson, of Newark, spoke of the value of the automobile industry and its worth to the people in general. He declared his belief that the pending amendments are unconstitutional. When questioned on this point by former Senator Lewis J. Martin Mr. Jenkinson declared that the State is forbidden to issue letters of marque and reprisal, yet the pending amendments take on such a character.

He declared it to be wrong in principle to single out automobilists as a class who can be arrested without the regular processes of law. The proposed amendments simply make an automobile owner a criminal and appoint the country constable as his executioner.

Winthrop E. Scarritt declared the Scovel law now on the statute books to be the ideal law, and that no change should be made. He asserted that the proposed legislation against automobiles in the New York Legislature had been practically killed after a hearing at which he was one of the speakers.

James B. Dill protested against the amendments. He spoke of the recommendation which Governor Murphy had made to limit the motor capacity of automobiles to twenty miles an hour, and pointed out his inconsistency by stating that within the last fortnight Governor Murphy's son had purchased a car of 40 horsepower, which, on its high speed, could not travel at less than forty miles an hour. Mr. Dill said it was only fair to the Governor for the people to know that the Governor signed the check that paid for the car.

While friends of the bill were not numerous at the hearing, yet good pleas were made for them by D. B. Denise, of Monmouth County, a prominent member of the State Board of Agriculture, and David Horner, of Camden. They said they appeared in behalf of horse owners of the State whose rights had been trampled upon by reckless automobilists. It was a common occurrence to drive machines at railroad speed through the farming districts, and a menace to life and limb of the people who had occasion to use the highways. Like so many people they seemed to believe that the roads were built for horses and not for men.

They said the horses were here before automobiles, and, for the vast majority of people, were going to stay here, and it was only common justice for the legislature to safeguard the rights of the greater number of the people whom it represented. Franklin Dye, secretary of the State Board of Agriculture, made a brief statement, in which he claimed that it was a mistake to say that farmers as a class were opposed to automobiles. The farmers, he said, were simply up in arms against a large number of automobile drivers who had no respect for life or the law.

Colonel Edward S. Edwards, of the Society for the Prevention of Cruelty to Animals, spoke in behalf of the Road Horse Association of New Jersey in support of the amendment. He insisted that the owners of horses were entitled to relief. He said that there was no justice in the present law, and for practical purposes it was not worth the paper it was written upon.

Under present conditions, he said, it was necessary to secure a warrant for the arrest of a violator, and by the time a warrant could be obtained the offender was in Connecticut or New York or some other place where he could not be reached. If it was fair to arrest a burglar or a man for the reckless driving of a horse without a warrant, it was fair to arrest an automobile driver who was running his machine beyond the speed limit and in a reckless manner.

The upshot of the hearing was the selection of three opponents of the amendments and three of those who favored it, who are to meet for a heart to heart talk and endeavor to reach an amicable understanding. It is believed that the motorists will have little trouble in winning over the "other side." It is reasonably certain, however, that, even if reported, the bill has absolutely no chance of passage.

TO STRIKE AT THE ROOT

N. A. A. M. Ready to Attack Licensing Laws —Arrests to be Made for the Test.

While legislatures are "piling on the agony" in the form of oppressive laws and automobilists are either fighting back or meekly bearing the yoke, the one way in which to lift the whole miserable load was definitely mapped out on Tuesday last.

On that day the Legislative Committee of the National Association of Automobile Manufacturers met at the office of Counsel Charles Thaddeus Terry, in New York, and decided to at once make the first move in that direction, the N. A. A. M., due to the earnest efforts of the chairman of the committee, George W. Bennett, having several months since made an appropriation of several thousand dollars for the purpose.

Mr. Terry has since been mulling over his law books. He at first considered resort to the Federal Courts to attack the statutes of those States which require non-resident automobilists to pay registration or license fees on the grounds that such acts constitute interference with the interstate commerce law, but at Tuesday's meeting this idea was set aside, and, instead, two or, perhaps three, test cases will be instituted in New York State. The necessary arrests will be made in this city, probably late this week or certainly next week. They will be fought through the State courts and will be carried to the Supreme Court of the United States if necessary.

More than one arrest will be forced, as the law will be disobeyed in two respects, if not three, in order that certain specific points may be settled for all time. Just what they are Mr. Terry will not say, but it is certain that "using an unregistered automobile" will be the basis of one case, since registration is the pivot on which all the State laws revolve.

In order to get quick action and to hurry the cases to decision, it is reported that the District Attorney will be in some way brought into the matter, but when questioned, Mr. Terry only said:

"Oh, leave the District Attorney out of it."

Committee Kills Saxe Bill.

Killed in committee is evidently to be the fate of the obnoxious Saxe amendment, about which such a tempest in a tea kettle has so recently been brewing, if appearances count for anything. In accordance with the plan announced last week, this bill was brought up on Thursday, and a motion to report upon it favorably was made, but voted down—all as arranged.

The Grady bill, which is merely another of the same "increased penalty" ilk, has not been moved in committee as yet.

Big Injuns Desert Mustangs for Motor Car.

Some of the big chiefs who have been gracing the New York Sportsmen's Show with their presence were inducted into the mysteries of that latest machination of the paleface, which his red brother would most aptly describe as "wagon-fly-without-horses." Louis Deer, White Bear, Dark Cloud, Shungopari, Frank Diebola and Red Eagle, in all their war paint and fixings, were the braves who were treated to a spin in a new 30 H. P. Pope-Toledo.

This most odd combination of the old and new was taken to the Park and there perpetuated by the camera in the very striking photograph shown here.

NILES ON LEGISLATION

His Address Studded with Advice that Conflicts with His Other Statements.

In his address on the present status of legislation concerning the automobile before the Automobile Club of America at the regular Tuesday evening meeting, W. W. Niles, counsel for the organization took the occasion to state "that in most cases the courts treat automobilists as being on the same terms at law with other highway users, and in almost the next breath amazingly advised automobilists not to fight for such equal rights by attempting to test the constitutionality of the special statutes relating to motor cars, and to have them overthrown on the ground of being class legislation. He said that there is no specific provision in the constitution against class legislation, and that in his opinion the law providing for the licensing of motor cars is not unconstitutional," which will come as a surprise to most of those interested, particularly in view of the fact that the N. A. A. M. are just about to take steps in the matter of testing the constitutionality of the license law on the ground that it discriminates against a certain class of users of the highway and in that respect is double taxation. Mr. Niles formerly was of counsel for the N. A. A. M. Whether the fact that he has "lost his job" influences his present views cannot, of course, be stated.

This was prefaced with a few remarks in regard to his personal experience with the laws now in force through having been called upon to defend automobilists arrested for violations, particularly for speeding. In this connection he said, "that the most illogical feature of any of the laws is that which sets a fixed limit of speed, because a person meaning to be law abiding may unwittingly violate the law when running down hill."

In the opinion of Mr. Niles there are now too many statute laws, and there are and have been sufficient provisions in the statutes against reckless driving without any special enactments for automobilists. He then called attention to certain sections of the Penal Code, particularly that relating to assault, and cited that a menace constitutes an assault and has been so held by the Supreme Court in a case where the driver of one vehicle attempted to run into another, and although he did not actually hit the other vehicle the menace was held to be an assault. Similarly, it was argued, it might be held to be an assault when an automobile was running toward a person or vehicle in a menacing manner.

He said that automobilists should be very meek and quiet unless trod upon or imposed upon, and they should then resent it in a very lively and effective manner.

Following Mr. Niles's address there was a discussion with questioning of the lecturer. In the course of this it was brought out very emphatically that the club's counsel advocates that sufficient law is now found in the general highway statute which provides that no automobilist shall drive at a rate of speed which endangers the life or limb of any person or endangers any property. Automobilists should struggle until only this provision remains on the statute books, he argued, because such an elastic provision is the only sensible and practicable one. He did not explain how this is to be brought about if his advice not to test the legality of the present one-sided statutes is followed.

A. R. Shattuck said that most of the troubles of automobilists are due to the fact that all do not drive with judgment and discretion.

Chicago's Y. M. C. A. in Line.

Automobile owners of Chicago present and prospective, will have a chance to be initiated into the mystery of the inner workings of cars at the Young Men's Christian Association course in automobile construction being organized in that city. The subjects embraced in the course are "Gasolene Automobile Engines," "Gasolene and Gasolene Mixing Devices," "Ignition," "General Features of Gasolene Engines," "Transmission Gears and Clutches," "Wheels, Tires, Springs and Brakes," "General Automobile Construction," "On the Road" and "Troubles and Remedies."

Built Road for Automobiles.

The Tonopah Automobile Co., of the Nevada gold mine region, which recently purchased a Columbia and a Winton to convey passengers between Tonopah and Goldfield, Cal., has completed its new road between these two towns. The highway is twenty-three miles long and cost the company $20,000. The builders intend to keep the route for their own private use, and to that end have petitioned the county commissioners for the privilege of reserving it as a toll road.

Colorado's Automobile Highway.

An automobile highway is being constructed between Colorado Springs and Denver, in Colorado. The road will be 85 miles long and costs approximately $1,000 per mile. Funds have been collected which will permit the immediate completion of 30 miles of the roadway, which will be 30 feet wide, and constructed of disintegrated granite. For several miles the road will follow the Palmer Lake Divide, and will enable touring parties to obtain a splendid view of Pike's Peak, Long's Peak and the Spanish Peaks.

Said No to the Quakers.

The famous Wissahickon drive, in Philadelphia, will continue to be closed to automobilists. A petition presented by Philadelphia automobilists to the Road Committee of the Councils Committee on Fairmount Park, to open the road, proved of no avail.

WOULD TAX HORSEPOWER

Onc ot New York's Innocent Country Legislators Strikes in a New Direction.

One more aspirant for honors in the automobile legislation factory has sprouted in the shape of Senator L'Hammedieu, of the railway and Niagara power grab notoriety, and one more outbreak of the accumulated petty hostility of that portion of the public which poses as the "constityooents" of the gentlemen at Albany is in evidence in the shape of a bill that bears all the earmarks of a "strike."

The following are some of the reasons why there should be such a law and some of the advantages as set forth in the words of its author:

"We must raise $6,000,000 revenue or return to direct taxation. No taxation plan now under consideration will meet the emergency. My bill will help along by about $500,000 a year. According to statistics I have gathered, there are 15,574 automobiles in the State.

"Make the average horsepower sixteen and the aggregate would be over 220,000, yielding $440,000."

"But are not owners of automobiles now compelled to pay a personal tax?"

"They are supposed to pay one, but my bill provides a personal tax exemption. That would be to the advantage of owners of flying machines. The personal tax on a $1,700 machine is about $34. Under my bill it would pay only $24."

There seems but faint doubt that if the fool killer could find time to take a vacation elsewhere, he would find much to do at the State capital when the legislature is in session, for of the other seven bills now in the process of incubation or hibernating in committee, one proposes to give the right to a majority of the land owners of any county to exclude motor vehicles from its highway for a specified period, and as no limit is given for the latter, it is to be presumed, indefinitely. The only requisite to the accomplishment of this somewhat unconstitutional proceeding is a petition on the part of the above named to the Board of Supervisors of the county in question and a resolution by such august body to that effect. In order to give it validity it will only be necessary that signs informing automobile drivers that they are without rights on such highways be posted in sufficiently conspicuous places as to be easily legible. What would happen to the automobilist committing such a wanton trespass or to what extent he would be mulcted if unfortunate enough to be caught, that wise solon, Assemblyman Smith, who is its sponsor, does not seem to have provided for.

Some "constityooent" must be an inventor and takes this way of introducing the result of his genius on a long suffering public, as his representative has perpetrated a bill

Oldfield on the Dallas Track.

OLDFIELD AT THE WHEEL; COL. GREEN STANDING BEHIND HIM.

to require every automobile to be fitted with an automatic device which prevents its speed from exceeding the legal limit. And these are only two of the seven; the Hall of Fame is much too small.

And as if it were not bad enough that the legislative mill up the State were working overtime in grinding out bills, many of which seem to be produced solely for the purpose of being "settled"—that is, quietly lubricated out of existence when their sponsors have been "seen,' the city's police commissioner takes it upon himself to butt in by stating that "imprisonment of automobilists who violate the speed law is the surest way of having the ordinance enforced." This comment was called forth by the receipt of a letter from a member of an automobile club, calling his attention to the West Ender's bill, and stating that the penalty was too severe.

"In my opinion," said Commissioner McAdoo, "making an example of some wealthy automobilist by giving him six months' imprisonment would have more effect than all the new laws proposed." It might be equally effective in suppressing some other evils to which a great amount of public attention is directed, such as—well, keeping the children off the grass in the parks.

Oldfield Performs at Dallas.

Not satisfied with driving his Peerless over the Texas track in 1:06 2-5, February 25, Barney Oldfield remained in Dallas and made good his promise to circle the course in less than a minute. He did so last Saturday afternoon, covering the mile in 59 seconds from a flying start. Oldfield at first intended to try three miles from a standing start and three from a flying start, but on the third mile his engine went wrong, and he had to be content with what he done.

The first mile was made from a standing start, and was negotiated in 1:13. The second mile, in which the 59 seconds was made, was, of course, from a flying start, being one of those intermediate miles which the A. A. A. is snuffing out. While slewing around one of the turns in the next mile the trouble occurred, and the exhibition had to be declared off. Oldfield's car will have to be sent back to the Peerless factory, and in the meantime his Southern dates will have to be cancelled.

It was intended to run the postponed fifty-mile race between Colonel E. H. R. Green's Pope-Toledo and J. Howard Hughes's Peerless on Saturday, but the latter's car is still out of commission, the new crank shaft not having been received from the factory.

Brighton Track to be Kept Busy.

Having been incorporated with William A. Engeman, J. G. Battersby and Charles H. Hyde as directors, the Brighton Beach Automobile Club proposes to hold a series of race meets on the track near the seashore the coming summer. The track is to be resurfaced and banked eight feet high on the outer edge. It is expected to open the track for trials on April 1. John R. Eustis, the well-known Brooklyn newspaper man, has been appointed manager.

Long Sight-Seeing Coach Route.

The Long Island Automobile Observation Co., of West Hampton Beach, has been incorporated, with $10,000. The company will carry passengers and freight from the New York City line on South Country Road, near Jamaica, L. I., and thence easterly along the road to Amagansett, L. I., a distance of about 100 miles. The directors are: Gustav H. Ludtke, George L. Robinson, George M. Auten, William H. Slatterly and Henry B. Lake.

King Compelled to Register.

King Alfonso of Spain has been forced, through public sentiment, to take out two licenses for his car, and to register himself as a chauffeur.

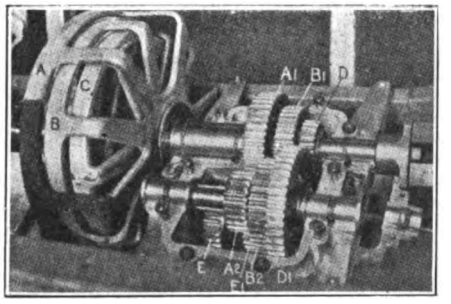
NOVELTY IN TRANSMISSIONS

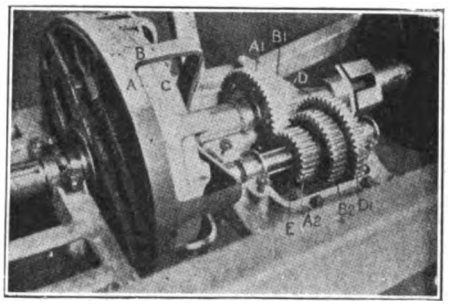
New Ideas Reduced to Practice Abroad—The Efforts to Produce Magnetic Clutches.

Judging from the number of novel forms being placed on the market for the coming season the problems of transmission and clutch construction are evidently receiving more than usual attention from the designers and builders abroad.



The "Metallurgique" car made in Belgium exhibits departures in this direction in the shape of an internally expanding metal clutch of novel design and a spring drive on the end of the cardan shaft, transmission being by live axle. The expanding clutch takes the form of two brake segments, which are expanded against the inside surface of the flywheel rim by means of a cone sliding on the clutch-shaft, and actuating the segments by means of short arms carying rollers at their ends. The spring drive is mounted

METALLURGIQUE CLUTCH.

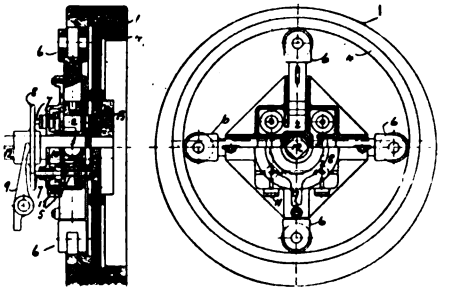


in a drum, b, set on the end of the bevel pinion spindle, a, having two lugs, c, opposite to each other projecting inwards from the rim. The cardan shaft ends in a forked piece, d, each end of which bears against one end of a spiral spring, h, laid round the disc, and bearing as to its other end on one of the projecting lugs, c, the power being transmitted through the forked ends, the sprigs, and the lugs on the drum, and the latter to the bevel pinion. The device is claimed to prevent shock on the bevel drive and to considerably reduce the noise.

Another novelty in the shape of a clutch is the "Octopus," operating by means of hydraulic power and manufactured by the Wilkinson Sword Company, Ltd., of Acton, England. The device, which has been designed by an Italian engineer to take the place of the ordinary leather faced clutch, is illustrated herewith, showing a sectional elevation and front view of the clutch, from which it will be seen that the flywheel rim 1 is cast eccentrically with regard to its thickness, but for the purpose of balancing the wheel the eccentricity of the circles forming the inner edges of the rim are opposed to each other. On a squared portion of the clutch shaft 12 is mounted the clutch body, which is cast of phosphor bronze, to form four plunger barrels and four valve chambers. In the plunger barrels are set plungers 6 carrying at their outer forked ends friction rollers. In view of the fact that the clutch body is mounted on the clutch shaft, the centre of which is the centre of the flywheel, it will be seen that as the flywheel revolves the plungers 6 must move up and down in their respective barrels, if there is nothing therein to impede such movement, or if the clutch body is held stationary. This reciprocating movement of the plungers is, of course, due to the ecentricity of the inner periphery of the steel ring 4 to the centre of the clutch shaft. The two vertical plungers are shown at either extreme of their

BRUSH TRANSMISSION.

strokes, the upper one being right out and the lower one right in, while the two in the horizontal position are at half stroke. The hollow parts of the clutch body are filled with oil, and the plungers can make the up and down motions in the respective barrels so long as the oil is free to flow from one part to the other; but when the clutch is in, or driving, the oil cannot so circulate, this being only possible by the lifting of the valves 7 from their seatings. While they remain closed the oil cannot pass from beneath a descending plunger to below a rising plunger; consequently, the eccen-



BRUSH TRANSMISSION (Front View).

tricity of the inner surface of the flywheel causes the flywheel and the clutch body to become locked together, the power of the engine being transmitted to the gear box. When the clutch has to be disconnected the fork arms 9 are caused to exert pressure upon the sliding disc 8, which in its turn conveys this pressure equally upon the four projecting ends of the valve spindles 7. By these means the four valves can be raised from their seatings to any desired degree, so bringing about as much or as little slip of the clutch as is desired. The valves are so arranged that the higher the lift of the same the greater the quantity of oil circulating through them. The clutch is claimed to be both smooth and certain in its action.

In order to overcome the disadvantages of the sliding gear transmission a novel form of change speed gear has been designed and will be employed on the Brush motor buses, built in England. As will be noted by reference to the illustrations showing this combined clutch and gear, three independent friction clutches of the expanding type, A, B and C, are employed to introduce the three forward speeds alternatively; the clutch A locks the wheel A1 to the driven shaft so that the power is then transmitted through the wheels D, D1, A2 and A1; the clutch B locks the wheel B1 to the driven shaft, and the clutch C gives a direct through drive. For the reverse the wheels A1 and A2 are separated and the pinion E introduced between them.

In this connection reference may well be made to the magnetic form of clutch which at one time seemingly held forth great promise as it can only be a matter of time when with increasing horse power the leather-faced clutch will become inadequate to transmit the constantly increasing driving torque. Experiments along this line have evidently

OCTOPUS HYDRAULIC CLUTCH.

been confined almost entirely to private individuals, who, once their curiosity was satisfied were apparently content to drop the matter, for despite the reports cropping out from time to time that certain continental manufacturers of prominence had decided to adopt this form of clutch it has never been applied to their cars for the market.

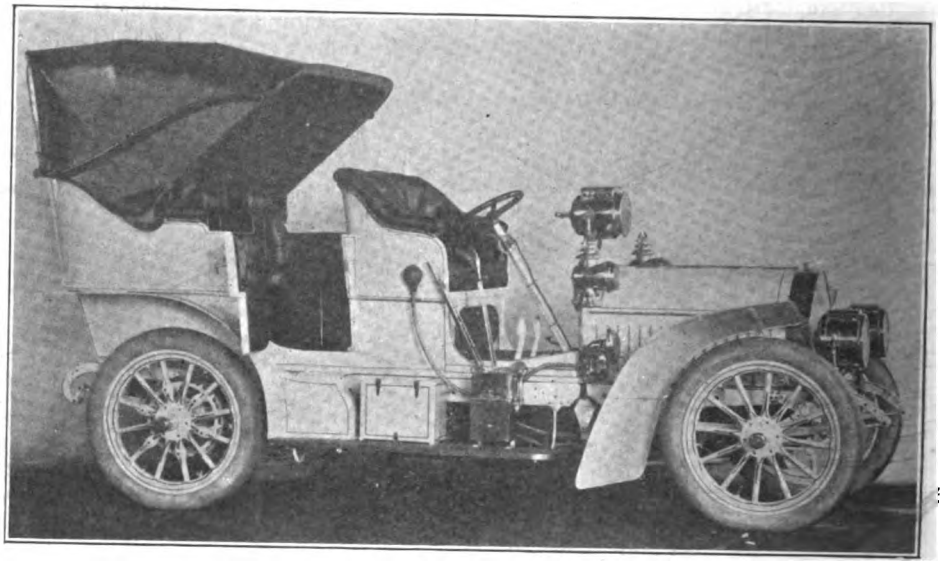
At the recent Paris show it would have existed as a fading memory of a "has-been-tried" but for the fact that it was actually in evidence on one car. So far as its operation in service went, it was found to do away with the drawbacks of the first clutches, but on the other hand introduced new ones of its own which more than counteracted its good points. With its aid it was found possible to start easily without jerking, and its hold was positive—in fact too much so, for here is where the difficulty lay—the residual magnetism was evidently too great, for a prompt release could not be depended upon, there being a decided tendency to drag when a quick disengagement was desired. This may have been due more to faulty design than any defect inherent in the device itself, but apart from this there are more than sufficient reasons why the magnetic clutch has not met with a favorable reception in automobile design.

In the first place, the magnetic clutch, unlike the ordinary friction clutch, constantly consumes a small amount of power when in action. It requires a source of electrical energy for energizing its coil, and this ener-

Digitized by Google

gy is consumed while the clutch is in operation. Its use means added complication and weight and entails the installation of a more or less delicate character which may be expected to be productive of occasional trouble. Then, while magnetic clutches are very efficient when run dry, there is a considerable loss of power when they work in proximity to oil. Present indications are that the magnetic clutch has been passed by in the progress of automobile development.

This recalls another attempt to utilize electricity on the car, in this instance to take the place of clutch and transmission altogether; that is, to eliminate them entirely and in their place to substitute a system which for elasticity and ease of control within the widest ranges of speed and power could hardly be improved upon. Instead of the usual flywheel, the end of the motor shaft would carry the armature of a fair sized direct curent generator and the speed of the motor could accordingly always be constant regardless of the speed of the car or whether on the level or an up grade, as there was to be no mechanical connection whatever between the engine and the driving wheels. Directly behind the dynamo operated by the latter was to be placed an electric motor driving the rear wheels through a propeller shaft and live axle. Current was conducted from the dynamo to a controller and set of resistances by which the electric motor could be governed and sent ahead or backward at any speed up to the maximum. Accumulators in shunt with the generator were provided for starting, lighting and ignition purposes and in theory the system worked out beautifully, but the closest approach to it that has been seen in practice in this country is represented by the Fischer system, which differs in that the entire output of the generator is stored in the batteries and the latter are utilized in exactly the same manner as in the ordinary electric driven vehicle, whereas in the system in question the electric motor's function was to take the place of the clutch and change speed gearing entirely—it was not considered as a source of power in itself, but more as a means of transmitting what the engine developed.



Toronto Holds a "Show" After a Fashion.

Although the Toronto Show was declared off, the Canada Cycle and Motor Co. tried to partly fill the breach by a makeshift exhibit, primarily to boom its own production, the Russel car, and dubbing it a "show." It was held in the Canada Cycle and Motor Co.'s garage, of course. It lasted the week of February 27 to March 4.

In all there were about forty cars shown, the product of eleven factories. The American cars comprised the Packard, Peerless, Thomas, Stevens-Duryea, Ford, Pope-Toledo, Pope-Tribune, Pope-Hartford and Pope-Waverly. The American cars were relegated to the rear and the Russell gasolene and Ivanhoe electric, two cars produced by the Canada company, were pushed to the front as much as possible. Fisk and Dunlop tires were also exhibited.

The Handsomest Locomobile.

What the Locomobile Co. of Bridgeport, Conn., considers the "handsomest car they ever delivered" was shipped from their factory last week to Dr. H. E. Thomas, of Chicago. It is a 40-45 horsepower car of the latest model, embodying all the improvements adopted as standard for the 1905 locomobile. The body is in pure white, relieved by narrow black striping, and both the upholstery and the Victoria top are black. While the motor with which the car is equipped is listed as stated, it is said to have shown 59.3 electrical horsepower on the special testing apparatus devised for the purpose. Some idea of the beauty of the vehicle in its sharply contrasting colors may be gained from the accompanying illustration.

CONSIDERED THE HANDSOMEST AUTOMOBILE EVER PRODUCED.

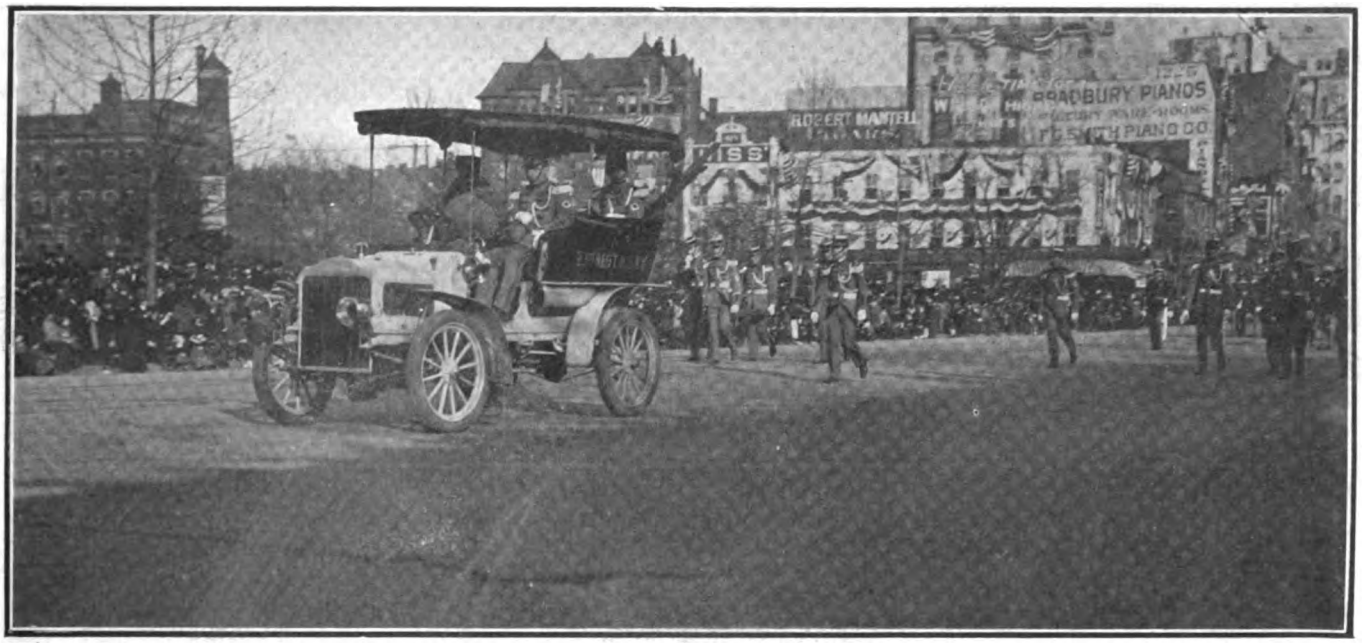
Says Peru Holds Promise.

Americans are very apt to consider that South American republics are far behind the United States in all points of development. Take, for instance, Peru. To the average reader Peru is a country about which little is known except that it is was the scene of conquest in early days of European discovery of this hemisphere. Quite refreshing, then, is the report of Consul Alfred L. M. Gottschalk that the Peruvians are adopting automobiles as a decided commercial advantage.

"Callao is practically the seaport of Lima," says Mr. Gottschalk, "in fact, it is so closely identified with the capital that it may be considered a commercial suburb of the larger city. This condition has been accentuated by the establishment of two steam railroads and a trolley line between the two places. The business district of Callao consists almost exclusively of shipping agencies, branch banks, seaboard consulates and, excepting ship chandlery, there is hardly a commercial establishment of any kind that is not a branch of some Lima firm. As a result of this condition there was need of cheap and rapid means of transportation between the two places. To meet this an automobile line for the carriage of freight has been established, and five cars are already in use, each having a carrying capacity of five metric tons. These cars take freight either direct from the steamers or the docks and deliver them to the stores in Lima, thus necessitating one handling of the goods between the ship and the store."

Consul Gottschalk thinks there is a good opening for American automobile makers, and that it would be advantageous to them to investigate the matter more fully.

German "Pirates" at Work.



One of the most noticeable features of the light cars shown at the recent Berlin show was the slavish following of American lines, exactly as was the case with the bicycle, making it appear that the automobile "made in Germany" will from now on convey as one of its significations the same methods of piracy that characterized the bicycle industry when at its height. Noting the world-wide sucess of the Oldsmobile runabout, several German manufacturers are now turning out home made imitations, which in one instance follow the original even to the shape and location of the escutcheon bearing the name. This is the "Ultramobile," made as a runabout and light tonneau, and rated at 8 horsepower in both styles.

Strike is Delaying Foreign Trade.

According to advices from Paris, automobile makers are being caused considerable delay and inconvenience by a strike of coach builders; indeed, they are said to be practically at a standstill, as their spring deliveries cannot be made until the strike is settled. For instance, it is stated that forty-five Mercedes chassis are waiting for bodies in the workshops of Rothschild & Kellner, and the makers are planning to have the bodies built abroad if the strike does not end this week.

The Automobile in the Inaugural Parade.

For the first time in its history the automobile has figured as a feature of the inaugural parade and the distinction of being the pioneer in this role is owing to a White steam car, which "marched" with the 23d Regiment of the New York State National Guard as an ambulance, bearing members of the Red Cross staff with the usual equipment of surgical supplies and stretchers.

The introduction of an automobile into the parade was one of the few minor details of the event which had not been submitted to the President for his approval, and there was some speculation as to how he would view the intrusion in the light of his great partiality for the horse. It is said, however, that not alone President Roosevelt, who pointed out the White steamer to Vice-President Fairbanks as an evidence of the widening of the scope of the automobile, but also the spectators along the line of march were quick to appreciate the novelty and utility of the idea.

Counterfeiting the Tire Protector.

To what base uses has the non-skidding device been put! Designed originally as an adjunct and protector to the good tire, it now covers the good and bad alike, and under its all enveloping embrace the tire that has reached a point where it is only fit for sale as old rubber is now being palmed off in England on the unsuspecting at prices just sufficiently lower than those of the genuine article to lure the economically bent. How the game is worked is thus related by an automobilist who was drawn into the trap:

"There is one form of non-skid which, after personal experience, I consider it simply a public duty to warn my motoring brethren against. I refer to the tires advertised as 'newly retreaded, fitted non-skid leather covers, never used since retreaded.' I was foolish enough to buy a pair of these. They were quite pretty and substantial-looking—to look at—but a week's running settled them both. One was a worn-out old tire, badly separated at the bead; the other had a bad burst through the middle of the tread; a neat canvas lining inside and the leather tread outside effectually concealed these defects. So, 'on approval' is of very little use. Instead of being vulcanized on, the leather cover appeared to be fixed with office gum or some equally powerful adherent, while a bit of tape was stuck round the edge by the beading. Once the leather was loosened it stripped off easily from the cover by slipping the thumb round the tire. Any old worn-out covers appear to be used, covered inside with canvas, outside with 'non-skid leather bands,' and advertised for sale. The process is simple, and, I should imagine, profitable."

This is the experience of one economist; here is the plaint of another, who evidently stacked up against the same process, but was not even so fortunate as to get a week's wear out of his bargain.

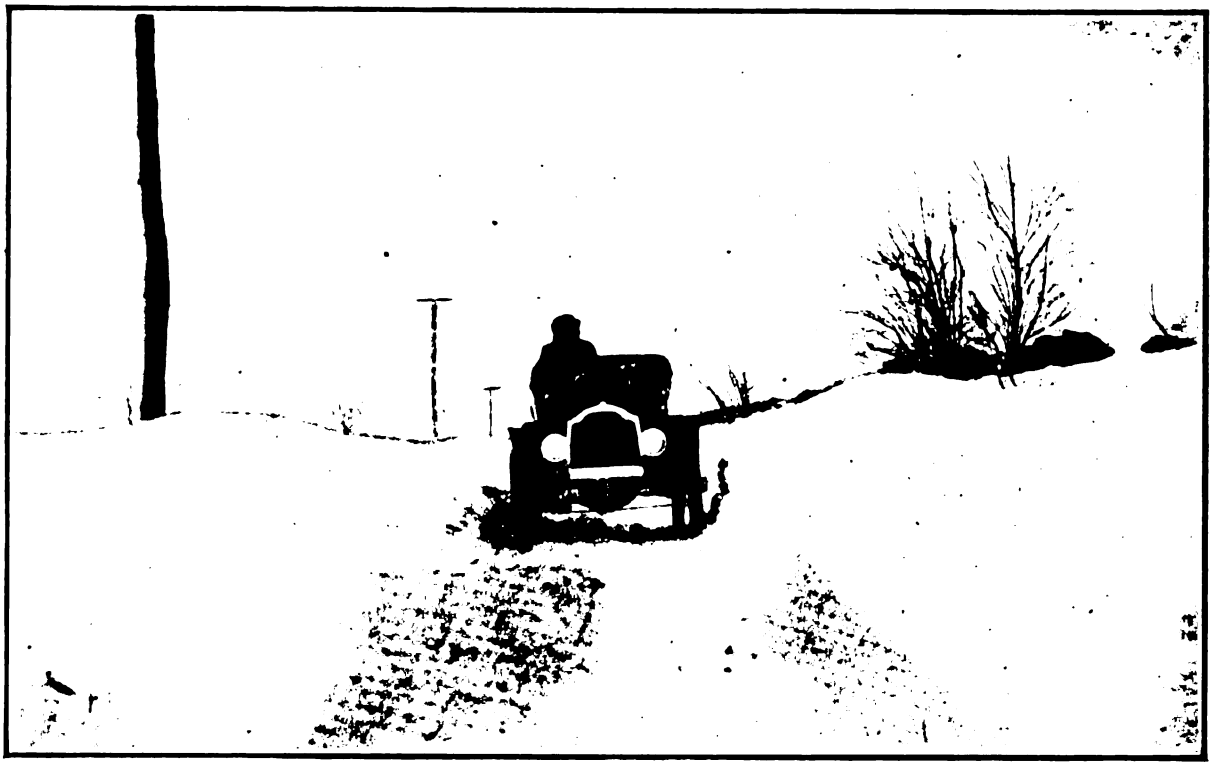
"I recently bought a pair of 810 by 90 mm 'newly retreaded, never used since' tires. These were sent on approval and looked nice; naturally I did not try them before sending check in payment. A few weeks later I had occasion to use them. They were put on the front wheels and inflated to 65 pounds' pressure. One ripped up after standing a quarter of an hour, the other following a little later, neither having run a yard."

To Mitigate the Searchlight Evil.

The Automobile Club de France is issuing a circular to its members urging them not to use powerful acetylene headlights in towns, in order not to dazzle the eyes of pedestrians and the drivers of other vehicles.

The Dayton (Ohio) Automobile School has been organized with these officers: President, Scott McDonald; vice-president, Howard Johnson; secretary, J. F. Taylor.

How the Circus Lady "Defies Death."



First it was the "cycle whirl," then followed the "loop-the-loop," and next came the "loop-the-gap." The multitudes who witnesed these feats pronounced them the acme of sensationalism, and said they ought to be prohibited, but still they flocked to witness the exhibitions. But Barnum & Bailey's circus has the latest "thriller," and it is to be presented to a skeptical public when the show opens in Madison Square Garden, New York, March 25.

"L'Auto Bolide" is the name of the new act, which comes direct from the Folies Bergères, and Mlle. Maurica de Tiers, an intrepid young Frenchwoman, will demonstrate looping-the-gap seated in an automobile.

Of different arrangement than other frameworks of the well known "loop-the-gap" acts, the automobile starts from a platform as high as a three story house and shoots down a declivity at an angle of 60 degrees, which is in form the outside of a gigantic letter S inverted. As the lower curve of the S is reached the automobile and its rider are suspended upside down and spring forty-five feet across the "gap." The steel framework here supports a curved runaway that begins in a half moon shape and straightens into an easy incline to the ground, where the young woman and her automobile complete their journey.

"For Rain or Snow or Any Kind of Weather."

ON THE SNOW COVERED ROADS NEAR STAMFORD, CONN.

Progress Slow in Sweden.

Automobiles were first seen in Gottenburg, Sweden, in 1901. In three years the number has not increased to any alarming extent, as now there are but fourteen in the city, which is the largest and most important town in Sweden. The roads in this country are fairly good, but cannot by any means be considered ideal for automobile travel. They are, as a rule, too narrow and slope too much from the middle toward the sides. The cars are mostly used within the city limits, and seldom on long tours. One of the reasons for the scarcity of horseless vehicles in this town of two hundred thousand inhabitants is that few people are really sufficiently wealthy to afford such luxuries; therefore the price here will always be an important factor, in view of the fact that no automobiles are manufactured in the country, thus making them more expensive than elsewhere. The import duty on automobiles is 15 per cent ad valorem, costs, insurance and freight entering into the dutiable value. The duty on gasolene motors is 10 per cent and 15 per cent on electric motors.

Partners Disagree; Litigation Follows.

On April 11 last Charles F. Holley and George Gilmore, of Delray, Mich., formed a partnership to do a general automobile repair business, and each put $425 into the firm's treasury. On July 1, 1904, the firm ceased operation by mutual consent, and now Holley has gone to court and asked that Gilmore be compelled to give an accounting for what he has done with the assets of the concern.

In the Retail World.

The Linscott Motor Company, Boston, Mass., have added the Corbin car to their line.

Dey Bros., & Co., Syracuse, N. Y., are having a garage built for them. The building will be of brick, 25x100 feet.

The Wilmington Automobile Co. Wilmington, Del., is this week taking possession of its new garage at Tenth and Tatnell streets.

Eugene Atkins and F. W. Wickshire have started, on a small scale, to supply Elkhart, Ind., residents with automobiles. They have the agency for only eighteen cars.

The printed report that Russell Drisko, of Boston, had signed the agency for the Stevens-Duryea car was based on misunderstanding. The agency will remain, as it has remained for three years, with F. E. Randall, with whom Drisko is connected.

Arthur M. Butts, of Oneonta, N. Y., has purchased the property at 8 South Main street, that city, and will erect a three story brick garage. The building will be equipped with a power elevator and the upper floors utilized for storage purposes.

Another of those "local shows" which seem about to become the fashion, and which furnish good advertising for the garages in which they are held, is scheduled for Hartford, Conn., March 22 to 24. It will be held in the Palace Automobile Garage, at 122 Trumbull street. Locomobiles, Autocars, Pope-Hartford, Pope-Tribune and Pope-Toledo cars will be shown.

One More Selden Suit Settled.

Peace will reign once more for Melville D. Chapman, the New York stock broker, who through his purchase of a French car directed to himself the attentions of the Association of Licensed Automobile Manufacturers. A decree of infringement of the Selden patent was entered against him by Judge Lacombe last Friday, sitting in the United States District Court, in an action instituted by the Electric Vehicle Company, and the papers were served upon the defendant on Tuesday last, but the latter compromised and settled the case.

A mighty protest was forthcoming at first, and Mr. Chapman swore that he would fight the suit to the last ditch, regardless of time or expense. In explanation of this sudden surrender it is said that the settlement was brought about by E. R. Chapman, the father of the defendant who had acted in the matter without the latter's knowledge during his absence. Mr. Chapman, sr., says he did so on the ground that defending the suit would have taken a great deal of time and money. He further complained that the plaintiffs declined to let the individual suits rest and be decided by the results of suits against corporations now in progress, which would entail the retaking of voluminous testimony.

Fire in a freight car in the New York Central and Hudson River Railroad yards, Thirty-first street and Eleventh avenue, New York City, Tuesday, wrought $400 damage to a carload of Simplex cars being shipped by Smith & Mabley, New York.

GOING FURTHER UPTOWN

How the New York Trade Has Drifted Parkward—New Garages Built and Building.

The march of progress is nowhere better illustrated than in the spread of a city's growth. The expansion takes place, not simply in an increase of the area covered by buildings, the filling in of suburban districts; but in and through its every quarter. The increased volume of high commercial and financial interests, with their parasite following, force the local and retail traders out and away from the old centres to sections where they have more room and better facilities to ply their trade. And they in turn, force others, dealers and residents, to seek new quarters farther out. And so it goes on, a wonder of the ages at which one never ceases to marvel.

This process of growth tends to bring together allied and rival interests in the many different sorts of business, with neighborhoods or quarters which are best suited to their needs, and the sharper the rivalry, the closer the competition, the closer they huddle together. If, perchance, one separate and betake himself to a new locality, he is regarded almost as an alien; but if the wisdom of his choice be very apparent, behold, a grand stampede of one and all, to his side.

New York's invasion by the automobile began in a very modest way. Here and there, where he found room, a dealer hung out his shingle. Later, as there was need, real or fancied, a man here and a man there changed the sign over a stable door, and lo, a new garage. But presently, business began to take positive active shape, and the increased rivalry soon developed the tendency to get together, as it were, and the Thirty-eighth street district was formed. And a lively little quarter it soon got to be. A year or two, however, so increased the volume of business that some of the old standbys began to be a bit crowded for space. A new row was formed on Thirty-ninth street, but there was no room for the new comers, so they began to crop out here and there along upper Broadway.

A couple of years or so ago, its proximity to the old Central and Mobile garages and its location on the way from the "street" to the Boulevard and Park sections, attracted two or three tire and parts dealers to the section of upper Broadway lying between Fifty-third street and the Circle. Soon afterward the Winton people, finding the old theatre on Fifty-eighth street too cramped for their needs, and its location east of Lexington avenue too remote from the trend of business, decided to build, and wisely chose the location on the east side of Broadway, between Fifty-fourth and Fifty-fifth streets. Other dealers, great and small, began to crowd in above and below, and presently there was talk of a new mecca for the motorist somewhere between Longacre Square and the Circle.

Soon the idea crystalized, and the dealers began to reach out and grab for locations. First came the Pope interests, with a swell three story building, on the west side at Fifty-fifth street. They are established in it already, though it is not entirely completed. The Packard agency remodelled an old building down in Longacre, and now boast one of the prettiest salesrooms in the city. C. J. Wridgway, with the Peerless cars, sought a location still nearer the old stamping ground, and has built in on the south side of Forty-first street, close to Seventh avenue. He has a salesroom at the front where he can show three or four big cars, and back of it, storage room for fifty cars or so, while above are a well lighted, well fitted shop, a large stockroom and the executive offices.

With the beginning of the year more plans and more again were laid by the dealers. Harry S. Houpt, of the Thomas agency,, decided to build, and picked out a lot at Seventh avenue and Forty-ninth street. The building will be of standard construction, two stories in height, with offices, dead storage and repair departments on the second floor. The street level will be wholly given over to the uses of a garage, while there will be in all ample accommodation for 140 cars. The old firm of J. B. Brewster & Co. will occupy one-half of the building which is to be of double construction. Work is being advanced so rapidly that the occupants expect to move in by the nrst of May. Another newcomer to the district will be the Standard Company, with a salesroom and garage on Broadway and Fifty-fifth street, and a wing running through to Fifty-sixth. Four stories in height, and thoroughly built, it promises to be one of the best buildings of its class in the city.

Just prior to the announcement of the Standard people, came the publication of the A. C. A.'s choice of site for its new clubhouse on Fifty-fourth street, just west of Broadway, a location which well fits it to be the capitol of automobiledom in New York. For by the time it is completed, there will be over twenty places of business either directly in the automobile line or allied to it, almost within stone's throw. There will be the showrooms of the Winton, Royal, Speedway, Haynes, Rochet-Schneider, Oldsmobile, Pierce, Mitchell, Queen, Baker, Pope, Brasier, Thomas, Stevens-Duryea and Decauville, to say nothing of their connected garages, and four tire depots.

All this represents quite an amount of capital outlay, and though its exact amount cannot be easily reckoned, some idea of it can be obtained from the statement that the cost of demonstrating cars alone adds up to over $50,000.

Waterbury, Conn., is to have a "show," and if the plans of the E. H. Towle Co. materialize it will take place the latter part of this month. The exhibit will be held in the company's garage on Harrison street, and will be free, of course.

SWISS ARE PREJUDICED

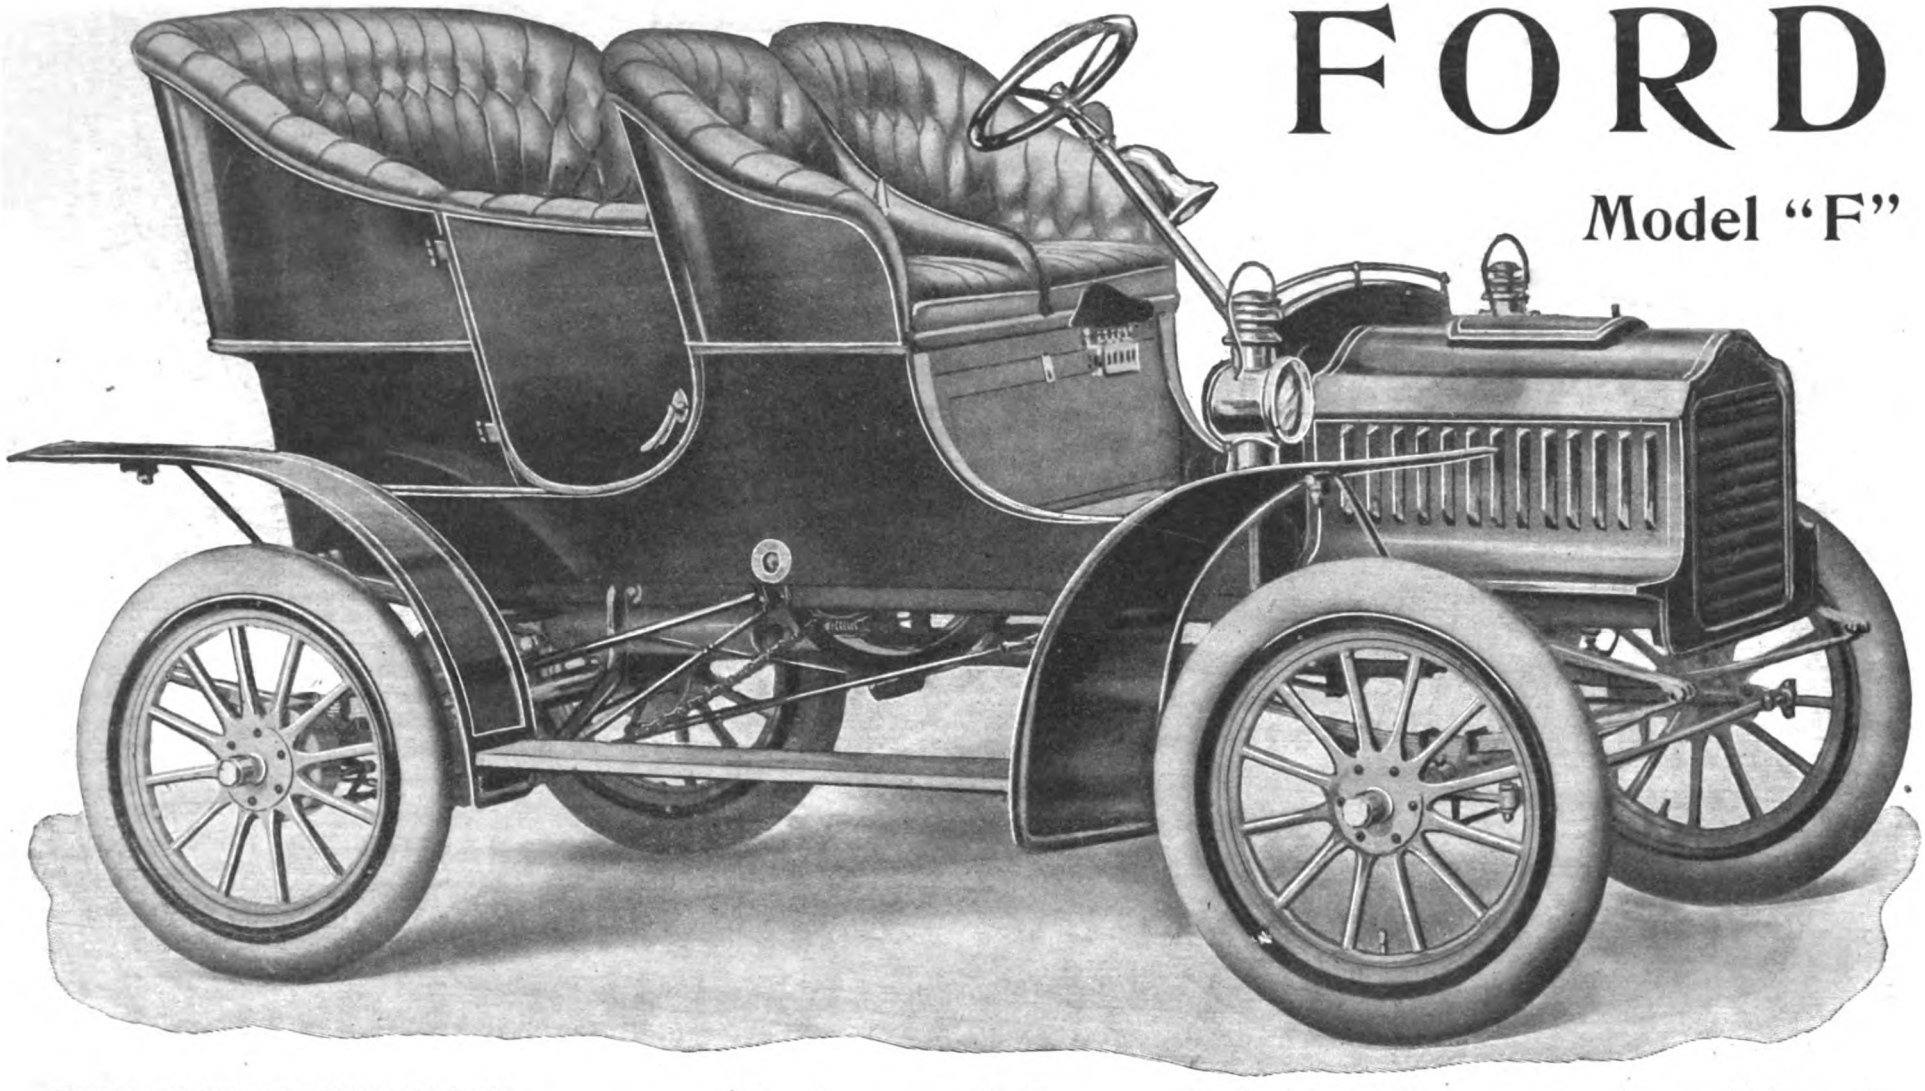
Why They Do Not Incline Favorably to American Cars—Chance for a Low-Priced Model.

"There is only one house in Basel, Switzerland, doing a considerable business in automobiles, C. Schlotterbeck," says Consul General Giffon, in his latest report. "It has sold some American cars (of the runabout type) at the price of 4,000 francs ($772). These two or three pioneer machines seemed to give satisfaction at first, but are now said to have lost favor on account of an alleged lack of durability.

"The same objection is made to automobiles of the American type that has always prevented American vehicles from obtaining a foothold in European markets, viz., size and appearance. The people, accustomed to the use of larger material, are afraid the American frame will break down under its burden. It is hard to account for this prejudice, since carriages built with a view to use on the so-called American roads are certainly capable of withstanding the much less serious wear and tear to which they are exposed on the magnificent thoroughfares which are to be found even in the most secluded districts of England, France, Germany and Switzerland.

"An American automobile that could be sold much cheaper than the rival types, say for 3,000 francs ($570), for instance, would ever now find many buyers.

"The number of automobiles used in Switzerland is increasing rapidly, and there is sure to be a very large demand for them as soon as the price is low enough to place them within reach of people of moderate means. This country possesses already a number of factories, of which the most important belong to the Messrs. Martini in Frauenfeld. The principal task of the American automobile industry will be to meet successfully the preference, or, if one may say so, 'the prejudice,' for well known foreign and firmly established favorites."



Small Boom in Shanghai.

"Practically speaking, there is no extended market for automobiles in China," says United States Consul Anderson at Hangchau. "In the average Chinese city it would be impossible to use a machine, and there is no prospect of any improvement in the near future of a character to promise any trade. In Shanghai a good many automobiles are in use, and their popularity is increasing. It may almost be said that an automobile boom is on in that city. There are many people there who can afford automobiles and who are accustomed to spend money in such ways, but the demand will be limited to Shanghai City, and machines suitable for city work rather than country touring are the ones needed. Automobile manufacturers in the United States should have representatives among the business men of Shanghai. American makes will be received upon their merits."

REGARDING RACING

What the Sport Calls For and the Men Best Fitted For It.

In these days of racing achievement, racing failure and racing mishap, one is brought to wonder at all three. The successes of some are marvellous, the failure of others astonishing, and the accidents of still others most deplorable. But on looking at the matter closely one sees that the result must depend almost wholly on the driver, and a close scrutiny of the art of driving makes it quite apparent that the average man is not fitted by nature to handle a racing machine.

For the ability to handle the steering delicately and the instantaneous accord of sense and action which serve in guiding the car, the unanimity of mind and muscle which make it possible for the trained operator to drive his mount at such tremendous speed that his motions must follow the ocular impression with the rapidity of thought, are born with some men and not with others, and although it may be to an extent acquired, that is to say, developed by training, he who is not gifted with that magnificent degree of self-control which has made it possible for a machine guided solely by the unerring instinct of a man's two hands to travel at a rate upward of a hundred miles an hour, can never hope to attain it by the exercise of will force, or by any amount of practice. It is an impossibility and he had better "keep off the course."

The fact that drivers are born, not made, does not in the least qualify the assertion often made that "mechanics make the best drivers." In every walk of life is seen the need of thorough elementary training, the training of experience; in every calling a certain amount of it is absolutely essential to a comprehension of its workings. That the broader and more diversified the experience the better the fitting, goes without saying; and the truism is just as applicable to a sport as to one of the "nobler" professions. And strange as it may seem, its value depends not so much on the degree of intimate familiarity with the details of regular work which it imparts as in its effect of qualification for the meeting of emergencies by the rule of precedent; the former may be learned from books, but knowledge of the latter comes only through the finger tips.

The racing automobile is a complex mechanism, differing from the locomotive, which runs on rails, only in its steering apparatus. That is to say, it has the same essential elements, and its control involves the use of the same general principles. On the railroad, a man may not enter the right side of the cab until he has served his full time in the shop, and suitably acquitted himself in a certain grimy post graduate course down behind the boiler butt; then, and not till then, is he trusted with the actual handling of the machine. Yet in the automobile field a machine to all intents and purposes the same as a locomotive, but far more delicate, because of more complex mechanisms and greater strains, is driven when and where he will by a man whose only qualifications are that he wants to and that it is his property. It is true that these carry weight in equity, but they do not qualify from a mechanical standpoint, and the idea seems a trifle incongruous. For no matter how fit he is naturally, no matter how sound his judgment, and no matter how great has been his experience in driving, he lacks that intimate acquaintance with the car which comes only from living with it day in and day out; long days and Sundays, too; an acquaintance which comes not only from knowing just how each and every part is constructed, but from having actually done a portion of the work and lived in the shop where it was done.

It seems odd enough that to wear dirty clothes and do over and over day by day the same odious, pottering little tasks at the bench in the shop, or about the machine in caring for it, should have any influence over the work of management, but somehow it seems to create a sort of harmony between the man and the machine which cannot come otherwise. The skilled driver knows by the sound, the feel or the ready response of this or that part just how well it is doing its work. The mechanic taking the entire care of a machine knows the precise condition of every part, he remembers just how complete and satisfactory was this adjustment, how incomplete that; he can gauge the effect of wear and tear on every part, and even look into the mechanism in his mind's eye, and see it work. And if he be a good driver at the same time the trained senses which tell of the action of the various parts help him to so complete an understanding of his machine that it seems almost a part of himself, and its control requires no more definite thought action than is necessary for the control of the muscles in walking. And under the keen exhilaration of fast driving his close watch on the movement of every one of the steel sinews beneath him is none the less thorough because it is subdominant to the prime effort of driving.

The return to New York of a well known chauffeur, crippled by a recent accident, is marked by his public criticism of his employer, who, he says, had not had enough experience with road racing, and to use his own expression, "tried to do stunts." This most ungraceful remark serves merely to bring out the point.

An owner, and a clever driver too, in many ways, but lacking experience, attempts to handle a heavy racing car at high speed on a public highway. In negotiating one obstruction he is suddenly brought face to face with a second, hidden by it, and things get all mixed up. You may call it an error in judgment or lack of familiarity with the risks of the road, the facts remain unchanged, and it might not have happened with another man. For statistics show that the majority of accidents of the sort have happened to amateur drivers.

It is no use to discriminate against owners in this respect, for many professional drivers are totally unfit for the work and are getting on only with an abundance of nerve and self-control and a remarkable degree of good luck. But as the owners are far more likely to assume the risk of driving ignorantly or recklessly, because of their independence, it is they who are most in danger and they who suffer most frequently.

Automobile road racing is at best a riskful sport, and a powerful machine even in the hands of a careful, trained operator may become a source of great danger at any instant. But given over into the care of one less expert in the art it becomes at once a menace not only to himself, but to such part of the civilized world as lies within a hundred feet of his course on either side.

The increasing number of heavy, swift cars and the corresponding increase in the number of men who become possessed of a desire to drive fast constitute an increasing danger, local with respect to each individual case, but general in its effect on public sentiment, and it is only to be overcome by a conservative feeling among motorists themselves tending toward a total suppression of the venturesome, devil-may-care spirit which prompts men to drive furiously whether they thoroughly know the art or not. H. A. R.

Ambulance for Army Use.

The automobile ambulance has been formally adopted by the British army. This action was taken after a severe test, in which the new vehicle thoroughly proved its efficiency.

The new ambulance will afford complete protection to doctors and nurses while on active duty on the field. The car is protected by armor shields, and the motor is not only capable of driving a heavy service truck, but of carrying a load of thirty persons. The walls of the car can be folded together while in motion, but when they are spread out a large red cross appears on each side as a sign to friend and foe that the vehicle is used only for hospital purposes.

"The King Can do No Wrong."

Dispatches from Madrid state that one Spanish magistrate has been bold enough, at the risk of royal displeasure, to criticise King Alfonso as regards his operating an automobile. The magistrate declares that the Spanish ruler drives his car faster than the law allows, and furthermore states that the royal car does not carry the official number nor has the license tax for it been paid. The magistrate, who seems to show some spirit of American independence underneath his Spanish training, has been warned by the "high and mighty" Premier to keep his anarchistic remarks to himself.

Paid Fifty Cents for Her Car.

Miss Anna Krakow, a Rockford (Ill.) stenographer, won the $800 automobile raffled off by the Dubuque Baseball Club last week. The winning ticket only cost 50 cents.

Successful Car Building.

WE are this year standing firmly on the fact that we have built a real car, because we have built a car adapted to American conditions, American roads and the American temperament. We know our American market as no French builder can know it.

We have surmounted the problems of car-building this year as we never surmounted them before, although our progress has been steady and on right lines.

We believe the Pierce car to-day expresses the best that can be had in car-building, and we are willing to abide by the result of actual experiment.

Booklet describing the six 1905 cars of the George N. Pierce Company, with special booklets describing the mechanism of each, will be sent on request.

VALUE OF DEMONSTRATIONS

New York Dealers Express their Opinions—Varied Applications of the Practice.

At just about this time every year when the weather man is revising his wind schedule, and the breaking up of winter is forecast by a warm day now and then, and when the sunshine and fresh air seem sweeter than they ever did before, and the shadows colder, those little itchings premonitory of the coming spring fever begin to assert themselves and all the world sits up and takes notice. And, by the same token, the little ferment which has been active in the motorist's brain ever since "show week" begins to take shape and grow and assert itself until the willing victim yields to its insistence and decides that it is quite time to be looking around for a new car.

Meantime the dealer is busy getting ready for him. He is facing down a whole lot of problems, some of them new, some old, and working up a system which is calculated to net the maximum number of sales at a minimum cost. He is very eager and hopeful, and quite ready for the hurly-burly of the season's rush.

Now among others is one problem which may or may not strike him as of great moment; a problem, however, whose neglect and careless treatment quite as much as the exigencies of the times have in the past cost him many a good dollar, which has gone never to return. The demonstration plays, perhaps, as important a part in the sale of an automobile as does the act of taking down a bolt of cloth and unrolling it on the counter in the sale of drygoods, simply because the human race is cautious and must see in order to believe. But the merchant balks at the idea of "loaning out" his material on trial, and the automobile dealer is often brought to question the wisdom of any but the most limited trial of his car.

In the earlier days of the trade a far different set of conditions obtained than hold at present. Then the demonstration was the most important part of the salesman's work. The public was deeply interested in the possibilities of the horseless vehicle and stood ready to be convinced of its utility; in many cases the prospective buyer was only deterred from committing himself by the thought that one more year's development would reduce certain of the so-called minor difficulties to a state of absolute subjection and make possible the ideal car. The market had to be convinced that "this year's" car was right, and that perfection if not yet obtained, was wellnigh unattainable. Moreover, every designer was an inventor, most alarmingly prolific of results; every builder had a system all his own for the doing of this or that; and every car fairly bristled with novel features, they stuck out all over it, and hence the different types of any season had very little in common. The salesman had to convince the customer of the wonderful superiority of his line over its competitors, and it was often uphill work, for the rivalry was intense and vital, since the continuance of a man's business often depended solely on a single season's results, and every sale thus became a triumph of diplomacy, the result of a crafty struggle against thrifty opposition and the heavy odds of a most doubtfully efficient product.

Aside from the direct results obtainable from a successful demonstration to a prospective customer, ther were the cumulative results to be expected from giving a ride to Mr. So-and-so—a man whose good word meant several sales—or in other words the advertising proposition. And in those days, when the individuality of the car was more pronounced than now, and its evil genius so bold as to assert itself when and where it chose, regardless of the wishes of the driver, a perfectly satisfactory demonstrating performance was by no means to be counted on, and a ride of any length which was not fraught with adventure of one sort or another was a thing to be boasted of, so that no opportunity for seed sowing of that sort was to be neglected.

But times have changed and the conditions which held a couple of years ago are now quite reversed. The public, fully convinced of the value of the automobile, is ready and eager to buy. It is no longer necessary, except in rare cases, to teach the operation of the motor, the prime utility of the electric current and the necessity of the transmission. The buyer has in general a pretty well defined idea of what he wants, his choice lies between one of two and one of a dozen cars, maybe, which are apparently suited to his purpose to a certain extent; his deliberation is careful and tempered with the advice of numerous friends; and his final decision must be based on actual experience with the various possibilities. If he be imbued with the universal desire to get a great deal more than his money's worth his verdict may hang fire for a time while he rides in this car and that and has a deal of enjoyment at some one else's expense. Customers of this type, and others of the parasite order, are, alas, quite too common, though their field of operation has become so narrowed down that their rides are few and far between. But their total eradication seems impossible because of the sharp competition of the "street" and the unwillingness on the part of the dealers to concert their action.

Demonstration is then, legitimate, essential if you will, when given to a sincere customer. Given to one whose influence is to be desired, it is equally legitimate, when tempered with moderation. But when used to excess for either of these purposes, or given to those who merely come around for the ride, it is a waste of time and its monetary equivalent. A tour of Broadway and its vicinity from Thirty-eighth street to the Central Park circle, in an effort to discover the present attitude of the dealer with regard to it, produced some interesting results. Everywhere was found a ready recognition of the evil in its past phases, and an almost uniformly optimistic personal attitude toward it.

The general tendency seems to be to be fairly liberal of brief demonstrations, even to give them to persons who casually drop in with the time honored request for a ride. In most salesrooms there is now a fairly complete "follow up system," which is brought to bear on every comer who brings any sort of promise, and which if well carried out, makes the position of the grafter pure and simple, an uncomfortable one. As one well known dealer put it: "The demonstrating car and its driver must be kept on tap, as it were, all the time, and the cost in fuel and wear and tear imposed by practically continuous service is so slightly in excess of that involved in standing the machine at the curb all day with the driver idling about inside, that we feel perfectly justified in taking out almost every comer. But, of course, we limit the ride to a turn in the park or a climb of Duffy's hill, and every one we take out is looked up afterward."

E. T. Birdsall's position was somewhat an exception to the rule. "I don't believe we have given a single demonstration this year," he said. "We seldom find it necessary. Those which we do give are seldom over twenty-five miles long, except in rare cases when an especially long run may be taken on the express condition of a sale unless the car fails to do well."

"Then you depend to a degree on the reputation of your goods, and the testimony of satisfied customers to take its place?' was asked.

"Yes, to a great extent."

"And do you think that the increased standardization of models, and the survival of reputable manufacturing concerns will ultimately tend to make the automobile saleable on represented merit and reputation without the attachment of conditions and the loose business methods which have given the purchaser in the past what has amounted to a privilege of return?"

"Why, yes, to a certain extent. That is to say, the demonstration is yearly becoming of less importance to the sale."

The Motor World man so liked the sound of this question that he put it to A. L. Newton, who is one of the New York Athletic Club's crack runners, and incidentally sells Northerns for Peter Fogarty—and got laughed at. Perhaps Mr. Birdsall had laughed, too, but if so it was not noticeable.

"Why," said Newton, "there are two cases in which the demonstration will always be necessary, cases when it will not suffice to hand over a few testimonials and show the machinery and turn over the motor a few times on the floor just to show how it sounds. There will always be a certain number of people, who have never ridden in a car, and must experience the sensation in order to be convinced that the motor is not a very frightful thing to deal with. And then there are the makers who bring out a new car. They will be without the essential testimonial, and hence must fall back on actual

Digitized by Google

demonstration. But if it were possible, it would save a lot of trouble and expense."

At the Electric Vehicle Co.'s store they rely on the perspicacity of the salesman to pick out the bogus customer and serve him up a dish of "frost" in acordance with his deserts.

"Just about a year ago," said an "E. V. man," "a man blew in here one morning in a brand new leather suit, and inquired about our twenty-four horsepower car. He examined it very attentively, and after asking a whole lot of questions, declared himself much pleased with it, but said he couldn't decide until he had ridden in it. He had his ride through the park, and was tremendously pleased. He promised to send us a check for the first deposit in the morning mail. But somehow the check miscarried, and we did not hear from him again until one day last week, when he sauntered in minus the leather suit, but with the same businesslike air. I knew him right away, but he evidently thought I had forgotten him. For he began to ask about this year's machine, displaying about as much knowledge as one might derive from a study of catalogues, and finally asked how she ran, intimating that one could tell but little of a car until he had ridden in it. 'Why,' I said, 'she runs just a little better than last year's model did. You had a ride in that, I believe?' He looked at me for a minute, and then said: 'Oh, yes; I do remember it now; so I did, to be sure.' And it didn't take him long to get out, I can tell you!"

Over on Forty-first street was C. J. Wridgway, just getting settled in his new Peerless garage, and a tight little one it is, too, with everything fixed just right.

"Yes, I know," he said, "lots of time and money have been wasted on demonstrations in the past, but I think the thing will work itself out. I have a little wrinkle of my own in connection with my "follow up system," but, of course, I don't want to give it away. You know I believe the other man's business is his own affair, and I don't propose to interfere with it. I have not felt called upon to give over a dozen demonstrations this year, and I think every one has more than paid for itself."

At the Packard, Pope and Winton stores they tell practically the same story: The grafter pure and simple has not become troublesome so far this year, and the usual programme of a ride in the park seems quite sufficient.

"Our hours are from 9 in the morning until 6 at night," said one, "and we feel perfectly justified in cutting out all night and Sunday work."

Harry S. Houpt, who handles the Thomas car, has been troubled apparently more than the others with the man who refuses to make up his mind.

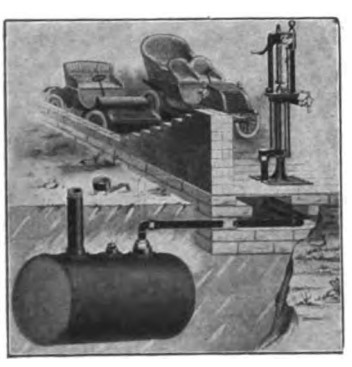
"Why, I have given eight rides to one man this year," he said, "and haven't landed him yet. But, seriously, I'm glad to have this matter brought up, for there's more in it than many of the dealers would have you believe. Yes, I believe that in some cases a long demonstration is perfectly warranted. For instance, I have arranged to take a party clear up to Poughkeepsie next week, and it will pay me to do it; yet only the other day I turned down a man who wanted me to take him a much shorter distance. It's a matter of judgment, and no fixed rule can be applied to it."

A bit of insight into the state of the market was obtained from Harry Unwin, who declares they have sold more Pierce cars than Olds so far. For it would appear that those who will buy the small cars are confident of immediate deliveries whenever they want the goods, while those who are buying the larger ones realize that it takes time to put up such machines, and in order to make full allowance for such alterations as are involved in putting on tops and repainting, are ordering well in advance of their need. Another interesting fact which he brought out is that the smaller cars sell easier than do the larger. Several of the orders for Oldsmobiles he has booked without a single demonstration. Though his record with the Pierce has averaged not over ten miles to a sale thus far.

Accurate figures in the matter of demonstration mileage are hard to obtain, and they vary widely according to the temperament of the dealer and the quality of the car, as might be expected. Mr. Unwin's figure was the lowest obtained, while the highest was over one hundred miles per sale. This was for a last year's car, however, and covered the entire season's work.

Whatever the millennium may bring in the way of conditions governing the sale of cars, for the present the actual working demonstration is an essential, and the cost of running the demonstrating car is an unavoidable item in the cost of selling. Hence, so long as it must be done in certain cases, it seems wise to be fairly liberal in the treatment of all who apply, even though they be unknown and not promising. But the ride to Coney Island, the ride to Morris Park, and the moonlight spin up Lafayette Boulevard are not generally productive of anything but expense, and are widely apart from the demands of business pure and simple.

Unwin Spins a Yarn.



Harry Unwin, the New York manager of the Pierce and Olds agency, after reading the Motor World's account of the "Elmore Cocktail" as a fuel for gasolene engines, tried to go it one better with the folowing:

"Last week a friend of mine who is just home from India," said Mr. Unwin, "told me of an incident that happened to him near Calcutta. He was running his Oldsmobile in the country when the gasolene tank ran dry. He thought he was 'done for,' when a young Englishman who had not been there long exclaimed: 'Say, why don't you try some of this native booze? It is the hottest stuff I ever tackled, and I think you will have no trouble to make it explode!'

"My friend tried it," concluded Mr. Unwin, "and it actually worked better than any gasolene he ever used, and after that he always used the native booze."

'Tis a great pity that one Reuben Henty, a stage driver at Cuckfield, England, had not improved his leisure time in learing to be a chauffeur. Foreseeing that ultimately automobiles will replace horses, he came to the conclusion that it would not be long before he would be out of employment and destitute—therefore he hanged himself.

BOWSER GASOLINE STORAGE OUTFITS.

Pump discharges gallons, half gallons and quarts at a stroke.

FROM 7 DOLLARS UP.

The Name of "BOWSER" GUARANTEES QUALITY, DURABILITY, SAFETY and CONVENIENCE.

Our 20 years experience in the Tank business, and in designing Oil Storage Systems, enables us to present a line of Gasoline Storage outfits which will meet the requirements of any automobilist, both as to equipment and price.

OVER A DOZEN DIFFERENT STYLES FROM WHICH TO SELECT, VARYING IN PRICE ACCORDING TO STYLE, CAPACITY, ETC.

If you use, or contemplate using Gasoline, it will pay you to investigate.

A REQUEST FOR CATALOGUE XIV. WILL BRING FULL INFORMATION.

S. F. BOWSER & CO., Inc., - Fort Wayne, Ind.

Eastern Office: 255 Atlantic Ave., Boston, Mass.

200,000 VARIOUS STYLES IN ACTUAL USE.

A medium-priced outfit not of the self-measuring type.

Continuous Performance Horns.

The shortcomings of the usual standard type of horn which only toots when the bulb is pressed seem to have been realized on both sides of the Atlantic at once, and a comparison of the means of solving the problem adopted here and abroad forms an interesting commentary on American and foreign methods. Here, as exemplified by the almost endless number of "continuous performance" horns exhibited at the several shows, simplicity has evidently been the chief aim of the manufacturer, in some instances a portion of the pressure otherwise wasted in the exhaust being utilized to perform this work, and compressed air, readily controlled by the operator, being called upon in practically all cases.

The extreme opposite of this is to be found in an electric horn shown at the recent Paris Salon by M. Legendre, of Rheims. For its operation it requires, first, a source of current supply, whether battery or generator; second, a transformer; third, a switch, and fourth, a receiver. The transformer is the usual trembler induction coil, the condenser of which is relied upon to lessen the effects of self-induction, likewise as usual. The switch is the usual article and is employed to start and stop the tooting, while an adjustment of the trembler on the coil produces louder or softer strains. The receiver is the ordinary bell of a horn fitted with a vibrator somewhat after the pattern of those used on telephone receivers. The current passing through the induction coil starts the diaphragm of the receiver vibrating at a high speed, according to the adjustment of the trembler, and the sound thus produced is amplified by the bell of the horn. It all sounds very feasible, and both the current supply and one of the coils now essential on a car could be made to do extra duty by blowing the horn in this manner, but delicate adjustments, such as are essential to the proper working of a vibrating diaphragm, are out of place where jolting cannot be avoided.

To Use Motor Buses in Egypt.

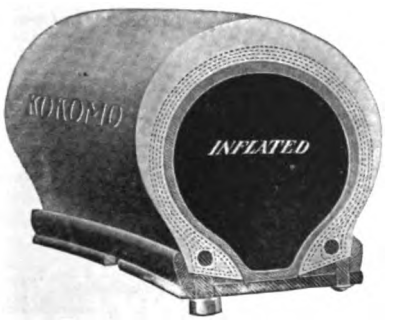
The silent Sphinx has had an opportunity to gaze on latter day locomotion as exemplified by the automobile, and now the streets of the ancient cities of the Pharaohs, Alexandria and Cairo, are to resound to the "chug-chugging" of motor 'buses.

The Egyptian Motor Company has been incorporated with a capital of £100,000 for this purpose, and it is stated that twenty vehicles of ample capacity will be placed in service on the streets of both cities. As transportation facilities are utterly lacking it is thought that good dividends will reward the enterprise of the incorporators.

How to Soften Brushes.

To soften paint brushes that have become hard, soak them in raw linseed oil for twenty-four hours, rinse in hot turpentine and repeat the process till clean.

The Use of Rubbing Stones.



New systems and processes of carriage painting come and go, but the application and rubbing or surfacing of rough stuff promises to go on forever.

Formerly in all carriage paint shops the volcanic or natural pumice stone, furnished in all sorts of shapes and conditions, was used for surfacing rough stuff. The chief disadvantage of using the natural pumice stone was found in the brittle, shelly nature of the stone as it became saturated with water. Minute pieces were continually breaking away from the working block, and in the hands of other than experienced workmen the block, rolling over these loosened particles, would mar and disfigure the surface. The natural black pumice stone rarely runs uniform in quality, hard and soft veins alternating throughout many of the blocks, so that, even in the hands of an expert surfacer, the results are not likely to prove uniformly excellent.

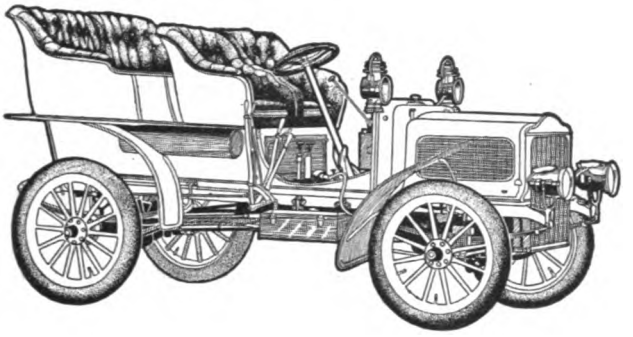
However, with the advent of the artificial rubbing stone, or brick, as it is variously called, the difficulties incident to the surfacing of rough stuff largely disappeared; more and better work is accomplished. And in all respects this particular line of work has been facilitated and made easier to do well.

The advantages of the artificial rubbing stone or brick are that it is entirely free from all unclean ingredients, and it can be furnished in any shape and in any degree of hardness or texture of grain.

KOKOMO

THE TIRE THAT WON'T COME OFF

until you take it off, and then only a small wrench is necessary.



The mechanical fastening shows why it cannot "creep," "crimp," "roll out" or "blow out." The lugs form part of the metal band, which is moulded into the tire itself, and are rigidly held in place by slots in the rim.

The INCOMPARABLE WHITE

THE CAR FOR SERVICE

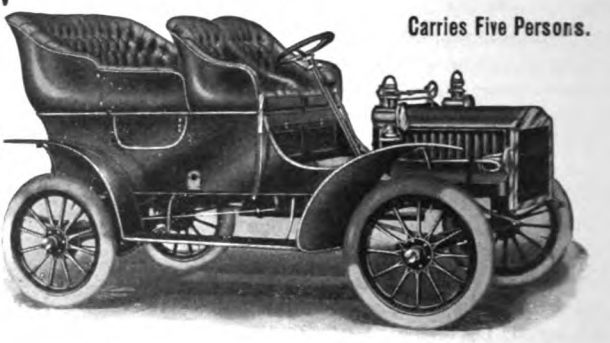
Choosing an Automobile

is a difficult proposition if the purchaser relies only on the appearance of the various models of machines as they stand in the salesrooms, and as they perform on short demonstration trips.

When Past Performances are Considered,

selection narrows down to the WHITE—for four years winner in all reliability and endurance contests, as well as in many speed and hill climbs.

Write us for Bulletin No. 8, which summarizes four years of automobile history.



WHITE SEWING MACHINE COMPANY,

CLEVELAND, OHIO.

THE MICHIGAN

MODEL E. $1250.

Carries Five Persons.

The Michigan cars are **SAFE** ones to drive, and this is more than can be said of the majority of cars of about the same price. They are usually provided with one brake, leaving one at the mercy of the reverse (if the engine doesn't stop just at the critical moment) should this one brake give way. This is a **SERIOUS** matter, involving the **SAFETY** and even the **LIVES** of the occupants of the machine.

Michigans are **ALL** supplied with a brake band around the differential, which is sufficient for ordinary use, and with internal expanding brakes, lined with wood fibre, on both rear wheels. Both brakes can be used at the same time, giving **PERFECT CONTROL** of the car under **ALL CONDITIONS**, making the Michigan a **SAFE** car to drive. This is just **ONE** good "Michigan" point. There are lots of 'em.

Our catalog tells about it.

MICHIGAN AUTOMOBILE CO., Ltd., Kalamazoo, Mich.

The Week's Patents.

782,968. Automobile Canopy. William F. Kramer, Dayton, Ohio, assignor to the Wm. F. Kramer Co., Dayton, Ohio. Filed October 14, 1904. Serial No. 228,398.

Claim—1. In a canopy for automobiles, a front canopy having a rear transverse marginal flange projecting downwardly, in combination with a detachable tonneau having a separate canopy with a front transverse marginal flange projecting downwardly and matching with the flange of the front canopy so as to provide a continuous canopy above the entire vehicle when the tonneau is in position, and means for uniting said canopies at the abutting flanges, substantially as set forth.

782,980. Carbureting Apparatus. John N. Moehn, Milwaukee, Wis. Filed January 13, 1904. Serial No. 188,827.

Claim—1. In a carbureting apparatus, the combination of a supply chamber; a generating chamber in communication with the supply chamber; a pipe leading from a source of air supply upwardly in the generating chamber to an elevated point of discharge therein; a tubular covering for said pipe provided with a float near its lower end and movable along the pipe, said covering and float being arranged with an intervening, annular, unobstructed space for the upward passage of gas and said tubular covering being closed at its upper end and open at its lower end; a perforated hood located above the float and connecting the float with the tubular covering; a gas storage chamber; and a pipe leading from the generating chamber to the storage chamber.

782,985. Friction Clutch. Andrew P. Olson, Chicago, Ill. Filed September 25, 1903. Serial No. 174,550.

Claim 1. In a clutch a cylindrical casing and a pair of spreading friction pieces in combination with toggle joint mechanisms in connection with the friction pieces, pinioned screw shafts in connection with the toggle joint mechanisms, and a sliding collar provided with rack bars adapted to work the screw shaft pinions, as specified.

783,020. Lubricating Device. Louis S. Clarke, Haverford, Penn. Filed January 28, 1904. Serial No. 190,980.

Claim—1. A lubricating device comprising a receptacle secured to the crank case of a motor, a tube, the lower end of which terminates at a point above the bottom of the said receptacle, and the other end of which projects upwardly through the top of the said receptacle and is normally closed, a tube passing through the said receptacle, the opposite ends of which are secured respectively in openings provided in the top and bottom of the said receptacle, the lower end of the said last mentioned tube being in communication with the said crank case, and means for closing the said lower end, the upper ends of the said tubes being in communication with each other, and the said closing means being adapted to be opened by the creation of a vaccuum in said crank case.

783,021. Steering and Controlling Mechanism for Vehicles. Louis S. Clarke, Haverford, Penn. Filed January 28, 1904. Serial No. 190,990.

Claim—1. In a steering and controlling mechanism for vehicles, the combination of a supporting tube having supporting brackets secured thereto, a plurality of concentric controlling shafts supported by the said brackets, and a single hand piece connected to the said shafts for operating the same.

783,037. Engine Transmission and Reversing Device. Nels P. J. Herby, Oakland, Cal., assignor to Gretchen Herby, Oakland Cal. Filed December 17, 1903. Serial No. 185,474.

Claim—1. In a device of the character described, the combination of a drive shaft and a driven shaft having relatively fixed bearings, an intermediate shaft having movable bearings, a support including a bell crank lever for said movable bearings and means for locking said lever at desired points, means for supporting said intermediate shaft at a uniform distance from the driven shaft, pulleys on the drive and intermediate shafts, a band connection between the pulleys and means for transmitting motion from the intermediate shaft to the driven shaft.

783,055. Lubricating Device for Vehicle Axles. Philip Le Sueur, Calabasas, Cal. Filed October 28, 1902. Serial No. 178,833.

Claim—1. In combination, an axle, an axle box thereon, the end wall of the axle box having a central hole for the introduction of lubricant, said axle terminating short of the end of the axle box, thereby forming a lubricant chamber at the end of the axle, and a solid bolt detachably engaging the end of the axle, the shank of the bolt traversing the lubricant chamber and passing through the hole in the end of the axle box, the head of the bolt being outside the axle box, the bolt being removable to open the hole and allow hard grease to be put into the chamber, the bolt when in place preventing egress of the lubricant and also holding the axle box on the axle.

783,056. Vehicle Axle. Philip Le Sueur, Calabasas, Cal. Filed October 28, 1903. Serial No. 178,835.

Claim—1. In combination, an axle, an axle box thereon, a hub carried by the axle box, a bearing plate on said hub, the outer end of said axle terminating short of the end of the axle box and being drilled and threaded, a solid retaining bolt passing through said bearing plate on the hub closing the entrance and traversing the chamber formed at the end of the axle for the reception of lubricants, and engaging with the threads in the axle, and a bolt stop between the bolt and the bottom of the hole in the axle.

783,058. Lever Apparatus for Mounting Pneumatic Tires Upon Wheel Rims. André Michelin, Paris, France. Filed December 14, 1904. Serial No. 236,814.

Claim.—1. A lever device for mounting pneumatic tires upon wheel rims, consisting of a lever with a curved and hooked end, adapted to be engaged with one of the edges of the wheel rim, a tumbler lever pivoted to the main lever, adapted to engage with the beaded edge of the cover which has to be brought into position on the tire, and having a tail which is adapted to bear against the under face of the wheel rim, so that, on raising the main lever, the tumbler lever is turned on its axis, so as to bring the beaded edge into position for engaging with the groove of the wheel rim, substantially as described.

783,061. Electric Terminal Clip. David B. Mills, East Orange, N. J. Filed May 3, 1904. Serial No. 206,198.

Claim.—1. An electric terminal clip made out of resilient metal and comprising two flat side portions forming between them an elongated opening, the flat surfaces of said side portions extending away from said opening, said opening having a narrow portion and a slightly larger seat portion, one at least of said side portions being adapted to yield at said narrow portion so as to enlarge the same, whereby a terminal larger than said narrow portion may pass by it

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

FOR SALE—4 passenger side-entrance car bodies, in good condition at considerably reduced price. DETROIT CARRIAGE CO., Detroit, Mich.

into said seat and be there retained by said narrow portion.

783,095. Vehicle Wheel. Charley R. Bohannon, Welsh, La. Filed August 31, 1904. Serial No. 222,859.

Claim.—1. In wheel structure, in combination, a hub comprising a shell, an axle box within said shell, lugs projected radially from the axle box, means for preventing displacement of the axle box from the shell, a rim, spokes attached to the rim at their outer ends and having their inner ends received by the shell of the hub, and nuts securing the inner ends of the spokes to the shell and co-operating with the lugs of the axle box.

783,104. Speed Regulator for Explosive Engines. Charles R. Daellenbach, Ellwood City, Penn., assignor to Daellenbach Gas Engine Company, Pittsburg, Penn. Filed December 16, 1903. Serial No. 184,427.

Claim.—1. In an explosive engine, the combination of an explosion chamber, a piston movable therein, a crank shaft connected with the piston and bearing an eccentric, a valve for controlling the supply of explosive mixture to the explosion chamber; said valve being adapted to normally assume and rest in an open position, and having an arm provided with a lateral projection, a rod having a strap receiving the eccentric on the crank shaft, and also having means for receiving and guiding it on the projection of the valve arm, and means for automatically effecting connection between the said rod and the projection on the valve arm and moving said arm when the engine attains an excessively high rate of speed.

783,105. Valve Gear for Explosive Engines. Charles R. Daellenbach and Arthur G. Daellenbach, Park Gate, Penn., assignors to Daellenbach Engine Company, Pittsburg, Penn. Filed December 16, 1903. Serial No. 185,375.

Claim.—1. In an explosive engine, the combination of a working cylinder, a working piston therein, a valve chamber having an exhaust port, and an explosive inlet port, a valve operated from the working piston for controlling communication between the working cylinder and the valve chamber, a piston or other suitable valve arranged in the valve chamber, to control the exhaust port and the explosive inlet port, means for holding the said valve in one position, means for releasing said valve, and means for moving it, independent of the first mentioned valve, subsequent to its release.

783,106. Explosive Engine. Arthur G. Daellenbach and Charles R. Daellenbach, Park Gate, Penn., assignors to Daellenbach Gas Engine Company, Pittsburg, Penn. Filed December 16, 1903. Serial No. 185,376.

Claim.—1. The combination in an explosive engine of outer cylinders and an intermediate cylinder open at one end, pistons serving in conjunction arranged between and connected with the explosion chamber of the intermediate cylinder and the explosion chambers of the outer cylinders, valves controlling communication between the outer cylinders and the intermediate cylinder and arranged to set toward the outer cylinders, a connection between the pistons whereby they are caused to move together, exhaust ports communicating with the explosion chambers of the outer cylinders, means for controlling said exhaust ports, and means whereby said explosion chambers of the outer cylinders may be supplied with explosive mixture.

783,114. Horseless Vehicle. Paul Flucks, St. Louis, Mo. Filed August 12, 1904. Serial No. 220,544.

Claim.—1. In a horseless carriage, a suitable carriage body, a reservoir mounted in connection with the same, a motor comprising a stationary section of cylinder mounted on the carriage body adjacent to the wheel thereof, a rotary piston carrying blades coupled to the wheel, a valve casing carried by the stationary section, feed pipes leading from the reservoir to the valve casing, a rotary valve mounted in the casing and capable of operation from without, a series of injection pipes leading from the casing through the periphal wall of the stationary section and having their discharge ends directed against the blades toward the axis of the wheel, and suitable ports formed in the valve for controlling the fluid, substantially as set forth.

YOU ought to have an air governed carburetter. It is the latest and best improvement on this year's automobiles. We make an Automatic Air Governor that can be easily attached to your old carburetter, making it as good as the 1905 models. Three sizes. $2.50 and $3.00.

AUTO-mobile owners should have one of our Pocket Ammeters for testing dry batteries. Guaranteed. Price, $3.50.

SEND for one of the Driver Electric Switches. Best on the market. Price, $1.50.

BOSTON BRANCH: 151 Columbus Avenue.

Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about March 15th, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

The 1904 edition is now out of print.

Sent upon receipt of 6 cents in stamps for postage.

Association of Licensed Automobile Manufacturers,

Room 1009. No. 7 EAST 42nd STREET, NEW YORK.

236

Automobiles were exhibited at the Chicago Automobile Show.

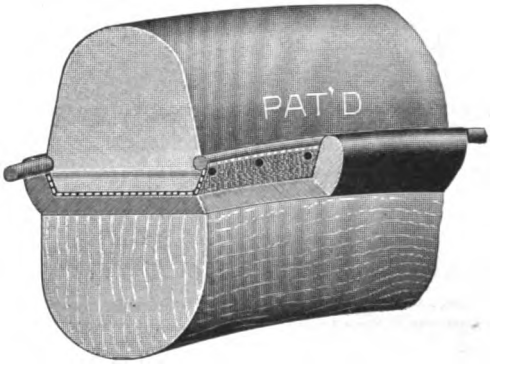
30

were equipped with Solid Tires.

22 OF THE 30

were equipped with

FIRESTONE SIDE-WIRE TIRES.



16 OF THE 30

were pleasure cars.

These statistics show the rapid growth into popularity of

SOLID TIRES

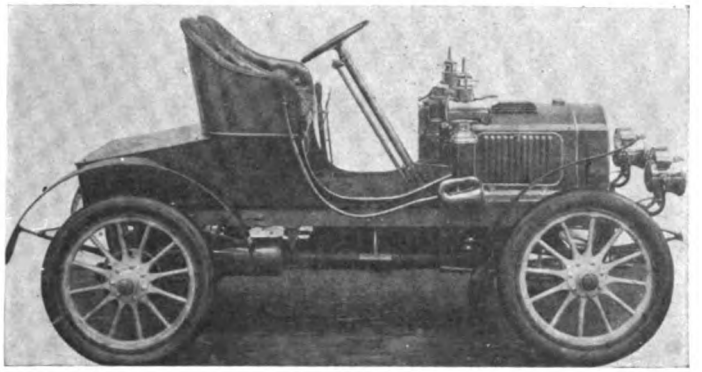
for pleasure as well as Commercial Automobiles.

These statistics like those of the New York show demonstrate conclusively that the

FIRESTONE SIDE-WIRE MOTOR TIRE

is recognized by manufacturers as the best Solid Tire.

Its use will save you MONEY, TIME and ANNOYANCE.



WRITE FOR PARTICULARS.

"THE QUALITY CAR."

Side Entrance,	1905 Model F,	-	$1,500
Rear Entrance,	1905 Model F,	-	$1,400
Runabout,	1905 Model F,	-	$1,250

Simplicity and accessibility were the two points which warranted the general expression, "No wonder it's practical," from all visitors at the New York and Chicago Shows. Write for Descriptive Catalogue.

PREMIER MOTOR MFG. CO., 1003 Georgia Street, Indianapolis, Ind.

The Automobile Shows at New York and Chicago demonstrated that the cars of this country are divided into two classes, to wit: Low-priced cars which are low-powered cars; and high-priced cars which are high-powered cars.

There was one striking and noteworthy exception to this general rule—one car which demonstrated its ability to get out on the road and do business alongside of cars costing $400 to $700 more. That car was

THE YALE

14-16 H.P.

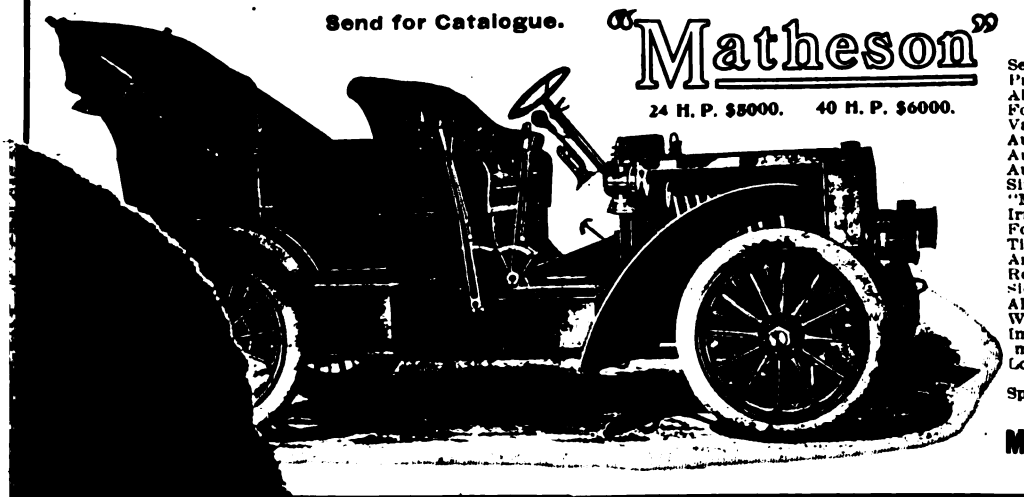
REAR ENTRANCE, $1000. SIDE ENTRANCE, $1100.

This question of horsepower—not horsepower claimed or promised, but horsepower delivered at the wheels—is paramount. Simplicity of operation and motor, structural strength, accessibility, elegance and comfort—all these points are vital; but the question for you to ask and answer is this:—

Is there a car in America, even at $1500 or $1800, possessing all these requirements, which at the same time delivers the same degree of power as the Yale at $1000 and $1100?

We predict with certainty and confidence that if your investigation is thorough your answer will be, "No; there is not."

It means a saving of $400 to $700 to you—isn't the investigation worth while?



Send for the 1905 catalogue describing this beautiful car and the superb 24 and 28 H. P. Yale at $2500.

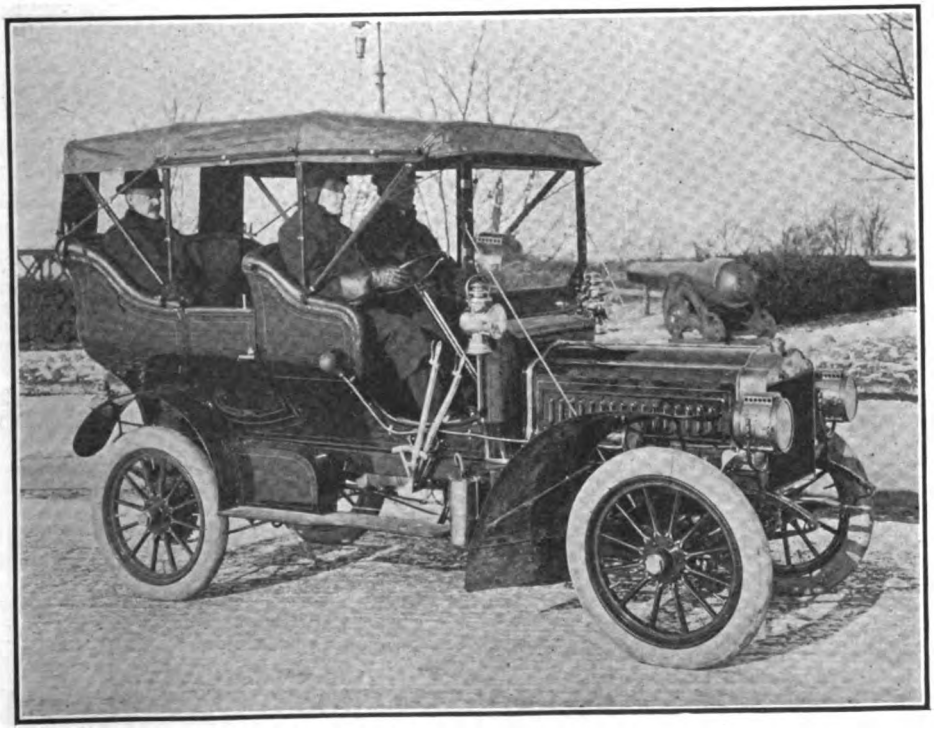
Veeder



"It's Nice to Know
How Far You Go."
Veeder Odometers.

If some one should set up mile-stones for you on every road you were to travel, you would think it a great thing, wouldn't you? For $10.00 you can have a Veeder Form B odometer (the kind that goes on the steering arm) that will not only show the miles, but every eighth of a mile and the total mileage of your car as well. For $25.00 youcan have a Veeder Form D odometer right up in front of you on the dashboard, which will show the miles in tenths on two registers at the same time. One of these registers may be set to zero any time, while the other keeps a total record. ***Send for free Catalog.***

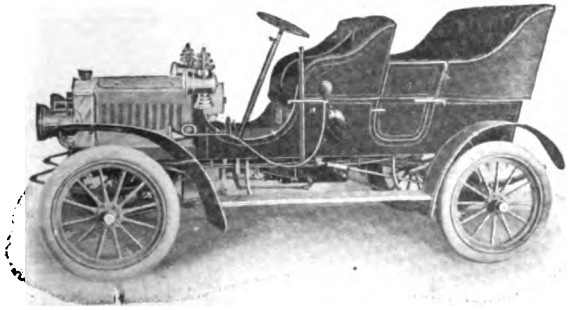
DESCRIPTION OF NEW TRAINS

"Between Cincinnati and Detroit" on the C. H. & D.—Pere Marquette Line.

The train consists of a combination baggage car and smoker, a ladies' coach, combination coach and dining car, and a perfect dream of a parlor car, which, when lighted with a myriad of electric bulbs, was resplendent and fascinating in the highest degree. Every one of the cars except the baggage and the smoker, which is of Flemish oak with rattan high back seats, is finished in mahogany. Even the combination car at the head of the train is provided with a lavatory with nickel-plated washstand. It will seat 44 people. The ladies' coach seats 88 people, and has high-back, rolled-top plush seats. A novelty which excited admiration is the coach and diner in one, there being seats for 50, although a spacious kitchen is locatetd in the centre, with four tables in the rear of the kitchen. But the triumph of modern car building is shown in the parlor car, which is said to be the handsomest ever turned out in the Pullman shops. The mahogany finish is made more effective by the olive green revolving chairs.



The smoking room in the parlor car is the most commodious ever seen on any train entering here. It is so constructed that it is absolutely private from the rest of the car, and has accommodations for 11 lovers of the weed at one time. At the rear of this car is a plate glass observation platform. The beautiful moving palace has wide vestibules, and each car has its own electrical apparatus for lighting, in addition to the Pintsch gas system.

In addition to the regular parlor car porters, etc., there is a neatly uniformed train porter, whose duties are to help ladies and children in and out of the coach part of the train, see that the coach lavatories are kept clean and supplied with fresh towels, and that the forward part of the train is kept up to the standard.

Why is this **"WHITNEY" HAND (FEED) MILLING MACHINE** used in preference to all others by U. S. Government, Western Electric Co., Underwood Typewriter Co., Smith & Wesson, leading Automobile Manufacturers, etc., etc.? Possibly it is because we make more of a specialty of Hand Millers than any other company in the world, and give our customers greater return for their investment by way of quality, quantity, range and efficiency.

These are "WHITNEY" STANDARDS for Roller Chains.

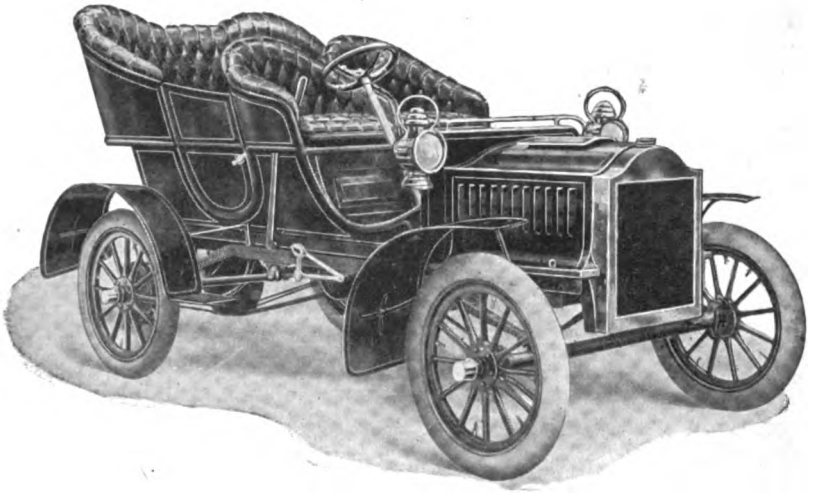
PITCH.	Diameter of Roll.
1 in.	5/8 in.
1¼ in.	¾ in.
1½ in.	⅞ in.
1¾ in.	1 in.
2 in.	1⅛ in.

The PITCH SIZES and DIAMETERS advance uniformly in perfect proportion. They have broken all records for efficiency, and have been adopted for most of the leading American Cars, including

"ACME" "AUTO-CAR EQUIPMENT" "BAKER" "BRAMWELL" "CADILLAC" "COLUMBIA" "CORBIN" "CHAMPION" "ELWELL-PARKER" "FORD" "FRANKLIN" "GROUT" "GAETH" "GIBBS" "HARTFORD MOTOR STREET SWEEPER" "KNOX" "LENAWEE" "MITCHELL" "MOLINE" "MATHESON" "MANHATTAN" "OLDS" "POPE-HARTFORD" "PIERCE-RACINE" "PRESCOTT" "QUEEN" "RAMBLER" "STEARNS" "SOMMER" "SNELL" "THOMAS 50 & 60 H. P." "TOURIST" "WAYNE" "WESTERN ELECTRIC"

PITCH.	Diameter of Roll.
1 in.	9-16 in.
1¼ in.	5/8 in.
1½ in.	¾ in.
1¾ in.	1 in.
2 in	1⅛ in.

These are the OLD or COMPETING Standards.



The PITCH SIZES advance uniformly, but the DIAMETERS are irregular and not in perfect proportion.

All chain manufacturers have adopted "Whitney" Standards for the new sizes 1 3-4 in. and 2 in. Pitch.

OLDSMOBILE

Look the field over and find its equal—if you can. This Touring Car gives you more for $1400.00 than you can get in any other car under $2500.00. It gives you 20 H. P.— enough to make easy work of the heaviest load you will want to carry—enough to make you feel easy in tackling the steepest hill you will encounter. It has a double-cylinder motor—it has efficiency without complication. It has style and quality—it is the product of the most careful, skilled workmanship—the product of the policy that only the best material obtainable is good enough for an Oldsmobile.

When you have made a careful comparison of this car with other cars you will understand why the Oldsmobile is the greatest selling proposition on the market today—why it was the only light car to be awarded a Gold Medal at the St. Louis Exposition.

If you are interested in further details we will be pleased to send them. Address Dept. 19,

DUQUESNE

"HALF OF THIRTY-FIVE."

The First Men of the country wound their watches with a key until a few years ago.

The Most Dignified professional and business men of today make spectacles of themselves in the public streets cranking their motors!

The Key-Winding Watch is now a relic of the primitive days of watch making.

The Starting Crank is just as primitive—it's a wonder it has been tolerated so long!

The DUQUESNE Starting Device by which the motor is started from the seat every time—a lady or ten year old boy can perform the operation with ease and absolute safety—is to the automobile what the stem-winding device was to the watch—revolutionizes the making of them—enhances the pleasure of using them.

Want to know more about it? Write.

* * * *

In Brief—4 cylinder, air-cooled, 16-21 H.P. vertical engine tandem in front, 5 passengers (generously), 4—40 miles, at the sensational price—

"HALF OF THIRTY-FIVE."

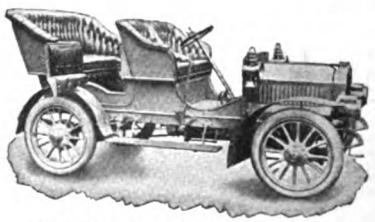
POPE-HARTFORD AND POPE-TRIBUNE AUTOMOBILES



represent the best efforts of high-class automobile engineering. They are cars not only graceful and of fine appearance, but possess simplicity, strength and durability. Every minute detail has been carefully studied to give the greatest comfort and satisfaction. Power and speed are suggested in every line and each performance amply bears out the impression.

Pope-Tribune Model IV

is the result of our effort to produce a light touring car of high quality and power. Graceful design, staunch construction, powerful two-cylinder opposed engine, bevel gear drive, three speeds forward, one reverse, together with the moderate price, make this car the happy combination of good things so long desired. **$900.**

Pope-Hartford Model D

with its simplicity of construction and remarkable accessibility for adjustment, stands out pre-eminently as the ideal car for one who has neither the time nor inclination to bother with complicated machinery. The car seats five, having divided front seat and roomy tonneau with an abundance of carrying space. Everything in finish and equipment bespeaks luxurious comfort. Two-cylinder horizontal opposed engine develops 16 h. p. **$1,600**

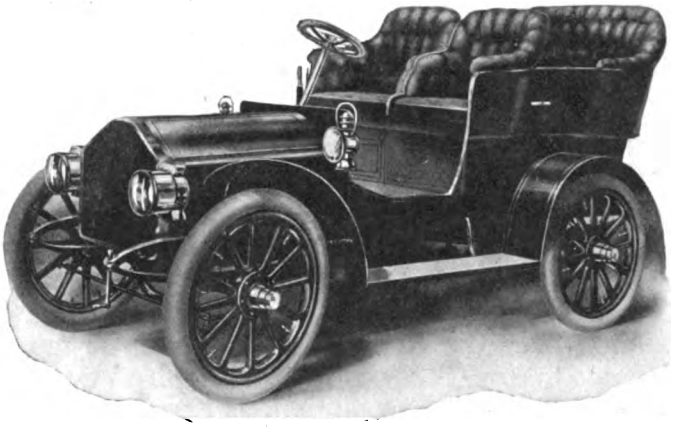
WE HELP YOU SELL.



ORIENT MODEL DE LUXE TOURING CAR. 20 H. P. Price $2250.

Our interest in a dealer does not end with selling him a certain number of Orient motor-cars.

Nor do we simply back him up with some magazine advertising, a bunch of catalogues, a few circulars in assorted lots, and let it go at that.

We have contracted for the exclusive use of the greatest automobile selling plan ever invented, and at our own expense we will carry out this plan for the benefit of every dealer handling the Orient line.

The meat of our proposition is to make it possible for every Orient dealer to sell more motor-cars than he could possibly sell without us.

ORIENT MODEL F LIGHT TOURING CAR, with Tonneau. 16 H. P. Price $1650.

We will actually send ninety-odd per cent. of the possible buyers in your territory right into your garage ready to talk business with you, if you sell Orients. Considering that there is nothing in their class that even approaches these Waltham-made, 4-cylinder, positive air-cooled cars, it is not remarkable that we have already closed with the strongest list of dealers selling any one line of cars in America, and have been obliged to double our capacity.

Details of this selling plan will not be published—but if your territory is still open they will be given you on request. **Ask** for the Orient Style Book, too.

Two Impulses with Every Revolution

THE ONLY SELF STARTING DOUBLE CYLINDER CAR IN THE WORLD.

This is the famous Elmore Pathfinder, which has demonstrated beyond a doubt the superiority of the two-cycle engine over the four-cycle engine. The most significant feature of the American Automobile situation to-day is the complete triumph of this impulse-every-revolution idea, or, with two cylinders, two impulses every revolution, as exemplified in the Elmore. That the Elmore does produce a constant torque; that it does utlize every particle of power and put a stop to waste energy; that it will take the steepest hill or roughest road at high speed, and that it has the most reliable self-starting engine in the world—for each and every one of these claims overwhelming proof has been produced.

The whole trend of expert and popular opinion is rapidly being directed toward the two-cycle engine.

You owe it to yourself to see this car, which will astonish you, not only by its fine appearance, but by its excess power and its extraordinary control on the high speed.

Send for our full line of literature, the booklet illustrating the 6,000-mile trip, our catalogue, explanation of our engine, and the opinions of people who have used our cars, all sent free, or, if you wish, we will send a 10x12 photograph of the Pathfinder on receipt of 10 cents in stamps.

CORBIN AIR COOLED

Motor Cars

Represent the acme of engineering skill and the ideal of elegance of the coach builders' art. In the Corbin motors, the principle of air cooling is applied to four vertical cylinders, running lengthwise with the frame. They show an amount of efficiency equal to the best of water-cooled motors, and an absence of complication which is refreshing alike to the expert and novice.

All Corbin cars are air cooled by the patented Corbin system. As the motor car of to-day represents an advancement in the art compared with the motor cars of five years ago, so is the Corbin system to all other methods of air cooling cylinders.

No Lugs Required with G&J Thread Fabric Tires

Our special clincher construction, giving uniform leverage at all points, holds the clincher securely in place.
The flap provides a smooth seating for the inner tube, and removes the possibility of pinched tubes.
The thread fabric construction prevents the heating of the tires in action, hence they are not self-destroying. It also makes the tire so pliable that anyone can easily place it on and remove it from the rim

ISN'T THIS THE TIRE YOU WANT?

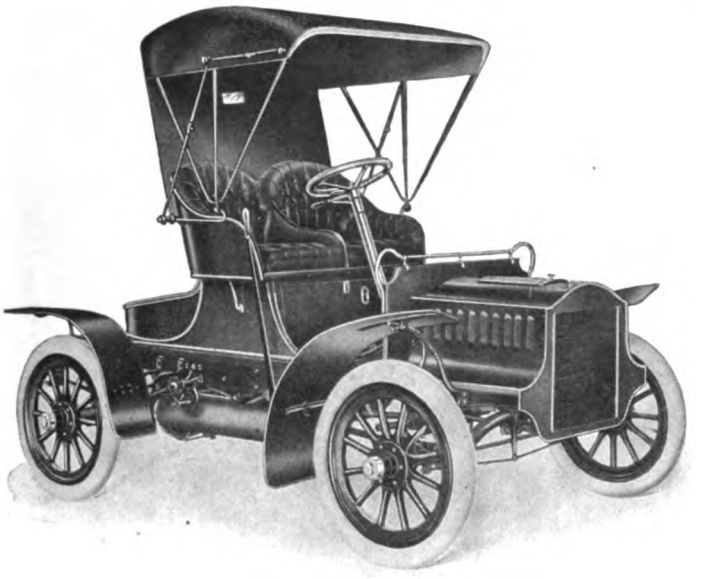
Clincher Tire with Tire Tools

Perfected Dunlop Detachable

It is well worth any man's time to investigate the quality and serviceableness of Morgan & Wright tires —Clincher or Dunlop.

These tires do not stand up day in and day out, under all sorts of conditions, without there being a "good and sufficient" reason:

That reason lies in superior construction, material and know how.



Investigate!

Ask for a copy of "The Other Fellow's Opinion."

"Doctor's Delight"

This little car is specially designed and equipped for the use of physicians and business men to whom time is money. It is a practical car 365 days in the year—built to go in all kinds of weather—and does it. Style shown is our

Model E Cadillac,

with top which can be easily raised or lowered as desired. The standard gear in this car is comparatively low for so light a machine with so powerful an engine. When desired for use where the roads are good and comparatively level, we advise a 10-34 gear combination. On very hilly and sandy roads, where 18 or 20 miles per hour would be the limit, a 10-41 gear will be found most satisfactory. This car embodies all the good features peculiar to Cadillac construction, and is a first class vehicle in every respect. It is of 9 h. p., and the **Price** is **$800** Send for 1905 Catalog, which gives complete specifications and tells all about it.

Cadillac Automobile Company, - DETROIT, MICH.

Member of Association of Licensed Automobile Manufacturers.

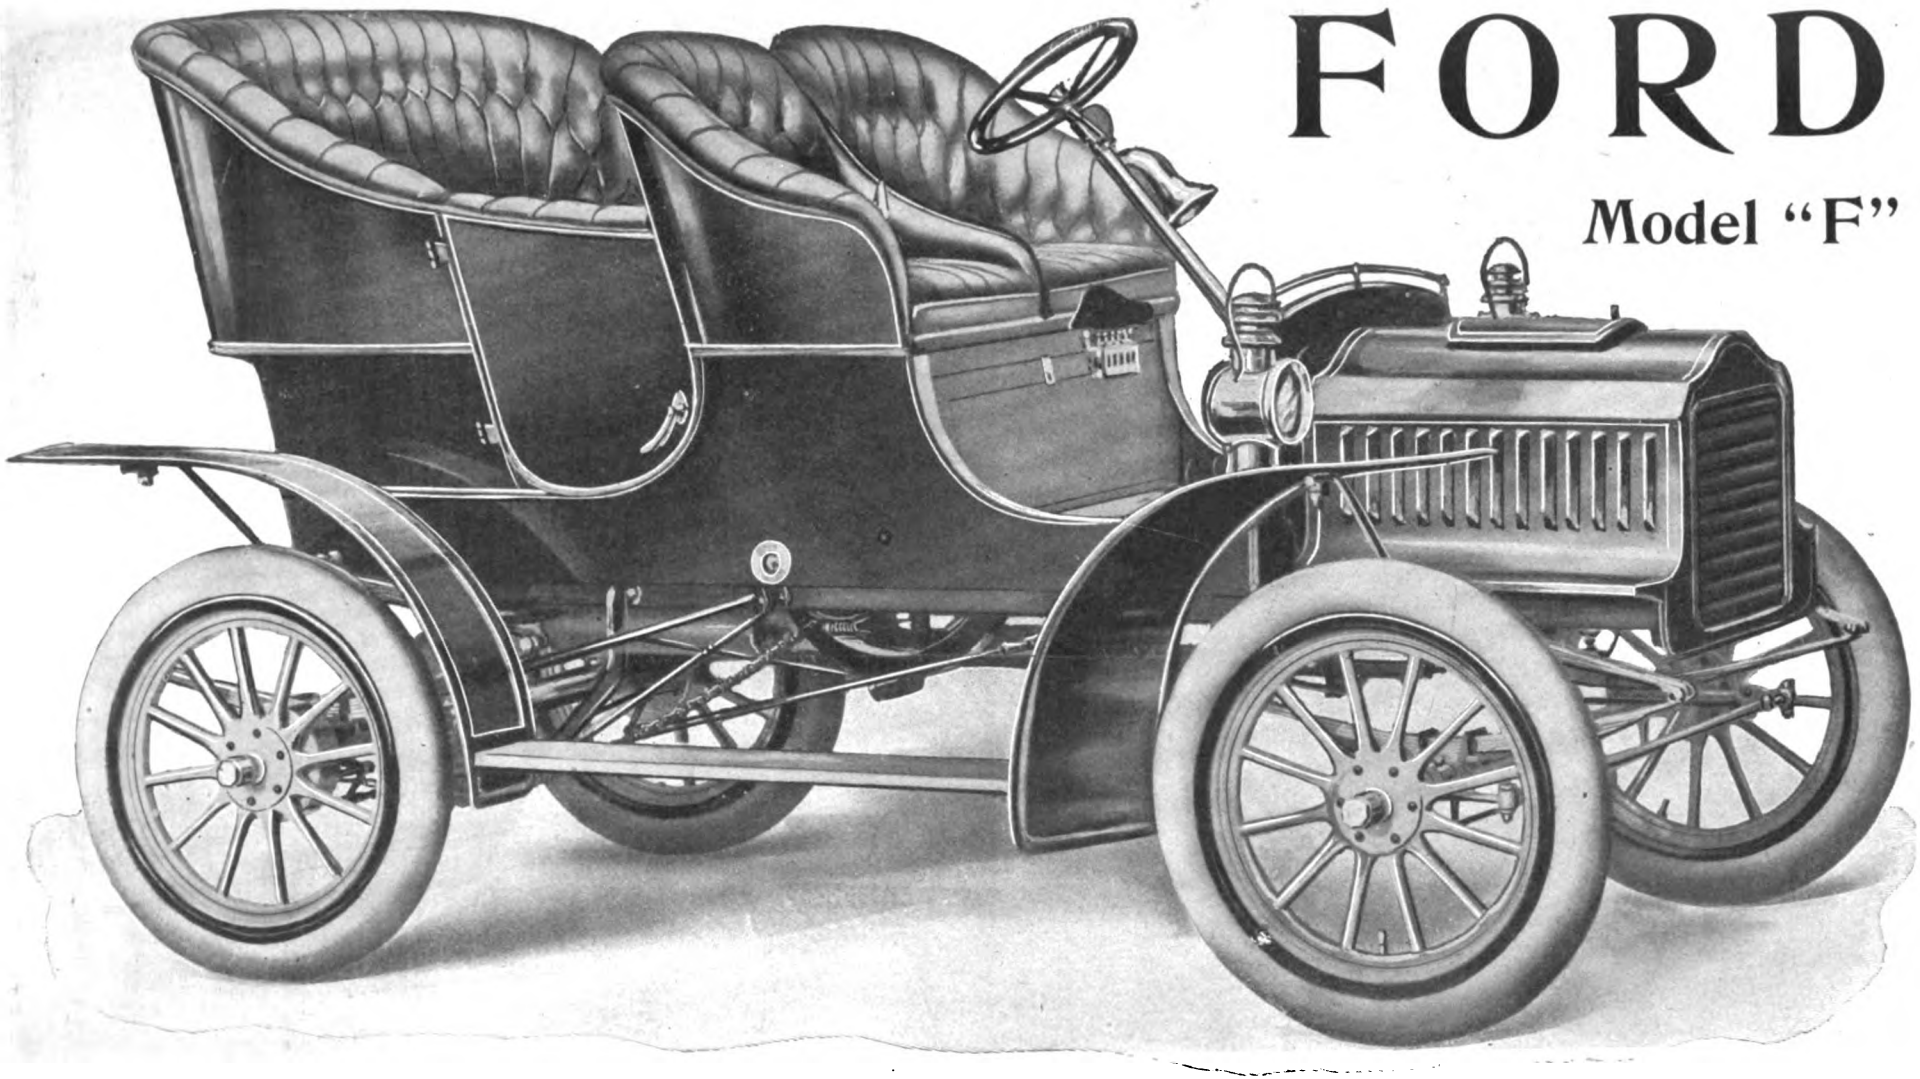
"The Maxwell"

There is not one complicated detail throughout "Maxwell" construction. The number of parts has been cut down to a minimum, and each part has been treated as a special problem and carefully worked out to perfection. It is fundamentally a car easy to explain, easy to understand and easy to operate.

The owner of a "Maxwell" is absolutely sure of two things.

First, that no car in the market AT ANY PRICE is more reliable than his, and, second, that he owns the one car before the public to-day in which, through its rare simplicity of construction, there is nothing to do but ride.

The "MAXWELL" cars have no pump (thermo-siphon). Their double opposed motor is in front under the hood and accessible in every part. They have Bevel Gear Drive. METAL BODIES. Transmission Case and Crank Shaft cast in one Aluminum casting. "Perfectly simple and simply perfect."



16 H. P. TOURING CAR, $1400. 8 H. P. TOURABOUT, $750.

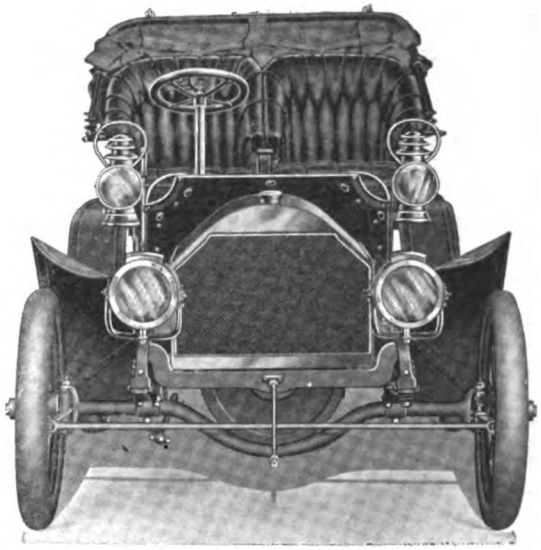
"STEVENS-DURYEA" TOURING CAR

New 20 Horsepower, 4 Cylinder



Gentlemen:—I take great pleasure in speaking a good word for the STEVENS-DURYEA. This is the third automobile I have owned, and it beats them all. I am delighted with it. I cannot speak too highly of it. In fact, I would not take three times what I paid for it if I could not get another just like it. It certainly is the smoothest running, easiest riding machine yet produced. There is not a cheap thing in the construction; every part is beautifully made. Such a piece of work is bound to give satisfaction and do good work. I use it every day, and it is always ready for business. When my friends ask me what to buy my answer is, "STEVENS-DURYEA" every time.

Very truly,
(Signed) DR. FRANK W. BRANDOW, Dentist.

Further Comment is Unnecessary.

ASK YOUR AUTO AGENT.

All we wish to emphasize is, **TRY** one of our reliable, efficient and durable carriages, and thus ascertain the secret for the invariable popularity of the **STEVENS-DURYEA.**

Send for beautifully illustrated catalogs, embodying detailed description, and also history and records of our noted "racing spider."

Price—1905 Touring Car—$2500.00.

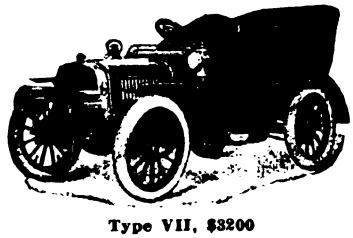
POPE AUTOMOBILES

POPE AUTOMOBILES



Pope-Toledo Supremacy.

By over a quarter of a century's experience in making and marketing mechanical vehicles we have mastered the subject of transmission.

The point of interest to the purchaser is not the horse power of the engine, but the efficient power delivered at the wheels. Idle gears in mesh or any mechanical part intervening between the engine and the point at which the power is delivered, lessens the power.

The wonderfully powerful Pope-Toledo engine transmits its Power to the Wheels by our Double Chain, Direct Drive System to an unbroken rear axle, a system of drive that in point of efficiency and desirability, and from every other standpoint, cannot be compared to the bevel-gear for high powered cars.

DON'T EXPERIMENT. BUT GET THE BENEFIT OF OUR LONG EXPERIENCE.

GOODRICH TIRES

Integral Construction
VS.
Wrapped Tread Construction.

The so-called wrapped tread construction is not new. It is old, and came into existence only as a makeshift.

There are many objections and no advantages to this construction. It was brought about by the necessities of the first builder and has been copied by others.

The Integral Construction (Goodrich) represents the correct and logical method of building tires, and is new inasmuch as we are the first manufacturers in the world to make a success of it.

Many others have tried and after failure, adopted the wrapped tread construction.

We have just completed, by means of an accurate, practical machine constructed for the purpose, a test of each of the leading tires of the world, and against the best, Goodrich showed 50 per cent. greater mileage.

Specify GOODRICH Tires on your 1905 car and get the latest and best construction.

Send for pamphlet describing history of wrapped tread construction and advantages of Integral Construction.

The Bailey "Won't Slip" Tire. Regular Goodrich construction, but provided with the Bailey "Won't Slip" tread. Prevents slipping, slewing or skidding.

Rambler

SURREY, TYPE ONE

$1,350

18 H.P. *Immediate Delivery*

Other Models, $750, $850, $2000 and $3000.

There is no pleasure in traveling over country roads faster than this vehicle can carry you. Besides all needed power, it has exceptional road clearance and other provision for comfort, reliability and ease of control.

The working parts are readily accessible, and so simple that adjustments can be made without the help of a mechanic and without crawling under the machine.

To beauty, reliability, and ease of operation is added the comfort made possible by big, luxuriously upholstered seats, and the almost complete elimination of vibration by the long wheel base, full elliptic springs, large tires, rigid bracing of the engine and the balancing of all reciprocating parts.

Every part, except the body, tires and induction coils, is made in our own factory. The savings thus effected explain the low price.

When delivered, the machine is equipped with brass side, tail and two gas headlights with separate generator, brass horn, drop forged wrenches, oilers, pump and repair kit.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, March 16, 1905. No. 25

SELDEN MEN BUY OPTION

Unexpectedly Slip in and Secure the First Claim on Sperry Ignition Patent.

Not less surprising than the news—published exclusively in last week's Motor World—of the unearthing of the Sperry patent of 1890, No. 433,551, as a master patent claimed to control the ignition of all save single cylinder engines, is the quick change that has been brought about in its probable ownership.

As the Motor World stated, the exploitation of the patent had been undertaken by A. L. Garford, president of the Federal Mfg. Co. He had interested several independent manufacturers in the syndicate which it was proposed to form for its purchase, and there was no suspicion but that it would become their property and that they would be able to present a strong checkmate to the Selden patent.

Early this week, however, it leaked out that men identified with the Selden interests had unexpectedly stepped in and purchased the option on the patent, and thereby placed themselves in position to command the situation should their experts, after investigation, recommend the consummation of the negotiations.

Information is hard to obtain. Just who are the men concerned or through whom the option was obtained cannot be learned, but it is understood that, discovering that Mr. Garford held merely the refusal on the patent and that no money or other consideration had passed to bind a transaction, they saw the loophole, and paid a sufficient price to secure the necessary legal option.

Hay Makes a Change.

Quite unexpectedly Thomas Hay, for the last three years manager of sales and advertising for the National Motor Vehicle Co., of Indianapolis, has resigned that position to take charge of the local sales of the Fisher Automobile Co., of Indianapolis.

The Fisher Automobile Co. are distributors of the Pope-Toledo, Winton, Olds, Buick and Pope-Tribune cars for the State of Indiana, or portions thereof, and maintain a subagency system that is very complete. They also expect to open a branch house in Logansport in order to better take care of the large number of touring cars that have recently been sold there.

In addition to automobiles, the company carries in stock a complete line of sundries, and claims to operate the best equipped garage in the State of Indiana. They are also headquarters for the Prest-o-Lite gas tanks.

Accessory Makers in Session.

At a meeting of the directors of the Motor and Accessory Manufacturers, held at the Iroquois Hotel, Buffalo, N. Y., on Friday last, the 10th, the show subject came up for informal discussion, but, although the entire board was represented, either in person or by proxy, nothing but routine business was transacted. It was decided to hold the May meeting in Hartford, Conn., when it is likely that the organization, which is caught between the fire of the two prospective New York shows, will go more seriously into the matter. As it is, the accessory men, who are friendly to both interests, are stared in the face by a doubling of expense.

Midgeley Moves to Hartford.

Thomas Midgeley, the head of the Midgeley Mfg. Co., Columbus, Ohio, who has been retained by the Hartford Rubber Works Co. as their consulting engineer, has taken up permanent residence in the Connecticut capital. This does not mean, however, that the company which bears his name and which produces the Midgeley pressed wheels and the rims for Dunlop tires, will lose his services, as it is part of his purpose to pay periodical visits to the factory at Columbus.

Adams Opens in Chicago.

The Adams Co., Dubuque, Iowa, have opened a Chicago salesroom at 1536 Michigan avenue. It is the first step toward actually placing the remarkably original Adams-Farwell car on the market.

G & J go to Boston.

To better care for their New England trade the G & J Tire Co. have opened a branch in Boston. Temporarily, at least, it will be located at No. 43 Columbus avenue.

TIRE TRADE AGAIN VEXED

Cost of Rubber Goes Away Up and May Compel Increase in Tire Prices.

Evidence of acuteness in the tire trade is again apparent, due to the amazing stretch of the price of rubber.

Quotations on the best Para gum last week touched $1.33 per pound, and, according to a particularly well informed tire man, there is every prospect that it will ultimately reach $1.50.

"And present prices," he added, "do not represent the real cost of the rubber to us. The stock we are getting is much greener than usual, which means that the shrinkage is correspondingly greater. The situation is not a comforting one. An increase in the price of tires is not desirable, and, if one is made, it probably will cause a mighty howl, and yet the condition of the rubber market is rapidly leaving us the choice of two dilemmas—an increase of price or a reduction in the quality of tires. And no manufacturer who has built up a reputation wants to tinker with the quality of his goods."

Gray & Davis Bring Suit.

In the United States Circuit Court in Philadelphia, Gray & Davis, Amesbury, Mass., have instituted suit against Charles E. Miller, the well known wholesaler, for alleged infringement of their patent, No. 764,396, of July 5, 1904. The proceedings are based on Miller's sale of Atwood lamps that are claimed to infringe the Gray & Davis patent in question, which covers their well known Bullet lamp. A defense will be entered.

Parker Joins Fisk Staff.

Burton Parker has been appointed advertising manager of the Fisk Rubber Co. He previously occupied a similar position with the Hartford Rubber Works, and later with the Olds Motor Works.

Henley Goes With Reliance.

A. B. Henley has been appointed sales manager of the Reliance Motor Car Co., Detroit. He formerly was connected with the Electric Vehicle Co. and Pope Mfg. Co., in Hartford, Conn.

$13,500 FOR NON-DELIVERIES

Court Awards Plaintiffs this Sum, but Meanwhile One Defendant Has "Gone Broke."

Judgment for $13,500, with interest from the date of suit and for all costs, has been rendered by Judge Morrow, in the San Jose (Cal.) Circuit Court, in favor of the Automobile Traction Co. of San Jose, Cal., against the Universal Automobile Co. and the Ætna Indemnity Co.

The plaintiff is a California corporation, A. H. Eddy and Charles W. Coe, of San Jose, being the principal officers and stockholders. In June, 1903, they made an agreement with the Universal Automobile Co. to purchase a number of cars for use in and about the city of San Jose. The cars were to be delivered in forty-seven days, and the price agreed upon was $4,500. Under the agreement Eddy & Co. were to pay one-half down, the remainder upon delivery of the machines. Payments were promptly made, but the cars were not delivered, and in December the stockholders went to San Francisco and protested against the violation of the contract. General Hart was the leading spirit representing the defendant, and acted as president of the Universal Automobile Co., which was a South Dakota corporation.

At the meeting in San Francisco it was agreed that if Messrs. Eddy & Co. would put up an additional $1,000 the Dakota corporation would give a bond for the faithful carrying out of the original contract to furnish the cars, and would guarantee delivery in an additional thirty days. Under that agreement the bond was deposited with the Ætna Indemnity Co., but neither the latter company nor any of the defendants carried out the agreement, and the cars were never delivred.

Suit was then begun in the Superior Court to recover damages for breach of the contract. General Hart had the case transferred to the Circuit Court, with the result that the indemnity company has been ordered to pay the plaintiffs $13,500, together with interests and costs.

Pending the proceedings the Universal Automobile Co. went into bankruptcy proceedings, and all its holdings were sold to pay the claim of preferred creditors, so that now the entire loss falls upon the surety company.

Pope in His New Garage.

What the owners believe to be the best equipped garage in America was formally opened in New York on Thursday last—the Pope garage, which will be headquarters, of course, for the various products of the Pope Mfg. Co., including the Pope-Toledo, Pope-Waverley, Pope-Hartford and Pope-Tribune cars.

The new structure is one of the most modern of its kind, and has every possible equipment for the comfort and convenience of its patrons. It is a four story building fronting on Broadway, near Fifty-fifth street, with an entrance on Fifty-fifth street. The basement is used for storage, with a turntable next to the elevator to send cars in any direction. On the main floor is the showroom and administrative offices. On the floor above is the ladies' parlor, room for chauffeurs, a commodious locker room for patrons and shower baths. The third floor contains storage and repair facilities and the electric charging plant machinery. On the fourth floor is a complete repair shop, equipped with the most modern machinery, including a travelling crane. There are pits in the floor to facilitate working under the cars and a ball bearing turntable next to the elevator. Here, too, is a complete stockroom and a dust proof room, where cars are painted and varnished. The garage is in charge of Elliott Mason, who for nearly a quarter of a century has been identified with the Pope interests.

The Profits of the Shows.

The profits of the Automobile Show, held at Madison Square Garden, New York, last January, were $55,933.33, not $59,933.95, as first reported. Of this sum the Madison Square Garden Co. received 40 per cent, or $22,373.27, and the Automobile Club of America and the National Association of Automobile Manufacturers each received 30 per cent, or $16,780.18.

The receipts of the Chicago show totalled $30,504.54, of which S. A. Miles, as manager of the National Association of Automobile Manufacturers, took the first $6,000 as his salary for the year. After deducting this amount the net profits were $24,504.54, of which Miles's share was one-third, or $8,168.18, and the share of the N. A. A. M. two-thirds, or $16,336.36. This makes Miles's income for the year as manager and show promoter $14,168.18.

Alleged Guarantee Leads to Court.

The Mississippi Valley Automobile Co., of St. Louis, Mo., is the victim of a trick played by an East St. Louis man, who claims that the firm owes him $200 damages for breach of contract. Russell Richardson telephoned to the automobile company to send its best car to East St. Louis, as he had a customer for it. When the car arrived Richardson and a constable were waiting with a writ of attachment, and the chauffeur had to walk back. Richards claims $200 damages for the company not fulfilling a contract which they made to him when he bought an automobile from them, they guaranteeing to keep it in repair for one year. Richardson is the defendant in a suit filed by the Mississippi Valley Co. for repairs on the car he purchased.

New Retailer in Utica.

The Utica Motor Co. have just organized in Utica, N. Y., with Frank E. Howes as manager. They will handle the Ford and Premier cars, having established a salesroom and garage at No. 128 Lafayette street.

PIERCE OFFERS BIG PRIZES

Apportion $1,000 to Obtain New Ideas in Body Designs and Finishes.

If there is any ingenuity or artistic talent going to waste or that requires encouragement to be turned to practical benefit, the George N. Pierce Co. has set out to supply the needed incentive. They particularly seek to develop body design and artistic finish, and to that end have appropriated $1,000 for competitive effort on the part of those who may consider themselves gifted.

This prize money has been apportioned in this wise:

For motor car open bodies—First prize, $250; second prize, $100; for a body for a side entrance car, based upon availability, usefulness and beauty. Specifications to be supplied.

For motor car enclosed or Limousine bodies—First prize, $250; second prize, $100; for a design for a body with side entrance, as per specifications to be supplied to be based upon availability, usefulness and beauty. Competitors must supply scale drawings of side and rear elevation and seating plan.

For color scheme for motor car bodies—First prize, $200; second prize, $100; for a color scheme of some existing type of our motor car, either open or enclosed. In awarding prizes the reliability of colors chosen and the appropriateness to the service will be considered.

The contest will close June 1, 1905.

All designs not worthy of award will be returned at the company's expense, or will be paid for at a price not to exceed fifty dollars at the company's option.

Gawthrop Scorned the Railroad.

W. W. Gawthrop, Eastern sales manager of the Elmore Mfg. Co., of Clyde, Ohio, and who is responsible for much of the success of the Elmore in the East, drove over from Philadelphia to the Boston Show last week, closing four agencies en route. Despite the trying weather conditions and bad roads, the Elmore, on its arrival in Boston, was promptly put in commission as a demonstrating car, and has been in service all week without any repairs or overhauling.

Royals in the Motor Shop.

The Motor Shop, Incorporated, 317-319 North Broad street, Philadelphia, has taken the agency for the Royal Tourist. The Motor Shop has taken the quarters formerly occupied by the Darracq, and are making extensive alterations.

The Chenys Begin Business.

Robert and Harry G. Cheny have started in business in Manchester, Conn. They will carry a full line of Columbia electric and gasolene and Walter gasolene cars.

SEEKING A SHOW BUILDING

A. C. A. Committee Meets Only to Adjourn — January Dates Conflict with Armory Usage.

A meeting to perfect details of the proposed show for next year was held by the show committee of the Automobile Club of America yesterday. Though no longer a member of this committee through having recently assumed the office of chairman of the building committee, A. R. Shattuck was also present. The latter's place on the show committee has been taken by W. A. Hamilton.

Plans were discused at length, but according to General George Moore Smith, chairman of the committee, nothing of moment was passed upon.

"The Board of Governors of the A. C. A. decided some time ago definitely to hold hold a show and referred the matter to the committee," said the General to a Motor World representative. "But we can't hold a show in the street, and nothing further can be done until a place has been arranged for." Naturally an armory is about the only building sufficiently large, and there are complications in the way of obtaining one. The Seventh, which has a larger floor space than the Garden, is the only armory of which its officers have complete control. The latter were not averse to having it used as an exhibition hall until they heard the date, and then deal was all off.

"When they learned that it would be wanted during January," he continued, "there was nothing more to be said, and this is somewhat of a hitch where the other two armories under consideration—the Seventy-first, at Thirty-fourth street, and the Sixty-ninth, at Twenty-sixth street—are concerned, but not of quite the same weight. The officers of either of these regiments have no insurmountable objections to suspending drills for a week, but the armories themselves are city property, and there are questions innumerable and miles of red tape to be unwound. The principal objection is that if an armory is permitted to be used for an automobile show, there will be a hundred and one applications to use them for other exhibition purposes. On the other hand, the compensation received would enable the regiment to fit up a gymnasium or bowling alleys—something which the city doesn't provide. In fact, if a proposition were broached to spend city money for such a purpose, I myself, as a member of the armory board, would vote against it."

To the question as to who the exhibitors would be, the general replied that "it would be a free-for-all show—any manufacturer of automobiles or accessories who wishes to exhibit may do so. The A. C. A., from its position in the automobiling world, could not afford to do otherwise. There can be no taking sides with any organization of whatever nature."

The Week's Incorporations.

New York City, N. Y.—Automobile Arcade, under New York laws, with $30,000 capital, to deal in automobiles. Corporators—J. L. Scott, Louis Schwarz and E. C. Griffith.

Milwaukee, Wis. — Western Automobile Supply Co., under Wisconsin laws, with $40,000 capital. Corporators—Edmund Verstraete and Winfield S. Grant.

Atlantic City, N. J.—The Auto Speedway Co. of America, under New Jersey laws, with $100,000 capital. Corporators—Walter H. McDougall, Louis Kuenkle and James O. Walsh.

New York City, N. Y.—Lincoln Carriage & Automobile Co., under New York laws, with $5,000 capital, to make automobiles. Corporators—A. M. Lasser, L. Lasser and W. R. Ecker.

South Orange, N. J.—South Orange Motor Co., under New Jersey laws, with $100,000 capital. Corporators—Fred Ardrey, Clara Ardrey, Alick Merriman and Evelyn Merriman.

St. Louis, Mo.—Automobile Exchange & Supply Co., under Illinois laws, with $5,000 capital, $2,500 paid in, to deal in automobiles. Corporators—A. L. Dyke, C. J. Dyke and Charles Peters.

Cleveland, Ohio—Whitcombe Automobile Co., The T. C., under Ohio laws, with $10,000 capital. Corporators—T. C. Whitcombe, M. J. Roseboro, S. Q. Kerrnish, W. S. Kerrnish and J. MacBeth.

Boston, Mass.—Tremont Garage Co., under Massachusetts laws, with $10,000 capital. Corporators and officers — President and treasurer, Frank D. Stranahan; clerk, Anna R. Stranahan.

Providence, R. I.—Flint Motor Car Co., under Rhode Island laws, with $30,000 capital, to manufacture, buy, sell and repair automobiles. Corporators—Elliott Flint, Franklin M. Chenery and Thomas P. Allen.

Boston, Mass.—Veerac Motor Car Co., under Massachusetts laws, with $60,000 capital, to deal in automobiles. Corporators and officers—President, C. F. Whitney; treasurer, A. P. Delabarre; W. E. Decker.

Fight for the Name "Knox."

On Saturday last the Knox Automobile Co., Springfield, Mass., obtained an injunction restraining the Knox Motor Truck Co., of the same place, from using in any way the name Knox as applied to self-propelled road vehicles or parts thereof. As the truck company was exhibiting in Boston, this prevented their display of a sign or printed matter of any kind.

On Monday, however, the Superior Court modified the injunction by temporarily permitting the Knox Motor Truck Co. to use the title on such signs or matter, provided the words "not Knox Automobile Co." are also displayed in letters of equal size above or below such title.

Issue will be joined on Tuesday next, when the case will go to jury trial.

"J. C." IS WANTED BADLY

Played a Low-Down Trick on Rambler People and They Offer $50 for his Name.

The ways of some men are past understanding. George W. Bennett, the well known manager of T. B. Jeffery & Co., had reason to remark the fact when, after an absence, he returned to the factory at Kenosha, Wis., last week. He found awaiting him a number of requests for information regarding the 10 per cent discount on Ramblers. They caused him to set up straight and "say things" in his emphatic fashion.

This innocent little two-line advertisement in the classified column of the Chicago Tribune was the cause of it all:

"Ten per cent off all new 1905 Rambler automobiles. J. C., 300 Tribune."

J. F. Gunther, manager of the Rambler branch in Chicago, and several of his staff had already answered the advertisement. Bennett and six of his friends did likewise. They all were "anxious" to obtain that 10 per cent. But nary an answer did they receive. "J. C." evidently had other ends to accomplish.

Bennett then had the newspaper office investigated. All he learned was that the initials "J. C." constituted a token that the advertisement had been handed in either by a large advertiser or at a suburban office. It was not enough to suit Bennett. He is fairly itching to discover "J. C., 300." If any one can uncover the guilty man $50 of Jeffery money will be cheerfully presented for the service. Jeffery & Co. have advertised such a reward in the Chicago Tribune, but at last accounts "J. C." was still hiding a diminished head.

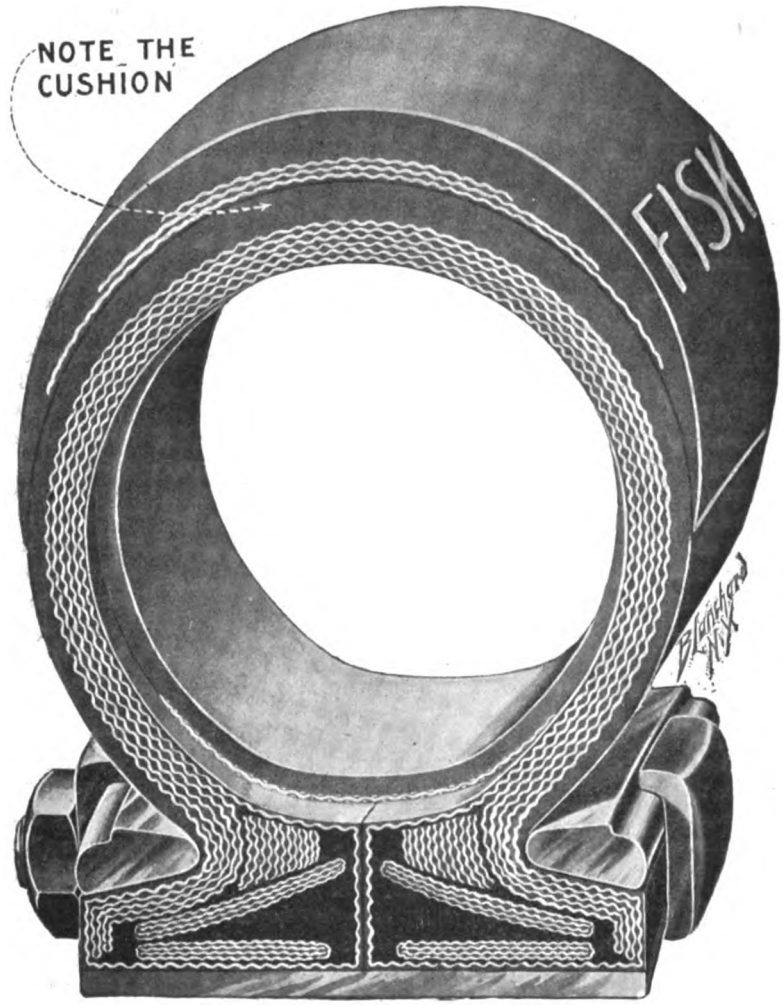
Sweden to Hold a Show.

Although Sweden has not a single automobile manufacturer an exhibition is to be held next April. The show, which is being organized by the Swedish Automobile Club, will comprise passenger automobiles, delivery wagon automobiles, automobiles for sanitary and fire appliances and military purposes.

Dyke Can't Use His Own Name.

A. L. Dyke, who after retiring from the A. L. Dyke Automobile Supply Co., St. Louis, Mo., continued to make use of his name in the automobile trade, has been enjoined from continuing the practice. It forced him to find cover under title of the Automobile Exchange & Supply Co.

Goodyear Opens in Los Angeles.



The Goodyear Tire & Rubber Co. have opened a branch store at No. 932 South Main street, Los Angeles, Cal. It will be in charge of W. D. Newerf.

Syracuse, N. Y., is coming into line. The Board of Contract and Supply has ordered a $3,500 electric patrol wagon from the Amos Pierce Automobile Co.

NEW YORK, MARCH 16, 1905.

The Self-Starting Feature.

Is self-starting—the ability to get under way instanter without the essential preliminary of winding the crank—a feature of the up-to-date gasolene car, without which the latter cannot be said to be complete? Or probably the question may better be put, Is self-starting a feature of any gasolene car that warrants the addition of any complication, no matter how small?

The question must be looked at from varying points of view—principally two—in order to receive an adequate answer. And, strangely enough, these do not involve its practical side nor the ease with which it may or may not be applied to any certain type of car, but rather to the owner of the latter. For instance, take the high-powered four-cylinder car on which various attempts have been made to apply it, and in the great majority of instances it is found they are the property of individuals sufficiently wealthy to employ a professional "shover" as an adjunct; it certainly is not a question of great moment to such an owner whether his servant has to raise a little extra girth on his biceps in producing sufficient initial compression for a start or not. If everything is as it should be half a turn does the work; if not, it is the "shover's" duty to see that it is, and the matter hardly admits of any further argument from this point of view.

From the standpoint of the purchaser of a moderate priced machine, the fact that the ability to stop the motor at any time without the necessity of dismounting to resume action, is a reliable feature of a car, would be much in its favor, and certainly an added charm, cannot be gainsaid. Where the owner, the driver, the chauffeur, the mecanicién and the repairman—except when serious trouble is in view—are, like the crew of the Nancy brig, one and the same individual, this functionary would prefer not to demean himself by descending to the street level to do the cranking, if it can possibly be avoided. On the other hand, he cannot afford to pay a high price for his machine in the first instance, and added refinements of this nature increase first cost greatly, as well as involving in many cases needless complication.

Where the owner of the light runabout is concerned, the question can hardly be said to exist, for this is a type of car the first cost of which prohibits the addition of any refinements purely in the shape of luxury, while, on the other hand, many may be termed self-starting; that is, they are intended to be cranked from the seat, and so far as the necessity of dismounting is obviated, sufficiently to fulfill the condition.

But, considered from any point of view, it must be evident that self-starting is a feature that must sooner or later become universal on the gasolene car of every type. Like the side entrance tonneau, it has to come, and for almost the same reasons; the only question is how to bring it about satisfactorily. That the solution does not lie in complicated adjuncts to a system already overburdened with detail is clear from the number of devices designed for this purpose that have been tried, only to be cast aside.

Concerning the Cost of Upkeep.

How much does it cost to run a small car, is undoubtedly the question uppermost in the mind of the average purchaser of limited means who goes in for a light runabout as a starter. Do the numerous endurance tests, specially conducted by the makers under the supervision of one of their most experienced employes, demonstrate satisfactorily what the average should be? Or, on the other hand, do the occasional newspaper stories of buyers who have been compelled to pay as much as two or three times the original cost of the machine in repairs in a single season—in one instance actually becoming bankrupt—come nearer to representing the truth.

Practice does not, of course, run to extremes in either direction, so that it is safe not to accept one or the other of these statements at its face value. The makers' test is carried out under conditions not approachable by the average individual owner, while cases of excessive repair bills are usually due to specimens of monumental ignorance or recklessness—often both—sometimes to defective workmanship in the car itself, but such instances are probably so few and far between where reliable makes are concerned that they may well be ignored.

More statistics have been gathered on this point of vital interest during the past twelve months than in any previous year of the industry, and the results should prove interesting to all whom cost of maintenance is a feature of prime importance. Probably there are few manufacturers who do not follow such trials and strive to benefit from the experience thereby gained to an extent little appreciated by the average individual owner.

A glance over the tabulated results shown by the carefully compiled records made on special endurance runs held by makers, as well as by those owners who have been sufficiently interested in the matter to produce records that are accurate enough to be of value, seems to bring one thing out prominently in every instance, and that is the cost of tires. In one run abroad—where they prate of superiority in tires as in all else—held under skilled supervision, this exceeded by fully 25 per cent. the entire cost of fuel—to be exact tires cost $100 and fuel $75 for a run of several thousand miles. Figuring the total cost of maintenance in this case, the cost of tire repairs and replacements still exceeded it somewhat. This might be considered an extreme case, but for the fact that figures in the majority of others are such as to substantiate them—tire maintenance is unfortunately always an entirely disproportionate fraction of the total.

Attempts to economize by saving a few pints of gasolene per hundred miles, or a corresponding economy in lubricants, seem futile in the face of such a state of affairs, but this can hardly be put forth as a good reason for standing still where improvement in fuel consumption is concerned. Probably as much may be accomplished some day at a single stroke in the solution of the tire prob-

Digitized by Google

lem as required years of close study to bring about in the engine. It is greatly to be hoped that that day is not too far in the future. Meanwhile experience points unerringly to the truth of the statement that no economy is so false as that which seeks to save a few dimes or dollars in the selection of tires. The best is always the cheapest in the end.

About Accessibility.

"Accessibility" is a watchword of every motor car salesman. It is the centre from which all his arguments radiate, and the point to which he invariably returns in conclusion. And, indeed, it is a most desirable quality, and one of the five virtues with which every car should be endowed. But it is often applied to an exaggerated degree, and not infrequently, when used by the dealer in a highly colored sense, its meaning is purely relative. For example, in some cases, the statement that the inlet valves are thoroughly accessible, may be taken by inference to mean that the exhaust valves are not, but quite the contrary.

The ideal car would be so constructed that every individual organ could be removed without disturbing any other, and that by the briefest, simplest process imaginable. Moreover, parts would not only be so placed that they might be gotten at, inspected and adjusted without serious interference with other functions, but such a process should not entail an acrobatic performance on the part of the mechanic, nor an abnormal cleverness in the use of his finger ends.

One who has spent the greater part of an hour lying on his back and reaching up with one hand through a small, round hole, vainly experimenting with various small tools in an endeavor to locate the proper position of an obstreperous cotter pin, in an effort to lock up a connecting rod, will fully appreciate the value of the quality, nor will he quibble at its being called a virtue.

Accessibility is, and should be, a relative quality; relative in a strict sense, and governed by two considerations, the comparative importance of the part in question, and its liability to get out of order. And apparent though it may be, the neglect of this very important principle costs the builder, the dealer, the owner and his mechanic many a dollar every season. Here is an illustration.

In a foreign car large numbers of which are in use on this side of the Atlantic, it is necessary to dismount the motor or else to remove the transmission, a process which, by the way, involves taking it entirely to pieces, in order to dissemble the clutch. The latter, although of the self-contained variety, and not of itself likely to become deranged, is, however, lubricated by oil which drips from a pipe onto the outside of the flywheel, and in due season, other things being equal, finds its way somewhat tardily to the thirsty mechanism within. In fact, this whole car is so cutely put together, that to do anything more than superficially examine the power plant involves an analysis of the thing into a multitude of little component parts, beginning with the starting crank, and ending with the cardan joint in the propeller shaft. And yet the dealer is wont to airily lift a couple of floor boards, and uncover the gear case with a flourish to show the stranger how very accessible is all the mechanism. Another foreign car—one of the best—for a long time was so constructed that to get at the governor required the dismounting of the starting gear in its entirety, disconnecting and removing the commutator, and then to remove a certain gear housing which obstructed the view of the mechanism in question. This is not intended as a criticism of prevalent design, by any means, but rather as a definition, but suggests that though the clutch in one case and the governor in the other are staunch and durable, they are buried, to all intents and purposes, and that a comparatively slight alteration in form in either case would have made it possible to uncover them at a great saving.

Sometimes the builder swings over on the other tack and complicates matters in consequence. A certain car which is lauded as a paragon of accesibility has the half-time shafts with all their appurtenances mounted on top of the cylinders. Accessible they are, to be sure, but of what avail is it, since their position is an exposed one and entails added complication in the removal of the values? In this case those parts of the mechanism which are least likely to get out of order, namely, the cams and their followers, are most easily gotten at, while others, which require more frequent attention, are more remotely placed.

The point to be emphasized is this: In order to be "getatable," parts need not be in an exposed or unnatural position, a casing or housing of one sort or another does not seriously interfere with the approachableness of the mechanism it protects, so long as it be removable without interference with other parts of the machine. And again, to so arrange parts that they may be inspected simply is not enough; they must be readily removable and easily adjusted, without the disturbance of other functions, without contortion on the part of him who is responsible for the car's well being, without prestidigitation on his part, and without great sacrifice of that breathless mystery—time.

Accessibility is then one of the subordinate, albeit very essential, factors which the draughtsman must have cut into the edge of his board in great big initials, as something he must constantly bear in mind. It is by no means a new desideratum! the builder has recognized its value all along, and striven to exalt it; he is working for it still, and will not cease to do so. But since it is subordinate to other considerations, it cannot be expected to develop all at once. Its best application cannot be obtained until the developing, compacting, simplifying process has reduced the motor to its lowest terms, and the round-shouldered man with the yellow pencil behind his ear has more leisure to attend to the refinement of his work.

"Many a tow home behind a 'haymotor' could have been avoided by carrying a spare chain, or at least a few spare links, in the toolbox; and the same may be said of a number of small parts," says the Automobile.

Why not add that many such an unpleasant experience might have been avoided by carefully inspecting the car before it left the garage? For, except in extraordinary cases, nuts get loose and stay loose before they come off, and parts show flaw before they break, or, in fine, every disease has its own premonitory symptoms, and the ounce of prevention applied in a saturated solution of simon pure common sense will often check the disorder before it comes to a climax, or will at least check its spread to other organs. If my lord the chauffeur would cut short the poker game and get right down on his stalwart back under the car with a monkey wrench, instead of giving orders to "have it fixed" by one of those dirty fingered mechanics on whom he affects to look down, he would stand a better chance of retaining the position of which their active ambition and skill of hand tend to rob him.

Franklin Murphy, Jr., has invented a device to limit the speed of automobiles to twenty miles per hour. Franklin Murphy, Sr., former Governor of New Jersey, recommended a law requiring the use of such a device. Papa has a great head!

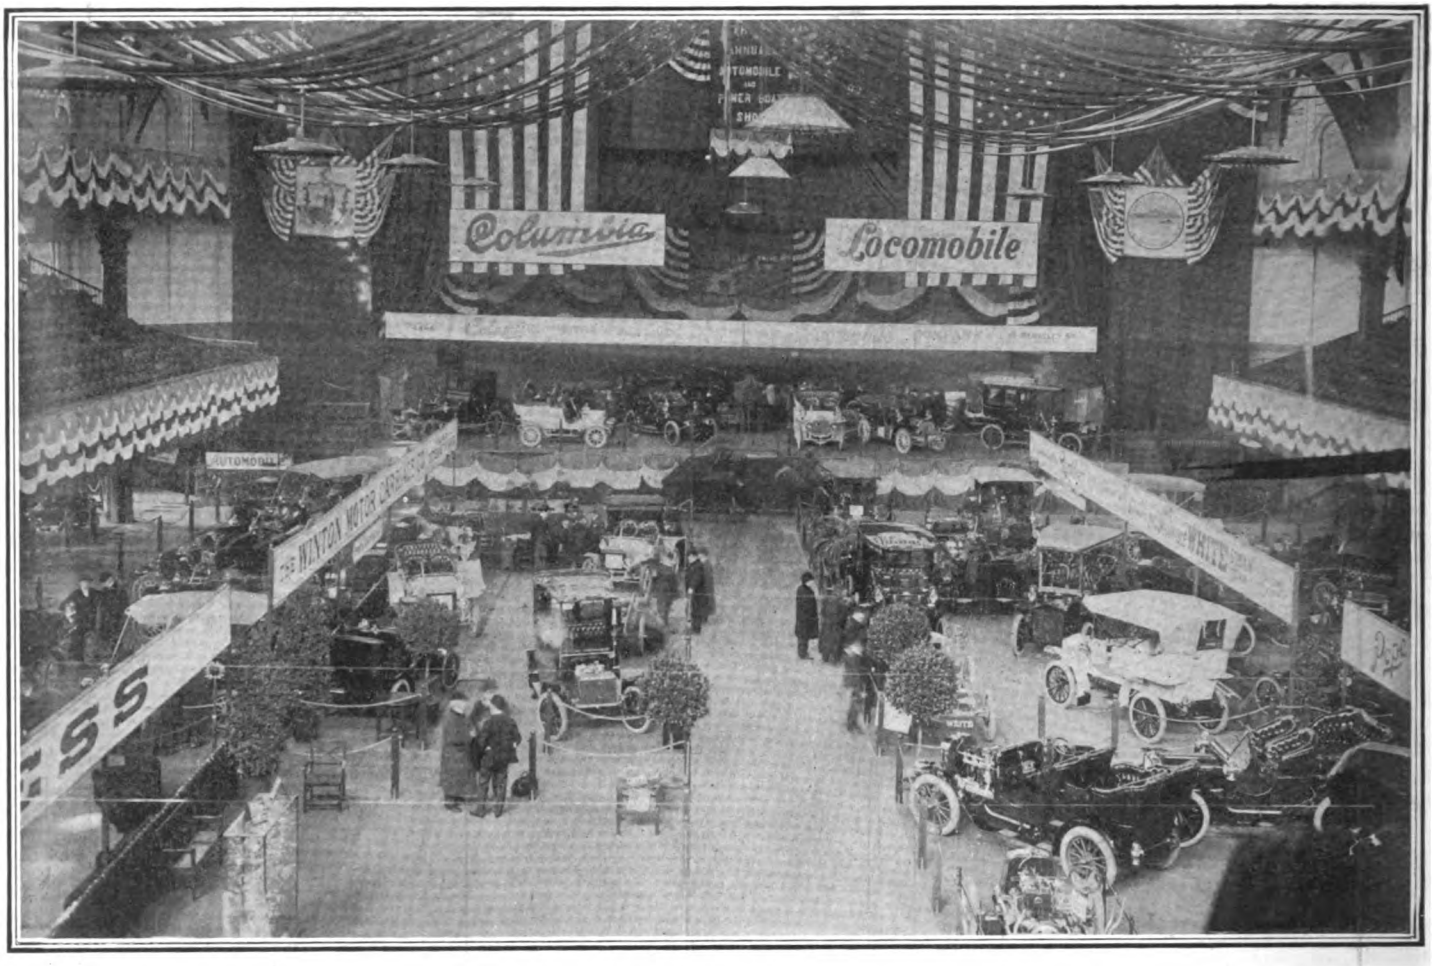
Boston Show Proves an Eye-Opener

Attains Magnitude of a National Exhibition and Attracts an Overwhelming Attendance—47,500 Persons Present the First Night, and Police Prohibit Further Admissions—Five new Cars Make their "Debut," two of them Being Radical Departures from Accepted Standards.

DEMONSTRATION CARS OUTSIDE MECHANICS' BUILDING.



Boston, Mass., March 13.—Up here where they swear by the sacred codfish and are so modest about it that they do the swearing in whispers, and where the blood of the populace is supposed to be so diluted with ice water as to make it difficult for the boiling point to be reached, the Automobile Show, which opened in Mechanics' Building on Saturday evening last, sent up their temperatures way above that point before the doors had been opened two hours. And a great show it is, too—quite the greatest ever held outside the confines of Madison Square Garden, New York. In the absence of authentic figures to the contrary, it may be added that never during any one night of a New York show was the Garden packed so tightly with humanity as this show was packed on Saturday night; and there have been some sardinelike crowds in the Garden, too.

The Boston crowd came early and stayed late. Those in the know were aware that 15,000 free tickets had been distributed for the opening night, and, although they had no idea that more than 40,000 people were crowded into the building during the evening, on several occasions a jocular wager was offered and declined that of the 15,000, 14,999 of the free admissions had been used. The building was simply packed to suffocation—the crowd swarmed everywhere, and although it was plain that the price of a motor car was beyond the means of the vast majority, it did not seem to lessen one whit their interest in the exhibits. They were far more inquisitive than any New York or Chicago crowd ever thought of being.

Looking down from the gallery in the concert hall at about 9 o'clock, not only were the aisles tightly wedged, but every car was so closely surrounded by people that the cars were practically hidden. It seemed an exhibit of humanity rather than of automobiles. It was only to-day when it was announced that the official count showed 47,500 admissions that a true idea of the immensity of Saturday's gathering was obtained; it was also made known to-day that so crowded was the building that the police had to put up the bars and refuse to admit the late comers, of whom it is stated there were several hundred, if not several thousand.

Even before the show opened, however, the promoters had apparently borrowed a leaf from Chicago, and were claiming everything, so to speak. The sign on the building, flung to the breeze, proclaimed that it was "the greatest and most complete show of its kind ever held in America.' Inquiry developed that the promoters really believed what the sign stated. They claim to have not only more floor space than Madison

Digitized by Google

GENERAL VIEW OF EXHIBITS IN CONCERT HALL.

Square Garden or the Chicago Coliseum, but also that they actually have more exhibitors than were in evidence at the shows in those places. None was fortified with figures to discomfit the claimants, who, however, were not unpleasantly assertive on the points. They certainly were safe in making the statement concerning their excess of exhibitors. Probably no man but the bookkeeper will ever know exactly how many are here.

The one feature of the show that is unworthy of it is the official programme. It is bulging with advertisements, and gives in great detail the orchestral programme for each day; but as for shedding light on the nature of the exhibitors or their location in the building it might as well not have been printed. It is enough to turn gray the hair of a newspaper man whose business it is to seek out and "check up" such data. It gives not only the name of the manager of various branch stores and of the agents of the various cars, whether they stage one brand or several, but also specifies the name of each separate manufacturer. Each manager, agent and manufacturer is made to appear a separate exhibitor, but no locations or the nature of the ware shown are included. It is possible that this method of listing may be responsible for the Boston count and the Boston claim of the greatest number of exhibitors.

This, however, is an incidental, and, although an aggravating one in many instances, it does not affect the merit of the show itself. It is, as stated, a great big show, spread out in a building admirably adapted to the purpose and splendidly appointed. In the concert hall, where the band plays daily and where the music loving Bostonians occupy the gallery chairs for hours at a time, the aspect is almost parlorlike. Here are grouped all the "elect"—the Pope and the Pierce, the Olds and the Rambler, the Peerless and the White, the Haynes and the Apperson, the Acme and the Northern, the Baker and the Autocar, the Ford and the Elmore, the Winton and the Packard, the Grout and the Yale, the Knox and the Cadillac, the Cleveland and Kenneth Skinner's line of foreign cars. On the stage, overlooking all these, are the Locomobile and the Columbia. The signs are harmonious—gold lettering on white backgrounds—and the exhibit spaces are carpeted with reddish matting, while nearly every booth has its quota of palms, plants and stunted shrubbery. The absence of electric lighted signs is scarcely missed.

In the main hall, and on the galleries above it the effect is not so impressive, and yet throughout there is a sweet, clean appearance that is not found at other exhibitions of the sort. Modified in a measure, this holds true even of the basement. By comparison, the basement in Madison Square Garden and the odor that seems ever to cling to it is a dungeon. The basement of Mechanics' Building is bright and clean and not stuffy. There is a motley display down there, motor boats and appurtenances forming the bulk of the exhibits.

Outside of the concert hall there is small effort at decoration; each space is carpeted, and above it the sign in white and gold; and, as a matter of fact, but little decoration seems necessary.

As always, the tire booths stand out conspicuously because of that quiet, effective simplicity of display in which the exhibitors of no other wares seem so well versed. Excepting the Diamond booth, the Hartford, the G & J and the Morgan & Wright spaces appear not unlike well appointed offices of well appointed merchants. The Diamond Rubber Works have departed from this beaten path and have had recourse in Moorish effect. Their booth is located at one of the entrances between the concert hall and the main hall, thus making it possible for them to obtain the full Far Eastern effect.

Those walking information bureaus in white duck, with the word "Page" on their arms, are, as in previous years, a feature of this show. They circulate everywhere, and are supposed to be able to answer all questions instanter.

One of the uncommon features of the display in the concert hall is the first automo-

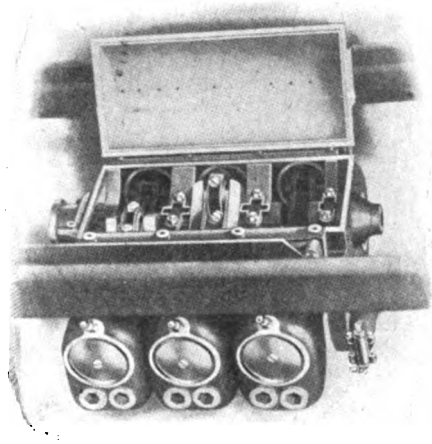
Digitized by Google

bile built by Elwood Haynes in 1893. By contrast with the magnificent touring car beside it, it tells without words the amazing progress that has been made.

In the gallery of the main hall there is also a display of typical Boston—that of the Y. M. C. A. Automobile School. It is made up almost wholly of photographs, charts and blueprints of motors and the like, and photographs of its pupils in various stages of instruction.

Just as the show is notable as a spectacle and as an unusually well attended function, it is noteworthy also for the number of cars that were not shown at either New York or Chicago. Two of them, the Gasaulec and the Sturtevant, embody radical departures from accepted practices that may mark epochs in the industry. Although the familiar levers are missing, in appearance they do not differ materially from touring cars of the standard type; there is none of that freakiness of design which marks so many wonder workers. These two cars are the product of ripened experiment, and are brought forward by manufacturers of means and standing; nothing like them ever was seen at any previous show held anywhere. Foreknowledge that they were to make their formal debut at this show led the Motor World to have the well known expert, Henry Souther, on the spot. He subjected them to close scrutiny, and his report, after thorough examination, is as follows:

SOUTHER ON STURTEVANT CAR.



Naturally the Sturtevant car, shown by the Sturtevant Mill Co., of Boston, is a centre of much interest; although in general outline it does not differ greatly from other cars, it differs just enough to attract the attention of the ordinary observer, and proves worth the study of the automobile engineer. It contains food for much thought.

In the arrangement of the motor it departs from the accepted type, with the engine under the hood forward.

In the type of engine it is new among gas engines. There are six cylinders, horizontal and opposed. There are but three cranks, as two cylinders work on each crank from opposite sides.

The cylinders are 4½x5, and by actual brake test in the laboratory of the company have developed 38 to 45 horsepower at 1,200 revolutions per minute. The engine over all is just the length of the width of the car, the cylinder heads coming flush with the sides nearly under the footboard. The spark plugs and valves are accessible without moving anything, and yet are protected by the frame and body from injury and the weather. The crank case is accessible by removing the footboard, which is especially made for the purpose. The engine is therefore fully as accessible as any engine, and rather more accessible than many of them.

One carburetter supplies gas for all six cylinders, and is located in the dash. The carburetter is of especial design, and is the result of most careful work extending over a period of four years. There is a governor on the carburetter that keeps the engine throttled to about 250 revolutions per minute, this being a speed that is made necessary from the fact that at speeds a little above this the automatic clutch takes hold. On the float chamber is a sight feed glass, so that shortage of gasolene may be seen from the seat. This trouble often arises, and is not quickly recognized. There is an automatic air inlet, so designed that the tension of the spring changes with the demand made on the carburetter. This part embodies the result of many brake tests made to study carburetters alone with an engine kept and used for the purpose. Some of the better established makers would do well to follow this scheme of learning instead of guessing or copying, as they are doing now. A good brake test will teach more in an hour than all the road

STURTEVANT MOTOR.

trials, with varying conditions, will teach in a week.

Ignition is accomplished by two magneto generators, one for each three cylinder engine. The advance of spark is made by the simple controlling lever that does everything else and which will be described. As a matter of fact, one side of the engine may be run as a three cylinder engine. It should be noticed that by the arrangement of cylinders described this engine with six cylinders is only as long as the ordinary engine of three cylinders of the same dimensions. The crank shaft is short and compact, with three bearings.

The flywheel of the engine is immediately in the rear of it and of the usual shape and dimensions. Within it is probably the most interesting feature of the whole car. At least it certainly leads to the most interesting results in the way of ease of control and flexibility.

This feature is what may be rightly called an automatic clutch. It is operated by the centrifugal force exerted by nine weights, and the action of the clutch is therefore directly affected by the speed of the engine. Within the flywheel are a series of steel plates. Half of these are attached to the flywheel proper on the outside rim of it. The other half (and alternate plates) are fastened to one of three concentric shafts extending into the change gear box.

There are three changes of gear forward and a reverse. There are therefore three groups of the alternating steel plates, one group of eight fastened to the hollow shaft having on it the low gear, a second group of six plates carrying the middle gear, and a third group of four carrying the high gear or direct drive.

The action of this clutch is as follows: At a speed of about three hundred revolutions per minute there is centrifugal force enough to cause the pivoted weights to compress the first group of eight plates and throw into action the low speed clutch. This requires a motion of about one-sixteenth inch, the plates attached to the flywheel being pressed against those attached to the low speed shaft. There is nothing sudden about the clutch, as it runs in oil, which insures a gradual tightening. Each group of plates has a set of six springs holding them apart normally. This spring tension is overcome by the centrifugal force of the weights.

If the engine continues to accelerate the force of the weights increases with the square of the speed, and the second set of plates is compressed, throwing in the middle gear, the change being gradual and imperceptible and automatic. Another sixteenth of an inch does this. With further increase the high speed direct drive is thrown in, and any further acceleration produces no further effect on the plates in the clutch. If a hill or other conditions requiring strenuosity is met and the engine slows down, the lower gears come into action because relieved from the strong pressure produced by centrifugal force. If congested traffic is met and the engine is throttled down, the engine returns automatically to the lowest gear and even releases the clutch entirely, the engine running on the governor. There is no knowledge as to which gear is doing the work at any given moment except as may be judged from the speed of the car. No shock or noise is perceptible.

The only control of the car is in one foot pedal. The engine, being started by cranking, begins to run on the governor. The first pressure on the foot pedal, or button, opens the throttle wider and causes the engine to accelerate. Each gear takes hold in turn, and the throttle is finally wide open. During this time the spark has been advanced with the opening of the throttle and by the motion of this same foot button. When the throttle is wide open the pedal still has about another inch of travel not exhausted. This is used for the extreme advance of the spark when the maximum speed is demanded. In climbing a hill this must be borne in mind by the driver, as the tendency is to push the throttle wide open to get the most power when as a matter of fact the extreme advance of spark is all that can be obtained at the end of the stroke, with a tendency to lose power and cause the engine to knock, because the spark is too far ahead and the explosions are premature.

The reverse speed is brought into action

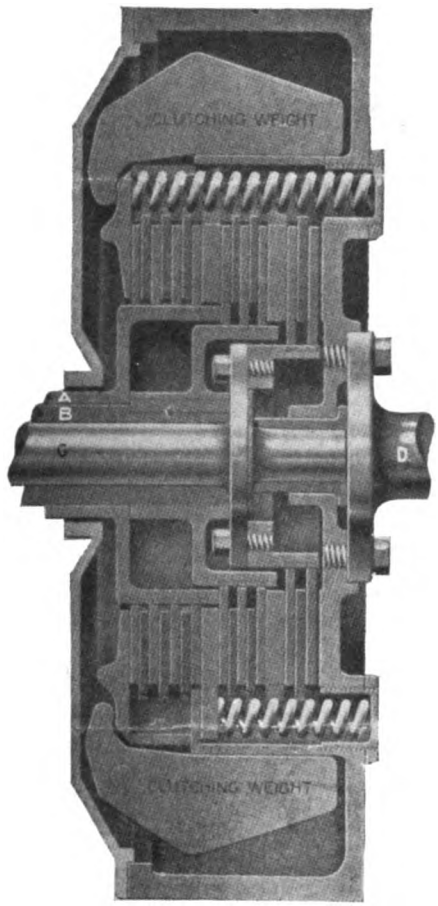
Digitized by Google

by a foot pedal that engages a disk clutch in the gear box, which in turn brings into action an idle gear, simply reversing the action of the low and middle speeds, giving two gears reverse.

If the action of this clutch is studied it will be seen that it is not possible to stall the engine, as is the case by letting in an ordinary clutch too quickly or on a side hill. This is because the moment the engine slows to a dangerous point, and quicker than could be done by foot pedal, the clutch is entirely released and the engine picks up speed again and goes ahead. In other words, the clutch is quicker and more sensitive than the hand or foot.

The question will be asked as to how much torque is available on the low speed to help the car out of a ditch or over some other bad obstruction. It has been seen that the middle and high gears come into action when the engine reaches a respectable speed. It is a fact that an engine develops its maximum horsepower at a comparatively high speed. Therefore it would seem that there would be only a small part of the horsepower available in connection with the use of the low speed clutch. As a matter of fact, it has been found by experiment with these engines that the maximum torque is exerted at a speed about coincident with the engagement of the low speed gear.

Plans are also made for small and underpowered machines to attach a device in the way of a simple lever that will hold the automatic clutch out of action in extreme cases where the full power of the engine is needed on the lower gear.



There is one startling and very worthy novelty in the power brake attached to the low speed shaft of the gear change. A friction disk brake (on the same plan as the clutch) is attached to the shaft mentioned. There is a leather disk in a cylinder so arranged as to tighten the disks when pressure is let in back of the leather piston. When the control button is entirely released and rises to the top of its stroke, it allows pressure from the working end of one of the cylinders to enter the brake cylinder and applies the brake. It makes no difference whether the pressure is the result of the explosion or the compression. Pressure applies the brake, and there is a safety valve on the cylinder of the brake to prevent excessive pressure. The first motion of the control button closes the connection between brake cylinder and engine cylinder before opening the throttle and starting the car. In addition to this brake is a powerful foot brake applied at the rear hubs in the usual way. The tires may also be inflated by the pressure from this same cylinder.

The gasolene is under a bonnet at the front end and is connected with a gauge glass within the dash back of a plate glass and in full view of the driver. The amount of gasolene in the tank is always plain to see. Beside this glass is another connected with the water supply of the cooling system. The radiator or cooler is in the usual place, the pump of centrifugal type distributing water to both sides of the engine.

Under the bonnet are also the two igniters, each with its own spark coil. The oiling system is within the dash and of the pump type. The oil supply being in a tank within the dask and above the oil pump.

Taken altogether, the car shows much study, and it has been developed into a fine car, a little out of the accepted arrangement, but one very easy to operate. The construction is good and strong, and it may be added that ball bearings are used throughout of the most approved type.

STURTEVANT CLUTCH.

A. Low Speed.
B. Intermediate do.
C. Direct Drive.
D. To Engine.

SOUTHER ON THE GASAULEC.

Since the beginning many attempts to produce an automobile combining the flexibility of the electric in the way of control and manipulation and the wide radius of action and independence of the gasolene machine have been made, and, for that matter, are now being made.

Up to the present moment the underlying idea has been to install a gas engine on the vehicle, arrange it so that it may generate electricity by means of an ordinary electric generator and then use this electricity through motors to drive the car. In other words, an electric automobile generating its own electricity, instead of carrying batteries. Such a combination, up to the present time, has lead to much complication and little mechanical efficiency.

In the "Gasaulec" car, which made its formal debut at this show, a new idea in the combination of a gasolene engine, electric generator and motor with storage battery, makes its first public appearance. This sounds more complicated than the older forms referred to. As a matter of fact, this proves not to be the case, as the method of application is so different. The electric power is used for auxiliary purposes only, and in such a way as to greatly simplify the manipulation and control of a gasolene engine, and yet the car remains primarily a gasolene car.

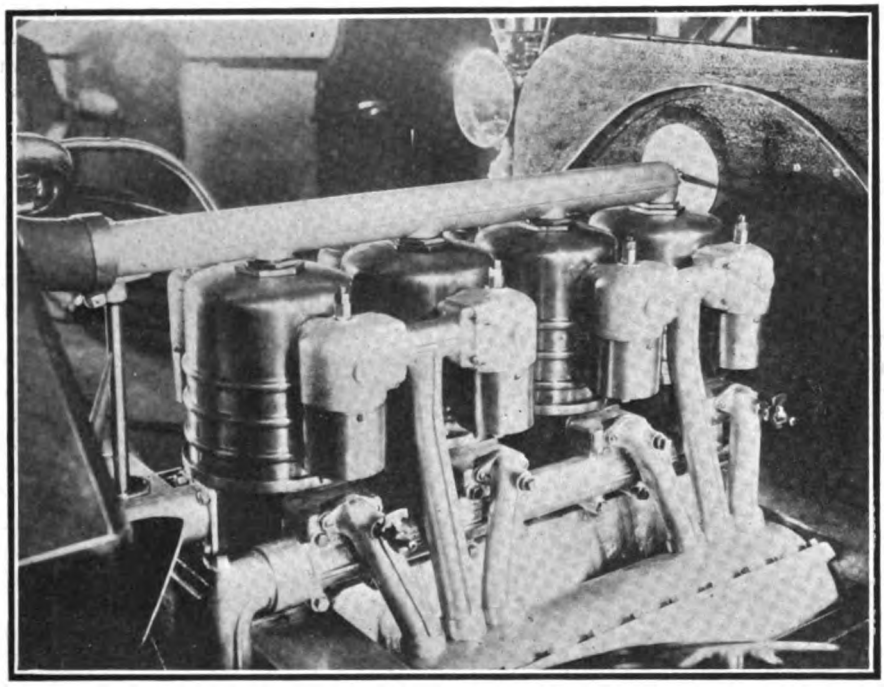
It will be naturally thought that all this must have been accomplished by large increase of weight over and above what a simple car should weigh having similar horsepower. This also is not true, as the Gasaulec with a 40-horsepower engine weighs but about 2,250 pounds, batteries included.

This car is made by the Vaughn Machine Co., Peabody, Mass., and for two years it has been in the works and on the road, so that it may be accepted as a ripened experiment at least.

The engine is a four cylinder copper water jacketed vertical one, of excellent dimensions and appearance. The valves are entirely novel, certainly as applied to automobile construction. There is a double exhaust, that is, a port at the bottom of the stroke uncovered by the piston and the regulation exhaust valve at the top of the stroke. The exhaust valves are double seated and electrically controlled by means of a magnet. Because of the double seat the valve is nearly balanced, with a slight tendency to close. The magnet, with pull of some 30 or 40 pounds, is used to only small portion of its capacity. The timing of the exhaust is alterable, but regulated by the builder once for all, so that the driver need not know anything of it. With increase of speed the timing is changed and simultaneously also the spark is advanced. In this way the utmost demands of speed are met.

The inlet valves are also magnetically operated. The fuel supply to the engine is entirely regulated by the timing of these valves. There is no throttle connection with the carburetter. The valves are closed at such a time as to retain much or little fuel to give much or little power. The valves being operated in this way, all necessity for a half time shaft or cam disappears. There is none.

There is no pump, as the engine is cooled by the thermo-syphon system, using, very wisely, exceedingly large circulating pipes. The cooling fan is driven from the crank shaft by means of spiral gears, in combination with a friction slip device. The same shaft turns horizontally rearward to the dash and operates the timing of the ignition.



At the rear end of the crank shaft is the flywheel. At the front end is nothing, no starting crank being necessary. Behind the flywheel are two cardan joints in the propeller shaft. This shaft connects with bevel gears, the multiplication being three to one,

Digitized by Google

the resulting speed being about 48 miles an hour.

Thus far the machine is like any 40-horse power machine, minus clutch and system of sliding change speed gears, in respect to arrangement of motive power.

Against the front side of the flywheel is a spur gear about 15 inches in diameter. This spur gear is so wound as a magnet that it forms a magnetic clutch operated at will by the driver. This meshes with a pinion about three inches in diameter, giving a multiplication of five to one. The pinion is on the shaft of a standard electric motor of about 2-horsepower, normal load, which sustains an overload for a short time of 8-horsepower.

GASAULEC ENGINE.

The construction is such that the motor is integral with the crank case of the engine.

To drive this motor there is installed under the rear end of the tonneau twenty cells Exide P. V. 5 batteries. The motor is so wired that it may become a generator and always keep these batteries charged. The use of the generator is automatic and controlled by a centrifugal governor in order that the batteries may never receive a charge at too high a rate.

The control of the car is through a controller operated by a foot pedal. The driver has no task except to steer and apply the brake. The cycle of operation of this controller is the most interesting feature about the car; it sounds complicated, but in operation is as simple as the movement of any lever and produces one after the other the following cycle of operations:

The car being at rest, the inlet valves of the engine are lifted and held open, the lever being at neutral. Backing follows a short rearward motion of the lever, the work being done by the electric motor. The engine also turning idle. The first movement forward of neutral operates the electric motor ahead, with the engine's valves still held open and the car moving seven or eight miles an hour. Under this condition the car will run several miles. The next movement forward applies the spark and allows the inlet valves to operate under the influence of suction, and being timed by the magnets. The gas engine now is in normal operation and pulling on the car with the motor. The controller next throws off the motor as a motor, and it is converted into a generator. 'Way forward the inlets lag less or remain open longer, in other words, and the car goes forward at full speed under the influence of the gas engine only.

On sharp hills, and with heavy loads, both gas engine and motor work together. With the moderate gear ratio adopted for all round touring, it has been found that the combined effort of both motors will mount any hill. The motor (gas) is so timed as to develop its full torque at comparatively low speed and thus be able to pull with the electric motor to a large percentage of its full power. With the multiplication of the electric, there is therefore available for a short time some sixty or seventy horsepower.

The timing of the valves and spark is by means of a rotary distributor on the back of the dash. This is connected with the controlling pedal, so that both spark and valves are timed together, in fact, it is seen that everything is controlled by the one lever.

Stepping into the car at a standstill, it is started as an electric by the movement of a lever, then it becomes a gasolene car of high power and remains so until very low speed is demanded again.

Stopping and starting in the crowded city street or on the country road to quiet a frenzied horse ceases to become in the least degree troublesome. Many more women would run cars if it were not necessary to crank them. This is a car that starts itself.

The independent operation of spark and timing of the valves must allow of the utmost economy of fuel. Careful test and experiment will teach the best setting, and as the timing of the valves is not limited or controlled by a half time shaft, the best setting for every speed is possible. The objection is raised that the valve magnets must overheat, being located so near the explosion chamber of the engine. This difficulty has not been met in the least degree.

The car is supplied with an ordinary set of rear hub brakes, and also uses its electric power and motor as a brake. The workmanship shown is most excellent, and no pains are spared to obtain the best of materials for the cars. Nickel steel in the highest degree of heat treatment is freely used in the vital parts of the machine.

Altogether the car is one of unusual interest, and one that must necessarily claim much attention. In outward appearance there is nothing to distinguish it from many others of a similar size, the detail described being of much more interest than the car as a whole.

ARIEL CONTRIBUTES INNOVATIONS.

One other new comer at the show is the Ariel, presented by the Ariel Motor Car Co., of Boston, which, though not startlingly radical, embodies several distinctly exclusive features.

It is equipped with a system by which the cylinders are either air or water cooled at will—that is to say, the cylinders are interchangeable and either system may be used at the discretion of the owner, or according to the demands of the season. In the air cooled arrangement the cooling fan is placed in the dashboard, and hence the draught is induced instead of being forced, as is more commonly the case. The openings in the hood are also provided with deflecting fins, which direct the incoming air upon the cylinders.

The general construction of the motor is not unusual—four cylinder, vertical, mechanically actuated valves in the heads, and so on. The rating is 22 horsepower.

The sliding gear system of transmission is used, with three gears forward and a reverse; the high speed is by a direct connection, and all the pinions are of large diameter and have 6-pitch teeth. An interlocking device is employed that is claimed to effectually prevent stripping of gears. In designing the gear box, and the crank case as well, all corners have been avoided and rounded surfaces substituted, thus doing away with the danger of flaws in the casting. The drive to the wheels is by a cardan shaft, and the rear axle is so constructed that the differential can be inspected by taking out two nuts, and even removed without disturbing the axle itself.

The frame is of presed channel steel, with dropped cross ties. The spring suspension is

Digitized by Google

DIAMOND TIRES IN A MOORISH SETTING.

semi-elliptic in front and full at the rear. The tread is standard; wheelbase, 100 inches; wheels, 32 inches in diameter, fitted with 3½-inch tires.

The body equipment is a well drawn side entrance, and the top speed is said to be forty miles an hour.

BERKSHIRE'S NEW TRANSMISSION.

Another car which made its debut is the Berkshire, made by the Berkshire Automobile Co., Pittsfield, Mass. Its chief talking point is the new individual clutch transmission, of which the makers are very proud, for there is not a bolt, pin, nut or screw used in its mechanism. The gears are constantly in mesh, and the clutches are internal, hence the affair is compact; and as the gears are wholly submerged in oil, they are silent in action; and, of course, the control is very flexible. It is also easy to take down and assemble and simple to adjust.

The motor is of the individual four cylinder vertical type, with jacketed valve seats on opposite sides. The connecting rods are of crucible steel, and the crank shaft is provided with five bearings. Jump spark ignition is used. The valve springs are incased by sliding sleeves, and the cam shafts are driven by fibre faced gears meshing with a bronze driving pinion.

An addition to the steam class, the Morse, made by the Morse Motor Vehicle Co., was also due to make its first appearance. But to date, although the sign is in place, the car itself is still missing.

Excepting the displays of boats and their motors and "fixings," the exhibits and exhibitors are as follows:

Burke, W. W., Boston, mgr. Electric Vehicle Co.—Columbia cars.

MacAlman, J. H., Boston, mgr. Locomobile Co. of America—Locomobile cars.

Brown, George M., Boston, agt.—Apperson cars.

Fuller, A. T., Boston, agt.—Cadillac, Packard and Northern cars.

Fosdick, Harry, Boston, mgr. Winton Motor Carriage Co.—Winton cars.

Gilmore, E. A., Boston, mgr., T. B. Jeffery & Co.—Rambler cars.

Reed-Underhill Co., Boston, agts.—Knox and Stearns cars.

Breed, E. S., Boston, agt.—Haynes cars.

Lowe, George H., Boston, mgr. White S. M. Co.—White steam cars.

Oldsmobile Co. of New England, Boston—Olds cars.

Masters & Co., W. C., Boston, agts.—Wayne cars.

Snow, H. M., Boston, agt.—Acme cars.

Bangs, A. R., Boston, agt.—Baker electric and Franklin cars.

Morrison, A. E., Boston, mgr. Peerless Motor Car Co.—Peerless cars.

Foss, W. J., Boston, mgr. Pope Motor Car Co.—Pope-Toledo, Pope-Hartford, Pope-Tribune and Pope-Waverly cars.

Skinner, K. A., Boston, agt.—De Dion, C. G. & V. and other foreign cars.

Williams, P. A., jr., Boston, agt.—Ford and Marion cars.

Moore & Smith, Boston, agts.—Autocars.

Woodward, H. M., Boston, agt.—Country Club cars.

Dowling & Maguire, Boston, agts.—Pierce cars.

Ridlon & Co., Frank, Boston, agts.—Yale and Elmore cars.

Sturtevant Mills Co., Boston—Sturtevant cars.

Lane Motor Vehicle Co., Poughkeepsie, N Y.—Lane steam cars.

Boston Automobile Exchange, Boston ,agts.—Phelps and Reliance cars.

Linscott Motor Co., Boston, agts.—Corbin, National and Reo cars.

Stanley Motor Car Co., Newton, Mass.—Stanley steam cars.

Upton Motor Co., Lebanon, Pa.—Upton cars.

Crest Mfg. Co., Dorchester, Mass.—Crestmobiles.

Vaughn Machine Co., Peabody, Mass.—Gasaulec cars.

Hills, Horace B., jr., Boston, agt.—Mercedes cars.

Henshaw, C. S., Boston, agt.—Thomas cars.

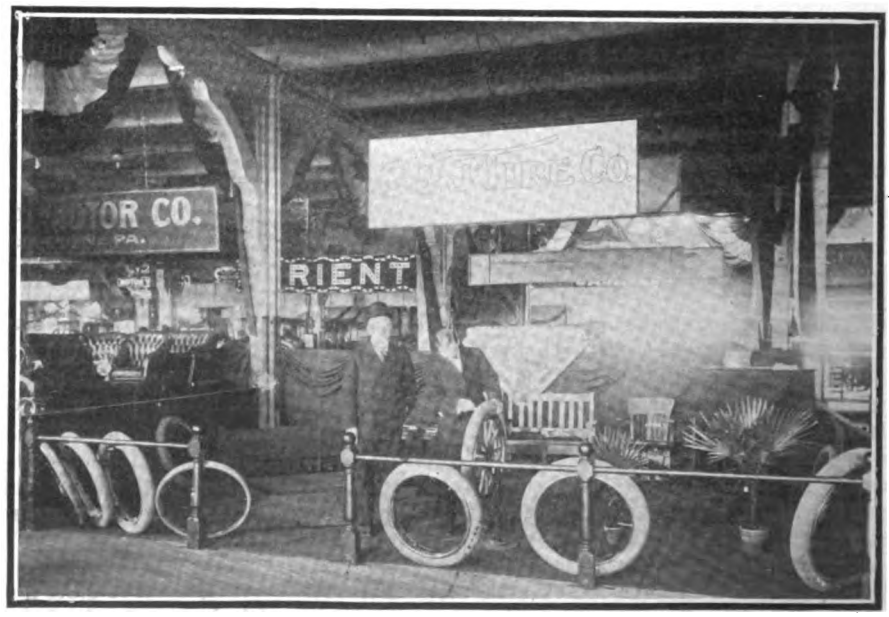
Dunham, George J., Boston, agt.—Royal Tourist cars.

Lewis, Ralph C., Boston, agt.—Ariel cars.

Bennett, A. L., Boston, agt.—De Dietrich cars.

Union Automobile Co., Oakdale, Mass.—Union cars.

Randliff Motor Car Co., Boston, agts.—Panhard, Maxwell and Stoddard cars.



Prescott Automobile Co., New York City—Prescott steam cars.

Napier Motor Co. of America, Boston—Napier cars.

Matheson Motor Car Co., Holyoke, Mass.—Matheson cars.

Berkshire Automobile Co., Pittsfield, Mass.—Berkshire cars.

A. A. A. DEALS OUT SURPRISES

Names Morrell for Racing Board and Batchelder for Secretaryship—Morrell's Views.

Although the name of Morrell has never appeared in the records of any of the race meets, nor figured prominently in any of the A. A. A.'s political stresses, that is the name which now heads the organization's racing board.

Robert Lee Morrell is the full cognomen, and it stands for a New Yorker a trifle below size and of serious aspect—until he begins to speak, for he is really very jolly—who wears glasses, and is perhaps 35 years old. He is of the law firm of Morrell & Bates, and is reputed to be "well fixed," as they say up State. Moreover, he has a penchant for touring, and his selection for the chairmanship of the racing board proved an unmitigated surprise.

He formally assumed his new role at the regular meeting on Tuesday afternoon, and his first dictum was to the effect that the qualification for team places must lie absolutely at the discretion of the national organizations, which are to be represented.

He would leave it with the Automobile Club of France to decide whether an elimination trial for French candidates for the cup will be necessary, whether that trial shall take place in France or America, and if in the former, whether recognition shall be given French racing cars already here.

Other matters pertaining to the Vanderbilt race were discussed and acted upon, and it was decided to arrange if possible a track circuit for the racing season—a proposal made necessary because of the many requests for reservation of dates. The Empire City Club applied for five days, and the Brighton Beach Club for four, but only the first dates of each were reserved; that is to say, May 6, for Brighton Beach, and May 30, for the Empire Track. The granting of sanction for the proposed Lakewood road races slated for April 10, was deferred pending the obtaining of the legal permit from the local authorities.

The proposed revision of the racing rules was taken up at some length, and the name of E. R. Thomas added to the racing board and also to the committee on revision, which now has four members, Messrs. Hilliard, Bowden, Birdsall and Thomas. The chairman of the board has written all of its members for suggestions, and their replies will be considered at a final meeting of the committee to be held early in next week.

When Mr. Morrell was questioned by a representative of Motor World as to his standing in the matter of amateur-professional classification, he said:

"Well, that's a much mooted question, and I don't know how it will be decided. But personally I am not in favor of making any distinction in the matter, at least not for the present, because I think it would simply be opening the door to a great deal of dissatisfaction.

"You see, there is a class of pure professionals, and a class of pure amateurs which are easily separated, but there are the manufacturers whose motives may be either those of the one or the other, or a combination of the two, and cannot well come under either category.

"As far as I am concerned," he continued, "I should not in the least object to racing against either Mr. Rollin White or Mr. A. L. Riker, for instance, for they would both be courteous opponents, though I really think I could drive better than either of them, and I know I've driven more miles! But there might be other manufacturers who would be less desirable competitors. Then, too, some company might take up Mr. Jones, just to suppose a case, Mr. Jones being known all over the world as a skillful professional driver, and say, 'Here, Jones, we'll make you our superintendent of tires at a salary of $3,000 a year.' Then when it came time for a race, Mr. Jones would drive such and such a car as an employe of the firm. Possibly in another year some sort of separation will be necessary, but at the present time I think an amateur definition would be productive of more harm than good."

Following close on the heels of Mr. Morrell's appointment as chairman of the Racing Board, the A. A. A. handed out an even greater surprise when it became known that overtures had been made to A. G. Batchelder, of New York, to assume the joint secretaryship of the racing board and of the organization itself. It was not at first credited, but is now known to be true, and, furthermore, that Batchelder has accepted the dual position. He will assume office probably on May 1, when the present secretary of the A. A. A., C. H. Gillette, had let it be known that he would retire.

Batchelder is at present editor of Motor, and has long been a member of the newspaper craft, chiefly in the sporting departments. He was prominent in League of American Wheelmen racing circles, and after that body relinquished control of racing he helped organize and became chairman of the National Cycling Association, of which he is now president. He will relinquish this office and also all journalistic connection when he becomes secretary of the A. A. A. For a while he figured as chairman of the so-called racing board of the American Motor League, which board finally dried up and blew up when he ordered that the use of his name be discontinued.

Steck Succeeds Himself.

At a meeting in Daytona, Fla., on Thursday of the Florida East Coast Automobile Association Edward M. Steck was re-elected president; H. G. Hunnewell, acting secretary, and F. M. Conrad, treasurer. The directors are H. L. Bowden, William Wallace, E. R. Thomas, F. E. Bond, J. B. Moore and J. W. Wilkinson.

John D. Rockefeller has presented his wife with a new 40 horsepower Rambler of the limousine type.

HOTCHKISS IS RENOMINATED

Buffalo Man Will Again Head New York Association—Taxation is Discussed.

W. H. Hotchkiss will undoubtedly succeed himself as the president of the New York State Automobile Association. The directors held a meeting at Buffalo last Friday, and the following nominations were made: President, William H. Hotchkiss, Buffalo; vice-president, Oliver A. Quayle, Albany; secretary and treasurer, Frederick H. Elliott, Syracuse. The annual meeting and election will take place in Syracuse this month.

Reports submitted at the meeting on Friday showed that the organization has nearly reached the two thousand mark in membership and is rapidly growing in size and influence. The Automobile Club of Elmira was admitted to membership, making thirteen clubs in the organization.

Considerable discussion was devoted to legislation now before the State Senate and Assembly affecting automobilists, and the following resolution was adopted:

"Resolved, That the committee on legislation be instructed to investigate and report at the next regular meeting:

"First—Whether any plans for taxation of motor vehicles involve the exemption of such motor vehicles from all other taxation; and,

"Second—Whether the avails of such taxation will be used exclusively for the maintenance of good roads."

Whether the association will oppose the proposed State automobile tax law depends upon the answers to these questions. It was decided yesterday that a committee should be appointed to investigate and report upon this matter.

Much satisfaction was expressed at the failure of the Senate Committee on Internal Affairs to report favorably on the Saxe bill, which proposes to make a violation of the motor vehicle law punishable by sentence to jail for the first offence. It is believed that the bill will be killed in the Senate.

Those present at the meeting were W. H. Hotchkiss, of Buffalo; Frederick H. Elliott, of Syracuse; A. H. Knoll, of Buffalo; H. W. Smith, of Syracuse; A. J. Baechle, of Utica; H. S. Woodworth, of Rochester, and O. A. Quayle, of Albany.

Test Cases Not Yet Ready.

Arrangements are progressing smoothly for the projected legal tests of the constitutionality of the license laws, but as yet the actual arrests preliminary to bringing the matter into court have not been taken. When interrogated on this point Counsellor Terry, who has the matter in hand, replied that papers were being drafted by him to cover every possible point in dispute that could arise, but that no offenders had been haled to the lock-up for not displaying license numbers or for other violations which will be committed.

DEALERS AND CLUBMEN MEET

They Discuss Chauffeurs and Commissions, and Bring Out Some Interesting Information.

"One of the great sources of commercial pollution is the giving of gifts by the purchaser to the agent of the seller or by the seller to the agent of the buyer. Transactions of this kind are characterized by two features; they involve an attempt to serve two masters, and they are secret. For both reasons they are bad, but the greatest evil is their secrecy. In some cases masters are aware of the presentation, but even so such a transaction is bad, because no man ought to consent to a practice which renders faithful and single-eyed service by his employe more difficult."

These words of Sir Edward Frey, uttered in connection with a discussion of the principles of commercial morality, aptly express the motif of the discussion which took place at Tuesday evening's informal meeting of the Automobile Club of America. The subject announced was "The Garage and the Chauffeur." The members of the New York Automobile Dealers' Association were the guests of the evening, and the function took the form of a heart to heart interchange of views as to the management of that most expensive functionary, the grafting chauffeur.

Former President Shattuck, in opening the debate, for debate it was, explained that the club's purpose to conduct a garage in conjunction with its new clubhouse is twofold. In the first place, the machines being kept in the same building as the club quarters, a larger daily attendance of members would be secured than would otherwise be possible, for so it has worked out in Boston and other places where the scheme has been tried; and, second, it is hoped that by having the care and stabling of the cars directly under the eye of the club officials the evil of the commissioned chauffeur may be stamped out. The dealers and garage owners were, he said, so well qualified to judge of the importance of the evil, and to suggest means for its suppression, that it had been deemed fitting that they come together informally to discuss ways and means and, if possible, arrive at some definite conclusion in the matter.

W. P. Kennedy, on whom he called as secretary of the dealers' organization to voice the dealers' attitude, explained:

"Many owners, feeling possibly their own technical incompetence, or being filled with business cares, prefer to deal with the chauffeur rather than to come directly into contact with the dealer. Often, too, his faith in the former as his own expert employe is so strong that he sides with him and permits himself to become prejudiced against the latter in case of any difficulty that may have arisen. The chauffeur's power is, then, very great, and we find ourselves obliged to give them commissions on the sale of cars, and, not only that, but we must give them a percentage on bills for supplies and a percentage on all repair bills, and we even find ourselves called upon to contribute $5 to $10 a month for the mere privilege of having the car stored on our floor. Hence the responsibility rests largely with the owners themselves; and, though the conditions react on us as well, it is they who suffer most in the end."

Mr. Shattuck, taking up a mild defence of the commision system, referred to its prevalence in France particularly, where it extends to all branches of servitude. He pointed out the almost universal practice of giving commissions to coachmen in this country, and the apparent necessity of it, since if it be refused the horses go lame, the varnish peels off the carriage and the harness leather cracks most mysteriously. Turning to the automobile driver, he showed how he had naturally drifted into a similar attitude toward the owner and the dealer, only since the automobile has been largely, and is yet to many an owner, a complete mystery, his temptation to fraud had been very great.

Speaking of the qualifications of the driver, Mr. Shattuck voiced what afterward proved to be the general opinion when he said that in his situation, the ability to dissect a motor and spread its parts all over the floor is not at all a requisite. He should be, first of all, a competent operator, and be able to make all ordinary running adjustments, but further than that he need not go. Moreover, he should be able and willing to wash the car and care for the brass. His own experience, had proved this, he said, for his best chauffeur had been a man—his valet—whom he had had trained by a French expert at $2 a lesson, and who not only took the entire care of the machine, but kept it in flawless condition.

In the matter of wages, it was the general opinion that the chauffeur is paid at a rate wholly disproportionate to the real value of his work; the same man in other lines of work could hardly earn two-thirds of his present salary alone, and the additional income from commissions, made his remuneration scandalously high. One particular case was cited in which a chauffeur received a regular salary of $250 a month, and a bonus of $250 a month if the car ran faultlessly—$6,000 a year in all and equivalent to the salary of a bank cashier. This custom of paying high salaries to drivers, forces the garage owners and repairmen to pay high rates to their mechanics, to prevent their desertion to the chauffeur's life just in the busy season, which, in turn, must raise the cost of repairs and again react on the owner.

Of the several members of the trade who spoke, among them Messrs. Plummer, Andrade and Haradon, some admitted a forced recognition of the chauffeur's claims, and others denied it, but all agreed that it was a growing evil and a detriment to their business.

An evil which comes up again and again is the man with a bad record, who, discharged from one place, readily obtains employment in another through misrepresentation. This seems particularly true of those who are wont to get drunk and to take out the car without the owner's knowledge. Various checks on this have been tried, but with doubtful success. The dealers' association has a system in use which serves as a check on the re-employment of the unsatisfactory man, which works very well, but to keep account of the doings of the unfaithful man is less easy. For if, for instance, the owner is at once informed of all repairs, he complains because his bill is not sent in at the end of the month. While, if a record is sent him of all the comings and goings of his machine, he considers it a comment on the extent of his use of the car, or even as an imputation on the faithfulness of his servant.

One of the club members present referred to the owner as being ground down between the upper millstone of the chauffeur and the nether millstone of the dealer or garage proprietor till he was forced to submit to rank extortion, whereupon Mr. Shattuck laughingly retaliated that the owner's salvation must then lie in a reversal of conditions; in getting the chauffeur between the upper millstone of the owner and the nether millstone of the dealer, and so grinding him down that he would be forced to come to reason.

Mr. Andrade, one of the last speakers, forsibly summed up the situation in this way. The dealers, forced by trade conditions to pay certain fixed prices for their goods, obliged to pay high rentals for their buildings, forced to pay high wages to station employes because of the tendency for them to desert in the driving season, and driven by competition to regulate their final charges to certain limits, are greatly oppressed by the commission system, for he said: "Suppose a job costs us just $100. We charge $125 to the owner and pay the chauffeur 10 per cent. That $12.50 is just one-half of our profit. Yet we must pay it uncomplainingly, or else the job is condemned." In conclusion, he said: "We, the dealers, are ready and willing to co-operate with you, the owners; we appreciate the magnitude of the evil; we even suffer more from it than you do, and we will do anything in our power to root it out—if you will only tell us what to do. For we cannot act without your help. If you will suggest a plan, I feel sure you will find us, one and all, ready to accede to it, and to abide by it."

The wisdom of definite co-operation between the dealers and the club was pointed out, but no final action was taken.

A. L. Shattuck, chairman of the building committee of the Automobile Club of America, has added not a little to the gayety of New Jersey by formally notifying the Murphy Varnish Co. that there will be no Murphy varnish used on the new clubhouse!! The Murphy concerned was formerly the Governor of that State, who, when retiring from office, recommended that automobiles be so "hobbled" that they cannot go faster than twenty miles an hour.

Climbing One of Boston's Steepest Streets.

There are some stiff hills in and about Boston. The picture shows a party of five in a 30 horsepower Pope-Toledo touring car climbing one of them—a grade of 16 per cent—on the second speed. The road was in bad condition, and it is so located that it was impossible to get a start up the hill. It has to start almost from a standstill as it turned the corner. The grade is 625 feet long. In the car were A. W. Pope, J. C. Kerrison, Arthur Hoy and Freeman Hinckley, assistant manager of the Pope Mfg. Co.'s branch in Boston.

Michigan Motorists Score a Point.

Michigan automobilists have won a victory in their fight against the Holmes bill, on which a protracted hearing was held last week. The act in its original state fixed the speed limits at fifteen miles an hour in country districts, in cities at ten miles an hour in residential sections, and six miles an hour in business portions. Every car must be licensed with the Secretary of State. The automobile clubs have induced Mr. Holmes to change the speed limits to twenty, fifteen and ten miles, respectively.

Representative Ladner has introduced an automobile bill also. Ladner would have all the owners of cars take out a dollar license with the county clerk, after which they must affix their names and residences on the machines in letters two and a half inches high. No speed limit is mentioned in the bill, but owners are held responsible in law for damages caused by their carelessness. It has been referred to the Committee on State Affairs, where it will likely be smothered and the Holmes bill be advanced for passage.

Mobile's Mardi Gras Parade.

An automobile flower parade, attempted for the first time by the Mobile (Ala.) Automobile Club, was the feature of the Mardi Gras carnival. Fifteen elaborately decorated cars were in the parade. The first prize, $100 in gold, was awarded to Mrs. George S. Leatherbury. Her car was a study in blue, the blue lotus being the decorative flower. Four young ladies, attired in blue and carrying blue parasols, gave an added charm to the effect.

Illinois Legislator Frames a Fool Bill.

Illinois has still another bill to regulate automobiles in the State before its legislature. Representative P. P. Schaefer, of Champaign, is its sponsor. It is of the assinine variety, providing that when meeting a horse the automobile shall be brought to a full stop within fifty feet of the animal, and before attempting to pass any horse the driver of the car must sound the horn, or bell, until the attention of the horse driver is attracted.

Another section of the measure provides that the owner as well as the chauffeur of the car shall be liable for all damages done by the unlawful driving of the car. In suits to recover such damage a prima facie case shall be made out upon proof of the injury and proof that the car was being driven in a manner contrary to law.

Importers Show a Pitiful Frost.

Boston, March 15.—Frost of an even more frigid variety than that which fell on the similar affair held in New York lays heavy on the co-called Importers' Salon, which opened in Symphony Hall on Monday night. There are about thirty cars in evidence, and the attendants are more numerous than spectators. When a Motor World man visited the place yesterday there were fifteen spectators in the hall; at night the attendance was about one hundred; to-day's count disclosed six visitors. Mechanics' Building was crowded at the same times. There are three American cars mingling with the foreign productions—a Buick, a Stevens-Duryea and a Knox Motor Truck Co.'s truck. Of the imported product it almost goes without saying that the Mercedes was most conspicuous.

Tart Wind-up at Buffalo.

One of the most enjoyable features of the Buffalo show was the banquet of the Buffalo Automobile Trade Association and the Automobile Club of Buffalo last Thursday night in the City Convention Hall. About one hundred and fifty gathered around the festive board. E. R. Thomas, president of the association, acted as toastmaster, and kept the diners in a continuous roar of laughter by his witticisms. After the banquet it is said there was a pretty pert show for the benefit of the "limited few."

The recently organized Kirkham Motor Mfg. Co., of Buffalo, N. Y., began operations last week. The company starts out with a payroll of fifty names.

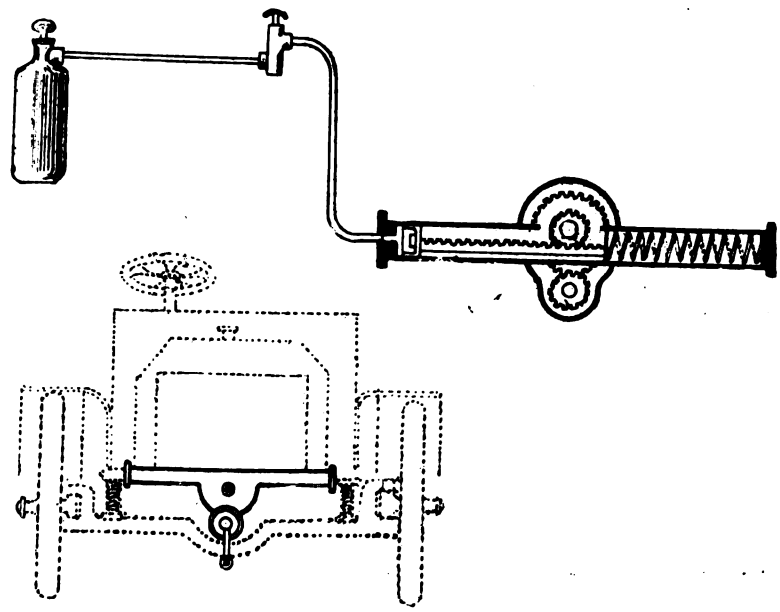
TO DISPLACE THE CRANK



Ingenious Use of Carbonic Acid Gas to Render Engines Self-Starting.

Of all the many schemes and devices of questionable merit designed with a view to permit of the engine being restarted from the seat without the necessity of dismounting and winding the crank, few seem to have survived their first season.

Of those that remain, the principal one can hardly be said to fall under either category. It is, in fact, neither a scheme nor a device, merely a possibility of the four-cylinder engine and perfectly feasible within the limits of the capacity of the cylinders to retain their compression. This method is probably too well known to call for any extended description; it consists simply in shutting off the spark, but not the fuel, a few moments before stopping the engine. There will thus be a compressed charge of mixture in one of the cylinders, regardless of the point on which the engine stops. By providing a means of advancing or retarding the spark sufficiently to cause it to occur within any point of the stroke at which the piston may stop, this may be exploded by simply switching on the current, and the impulse is usually sufficient to cause the engine to take up its usual cycle of operations.

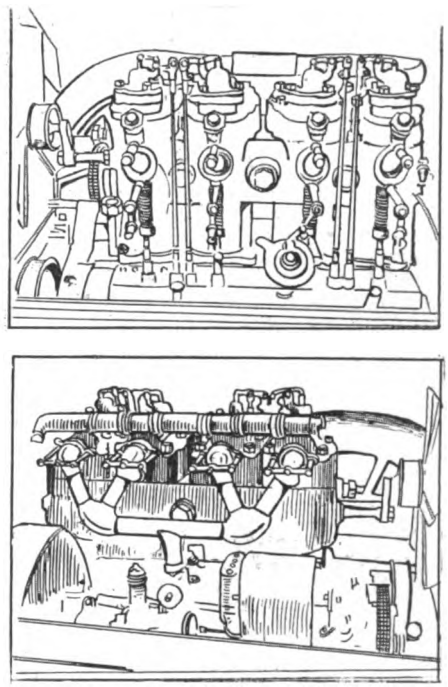
Compressed air and springs, also a means of sending the current of an accumulator through its generator and causing the latter to act temporarily as a motor to produce the initial compression in the cylinders, are other means, all of them dependent upon the engine itself to store the energy in the first instance. All have been tried at one time or another by various makers, but none seemingly have come in for any great amount of serious attention.

"Le Cinogene" is the title of a somewhat novel device the details and method of operation of which may be seen at a glance in the accompanying illustrations. It differs from any of those previously mentioned in being provided with an independent external source of energy in the shape of a cylinder of carbonic acid gas at a high pressure—in other words, nothing more or less than a soda fountain reservoir. A lever placed within convenient reaching distance of the chauffeur's hand communicates with the latter and allows the gas to escape into a cylinder, the piston of which carries a long rack engaging a pinion, which in turn revolves the engine shaft. By opening the valve suddenly, the rack is shot out with considerable force, and is said to have sufficient power to give the engine shaft six or more complete turns—more than enough to cause the motor to start, barring derangement. The piston acts against the pressure of a heavy spiral spring, which serves to return the former to the other end of the cylinder after the completion of its stroke, means being provided for the escape of the used gas and for releasing this starting train of gearing from the engine shaft when the latter is running under its own power.

"LE CINOGENE" SELF-STARTER. IN DETAIL AND AS APPLIED TO THE CAR.

To quote from a French contemporary from which the above description is taken, this device "at first sight seems to provide a happy solution of the problem." No data concerning the capacity of the cylinder of gas, its pressure or the number of impulses it is capable of without recharging are given.

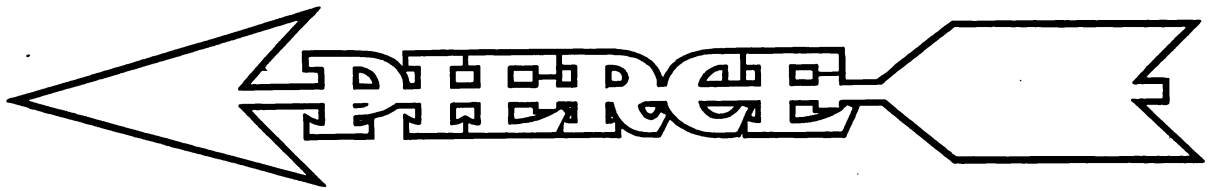
Thought the Motor was Junk.



Because they thought an electric motor was only old junk, two Buffalo (N. Y.) boys are in jail on a charge of grand larceny. Fred Penn, twenty years old, and Martin Brennan, nineteen years old, took the motor from a shed belonging to Alfred Miller and tried to sell it in a second hand store, when the police nabbed them.

ONE-PIECE ENGINE CASTING

How the Experiment has been Cleverly Worked Out— Many Changes Made Necessary.



Whether the idea of casting the four cylinders in one piece integral with the water jacket is to prove a success or not is yet to be determined by actual usage. Evidently the task of proving its superiority is to be left, for the present season at least, in the hands of the single maker advocating this radical departure—the builders of the Ariel cars, in England.

The accompanying sketches showing the engine as installed on the latest model of the car in question serve to indicate the general outline of the casting, but unfortunately is otherwise obscured by the amount of detail, such as the rods and rockers of the mechanically actuated valves. However, in the view from this side of the engine it will be noticed that the water jacket is somewhat in the form of a trunk extending the entire length of the engine, and from which the cylinders protrude in both directions, an independent head being fitted. The rather novel placing of the exhaust and intake valves can also be noted. On the carburetter side shown in the second sketch in the magneto is also shown in the lower right hand corner, the detail of cylinder design is not so easily followed, but it will be noticed in both that despite the fact of one casting being employed, the practice of separating the pairs of cylinders somewhat more than the individual members is adhered to, just as it is where twin cylinder castings are used. Outlets of generous proportions are provided at this point on both sides of the engine to permit of the examination of the jacket and cylinder walls.

ARIEL ONE-PIECE CASTING.

$1,000 IN PRIZES

TO DESIGNERS AND ARTISTS.

The George N. Pierce Company, of Buffalo, makers of Great Arrow Motor Cars, in order to secure the best designs and color schemes possible for their cars, offer the following prizes:

For Motor Car Open Bodies.

1st Prize, $250; 2nd Prize, $100,

for a body for a side-entrance car, based upon availability, usefulness and beauty. Specifications to be supplied.

For Motor Car Enclosed or Limousine Bodies.

1st Prize, $250; 2nd Prize, $100,

for a design for a body with side entrance, as per specifications to be supplied, to be based upon availability, usefulness and beauty. Competitors must supply scale drawings of side and rear elevation and seating plan.

For Color Scheme for Motor Car Bodies.

1st Prize, $200; 2nd Prize, $100,

for a color scheme of some existing type of our motor car, either open or enclosed. In awarding prizes the reliability of colors chosen and the appropriateness to the service will be considered.

Designers and artists are requested to write at once, to the George N. Pierce Company, Buffalo, N. Y., for full description of the contest and specifications or outlines to work upon. Full information cannot be given here.

The contest closes June 1st, 1905.

All designs not worthy of award will be returned at the company's expense, or will be paid for at a price not to exceed fifty dollars at the company's option.

THE GEORGE N. PIERCE COMPANY, Buffalo, N. Y.

ABOUT MOTOR WAGONS

Progress of Development Here and Abroad—Wide Divergance of Power Employed.

Development of the heavy motor vehicle means two things, according as the subject is reviewed from the standpoint of the American builder or of his foreign contemporaries in the same field abroad. In England, France and Germany, the first two probably having given the subject a greater amount of consideration within recent years than it has received elsewhere, automobiles for heavy haulage mean steam power almost invariably. Where Germany is concerned, alcohol holds greater promise than any of its competitors, and numerous heavy vehicles employing it as a motive power are in daily use.

In the United States a power that has been ignored on the other side almost entirely has here come in for the maximum of attention. That is electricity, and results attained with its use in heavy haulage on city streets, employing units of 2 to 5 tons capacity, has proved it to be equally economical and better adapted to the purpose. For lighter loads, ranging up to but not exceeding two tons, the electric delivery wagon pre-empted the field here, but is now beginning to feel the competition of the gasolene wagon; in France the latter has always had first call after steam, even for passenger service.

A consideration of the advantages and drawbacks of the three powers, steam, electricity and gasolene, based upon experience with all three under conditions sufficiently alike to render the results comparable will be of interest.

Ease of operation and elasticity of control are elements of advantage in favor of steam which, however, are more than offset by the tremendous proportion of dead weight involved in any system of automobile propulsion employing it. Though faster than the heavy draught horse at the outset—the latter's speed in such work seldom attaining to three miles an hour—still, the rate of the pioneer heavy steam vehicles was not satisfactory, but attempts to increase it have only been effected by a decrease in the load efficiency, as shown by the results given in one instance in the "heavyweight" competition held by the Automobile Club of France. The total weight of the vehicle entered the first year was 9.9 tons, with a carrying capacity or useful load of 4 tons, which gave a load efficiency of 44 per cent. Decreasing the former in the second year's vehicle to 8.8 tons resulted in a like diminution of the useful load to 3.3 tons, and the load efficiency to 31 per cent. A further decrease in the total weight to 7.67 tons and the capacity to 2.4 tons raised the efficiency to 39 per cent.

As already mentioned, numbers of heavy steam trucks are in use in England and France, some with a carrying capacity of 10 tons, though this has been found to be excessive, as well as ruinous to the road. The mechanical features of both the English and French vehicles are along practically the same lines. A continuous feed, water tube boiler of small proportions, two-cylinder compound engines placed forward under the chassis for tractors and toward the centre for trucks, transmission being effected by gearing direct to the rear axle or chains to each wheel. The majority are designed to bear a load of 2 to 5 tons, and even with the widest tires have been found to greatly increase the cost of maintenance of the roads. Steam wagons have been adopted for military purposes in England, but the tests referred to have shown the operating cost of the steam vehicle to be very high. Steam wagons were given a trial in New York City by one of the large express companies, two of them, vehicles of five tons capacity each, were in service for several months, but the same company now employs hundreds of light electric delivery wagons and is experimenting with gasolene for heavy loads. The great amount of dead weight involved is evidently an insurmountable objection to the use of steam, which militates against it to an extent that, even if it possessed the feature of greater economy which is lacking, it could not compete in the same class with gasolene and electricity. And this, aside from its disadvantage of requiring a greater amount of skilled supervision. England took up steam for the heavy motor truck as the result of conservatism, and having adopted it to the extent she has, it is not to be expected that it will soon be cast aside—the same spirit will cause its retention, even though apparent that it proves at best but poor economy.

Where the electric vehicle is concerned, extended use in all kinds of service, ranging from the lightest description of delivery wagon up to the five-ton truck with an independent drive on each wheel and power steering, have demonstrated only too well its superior economy and advantages, and the former is bound to increase proportionately as charges for power go down. Where the latter is to be had from the lighting plant of the establishment itself, as in the case of the department stores, many of which have adopted such service on an extensive scale, or where, in the case of the private individual, a gasolene or gas engine is utilized for generating the current, economy has long since been brought to a point where superiority over horse haulage in this respect is no longer in question. When public lighting company's rates reach a more equitable basis, charges to the man who cannot afford to own a private plant will bring the operating cost to about the same level.

Gasolene, as already stated, had first choice in France, and the results attained through its use leave no room for doubt that, with added reliability of the motor and its accessories, this type of vehicle has reached a plane already in advance of the steamer. In Germany similar results have been attained with alcohol, but slight changes in the engine being necessary to adapt it to this fuel, which is there on a par with gasolene, so far as cost and economy in operation is concerned. In this country gasolene has not come in for the attention it deserves for heavy haulage, but is in a fair way of obtaining it.

Here's the "Pedestrian Catcher."

"Pedestrian catcher" is the high sounding title applied by the cousins across the water to what here goes by the everyday name of fender.

Some interesting trials were made recently in the Bois de Vincennes, Paris, with a Serpollet steam car fitted with one of these, differing from the usual Brooklyn trolley car equipment only in the manner of its application. Its dimensions are 3 feet 6 inches by 2 feet, the long side being held upright and tilted at an angle about 18 inches from the road. The body is formed of heavy netting, while the frame is of tubing, the whole apparatus being supported on unsightly pipe brackets.

The trials were made with a dummy weighing 154 pounds, which was successfully picked off the road and deposited in the cradle with the car travelling at speeds of twelve, eighteen and twenty-two miles an hour. The inventor—a French colonial engineer—next trusted himself to the tender mercies of the driver of the car. The latter was, however, only driven slowly—about six miles an hour—but M. David was safely landed in the cradle. It is suggested that not only would the arrangement be found useful in dealing with lackadaisical pedestrians, but also in picking up refractory dogs!

To Put Mufflers to the Test.

That "silence is golden" seems to apply to the working of the automobile motor with no less force than to the subject which originally called it forth. Though somewhat later in the day, where American cars are concerned, as few manufacturers here have not come to realize the value of seeing and not hearing a motor "mote," the Automobile Club of France will hold a muffler, or "silencer," competition on April 1.

In the rules just issued it is stated that each system should be represented by two sizes of silencer—one for a single cylinder motor and the other for a four cylinder engine. The engines on which the trials will be carried out have the following dimensions: Single cylinder engine, bore 140 mm.; stroke, 160 mm.; speed, 800 revolutions per minute; 8-9 horsepower. Four cylinder engine, bore, 105 mm.; stroke, 105 mm.; speed, 1,400 revolutions per minute; 18-24 horsepower.

All devices entered must be accompanied by sectional line drawings showing the interior construction. The judges, when making their awards, will take into consideration the silencing effect, back pressure induced, size, weight and simplicity of the apparatus.

The Week's Patents.

783,112. Lubricator. Giovanni Enrico, Turin, Italy, assignor to Societa Fabbrica Italiana Automobili di Torino. Filed April 6, 1904. Serial No. 201,919.

Claim.—1. In a lubricating apparatus, a chamber for containing oil, a feeding device acting to elevate oil from said chamber and deliver it out of the apparatus, and means for maintaining a substantially constant level of oil in said chamber, said means acting to supply fresh oil to said chamber to take the place of that delivered.

783,121. Speed Regulator for Explosion Engines. Emile Martignoni, Paris, France, assignor to Société Anonyme des Moteurs et Automobiles Hérald, Paris, France. Filed September 26, 1903. Serial No. 174,836.

Claim.—1. In an explosion-motor, in combination, a cylinder, a carburetter, a chamber 20 communicating with said cylinder and having a cylindrical portion with ports at opposite ends communicating with said carburetter and the atmosphere, respectively, a hollow piston 16 in said cylindrical portion, a piston-rod 15, a link 14 connected thereto, a transverse shaft 11 having near one end an arm 13 connected to said link, a governor, a fork 10 upon said shaft engaging the sliding member of the governor whereby the piston obstructs more or less the passage of the combustible mixture according to the velocity of the motor, and interrupts the supply of the mixture completely and admits only pure air when the velocity reaches a predetermined limit in order to cool and cleanse the cylinders, a speed regulator 29, including a spring 32, and arranged at the opposite side of the motor from the link 14, said regulator and link being extended parallel with the length of the motor, and an arm 31 on the end of said shaft 11 opposite the arm 13 and connected to said regulator 29, whereby said regulator determines the resistance of the spring to the action of the governor, according to the speed at which the motor is to run.

783,138. Pump for Inflating Pneumatic Tires. Decimus Rowe, Wanganui, New Zealand, assignor of one-half to John Stobert, Wanganui, New Zealand. Filed June 15, 1904. Serial No. 212,743.

Claim.—In means for inflating pneumatic tires, a semicircular casing provided at one end with means whereby it may be pivoted to a fixed point, a longitudinal slot in the top of the casing, a sliding bolt fitting in such slot and adapted to be secured at any point therein, and a pump, the plunger rod of which is pivoted to the sliding block and the free end of which is provided with means whereby it may be pivoted to a fixed point, substantially as specified.

783,158. Sparking Igniter for Explosive Engines. Arthur E. Taylor, Elyria, Ohio, assignor to The Elyria Gas Engine Company, Elyria, Ohio, a corporation of Ohio. Filed July 9, 1903. Serial No. 164,788.

Claim.—1. In an explosive engine igniter, in combination, a pair of electrodes, one of them being mounted on a movable shaft, a block in which said shaft is journaled, an arm rigidly secured to said shaft, a hammer plate loosely surrounding the shaft and held in place by said arm against the face of said block, a pair of wings both on the same side of said hammer plate, said arm being adapted to engage one of said wings, a spring compressed between the arm and the other wing, and means for moving said plate to cause the electrodes to contact and thereafter suddenly release them, substantially as described.

783,159. Lubricator. James Trotter, Sycamore, Ill. Filed May 9, 1902. Serial No. 106,559.

Claim.—1. In a device for the purpose described, the combination of means for forcing a supply of lubricant, a lubricant passage communicating therewith and connected with the part to be lubricated, an oil relief in said passage between the supply and the part to be lubricated, a pressure regulator actuated by the pressure in said passage for opening said relief, and a direct connection between a source of fluid pressure and said pressure regulator for closing said relief, substantially as set forth.

783,168. Power Transmission Mechanism for Automobiles. Walter C. Baker, Cleveland, Ohio. Filed May 29, 1903. Serial No. 159,266.

Claim.—1. A casing for the power transmitting mechanism of an automobile, consisting of a casing body, a cap which is separable from the body in a diametrical plane, means for fastening said body and cap together, and two aligned tubes clamped between said body and cap extending laterally in opposite directions therefrom, substantially as specified.

783,194. Two-Cycle Internal Combustion Engine. Arthur Hardt, Cologne, Germany. Filed September 2, 1903. Serial No. 171,579.

Claim.—1. In an internal-combustion engine comprising the working cylinder, pump for forcing explosive mixture into the working cylinder, ports in the cylinder wall controlled by the piston for the escape of the spent gases, and for admission to the working cylinder of air and explosive mixture, the combination with the working cylinder and the pumping cylinder, of a channel connecting the said cylinders, port for admitting air into said channel and means for opening the said admission port at the end of the return stroke of the piston, substantially as and for the purpose described.

783,207. Vibrator for Induction or Spark Coils. Arthur A. Kent, Philadelphia, Pa. Filed November 8, 1904. Serial No. 231,862.

Claim.—1. In a vibrator, an armature, a plate, to which said armature is attached so as to vibrate therewith, a fulcrum intermediate the ends of said plate and projections adjacent each end of said plate to produce a flection thereof and to hold the same upon said fulcrum.

783,219. Pneumatic Tire. Harry A. Palmer, Erie, Pa. Filed October 12, 1904. Serial No. 228,174.

Claim.—1. The combination of a pneumatic tire sheath having an annular opening in its inner face, with inwardly extending clips secured to the sides of said sheath and adapted to be clamped between the sides of a vehicle wheel rim and the channel flanges secured thereto, substantially as set forth.

783,289. Protector for Pneumatic Tires. Emile Lapisse, Elbeuf, France. Filed November, 1904. Serial No. 232,092.

Claim.—1. A protector for pneumatic tires

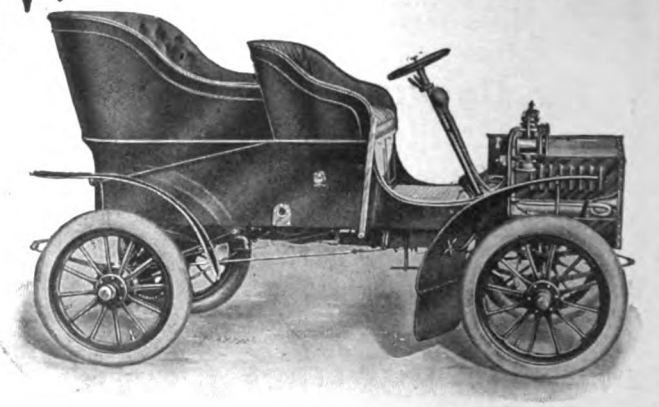
Hand Book

OF GASOLINE AUTOMOBILES ISSUED FOR THE INFORMATION OF THE PUBLIC WHO ARE INTERESTED IN THEIR MANUFACTURE, SALE AND USE.

This new edition of this handsomely bound and artistically printed book, containing illustrations of about 125 gasolene cars, will be ready for mailing about March 15th, 1905. The products of the principal manufacturers throughout the United States of America and the Importers of gasolene machines are shown by illustrations and specifications. These specifications form a series of the leading questions that arise in the mind of the purchaser, with the answers thereto in red ink. The questions being uniform, the ease of comparison is obvious, and the purchaser is enabled to select the machines which are best suited to the service required, to his personal taste, or the means at his command.

The 1904 edition is now out of print.



Sent upon receipt of 6 cents in stamps for postage.

The GASAULEC

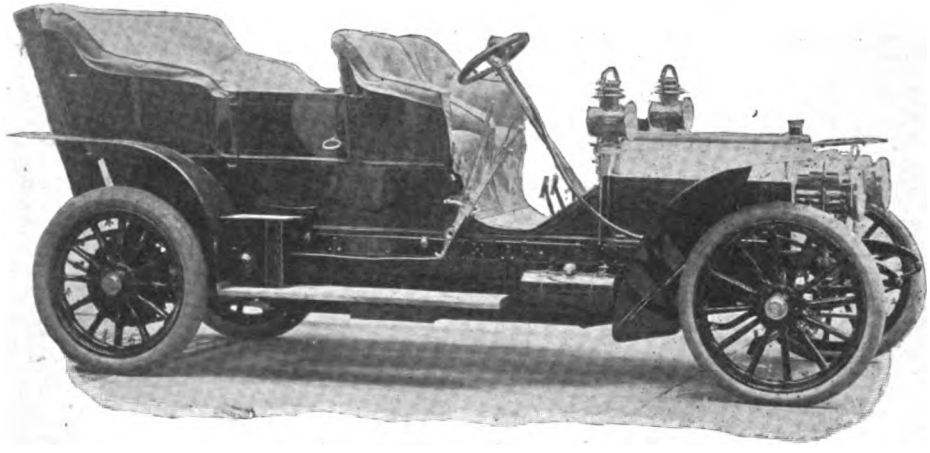
A 40-45 H.P. five passenger, side entrance, gasolene touring car of the highest grade

Without a starting crank.
Without a "clutch."
Without "change speed gears."
Without cams, rocker shafts, tappets or valve gearing.
Without the usual confusing multiplicity of operating levers.
Without complications.

Every movement of the motive power and the car, from a state of absolute rest, forward at any speed or reverse, controlled by one simple foot pedal having only forward and backward action. Positively no other speed or movement controlling device of any kind on the car.

Double brakes. Irreversible steering wheel. The GAS-AU-LEC is the simplest car in world and the easiest to operate and maintain.

Not an experiment, but a success.



Not a freak, but a practical revolution.

Rambler

SURREY, TYPE ONE

$1,350

18 H.P. *Immediate Delivery.*

Complete with brass side, tail and two gas headlights with separate generator, brass horn, drop forged wrenches, oilers, pump and repair kit.

Other Models, $750, $850, $2000 and $3000.

The low cost of maintenance is one of its most attractive features. No automobile has fewer and simpler working parts. So few and so simple are these parts that they may be seen and understood in a moment. The long, heavy, pressed steel frame, the rigid cross members supporting the engine, the perfectly balanced reciprocating parts, the full elliptic springs, large tires, non-friction metal and ball and roller bearings reduce wear and tear to the minimum.

With the elimination of unnecessary parts and a direct transmission of power, fuel is economized without a sacrifice of ability to go at comfortable speed wherever roads are fit for travel.

Disorders are so infrequent, and so easily repaired when they occur, that one may dispense with the help of a chauffeur. It is a machine that women can and do handle and care for themselves. We can point out instances.

THE MOTOR WORLD.

A WEEKLY JOURNAL DEVOTED TO THE AUTOMOBILE AND KINDRED INTERESTS

Volume IX. New York, U. S. A., Thursday, March 23, 1905. No. 26

LAMP MAKERS POOL ISSUES

Join Forces with Atwood to Test Validity of the Bullet Design Patent.

It develops that there are far more interests involved than appears on the surface in the suit brought in the United States Circuit Court, in Philadelphia, against Charles E. Miller, the well-known wholesaler, by Gray & Davis for alleged infringement of the design patent of their "Bullet" lamp.

Miller's alleged infringement consists in having sold an Atwood lamp, of the so-called bullet shape, and the Atwood Mfg. Co., of course, appear as sole defendants. As a matter of fact, however, several other lamp manufacturers have pooled issues with Atwood to test the patents in question, No. 764,396, and design No. 37,301, and are standing together in the matter and will share in the defense.

Fire Never Touched Them.

Fire which on Tuesday night destroyed a frame building owned but not occupied by the International A. & V. Tire Co., Milltown, N. J., led to a report that a portion of that concern's tire plant had been badly damaged. This is not the case, however, as the International factory was not even scorched. The building destroyed was leased and used by wholly different people.

Wanamaker to Move Uptown.

John Wanamaker has felt the necessity of getting into the thick of the uptown business district. Accordingly, on or about May 1 he will take possession of part of the Brewster Building, at Forty-ninth street and Broadway, where his salesroom will be thereafter located, and where, of course, Fords and Premiers will be displayed.

To Continue Darracq Business.

The death of F. A. La Roche, president of the American-Darracq Company, will not interfere with the continuation of the business. Arrangements to that end have been perfected, G. M. McWilliams being now in control of the business affairs of the company.

Boston Show Boomed to the End.

Interest in the Boston Automobile Show continued of the feverish variety until the close on Saturday night last. The average paid attendance was 7,000 per day, excepting, of course, the opening night, when the record-breaking total of 47,500 persons passed through the doors.

There was considerable business done, not only locally, but in a trade way, many agents from Maine, New Hampshire and Vermont, where the season opens later than in any other part of the country, visiting the show to make connections for the year.

Screw Plants Bring Big Prices.

The Standard Screw Co., of Detroit, has purchased the stock of the Hartford Machine Screw Co., Hartford, Conn., and Western Automatic Machine Screw Co., Elyria, Ohio, which latter was a subsidiary of the Hartford Co. Both have been making a number of small parts for the automobile trade. The $100 shares of the Hartford concern, which has been paying dividends of 10 per cent. a month, brought $1,000 per share and of the Elyria plant $285.

Michigan Opens in Kansas City.

The Michigan Automobile Co., Ltd., of Kalamazoo, Mich., are turning out a very handsome car for the use of doctors and others. This is a single seat rig, and is their regular Model D car with tonneau removed. In place of the tonneau there is a shapely box, giving the rear of the car a square effect, which adds much to its appearance.

Waltham to Build Wagons.

The Waltham Mfg. Co. is preparing to go extensively into the production of commercial vehicles. To that end they have recently been acquiring a number of patents covering the several types, among them a gasolene-electric system.

Crompton Sustains Fire Loss.

The Crompton Motor Car Co., Worcester, Mass., which built steam cars on a small scale, was among the sufferers from the fire which wrecked the Crompton Building on Friday last. No estimate of the damage is given.

DEPARTURE IN JACKETING

Philadelphian Strikes Out in New Direction—How he Does it and the Objects Sought.

The cooling problem is one of the most unsettled of all the questions which have arisen, and its ultimate solution for the automobile motor is highly problematical. For a long time the utility of the independent copper water jacket has been recognized by designers, and not a few attempts have been made to perfect its application to a degree which would make possible its general adoption. These efforts have been only partially successful, however, and though some engine builders have experimented to no purpose, others have been better prospered, and are using the principle to advantage, as, for instance, in some of the larger Panhard models and the Pope-Toledo.

The arguments in favor of this method of construction are: that a better cylinder casting is secured than would otherwise be possible, since the form is much less complex, and simpler cores are used, thus making cleaning and inspection easier and more thorough; that the weight of the motor is considerably reduced; that the jackets are easily demounted for cleaning, inspection or repairs; and that the damage resulting from freezing is greatly reduced since the cost of replacing the jacket alone is slight compared to that of renewing the entire cylinder.

It is argued, on the other hand: that it is extremely difficult to secure tight joints between the jacket and cylinder, and that, notwithstanding the reduction in the cost of the cylinder casting alone, the expense of the spun jacket and the difficulties connected with fitting it to the cylinder are so great as to cause a slight increase in the cost of the motor when completed. But, however just the criticism may be, it would seem to a casual observer that an unfavorable attitude toward the system were due quite as much to prejudice and unskilled effort to apply it as to any inherent defect in its theory. For, taken at its face value alone, it seems a long step in advance of the more common practice.

Up to the present time all effort in this

Digitized by Google

line has been concentrated on the independent cylinder arrangement, but there is now being brought out in the Quaker City a quadruple motor of twin cylinder construction, to which the principle has been applied with apparent success.

The cylinders are 4 1-16 by 5 inches, and this, with the normal speed of 900 revolutions per minute, make the rating of twenty horsepower seem perfectly just. The jackets are spun into dome shape and entirely enclose the cylinders and valve pockets. Each is provided with six openings, four for the plugs which cover the valves of the two cylinders, and two for the inlet and exhaust piping which leads to siamesed ports. The metal is beaded over around these openings, and the parts adjacent to them are flanged and screwed into place. The joint at the base of the jacket is made by slipping a cast iron ring of slightly trapezoidal section over the outside and thus forcing the jacket tightly against the main casting. The ring is held in place by screws halved between it and the cylinders. The construction of the pistons, rods and crank is "regular," the latter being lubricated by ring oilers, and the former by splash. The crank case is wholly of aluminum and is in three parts. The upper portion is heavily ribbed, and provided with four supporting arms of channel section; the lower part contains the end bearings of the crank shaft, and is removable without interfering with any of the mechanism, while the front end of both portions is closed by a removable head, which facilitates the dismounting of the cam shafts. The latter are driven by two uninclosed gray fibre gears, meshing with a steel pinion on the crank shaft. They are of sectional structure, the cams being keyed in place, and spaced by means of steel tubes, which are slipped over the end of the shaft. The four bearings in which they run are fitted with large bushings, so that they may be withdrawn bodily from the end of the case, the former remaining in place. They are entirely inclosed in the crank case, and hence get the full benefit of the oil splash. The cam lifts are of hardened steel, without rollers or springs, and work in guides which are bolted to the case; the valves themselves are, as would naturally be expected, opposed and interchangeable.

The gas is supplied by an automatic float feed carburetter having the usual diaphragm regulation, and is controlled by a water governor similar in principle to that employed on certain of this year's Panhard cars, but not at all a derivative of it. The ignition is accomplished by the usual quadruple jump spark system, the internal wipe contact commutator being located at the back a trifle above the top of the cylinders, on a vertical shaft driven from the exhaust shaft.

An article which recently appeared in these columns pointed out the marked advantages of inclosing the several cylinders of a multiple motor in a common water jacket, instead of keeping them entirely separate from one another. For, as was shown, laying aside all purely structural considerations, there would accrue an economy in over all length, since the cylinders could be set more closely together, an increase in jacket capacity without a corresponding increase in outside measurement, and a simpler and more effective arrangement of the circulating system than would otherwise be possible. It was further shown that while such an arrangement would be, in theory at least, as applicable to three or four cylinders as to two, that fickle dame, common practice, had as yet failed to sanction its extension beyond the twin-cylinder formation.

Hence it will be extremely intersting to note the success of this new departure, as its permanent adoption may forecast an ultimate extension of the separate jacket to the multi-unit cylinder construction.

The engine in question is after designs by L. S. Chadwick, and is made by the Fairmount Engineering Co., of which he is president.

Among the Retailers.

A. P. Shumaker will build a garage in the East End, Pittsburg, Pa. It will cost at least $25,000.

Frank A. Sanford, who some two months since secured the metropolitan agency for the Yale car, has finally located himself at No. 1,653 Broadway. It is in the heart of the automobile district.

The Brackett Automobile Co., of Manchester, N. H., has leased the Palace stable building at No. 486 Chestnut street. The floor space is 6,000 square feet, which ought to give them plenty of room.

Articles of incorporation of the Minneapolis (Minn.) Automobile Dealers' Association were filed last week. The capital is placed at $10,000, and E. H. Moulton, H. E. Pence and T. C. Jordan are named as incorporators.

Edward Keller and Floyd Needham have leased the Johnson & Landis garage at Decatur, Ill., and will take over the business of the latter firm. The new concern will be known as the Keller-Needham Automobile Co.

To keep abreast of the times the James Foundry Co., at La Crosse, have taken on automobiles. The James Foundry Co. will sell cars and conduct a garage. The company boasts of the best equipped machine shop in the Middle West.

The Riddell Automobile Co., formerly W. J. Riddell, has been incorporated at Des Moines, Iowa, with $25,000 capital. W. J. Riddell will continue to manage the business as president and treasurer. The firm is located at Nos. 720 and 722 Locust street.

The Essex Automobile Co. is the name of a new concern that will sell, repair and hire automobiles in Newark, N. J. The garage, repair shop and salesroom are located at Nos. 9, 11 and 13 Lombardy street. The company will handle the Ford, Jackson and Premier cars.

The recently organized Iowa Automobile & Supply Co., of Des Moines, Iowa, has leased 11,000 square feet of floor space opposite the Savery Hotel, to be utilized for display, storage and repair purposes. The company has taken the State agency for the Rambler, Marion, Queen, Gale and Acme cars.

Ground has been broken for the garage to be built in Plymouth avenue, Rochester, N. Y., by the United States Automobile Co. The building will be 135x140 feet and will cost $20,000. The company has also built another garage on Park avenue. The latter building is 80x100 feet, and is built with a view of enlargement if necessary, the site being 160x385 feet.

No Damages for Grenfell.

Justice Barnard last Friday instructed the jury in Circuit Court No. 1, at Washington, D. C., to return a verdict for the defendant in the case of William Grenfell against the Washington Electric Vehicle Transportation Co.

The suit was for $10,000 damages for injuries received by the plaintiff in an explosion of gasolene which had been left outside the establishment of the defendant company, and taken therefrom by a number of small boys, who threw it upon Grenfell. The gasolene was ignited by a burning candle in a playhouse used by the boys. The plaintiff contended the automobile firm was careless in letting the boys get hold of the fluid.

Queer Cause of an Explosion.

An explosion of gases, supposedly those of gasolene and sewer gas combined, under the new concrete turntable in the garage of Frank Bull, Wisconsin street, Racine, Wis., one day last week, caused considerable excitement and some little damage. A workman cut a hole in the base at one side of the turntable, and it is thought a spark from the cold chisel ignited a congestion of gases under the floor. The explosion lifted the three-ton block of concrete and steel off its track and hurled it to one side. A new 40 horsepower Pope-Toledo car, which was on the turntable, was considerably damaged. Two workmen were injured, though not seriously.

"E. V." Opens Hartford Salesroom.

For the better accommodation of the public of Hartford and vicinity, the Electric Vehicle Company has opened a commodious down-town salesroom at 372 Asylum street, one block east of Union station. The new quarters are in charge of G. E. Risley and F. E. Dayton, of the sales department. Incidentally, the company's offices at the Laurel street factory have recently been remodeled and a large reception room provided for visitors.

To Sell American Cars in Denmark.

Carl Simonsen, of Simonsen & Nielsen, Copenhagen, Denmark, who has been in this country for the past fortnight, while here secured the agency for an American line of cars. He sails for home to-day.

ANTICS OF A MALCONTENT

Expensive Extremes Employed by a Disgruntled Buyer to Injure a Car's Reputation.

It probably is safe to say that the automobile trade has had more than its share of disgruntled customers. The very nature of the vehicle, coupled with the predisposition of some men to fancy that they "know it all," makes for such a state of affairs; as usually is the case, such men charge their own shortcomings to the car, and the more vicious of the ilk have on occasion resorted to amazing methods to "get even."

Probably the most despicable effort of the sort came to light during the week of the Detroit show.

The disgruntled individual in the case, a Detroiter, had, after visiting the factory, last August, purchased a four cylinder car of reputable Western manufacture.

From the date of purchase until the present the maker's books show a total charge for replacement of parts, and so forth, of $92. They thought no more of the car than of the others they had produced until early in January, when they were astonished by the receipt of a letter demanding an immediate return of the purchase price of the car. The demand was coupled with all manner of dire threats in the event the money was not forthcoming. The answer of the company was prompt and to the point; it was, in fact, that, while they disliked to see any customer of theirs wearing a fool's cap, at the same time, if that was his desire, it was certainly his privilege to do so, so far as they were concerned. The letter wound up with the statement that under no circumstances would they comply with any such demand. They heard no more of the matter until during the Detroit show, when they beheld the car covered with signs reading:

"This is a —— car. A bum machine. Cost me first month for repairs, $369; second month, $289; third month, $186," etc, giving, of course, the name of the machine. The owner had hired an express wagon to tow the car about the streets, and at the same time wrote the company what he had done, and promised to repeat the performance at Chicago during show week, and later on in most of the large cities in the country for a period of sixty days.

No attention was paid to his communication and no attempt whatever made to interfere with his actions. During the week of the Chicago automobile show, however, the company's Chicago agent was called up by telephone and advised that the car was at the depot and would be run about the streets unless some satisfactory arrangement could be made to withdraw it. Savoring strongly as it did of blackmail, the answer of the agent was, in effect, that if the customer would call at his store he would receive satisfaction so warm that he, at least, would not drive that car, or any other, for some days to come.

Little more was heard of the matter, and while it is stated that the car did actually start with the signs in question, it was withdrawn, or at least little was heard or seen of it during the week, its owner evidently having become tired of his job or awakened to a sense of the futility of it.

The Week's Incorporations.

Augusta, Me.—C. O. Q. Automobile Co., under Maine laws, with $500,000 capital. Corporator—I. L. Fairbanks.

Chicago, Ill.—Chicago Automobile Service Co., under Illinois laws, with $10,000 capital. Corporators—Lewis W. Parker, Henry M. Hagan and Charles W. Kefer.

New York City, N. Y.—Multiplex Power Co., under New York laws, with $1,000 capital, to manufacture motors. Corporators—H. Hollmann, C. Weik and L. Storck.

New Orleans, La.—Motor Co., Ltd., under Louisiana laws, with $25,000 capital. Corporators—Bishop C. Perkins, William P. Luck and Thomas S. Witherspoon.

San Antonio, Tex.—Johnson-Schofield Automobile Co., under Texas laws, with $10,000 capital. Corporators—H. E. Johnson, George L. Schofield and Carrie L. Schofield.

Portland, Me.—Autobed Co., under Maine laws, with $50,000 capital, to make automobiles. Corporators and officers—President, H. P. Sweester; secretary and clerk, L. L. Hight.

Westfield, Mass.—Hampden Automobile Co., under Massachusetts laws, with $10,000 capital, to sell automobiles. Corporators—Henry R. Barton, Dr. George H. Jaynes and Myron A. Gilman.

Columbus, Ohio.—Uneedme Tool Co., under Ohio laws, with $5,000 capital, to make tire removing tools. Corporators and officers—President, Joseph Schonthal; vice-president and manager, M. M. Phenice; treasurer, Dr. C. M. Taylor; secretary, Dr. C. A. Howell.

Locks Gasolene Supply Against Meddlers.

Automobile owners and drivers have experienced considerable annoyance at having cars tampered with by unauthorized persons, and various devices have been talked of to lock a car against all but the owner. These have usually taken the form of lock switches on the electric circuit.

Eben J. Hill, jr., superintendent of the Norwalk Iron Works, at Norwalk, Conn., has, however, patented an idea which he thinks will be a valuable addition to every automobile. It is a key lock for the gasolene supply. The lock fits on the side of the gasolene pipe, taking the place of the usual shut-off at the side of the engine.

It is a small brass device, and is turned with a special key, no two keys being alike. One of the features of the arrangement is that the key cannot be taken from the lock until the gasolene supply is entirely shut off. The device is simple, the key being inserted in the lock and the gasolene turned on. The locks are perfectly tight, being tested by gasolene under a pressure of ninety pounds.

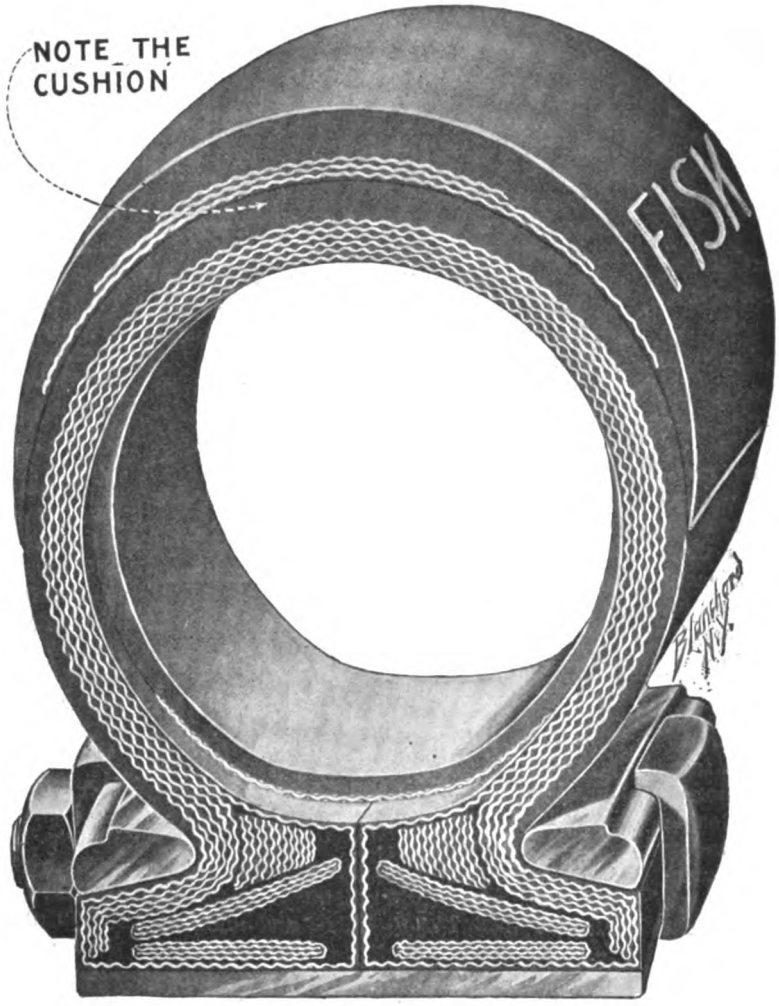
TOOLS THAT "LOSE THEMSELVES"

Petty but Aggravating Evil that Afflicts Garages—The Efforts to Combat it.

A complaint which very frequently comes to the ears of garage owners and repair men is that tools and accessories are lost from machines left in their care. Similar complaints come from chauffeurs, and a counter wail now and then from mechanics who mourn the loss of a pet tool of some sort. These as well as certain most astonishingly irregular results in the monthly account of oils and other supplies which are more or less accessible to all, point to an alarming inability to distinguish the right of property ownership.

It seems at first a trifle strange that a workman would rather take a wrench from the toolbox of the machine upon which he is working than to cross over to his bench and get its counterpart, which happens to be his own personal property. But it is not at all to be wondered at that when the job is finished it should go into his kit, along with the other tools, because it looks like his own and because mechanics are proverbially absentminded in this respect. They are universally shy of tools when they go on a job, and as universally overplenished when they leave. And as they seldom buy for cash the deductions are obvious. As to the chauffeurs, quite the same conditions are to be noticed. They are forever loosing things, tools, parts, gloves, even clothing; yet their stock is never wholly wanting. And it is evident that if the new things have been bought, their wages have not been visibly diminished in consequence.

Now all this points to a condition of petty dishonesty, which, if let go, may ultimately breed a great deal of trouble for the garage man and the owner. But what to do?



Some have tried imposing a fine of $5 in every case in which it is proven that the contents of a car have been tampered with. In some cases the result has been noticeable at once, while in others a disposition to listen to excuses of mitigating circumstances and to deal gently with pet offenders has done more harm than years of rigid enforcement could undo. But, take it on the whole, it would seem that thorough protection of the car owner's rights could only be obtained through hard, well enforced discipline. And as to the trouble between the men themselves, many a foreman has learned by bitter experience that it is best to let all those little bickerings which are essential to the wage earner's life take care of themselves and not attempt to arbitrate between them.

To Take Over Chain Business.

The Diamond Chain & Mfg. Co., Indianapolis, Ind., which was recently incorporated under the laws of that State, will take over the chain manufacturing business of the Federal Mfg. Co., for which purpose it was organized. The negotiations are now being concluded.

The Only Real Automobile Tire.

NOT
MERELY AN ENLARGED BICYCLE TIRE,

but a tire designed, developed and constructed specially for use on automobiles, and supplied with a flat rim (don't overlook that), and a fastening in keeping with the design of the tire. And what is very much to the point, it is a tire and a fastening that have been tried ruthlessly for two years and found not wanting.

If you would know more about it, permit us to mail you a copy of our booklet.

Entered as second-class matter at the New York, N. Y., Post Office, November, 1900.

NEW YORK, MARCH 23, 1905.

Striking at the Overcharge Evil.

One of the very earliest evils which the automobile industry encountered was chargeable directly to those engaged in it; i. e., the practice of charging for a repair job, not according to the work performed, but as much as it was believed the car owner would stand.

This "get-rich-quick" practice is not now so general as once was the case, but it still obtains to an appreciable extent. There are men in the trade who will not see that in adding unnecessarily to the cost of a car's upkeep, they are standing in their own light and creating an undesirable advertisement. They are sacrificing the future for the present. The idea that it "costs a mint" to maintain an automobile is already too prevalent.

While it probably is one of those great questions which time will solve, there are manufacturers who have given it thought and are seeking to hasten the solution. They cannot, of course, control the charges their agents may impose for repair work, but at least one of them lessens greatly, if not entirely, the chance of owners of his cars being "gouged" in the purchase of parts for replacements. Every car that is shipped is accompanied by a booklet cataloguing each separate part and specifying the price thereof. With knowledge that such information is in the possession of his patron, the agent will scarcely dare inflate the price of any part.

Another manufacturer seeks to minimize the overcharge evil by making an almost direct bid for the "overhauling" trade. He is encouraging users of his cars to send them to the factory for overhauling during the winter months, and names a price for the work that makes the encouragement hard to resist. The manufacturer himself prefers to do such work on his cars, and generally, and not unnaturally, the owner would rather have it done at the factory. It assures greater satisfaction all around.

That this state of affairs will not be relished by dealers and repairmen goes without saying. But knowledge that a beginning has been made may serve to bring some of them to their senses and cause them to keep their figures within reasonable bounds.

Defining the Amateur.

Like nearly every one else identified with the organization, the new chairman of the A. A. A. racing board is possessed of the idea that automobiling has brought with it new phases of the amateur definition. As a matter of fact, every side it presents is as old as the hills. The man in the trade ever has been the bugaboo of sport. The men fit to govern any sport do not temporize and do not fear to grapple with him. There are sportsmen in the trade as well as out of it; it does not require a spyglass to locate them. The real professionals are equally conspicuous, or cannot long remain concealed.

There really is no occasion for a complex definition of an amateur. The essence is contained in three clauses: (1) He shall not, directly or indirectly, compete for cash or against professionals; (2) he shall not sell or otherwise realize on his prizes, and (3) he shall not follow racing as a means or partial means of livelihood. If it is desired to make the definition even more comprehensive, it might be added that he shall be the owner of the car which he drives.

It is possible to surround the definition with a mass of "ifs" and "ands" and "buts" and other flubdub, but the spirit of amateurism is contained within and is amply protected by the three simple clauses quoted.

Suppose the principal in an automobile company or the manager of a depot does occasionally engage in competition; it certainly does not imply that his motives are sordid. Any man with half an eye can quickly tell whether such competition is to him a partial means of livelihood. There is small chance that will prove the case, and if he does not race for cash or dispose of his prizes he is as good an amateur sportsman as the millionaire who wanted cash prizes "because automobile racing is an expensive game." There should be no trouble in placing in his proper category the tradesman taken from the bench or ostensibly kept at a bench because of his racing capabilities. "Partial means of livelihood" amply covers his case.

If the men in the trade still constitute a bugaboo, then let the rules require of all of them that they execute affidavits that their racing expenses are not borne, directly or indirectly, in the form of salary, commission or otherwise, by the firm or company of which they are a part or by whom they are employed. By making this exaction general it cannot give offence to any. For the man who would be a perjurer rather than a professional there is no hope, and no law, human or divine, will reach him.

But the crux of the whole matter is that where there's a will there's a way. The way to an amateur definition is easy, and the A. A. A. should cease quibbling and come out into the open. Given the hired man, the money chaser and the professional promoter, there will be no sport for the love of sport unless the men who love it take a stand and draw the line deep and distinct and do so quickly.

Are Governors and Pumps Necessary?

Is the governor a necessity on the automobile engine in its present state of development? The question is practically that of the greater effectiveness of hand or automatic control—which of these, all things considered, is best adapted to give the best service in the long run?

Of course the theory of the governor is correct, and if there were nothing more to it than this a governor would be absolutely essential on every car, otherwise would not the engine run away straight to the scrap heap the moment it was freed from the load?

To what extent the theory has been found to prevail probably may best be illustrated by the fact that of fifty representative American and foreign cars only eleven, or slightly over 20 per cent, were so equipped last year,

Digitized by Google

and changes in this respect in the present year's models have been more with a view to eliminating all surplusage in the way of needless apparatus—a category to which the governor has apparently been relegated by an overwhelming majority vote. Some well known builders on the other side, who have hitherto considered automatic regulation independent of the chauffeur as indispensable, have concurred in the stripping process, and it is no longer a feature of the power plant of their cars.

The automatically governed engine in many instances presents a striking anomaly, for no sooner has its maker decided to prevent it "racing" by a governor than he goes a step further and provides it with an accelerator; nothing more or less than a device to prevent the governor from slowing the engine down so that in all probability when most needed the safeguard would prove inoperative, a system akin to that prevalent in the navy and other government institutions of putting a man to do a certain piece of work, and placing another either so as to hinder the first man as much as possible or undo the result of his labor.

Of the eleven instances in which the device is employed, eight follow steam engine practice by governing the throttle, the majority of this type utilizing centrifugal force in one manner or another; only two govern the ignition, and one employs a patented system of pneumatic governors controlling the entire power plant automatically. Fifty per cent of the first subdivision is represented by cars of foreign make, so that this narrows the number of American cars employing any governing device down to seven in a total of forty-six, or slightly more than 16 per cent. It would hardly seem from this that the governor can be said to constitute a feature of American practice, nor, on the other hand, that the results of four years' experience have shown it to be a necessity in any sense of the word.

Another adjunct the necessity for which is somewhat in question is the circulation pump, but a resumé of present day practice where this is concerned shows its status to be quite the opposite of that of the governor. The pump is overwhelmingly in the majority, but that, of course, does not prove it to be essential by any means.

This may appear at first sight to be blowing hot and cold with the same breath, and applying the force of the argument indicating that the governor is a superfluity in the reverse direction to prove the same of the pump, but a moment's consideration will reveal that there is a distinction with a difference. Because the governor is only used by the minority shows conclusively that it is not indispensable by any means, otherwise there would be many runaway and wrecked engines; but the fact that the thermosiphon system of circulation is only employed by a pitiful few does not go to prove that it is impracticable, but quite the reverse; that if successful in a few instances, with a little study its greater possibilities might be apparent to the majority.

Of the same fifty cars used in the former comparison but three relied on the automatic circulation of the hot water to effect the cooling, and but one of these was an American car. But it is a significant fact that after three seasons' use this feature is still present on this year's models of the last named. Where foreign cars are concerned, the showing in favor of the natural system is considerably more favorable, as out of the entire number of cars shown at the Paris exhibition in December last some 14 per cent were equipped in this manner. Of those using a pump the preponderance here is for the friction drive; on the other side the direct gear drive is largely in the majority.

It may be argued that makers in this country have tried the thermosiphon system of cooling and were compelled to abandon it, but that only goes to prove one thing, and that is that it was not adapted to their particular cars as they were then constituted. Its failure under such circumstances might be indicative of many other things than its own shortcomings, for the efficiency of any part of a system must always depend upon and be corelative to that of its other components. Probably the most patent fact in connection with its co-called failure here is that the average American car does not carry sufficient water to take advantage of it, or, on the other hand, that the area of the radiator is inadequate for use in this connection. It is hardly to be expected that with its inherent limitation of sluggish movement of the liquid this system could carry off the heat fast enough to keep the engine cool without a generous supply of water, and forced circulation is in consequence a necessity where the latter is limited.

Not that it is without its advantages, for a minimum supply of water means eliminating the water tank, and the pump, moreover, is capable of moving obstructions in the piping that would cripple its weaker rival. The question then rests between the water tank and the pump, and with the alarming increase of weights a hundredweight of water is not desirable. Again the improved pump permits of the natural circulation should it fail to perform its functions.

The whole matter, both where the governor and the pump are concerned, narrows itself to a question of simplicity in the engine, and the type that is least burdened with useless complications in the way of non-essential accessories is bound to be the one that will be a thing of beauty and a joy forever—or at least a much greater fraction of that infinity of time than its encumbered rival.

Moulding the Chauffeur.

The chauffeurs' school has come to be an institution of recognized importance, both here and abroad. The need of skilled operators with a known past has brought it about. And its extension will probably bring about a great change in the status of that worthy, who has hitherto made great gain by trading on the impression that his calling was a gift of the gods, dispensed to only a chosen few, and not to be "picked up" or learned except at the expense of a certain mysterious period of servitude at Canstat or Neuilly.

But, aside from the need of skilled, businesslike operators, there is a growing demand for men of superior calibre, who will enter the lower ranks and not only will merit promotion as the business develops, but will be able to stand advancement without going to pieces or becoming too haughty to dwell with their fellow men, and whose training will stand in good stead when such a time comes. For such men there is plenty of work, and work which pays as well as the elementary work in any other line, and which promises better because it is a gamble with rapid advancement.

"For sale.—Up to date automobile, without motor or tires, but otherwise complete; price, $200. Box 750, Binghamton, N. Y."

This is the naive advertisement which really appeared in an American paper within the last month. It is almost too funny to be a real "ad," paid for in good money. "Otherwise complete" is about as alluring as the usual way in which the ancient junk shop on wheels is advertised—"Good as new; only run a million miles."

This has been an unusually dull week in New Jersey. Not a single automobile speedway has been projected or even suggested.

FARSON IS STILL FIGHTING

Chicago's Ordinance is "Oppressive and Idiotic" Says Counsel in Renewing the Attack.

Chicago's automobile ordinances were vigorously attacked before Judge Kohlsaat, in the United States District Court, last week, and at the conclusion of two hours' arguments the jurist declared he would take the case under advisement until the filing, within ten days, of a brief showing whether the court had jurisdiction of the question of granting an injunction against the city in favor of John Farson and 134 other complainants.

Attorney Charles F. Davies appeared for the complainants, having taken the place of Attorney Chester B. Masslich. The latter filed the bill for the injunction, but withdrew from the case. The city was represented by Assistant Corporation Counsel Beckwith.

Attorney Davies directed his batteries at the right of City Electrician Ellicott, Commissioner of Health Reynolds and City Engineer Ericson, the automobile board, to sit as an examining body and pass on the health and disposition of a man wishing to qualify as a chauffeur.

"It would be just as sensible to provide that a man shall not have a corn on the little toe of his right foot because he operates three levers with that foot," said Mr. Davies. "The ordinance does not provide that the board of examiners shall have a physician for one of its members, and if it has not how can a city engineer and electrician pass on the physical condition of a man? There is no examination of this kind for drivers of spirited horses which are on the street continually. I insist that this ordinance is unreasonable, oppressive and idiotic."

"I also want the court to understand," concluded the attorney, "that neither myself nor my clients had anything to do with the automobile case decided by former Judge Haney, which was thrown out of the Appellate Court."

Illinois Strikes at "Road Hogs."

By a vote of 36 to 2 the automobile bill drafted and caused to be introduced by the Chicago Automobile Club passed the Senate on Wednesday of last week.

The bill allows a speed of ten miles in congested districts of cities and towns, fifteen miles an hour in sparsely settled districts and twenty miles an hour on the country roads. The penalty for violation is a fine of $15 for the first offence, $25 for the second offence, with a revocation of the license for fifteen days. A fine of $50 and the revocation of the license for six months is the penalty for the third offence.

Another important clause of the bill is that which provides that vehicles moving slowly shall be obliged to give the right of way to those going at a higher rate of speed. This section is meant especially for farmers who refuse to let cars pass them on the road if they can prevent it. Failure to comply with this provision will cost the unobliging person $25.

Saxe Bill Given Finishing Stroke.

While reported unfavorably by the Senate Committee as the result of the strenuous opposition brought to bear against it by allied automobile interests, the obnoxious Saxe amendment had still to run the gauntlet of the Assembly Committee, which is a very large one.

Accordingly, at the request of the legislation committee of the N. A. A. M., Counsellor Terry went to Albany during the past week to make a further argument against it, and it has since been reported that a large majority of the Assembly committee voted against it, which virtually means its demise. As to the numerous other bills pending, Mr. Terry said that none of them is in a sufficiently advanced state to call for any attention at this session.

Asked about the progress of the test cases regarding the constitutionality of the license and registration laws, the laconic answer was, "Nothing for publication."

Col. Green Gives a Gold Cup.

Colonel E. H. R. Green, the Dallas, Texas, enthusiast, does things in a manner commensurate with his size. His Pope-Toledo car having established the 100-mile track record of 2:06:42 3-5, he is anxious to see it broken. To that end he has offered a gold cup as a perpetual challenge trophy, stipulating only that the first race for the trophy shall occur on the Dallas track. Thereafter the challenged party will be privileged to name the course. To each holder of the gold trophy will be given a replica in silver.

For the Protection of Street Railways.

Representative Lahrens has distinguished himself in Nebraska, or at least he probably thinks he has. This all-wise solon has introduced in the House a bill "For an act to prohibit the operation of automobiles and all other vehicles propelled by steam and gasolene power on or along any public street traversed by electric cars."

"Souvenir" of New York's Railway Strike.

HOW THEY GOT TO BUSINESS ON TIME.

CAN ENTER FREE OF DUTY

Uncle Sam Lifts Ban on Foreign Tourists—Also Issues Ruling on Exchanged Cars.

According to new regulations governing the importation of automobiles for touring purposes, promulgated last week by the Treasury Department, the privilege of bringing in cars free of duty is limited to non-residents of the United States. To do this the owner must get a certificate from the United States Consul at the port of exportation to the effect that the car is for touring purposes only, and that the owner is not in any way connected with the automobile trade. The owner may bring the car with him or it may come thirty days before or after his arrivel in the United States. It cannot be used for business or exhibition purposes, but it may be used for racing or other specific contests.

The new regulations prohibiting such entry to cars owned by those connected with the automobile trade will chiefly affect foreign manufacturers who send racing machines over for the Vanderbilt Cup or the Florida events. Heretofore these cars were allowed to be kept three months in bond after there arrival in this country while being raced.

Considerable difficulty was experienced by tourists to this country under the old ruling. The owner of a car had to place with the appraisers' department a sum of cash equal to the value of the machine, or 45 per cent of the car's value as duty. Before the car was released the owner had to file a bond for double the value of the machine with two sureties. Each of the two sureties had to file a bond for double the amount of the bond, plus the duty on the car.

About three years ago the executive committee of the Automobile Club of America made an application to the Canadian government for permission to have free entry into Canada of all automobiles intended for bona fide touring purposes. The Canadian government granted the application and made a very broad rule in regard to the entering of such cars into that country. That ruling in substance has been adopted by the Secretary of the Treasury.

The new ruling also permits the free entry of an exchanged machine which has not been used abroad a year, provided it is proved and included in the declaration that the exchange was necessary because of defects in the first machine, which must be exchanged for one of the same make, power and cost.

Automobiles to be free of duty as household effects must have been used abroad for a year or more by the owner or members of his family residing with him abroad, and these include father, mother, brothers, or sisters. The period of such use may not have been consecutive or immediately preceding the importation.

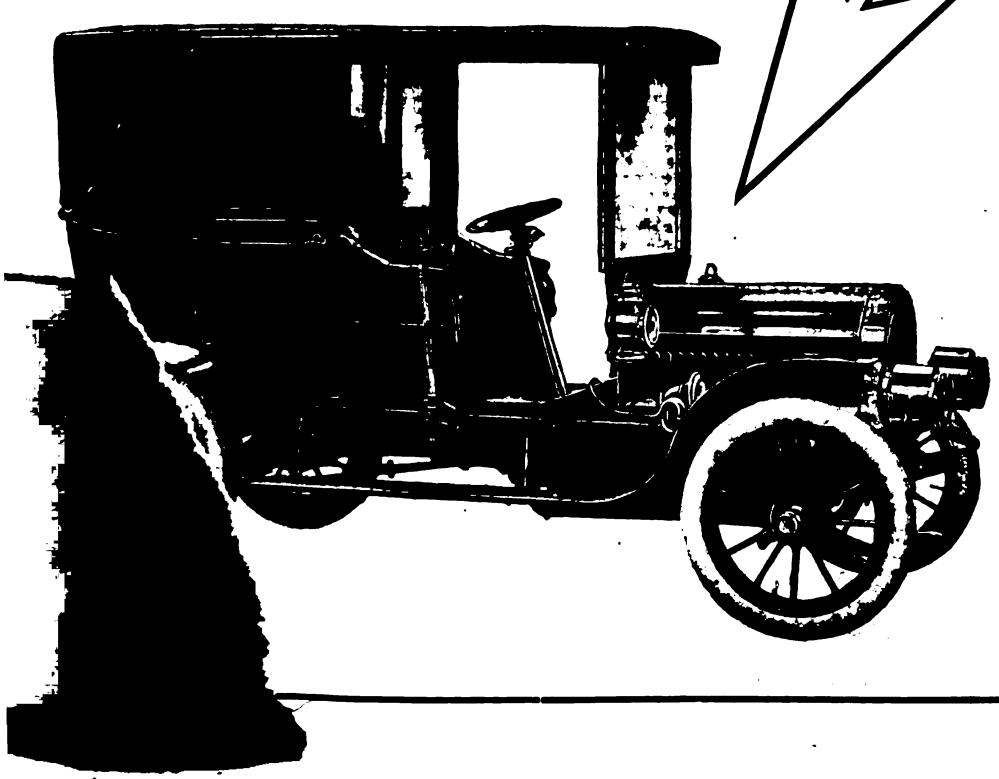
Successful Car Building.

WE are this year standing firmly on the fact that we have built a real car, because we have built a car adapted to American conditions, American roads and the American temperament. We know our American market as no French builder can know it.

We have surmounted the problems of car-building this year as we never surmounted them before, although our progress has been steady and on right lines.



We believe the Pierce car to-day expresses the best that can be had in car-building, and we are willing to abide by the result of actual experiment.

Booklet describing the six 1905 cars of the George N. Pierce Company, with special booklets describing the mechanism of each, will be sent on request.

The George N. Pierce Company,
BUFFALO, NEW YORK.
Manufacturers of Pierce Cycles.

Members of the Association of Licensed Automobile Manufacturers.

The 28-32 horse-power Pierce Great Arrow Landaulet body by J. M. Quinby & Company. **PRICE, $5,000.**

SIFTING THE BILLS

Public Hearing Discloses Unusual Situation in Connecticut and Brings Out Opinions.

Public hearing on the various automobile bills which have been introduced in the Connecticut Legislature this session was held last Friday in the Senate chamber at Hartford.

The hearing attracted a large number of persons, among those who were present being M. Toscan Bennett, representing the National Association of Automobile Manufacturers; Assistant Prosecuting Attorney Harrison B. Freeman, jr., representing the Hartford Automobile Club, and, in his official capacity, Judge James E. Cooper, of New Britain, representing the New Britain Automobile Club; J. Howard Morse, president of the Hartford Automobile Club; Lawyer W. T. Hincks, of Bridgeport; Representative E. A. Smith, of Hartford; Representative Fosdick, and Representative Northrop, of the committee of the Farmers' Association; W. R. C. Corson, Governor Roberts, Highway Commissioner Macdonald, Street Commissioner Angus, ex-Representative Philbrick and a number of individual automobile owners, as well as others interested.

The various measures were taken up in groups; first the petitions for exclusion of automobiles from the country roads; next all registration matters; third, the speed limit bills, and fourth, the light bills.

Of the registration bills, two provide for the retention of old numbers when owners sell one car and get another; a third provides that the law apply to vehicles for hire; a fourth requires manufacturers to have their test cars marked, and a fifth provides for a renewal of registration every year.

Attorney Bennett, representing the National Association of Automobile Manufacturers, and evidently unaware that the association is preparing to attack the laws requiring registration, said the manufacturers are perfectly in accord with the people in the matter and are ready for some sort of registration. It was simply a matter of detail. He agreed to present to the committee a bill that would meet the points. Mr. Bennett said also that the present law enables a locality to require a license from drivers of automobiles than can be hired like public carriages. The impression prevailing now is different.

Assistant Prosecuting Attorney Freeman, of Hartford, showed that there was unanimity for entire registration, and suggested remedies for the testing troubles. The police cannot do anything with the men from two plants in this city as things are, he said. He suggested that placards showing the name of the company be on the cars, and also the initials or name of the drivers. He said the city wants to catch the testers and hasn't been able to for two years. The manufacturers have tried to help, but the men shield each other, and it can't be found who the particular violator is. He wanted initials of drivers to show on the cars, and Attorney Bennett said there could be no objection to that. He could only object to having each man take out a State certificate, for changes in operators are constantly made. Mr. Freeman thought it would be too much red tape to make manufacturers keep records, as livery stables do, of all trips.

The present law provides a speed limit of twelve miles an hour in cities and fifteen miles on country roads, but at no time must the speed be greater than is consistent with safety to life and public property.

Attorney Freeman explained the new bill introduced through Representative E. A. Smith for the Hartford Automobile Club. It provides, he said, that no automobile shall be run at a rate of speed dangerous to life and property, that the speed not exceed fifteen miles in cities and twenty-five in the country. He spoke of prosecutions in Connecticut brought under the present law, and said that after the experience he had had with the law, he, as associate Prosecuting Attorney, concluded he had had enough of it. He went on to tell how one day eight persons had been arrested and convicted for speeding on one avenue here. It turned out that a policeman had been stationed on a certain corner for an hour, and that he had timed all automobiles passing. Nine out of ten violated the law, but by an arbitrary decision only those doing the quarter-mile stretch in less than fifty-five seconds were arrested. He was not for the present law, for we don't want to keep a law that everybody violates.

Since the local raid, he said, the department has refused to prosecute many cases because it appeared the complaints had been made because of spite, even though the persons complained of had actually been violating the law.

Highway Commissioner Macdonald said he had heard and observed a good deal about the use of automobiles on the country roads. If the question of the location of the automobile on the road, as covered by Representative Fosdick's bill, could be taken care of, it would be a good thing. He suggested raising the license fee and turning the money over to his department to keep the roads in order; also having the fines imposed on violators of the road laws turned over to the same department. He advocated limiting the rate of speed at curves on roads, as those were the places where many accidents occur. Representative Fosdick's idea of allowing a good speed on a broad road was good. On other roads he thought the matter would take care of itself. On some highways in the State automobiles, no matter how powerful, couldn't go one mile an hour. Make the speed limit a decent one, he said, and perfect the law year by year as experience shows best. "Give automobilists the same rights and privileges on roads enjoyed by others—no more, no less. Automobiles are here to stay, and in the near future they will be in general use for business as well as pleasure," Mr. Macdonald emphatically concluded.

There were three light bills. One provides that all automobiles must have lights showing from the front, red on one side and white on the other, and vice versa from the rear, only automobiles to have such lights. A second bill provides for lights on all vehicles using the highway from one hour after sundown to one hour before sunrise. The third requires every vehicle on the highway to show from one hour after sunset to one hour before sunrise (but not require between 5 a. m. and 7 p. m. any time) a light or lights visible two hundred feet from front and rear.

After lengthy arguments pro and con on the light question the meeting broke up, having been in session over four hours. The Committee of Public Health and Safety, which has the bills in charge, gave no intimation of which bill it would report favorably, but it is generally thought that the committee will be fair minded enough to advance a measure that will be agreeable to all users of the roads.

Senator Jetton Tries Again.

Senator Jetton, that Tennessee legislator who had what was considered an incurable case of motorphobia, has doubtless been convinced of the error of his ways, as he now comes forward with a measure which indicates some semblance of saneness on the part of its maker.

Jetton's first bill was one which prohibited automobiles from being operated in cities with a population less than 9,000. His next measure was to require each automobilist to deposit a $3,000 bond as indemnity in case of accident. Both bills were thrown out of the committee as worthless. Senator Jetton's latest effort at automobile legislation is a new measure which was introduced in the Senate last week. It provides for the registration of each car with the Secretary of State, on payment of a fee of $2, and an additional fee of $1 must be deposited with the County Clerk of the county in which the automobile owner resides. In case of the sale of a registered car, the new owner is required to pay a fee of but $1 to the Secretary of State and 50 cents to the County Clerk. The bill provides that actions for personal injuries shall be a lien upon the car alleged to have done the damage.

Law now on Montana's Books.

Montana has enacted a State automobile law. It requires that all cars to be registered with the Secretary of State and display the official numbers. It allows a maximum speed limit of twenty miles an hour on country highways, fifteen miles an hour in the residential portion of cities and towns, and ten miles in the business sections. The driver of a car is required to stop the machine when signalled to do so by the driver of a horse, if the animal gives evidence of fright. In case of such a request being made, the chauffeur must assist the owner of the frightened animal in controlling it.

"Doing" Europe in an American Car.

GEORGE H. DAGGETT AND PARTY, OF MINNEAPOLIS, JUST PREVIOUS TO SAILING FOR ITALY.

These Ferries Remain Obstinate.

Despite the passage of the amendment to the Federal statutes permitting automobiles to be run on and off ferryboats under their own power, the Delaware River ferries, plying between Philadelphia and Camden, are giving it no heed. They are still requiring that cars be pushed on and off, taking refuge, of course, in that section of the law which gives "any owner, master, agent, or other person having charge of passenger steam vehicles" the right "to refuse to transport automobile vehicles, tanks of which contain gasolene, naphtha or other dangerous burning liquids."

Rules that Owner, not Car, is Registered.

City Clerk Hinkle, of Milwaukee, Wis., has decided that it is the owner and not the car which is licensed, and for that reason the sale of a car does not include the number. On the written order of the original owner, however, the license will be transferred to the new owner without charge. If the licensee desires, he can transfer his old license to a new car without changing the record at the city hall.

California Club's Big Growth.

The membership of the Automobile Club of California is increasing by leaps and bounds. On January 17 there were 225 members on the roll, while on the first of March the club had over 350 members. All of the members do not, however, own cars, many of them having joined the club from sympathy with the work it is doing for the betterment of roads. Chances of getting the mountain road from Santa Cruz to San Jose opened to automobiles seem to have brightened greatly. The only serious opponent to the arrangement is one of the supervisors of Santa Clara county. It is probable, however, that the offer of the club to make some repairs on part of the road will bring an amicable arrangement much nearer.

The Record Police "Bag."

Eleven hundred and fifty dollars in fines from eighteen owners of automobiles in one day is the record of an English police trap at a spot on the map of the countryside termed Hayward's Heath. Even in their palmiest days the Long Islanders made a poor showing compared with this.

To Race Baldwin's Airship.

E. M. Clinton, a Los Angeles, Cal., automobilist, has made a wager that he can beat the "Capt." Baldwin's new airship in a race from Los Angeles to Santa Barbara. As the airship flies—if it does—the course is 80 miles, while the road which the automobile must run over is 100 miles long. The race will probably take place next month.

Chicago's Racemeet in May.

The Chicago Automobile Club contemplates having three days of racing in the spring, and has accordingly asked for the sanction of the American Automobile Association. The dates of the projected meet have been set for May 27, 29 and 30.

Rockford has a Racing Club.

Automobilists in Rockford, Ill., have formed the Rockford Automobile Racing Club. The following officers were elected: President, N. F. Thompson; secretary, O. W. Johnson; treasurer, Lee Burr. The club has a meet in the "works" for July 4.

ABOUT ENGINEERS GENERALLY

How Some of Them View Themselves and How Automobile Work Compares with their Views.

Whether or not the building and operating of automobiles may be considered in any way as a branch of the engineering profession is somewhat of a question. Engineers, as a rule, love to deal with big problems, problems involving vast outlay of capital, the results of which stand silhouetted against the background of time as great achievements. The technical training which they receive rather tends to induce in them an attitude of scorn toward any but great undertakings. If a well established engineer turns his efforts to the production of a light class of work, as, for instance, the development of labor saving devices or automatic vending machinery, he is looked upon by his brethren as having forsaken the field which tradition has marked out as legitimate engineering.

Yet in baffling intricacy and persistently recurring difficulties this work is a far greater tax upon patience, ingenuity and skill than is the pure engineering whose great dependance is upon precedent.

To say that engineering is not original or that it depends solely on precedent is palpably erroneous; yet no one can deny that the great achievements of the day, the tunnels and bridges and huge buildings that make all the world stand aghast, are but the extended application of principles known and used for years, and hundreds of years, which have been modified to meet the demands of purely local conditions. Steam and electrical engineers are working on newer lines than are either the architectural or civil engineers, but both have now a more or less complete record of past performance for their guidance.

Time was, and that well within the memory of man, in the case of electricity, however, when those who wrought and sweat and struggled to produce the perfect lamp and the perfect motor were looked upon as triflers. To-day some of those very men are known not simply as engineers, but as scientists and benefactors to the world.

To say that the automobile is destined to be crowned with such a measure of success, will become of so great utility to the world and its production of such importance; that the "automobile engineer" will some day take his place by the side of and as of equal rank with him who designs the huge locomotive or the electric streetcar with its sound as of the grinding of coffee; that the captains of the industry and the sly promotors will hobnob with railroad magnates, and "automobiles" be classed with other transportation securities, is perhaps to yield to an idle, rosey dream. And yet the Spaniards say "Quien sabe?" and light another cigarette. And the fact remains, no matter what the future may bring forth, that just now the living present holds for the designer of the motor car, whether it be of hydro-carbon, steam or electric propulsion, whether it be for business or pleasure in its intent, certain problems which are as difficult to solve as any which fix the attention of the executive of a great contracting company. There are bothersome little questions which must be decided on no more substantial basis than the experience of one or two mechanics who insist that such and such a device will not work, when theoretically it cannot fail to do all that is required of it. There are mechanisms to be designed which are without precedent in their use. There are stresses to be calculated on an unknown basis, and loads and strains to be worked out on the vaguest kind of empyrical data. And in a field which is free for all, where the play is fast and furious and the only tribute demanded of a newcomer is in the form of tangible results, is there not an opening for the trained engineer?

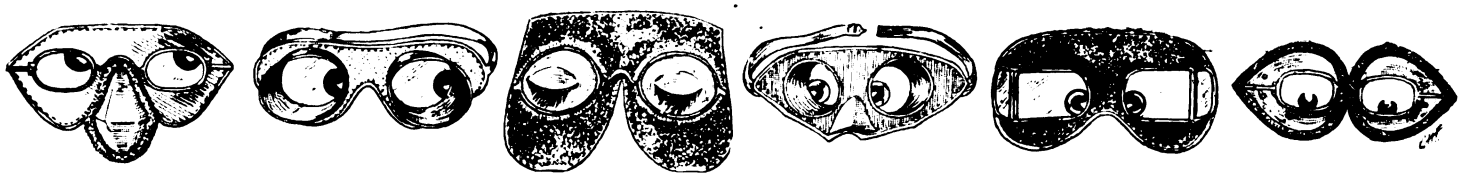
Perhaps the decline of the bicycle industry, which at one time held out very great inducements to the engineer, serves as a check on some who would otherwise join forces with the newer line. They fear a similar ebb tide later. But this fact is as fixed and true as the laws of the Medes and Persians. The bicycle industry in a few short years took what had been a crude child's toy and presented to the world the most beautifully complete mechanism it has ever seen and one which, in lightness, simplicity and smoothness of running rivals anything made before or since. Granted even that the automobile business in its greatest magnitude is to be merely ephemeral—which no one really believes for a minute—it has taken up the matter of shop production, of the interchangeable feature in manufacture and of rapid, accurate machine tool work, just where the other has let it drop, and is carrying it a step further. It is carrying on the experimental education of the industrial world, and if it gets no further will not have existed for naught.

There are a few engineers who have turned their attention to the work with successful results; others are constantly being attracted to it and are joining the ranks one by one. But in all its branches is felt the need of the trained technical man, who will take hold of the work on a scientific basis, who will gather accurate statistics and present them in practical form, and who will overcome the tendency to grasp a dollar to-day regardless of its effects on to-morrow's income, and work for the sake of the work—because of his professional pride. Such men are needed, and until they come from the schools with their crude boyish self-conceit, and turn from other lines with a few years of the leaven of experience to balance the early dreams, the industry will continue to feel their need.

The Fourth Chamber of the Tribunal de la Seine, at Paris, has decided that skidding is no excuse for an accident. In a case in which the tires of an automobile skidded and caused an accident the owner of the car was held to be responsible.

SPARK PLUG IMPROVEMENT

Efforts Making in that Direction and Some of the Recent Creations that have Resulted.



Considerable attention is being paid to the matter of improvement in the spark plug, to judge from the crop of so-called improved plugs heralded all at once by the automobile press on the other side. But, on the whole, as mentioned in the Motor World recently, this highly important essential has not undergone any radical change during the whole course of its existence, and none is noticeable in the alterations under review.

The Germans must be credited with being pioneers in the successful production of a mica insulated plug worthy of the name by adopting the transversely placed layers put together under high pressure. It has been found, however, that even mica fades away before the fierce heat to which the end of the plug is subjected, and at least one such plug has recently been improved by the substitution of a porcelain tip. As this does not receive the full force of shocks of vibrations, it is not open to the objection of frequent breakage which has given the all porcelain plug an unenviable reputation.

The petticoat insulator, universally used for telegraphic and power transmission purposes, is such a common sight that it appears strange that no one has taken advantage of it for the porcelain head of a plug before now. Its function is, of course, similar to that of an umbrella; it prevents moisture from dripping on the pin or support of the insulator and, in the case of a plug, on the core. This is a feature of the Dinin, an English plug, but its advantage is lost if the plug be placed other than vertically. Another feature of the same plug is a mushroom head instead of a sparking point, as ordinarily employed, and in this respect advantage is take of one of the elementary laws of static electricty—that a ball of fire jumps from a ball and only a thin, jagged stream from a point, this being exemplified in the Leyden jar, which is invariably constructed with brass ball terminals, varying in size according to its capacity. The polished surface of this mushroom terminal discourages carbon deposit, and is said to be an effective preventive of sooting. It is supplemented by an arched ground wire, extending completely across it and made fast at each end in the body of the plug.

"Osbolor" is the rather "hifalutin" title of another English plug that has no connection with its construction, as its only claim to distinction is the somewhat doubtful improvement of an extension of the sparking terminals; otherwise it is just the common garden variety of article. The platinum wires are extended an inch or less beyond the end of an ordinary plug, the idea being to produce the spark more toward the cen-

"GOGGLE EYES"

tre of the charge and in consequence to obtain more efficient combustion.

These are some of the important claims made for it: "The gas can be fired in the middle of the combustion space, thus giving a quicker and stronger explosion, the propagation of the latter taking less time than if fired at the top or side of the combustion space. Live gas is ignited instead of the spark occurring in the strata of contaminated gas remaining at the top or directly over the exhaust valve of the cylinder. Any oil vapor which tends to foul the ordinary type of plug collects about the long stem and is led away from the porcelain. The porcelain may readily be cleansed all around owing to the distance at which the points are placed from it."

It is safe to say, however, that this new type of plug has not been accorded any very exhaustive trials in practice, as it would readily develop serious defects, principal among which would most likely be the bending of the points from the concussion of the explosion, followed by dissolution through overheating, unless made of a size that would render the employment of platinum prohibitive owing to its cost.

The magnetic, self-contained, automatic, sparking idea in plugs seems to have just struck England, as the "Firefly" is apparently the first of this class to be put forward there. Probably more than half a dozen of this type has made its appearance in this country within the last three years, but hardly more than one has survived the test of time, and the one remaining in the field bids fair to disappear before long. Theoretically considered, the magnetic plug should solve half the ignition troubles to which an engine is subject, but it falls a long way short of it, and is only another of the very large number of instances of where theory and practice are so far apart that they cannot be reconciled. Doubtless the greatest drawback to its use on the automobile or marine engine is the limitation of the battery because of the plug's excessive current consumption—the magnet winding requiring more than the sparking and the demand upon the cells through this cause not only being more than double the ordinary, but practically constant, as the attraction of the armature and the occurrence of the spark take place in sequence and not simultaneously. Even the most efficient form and method of winding the magnet has not been found sufficient to overcome this, and probably it is the chief reason for its failure to find favor here.

If under such conditions no success has rewarded the efforts of the various inventors who have tried to solve the problem in this manner, how much less so must be the case in the instance under consideration, where the design is that of a solenoid using an attenuated plunger. It would be difficult to create a means of bringing movement about magnetically that is more wasteful of current than this, and where the source of energy is confined to a battery this is an element of prime importance. Numerous other defects have developed in the use of this type of plug here which have been found to render its use of extremely questionable benefit.

The "A. D." plug, used on Panhard cars, has been altered somewhat, but the difference is so slight that the average purchaser would scarcely note it. A change in the porcelain and a slight elongation of the return point, which now extends about one-quarter of its length beyond and alongside of the central sparking point, constitute the improvement which is claimed to make for a cleaner and, on the whole, more serviceable article.

Seeking to Employ Magnetism.

Faith lost in the magnetic clutch has apparently not been sufficient to prove the undoing of this force entirely where the automobile is concerned; it has merely been transferred, for now an attempt is making to prove its adaptability in a slightly different manner, and at the same time to demonstrate that it is superior to existing methods.

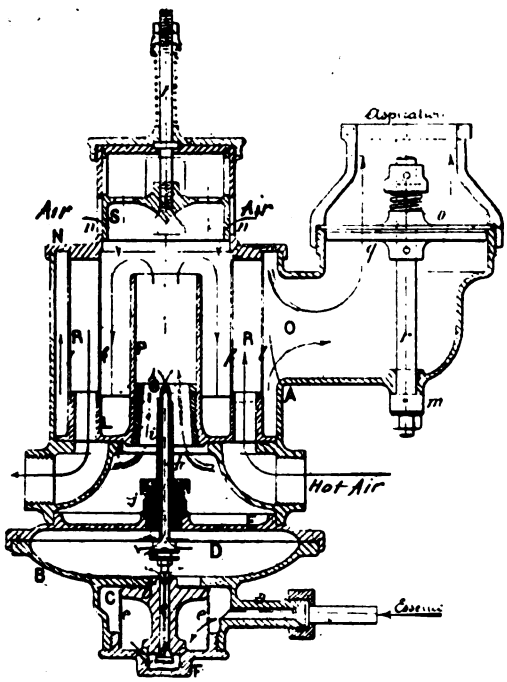
This is exemplified in a car recently produced by Le Societe La Magnetique, of Paris. With the aid of this mysterious force the inventors rely upon eliminating both the clutch and the transmission—truly a consummation devoutly to be wished. To accomplish this a large electro-magnet in the shape of a plate of steel is employed, placed a short distance away from a corresponding steel plate designed to act as an armature. The first plate is recessed to take the winding, and when this is energized by a current from an accumulator or generator provided for the purpose it is calculated that there will be sufficient adherence between the magnet and its armature to prevent any loss of power, and, in short, to provide a direct through drive without the intermediary of a clutch.

The magnet is placed on the end of the engine shaft, and its armature forms the forward end of the first speed shaft—that is, this is one unit of the system, for there is one for each separate speed. The pinions are always in gear, but are free to revolve around the first speed shaft, except when the two plates corresponding to this speed adhere through their actuating magnet being energized, and so on in turn with any speed required—each is practically independent of all the others. With this system the change speed levers are no longer a feature of the car, and it is possible to shift from the third, or high, speed directly to the reverse at a moment's notice, and the operation is not accompanied by any shock or noise, the reverse motion in this case acting as a brake until the car has come to a standstill and started in the opposite direction. It is adapted to be employed either with the cardan shaft or with chains.

Experiments with magnets in large metal working plants in this country, particularly for picking up sheets or other large pieces of steel or iron, have shown the tremendous adhesive power of which a properly designed and energized magnet is capable—so much so that it is safe to say that, all other things working to the maximum efficiency, the engine shaft and the speed shaft should become practically one piece when running. But adhesion which merely means lifting power and adhesion which must resist torsion strains amounting to the whole net output of the engine are widely different things, and whether the same amount of current which is sufficient to energize the magnet in the first instance will do so in the latter is something not to be demonstrated by mathematics.

It is also questionable if the magnetic force while sufficient to maintain adhesion would at the same time suffice to prevent the plates turning, even though they remain intact. As for the amount of power required to develop the requisite current to energize the magnets, this should certainly not exceed that now absorbed by the sliding gear transmission and the clutch, while an ample supply of electric current is never out of place on a car. So far as this goes, the system has everything in its favor, and in its simplicity and ease of manipulation and control holds forth alluring possibilities. Whether they can be materialized or not is another story.

More Horses to be Released.



After making a number of experiments and finding that by using automobiles to deliver baggage it will take just one-quarter the time that it took with horses and trucks, the Detroit (Mich.) Omnibus Co. has decided to abandon the old style of delivering baggage and use automobiles exclusively hereafter. The change will be made as soon as the new cars can be built.

ELIMINATES THE FLOAT

French Carburetter that Departs from the Beaten Path—Its Design and Operation.

Since the float feed principle first proved so well adapted to the needs of the automobile carburetter, its use has become almost universal, and despite the endless stream of patents constantly issuing for improvements on this essential adjunct, very few inventors have devised any other basis as a starting point. A French firm—Theveniu-Sequin, of Lyons—is now, however, marketing a carburetter, which differs radically from any of its predecessors. Primarily, it does away with the float system of regulation, and in its place substitutes the weight of a column of liquid—in other words, hydrostatic pressure.

It is composed of the usual brass cylinder, in this instance slightly longer than ordinary, fitted with annular chambers, a basin for the reception of the gasolene and the necessary outlets for the mixture. A circular metallic diaphragm of 1 mm in thickness, acting under the hydrostatic pressure produced by the column of fuel, performs the office of a regulator and serves to keep the level of the liquid constant. The cylindrical body carries at its lower end the flattened holder B, which is prolonged toward the bottom to accommodate the receptacle C, into which the feed pipe enters.

Across this receptacle C is centrally disposed the part b, pierced at the base by small conduits and centrally by an opening through which passage a fluted trunk extends, terminating at its lower end in a clack valve, d, the seat of which is formed by the lower part of the piece, b. In addition, the trunk, c, carries at its upper extremity a nut, forming an opening between the two collars, ff, the position of which is adjustable. This upper end of c engages a small hole or hollow of the arch in the stirrup-shaped piece, g, which in turn is soldered to the under surface of the diaphragm, D. All these pieces may be readily dismounted without any difficulty.

Around the piece, b, is disposed a cylindrical filter or sieve, e, the purpose of which is to collect any dirt in the fuel. This may be instantly discharged by unscrewing the tap, E. The light brass diaphragm, D, of but 1 m.m. thickness, is pinched around its entire periphery between the edge of the lower part of the reservoir, B, and the edge of the cover, E. In its centre and on the upper side is soldered a tube or adjustment, G. This tube is so placed as to slide freely on another tube, i, screwed to the upper part of the cover, E. The latter is pierced by a hole, through which the small rod, j, may pass and project outward over the side of the tube, i, and on which is supported by a circular enlargement the lever, H, movable by hand from the exterior of the carburetter. The latter is designed to facilitate the priming of the carburetter by lightly shaking the diaphragm, D, in such a manner that it causes the fuel to mount the tube, c, to a convenient height.

The principle on which this system of automatic feed by means of the diaphragm is based is as follows:

Starting with B full of liquid, which raises the adjustment of C to a certain height, the resulting pressure of the column of liquid above the level of the diaphragm is also exerted beneath it, thus holding it in equilibrium and in consequence subject to atmospheric pressure, which is free to act on the upper side of D. After an aspiration of the motor, the column of liquid recedes, this equilibrium is disturbed, and the thin membrane is arched downward under the force of the atmospheric pressure.

Through this movement the rod, c, and with it in turn the clack valve, d, is actuated, so that the liquid under pressure refills B to a point where the column is replenished sufficiently to regain the equilibrium of the diaphragm, and the movement of the latter then shuts off the supply. This arrangement possesses the advantage of not only being extremely sensitive, but also of performing its functions through the medium of a minimum of the lightest possible moving parts, and which do not require a relatively long range of travel in order to effectually shut the clack, d. Moreover, the parts are free from the vibration to which the float of that type is subject, nor are they influenced by the position of the carburetter itself, no matter at what an angle the latter may be placed. It also follows that this principle of regulation—that is, by means of a diaphragm—is adaptable to any carburetter of the constant level order. In order to do this, it is only necessary to join B to the carburetter, of which the usual float feed reservoir is omitted. To this end B must have an outlet provided with a joint.

The body, A, of the carburetter includes an air-intake chamber pierced with a series of holes about its entire periphery, which will be noticed in the sectional view. This air enters the annular chamber and becomes carburetted upon contact with the spray of gasolene issuing from the small orifice, c, while a diffusing tube, P, aids in preparing the mixture. About this diffuser three concentric chambers are disposed.

Two concentric walls, k and l, with the cover, N, combine to form the first annular interior chamber, while the space between P and the partition k comprises the median or second chamber, R R, lying between the walls k and I. The third chamber is formed by the partition k and the inner side of the body of the carburetter A, this last chamber communicating directly with the aspiration outlet, O.

Through the piece, L, two vertical conduits, m, are pierced, thus placing the warm air inlet in direct communication with the median annular chamber. On another part the piece, L, is pierced by a series of radiating conduits, represented on the plan, and serving to place the exterior and interior annular chambers in communication with one another. Through one of these conduits, on the right, for example, enters the gas escaping from the median annular chamber and, traversing it, passes out again on the left.

The carburetted mixture formed by the diffuser, P, descends the interior annular chamber, striking the walls of the median chamber, k, by which it is warmed, passes through the horizontal openings to the outer or third chamber, and here, reascending, is further warmed by contact with the exterior wall of the median chamber, and from here passes to the intake of the motor. On the in-

Digitized by Google

terior of this intake tube is placed a butterfly valve, which permits the quantity of mixture admitted to the motor to be regulated to a nicety.

This valve is composed of a fixed plate, o, pierced with two slits or long openings. This plate is held between the edge of the tube, O, and the portion of the intake tube entering and narrowing toward the top, fitting the tube, O, snugly, on which it is screwed. A movable plate, q, situated directly beneath the fixed plate, o, and mounted on an axle, r, is likewise provided with long apertures, of which the sides have an angular profile, in such a manner that these sides cut the corresponding sides of the openings, p, in the fixed plate, so that even the slightest change in the angle of the mobile plate, q, alters the quantity of mixture and provides an extremely accurate and sensitive means of regulating the amount admitted.

A small spring fastened at one end to the fixed plate, o, and at the other to an extension from the centre of the axle, r, serves to maintain the movable plate, q, against the fixed plate, the adjustment of the former being accomplished through the light lever, m, fixed to the axle, r.

It is also provided with an auxiliary air supply. On the body of the carburetter, A, the lid, N, is surmounted by a cylinder, and the latter is pierced with small openings adapted to be tightly closed. On the interior of this cylinder there is a piston, S, closed at the bottom and also provided with openings, which correspond more or less with those in the wall of the cylinder as the piston drops. The latter is provided with a rod, t, passing through the cover, by means of which it is constantly lifted to the upper part of its cylinder by a small spring.

This spring is very weak and is not set to absolutely counterbalance the weight of the piston, T, the function of which is regulated by its pneumatic character as follows. In proportion to the increase in the depression in the body of the carburetter, the piston, S, lowers owing to the vacuum between the cover and bottom, so that the force exerted upon it tending to replace it in position is equal to the difference in the pressure exerted above and below the piston. But owing to the weak spring, the air re-enters sufficiently slowly so that a perfect vacuum is not produced and the resistance met by the piston, S, in descending diminishes in proportion to its travel, and at the same time the exhaustion beneath it is augmented.

While apparently very complex, this series of operations can better be followed by reference to the sketches showing an elevation and cross section, from which it will be seen that it is much more simple than the description of its working would imply. It is claimed to be much more sensitive and reliable than the float feed type.

Freas C. Hayman, a mail carrier in Santa Barbara, Cal., is trying an automobile as an experiment in mail delivery in that city. Hayman will endeavor to determine the cost of automobile delivery as compared with horse and wagon.

Two Thousand Miles Through Mud and Snow.

Philadelphia had something to look at and talk about last week—a big Thomas Flyer, incrusted an inch deep with the clay and mud of four States so that its original color could not even be guessed. It stood in front of the garage of the Martin & Hart Motor Co., 215 North Broad street, and looked more like a mud scow than anything else. It had just returned from a run of 2,000 miles over the teritory between Philadelphia and Richmond, Va., embracing the roughest roads in the country. Despite its looks, it was in perfect condition and ready for another racking test.

Other tests to which E. L. Hawkins, of the woolen firm of E. R. Hawkins & Co., had submitted the machine convinced him that it could make a trip, hitherto never attempted, over the back roads of the South in winter time. He started a fortnight ago. His business called him away from the beaten path of travel and carried him via Wilmington, Washington and Richmond, but much of the entire trip was made over roads on which the tire of a motor car had never made its mark.

In describing the trip, Mr. Hawkins declared that he does not see how he ever made it. When he passed from the main road for the first time and pushed up a narrow mud trail south of Baltimore he was tempted to turn back. Hardly a mile was traversed before the wheels were sinking deep into the mud. But the Thomas, to the driver's surprise, pushed along serenely. It was only a suggestion of what was to come. The further south the machine went the worse became the roads.

Before Mr. Hawkins reached Richmond the car had ploughed mile after mile with the wheels sunk to the hub in mud and clay. Crossing on the ice over a creek near Richmond, the car broke through, but it forged through the water to the bank, and six horses dragged it uninjured to the level ground. During the entire trip, Mr. Hawkins says, he was not obliged to stop once for repairs.

How Duerr Celebrated the Day.

C. A. Duerr, New York agent for the Royal Motor Car Co., of Cleveland, was about the happiest of the thousands of happy people in New York on St. Patrick's Day, for, like a good Irishman, he celebrated the day right royally by selling two Royal Tourists, one a limousine, to Major C. J. S. Miller, who has attained some prominence in the racing field and who is an enthusiastic and experienced motorist. Major Miller has owned several cars, and that his latest choice should fall to the Royal Tourist is naturally a cause for elation to Mr. Duerr.

Arrested for "Automobile Lottery."

Charles W. Smith, of Bloomfield, N. J., was arrested in Newark last Friday night on the charge of having used the mails to exploit an automobile lottery. The complaint against Smith was sworn out by Anthony Comstock before United States Commissioner Bigelow, on the ground that Smith induced him to participate in the lottery to be "fleeced."

As a Doctor's Car.

The Michigan Automobile Co., Ltd., have established a branch in Kansas City, Mo., under the management of H. D. Clark, Jr. They are located at No. 1319 and No. 1321 East Fifteenth street. This is the store occupied last season by the agent for the Cadillac.

ECONOMY IN RECHARGING

Low First Cost and High Efficiency of Mercury Arc Explained by A. C. A. Lecturer.

Mercury arc rectification of the alternating current for accumulator recharging was the subject of the lecture delivered before the Automobile Club of America on Wednesday evening by Alexander Churchward, who explained the workings and advantages of the apparatus by a demonstration of a standard 30 ampere rectifier in connection with a set of lead cells and an Edison battery.

There are several methods for recharging available to the owner of an electric vehicle who wishes to be independent of the charging station, such as a small gasolene-driven generator, a single phase rotary transformer, a motor-generator set or chemical rectification, but all are open to the objection of requiring constant supervision. Alternating current presents so many advantages for power and lighting purposes, and particularly for long distance transmission, that its use in smaller towns and cities is now almost universal, and recourse must be had to some method of transformation to direct current. But even where the usual 110-volt direct current lighting circuit is available the use of the mercury arc rectifier is an economy in that no external resistance is necessary to cut down the pressure to that required by the battery.

The fact that alternating current is not available for recharging accumulators is probably too well known to call for comment, but the reason therefor is not a matter of such common knowledge, even on the part of many otherwise well informed. Alternating current, as its title implies, alternates in direction, first one way, then the other, the periods or cycles varying in number from 25 to 133 per second. The current supply for storage must flow continuously in one direction from the positive to the negative, thus liberating oxygen and hydrogen, which gases, in turn, combine with the chemical filling of the plates, and in some cases with the electrolyte or acid solution employed. By this means new chemical compounds are created, which in this instance means the storage of energy. These are reconverted to their original constituents by the discharge, so that it will be evident that unless the current flows in one direction, no chemical reaction occurs, and consequently no energy is stored.

The advantages and disadvantages of these various systems as compared with the mercury arc rectifier are as follows: The small direct current generator set run by a gasolene engine is, of course, practical and economical, but requires constant supervision. The next best thing is the motor-genator set —an induction motor on the alternating side direct connected or belted to a small direct current generator. Both this and the engine driven set call for a comparatively large first cost, and in the latter the efficiency at full load is not as high, while on a light load it is very wasteful. Both, likewise, require considerable floor space.

The single phase rotary transformer combines in one frame the alternating current motor and the dynamo of the generating set. It is, however, not so flexible, as the motor side has to run synchronously with the supply circuit, an objection to which the motor-generator set is not open, owing to the use of the induction motor. It, however, calls for a smaller investment in the first instance, and has a much higher efficiency, even at light load. But skilled supervision is necessary in starting, this being done by turning it over as a motor from the direct current side until its revolutions become synchronous with that of the supply—in other words, until it gets "in step" when the alternating current is thrown on. Once running, it does not require any more attention than the motor generator set.

There is still another method, and that is the synchronous or mechanically driven rectifier, and while largely used abroad, it has not become popular here. It consists of a small alternating current motor of the synchronous type, driving a specially constructed commutator to which the alternating current is fed, and from which the direct current is collected. This type of machine is comparatively small, but requires considerable attention, as the brushes collecting the converted or direct current spark badly, and require constant renewals, adjustment and attention. Its efficiency at all loads is, however, high,as compared with the motor-generator set.

The chemical rectifier generally used is either of the Noden cell or a modification of it. Its operation is based on the principle that aluminum and lead, or iron or carbon plates, placed in certain solutions, only permit the flow of current in one direction. The gases generated combine chemically with the solution, and the aluminum plate and a valvular action ensues which allows the current to flow only in one direction. Its advantages are low first cost as compared with any of the above mentioned methods, and small amount of floor space required, but, on the other hand, its action is not uniform or reliable and its efficiency is low under all conditons.

From this it will be seen that the mercury arc rectifier presents the advantages of lower first cost, simplicity and higher efficiency than any of the systems enumerated when used for the purpose for which it is specially designed; that is, recharging in the private garage. Its action is based on a principle analagous to that of the chemical rectifier, that mercury vapor will permit a current to flow in one direction only. The apparatus consists of four important parts, namely, the panel, tube, holder and compensating reactance. On the panel are mounted the necessary instruments for indicating the voltage and amount of current used on the direct current side, as well as the tube holder and all necessary switches, fuses and the like. A lamp is also provided to indicate that the starting resistance is in circuit, so that the latter may not inadvertently be left on after the arc is in operation.

The tube in which the transformation takes place is an exhausted glass vessel containing two anodes connected to the alternating side of the circuit. These are located at each side, a few inches above the bottom of the tube, and a cathode forming the positive of the direct current side at the bottom of the tube on which the mercury rests. There is, further, a small starting anode, the function of which is to form an arc to start the rectifier. This is done by shaking the tube slightly from the top, and this auxiliary anode only remains in operation long enough to start the arc.

The compensating reactance is a most essential part of the apparatus. It is connected directly across the alternating current supply mains and furnishes from this neutral point the negative side of the direct current circuit. Taps are brought out from the reactance to a dial switch mounted on the front of the panel. By means of this switch the amount of current and the voltage may be varied within the limits of the capacity of the rectifier without the use of an external resistance which would tend to reduce the efficiency.

The tube is made of extremely thin glass in order to render the co-efficient of expansion of the latter as nearly as possible equal to that of the platinum contacts, and it is exhausted until the most perfect vacuum obtainable is produced. Owing to the amount of mercury necessary, the tube must be handled with extreme care. At this point the lecturer was interrupted by interrogatories as to the life of the tube and as to how it was possible to transport such a fragile article, owing to the fact that suddenly tilting it would suffice to cause the mercury to crash through the end of it. As to the first, the average life is about 400 hours, although one now in use has lasted 1,500 hours, and they have been known to give continuous service for 2,700 hours. The causes of dissolution are principally careless handling; that is, not of the tube itself, but of the current, such as throwing on the full load suddenly when the tube is very cold. The heat generated in the tube must exceed 360 F., as mercury boils at this point, and it must do so to vaporize. Then, again, after continued service the mercury begins to form an amalgam with the platinum of the contacts, and thus bridges across the tube, preventing the formation of an arc. Or, if overloaded, the glass at the anodes becomes softened through the intense heat, and as owing to the vacuum there is an external pressure of practically fifteen pounds to the square inch, it is forced in and destroys the vacuum.

As to transporting the tubes, while the usual precautions in packing are taken, the admonition, "this side up," is further enforced by placing a glass bulb with colored water in it protruding through the top of

Digitized by Google

the box, and the expressman, fearing acid, keeps it right side up and handles it gingerly.

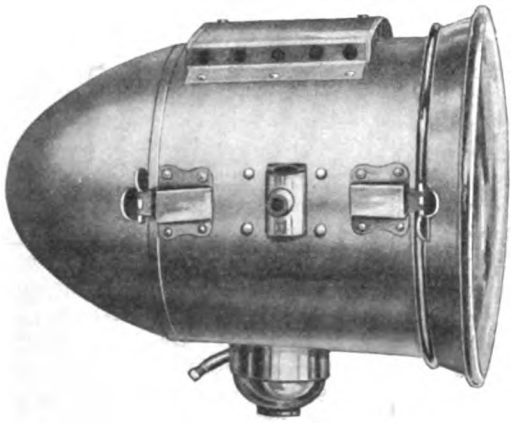
The function of the compensating reactance, which is a winding on a heavy iron core similar to a transformer, is to allow one part of the wave to flow through the tap and prevent the other of alternating wave. A representation of the latter on paper is indicated by a zigzag line, varying in height according to the current, the tops or upper ends of which are termed the peak of the wave and the lower end zero. The transformation process means the elimination of this zero portion or drop in the wave by causing it to overlap the next alternation slightly. The reactance does this, but unless properly built, it will not give satisfactory service.

As it is converted into vapor, the mercury rises into the bulb-shaped enlargement of the upper end of the tube, where it is condensed by the comparative drop in temperature and then flows down the sides of the tube in the shape of metallic mercury.

The standard rectifier has a capacity of 30 amperes at 220 volts, but experiments are now making to build outfits of double this capacity, though as yet they are not ready for the market. It is, however, adapted for use on alternating current at a pressure of 110, 220 or 330, and the direct current can be varied from 16 to 115 volts. When connected to a 220-volt supply the range of voltage on the direct current side will be from 45 to 110 volts. Where a small number of cells are used, the pressure required is between 16 and 45 volts, and to obtain this the 110-volt alternating current has been found most satisfactory.

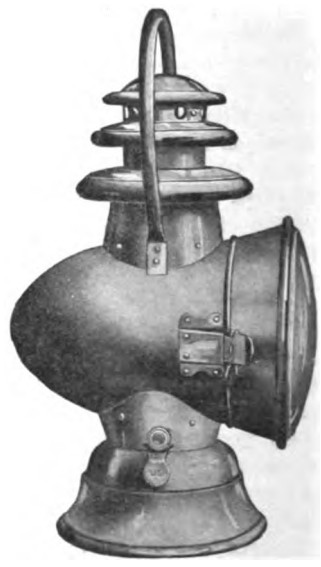
Where reliability is concerned, one of the chief advantages of the system is the possibility of using it for all night charging and of the absence of necessity for supervision, as any unusual drop in the current causes the arc to rupture and back pressure from the battery would do likewise. If an attempt were made to start below the voltage of the battery, the arc wold not form, so that no combination of circumstances could damage the battery. If subject to frequent and violent fluctuations in the supply that would cause the arc to rupture, an automatic restarter in the shape of a magnet and armature to shake the tube is provided.

The efficiency of the rectifier as laid out for charging storage batteries is very high at all working loads. For instance, a 30 ampere rectifier suitable for charging a 44 cell 11 M. V. lead battery would have an efficiency at full load—namely, 30 amperes, 110 volts—of approximately 80 per cent., while a motor generator set of the same capacity and under the same load conditions would have an efficiency of not higher than 62 per cent. If the charge should be of long duration, such as all-night charging, the current would have to be reduced. For instance, for an all-night charge of ten hours, to charge a 44-cell, 11 M. V. battery, the average current should be 16½ amperes at an average voltage of 106 volts. The efficiency of the rectifier under these conditions would be approximately 80 per cent., while the efficiency of the motor generator set for this light load, namely, 16½ amperes at an average voltage of 106, would only be 51 per cent. The efficiency of the chemical rectifier for charging the above battery could not be higher than 50 per cent. at full load conditions.



Winthrop E. Scarritt supplemented the lecturer by stating that in his personal experience with the mercury arc rectifier, he had found that this new "baby of science" was the greatest source of comfort to the owner of an electric vehicle. "To be able to hook her up to the current in the barn before going to bed and get up in the morning knowing that the battery would be fully charged was indeed a convenience," he added.

One Club's Weekly "Show."



The exhibit at the weekly show of the Long Island Automobile Club, in Brooklyn, next Friday night will comprise the well-known Pope cars. The Long Island Club inaugurated the novel method of displaying and having the principles of one or two cars explained each week. The first exhibit took place soon after the New York show, and since then different cars have been shown each week.

Atwood Manufacturing Co.

HIGH GRADE LAMPS.

If you want Bullet-shaped Lamps of the highest grade send to us; we make them and our prices are right. We also have plenty of other styles.

We warrant our Lamps, and will defend anyone using them against any suits that may be brought for alleged infringements.

CONCERNING SPRINGS

Stresses to Which They are Subject Not Generally Appreciated—Some Effects Illustrated.

Now that a goodly amount of success has attended efforts in the production of a reliable motor and its attendants, the carburetter and igniter, tire troubles stand out more prominently than ever as the greatest bete noir of the automobilist. While there is small chance that the air tire ever will be displaced to any appreciable extent, the results of last year's Reliability Trials, in England, have been taken as an instance by an English engineer of the lack of reliability of the "footwear" of the car and an argument in favor of the adoption of the solid tire with better springs to compensate for the shortcomings of the latter.

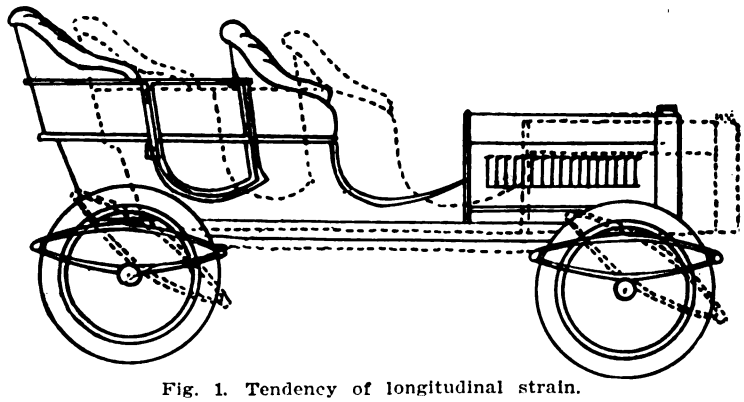

Fig. 1. Tendency of longitudinal strain.

In the trials in question, low-priced cars suffered from tire trouble in 63 instances, and the time spent in the garage from the same cause was 743 minutes for repairs and 123 minutes in pumping. Taking time, the number of accidents and the total mileage, this imports a puncture for every 300 miles, and some minutes' tinkering with the tire in some way or other for every 24 miles driven. In the more expensive cars results were very much more favorable—a total of 26 instances of trouble, or an average of one in 1,340 miles—in the garage, 15, or one in 2,400, with 145 miles traveled for each minute spent on tires in garage.

But this refers to the high-priced cars within the reach of comparatively few and cannot be taken as a basis. The above figures for the lighter cars mean that for every trip of 50 miles the chances are 6 to 1 against covering the distance without delay from this cause. Three thousand miles is said to be the average life of a set of tires in England, and probably it will hold good here as well, and taking their cost as $150 there, it is figured that tire maintenance means 24d., or practically 5 cents a mile—a pretty stiff figure sans the ever present chance of trouble.

Solid tires of generous proportions immediately suggest themselves as a remedy, but it is evident that the car must be built for them, for to apply them to one designed for pneumatic tires is to court certain failure. Even the latter did not prevent smashed springs in several instances in last year's Vanderbilt Cup race. The car of to-day has been perfected on the assumption that nearly half of the spring play will be in the tire, say, 3 inches; this, with the 3 or 4 inches provided by the usual single springs, is ordinarily ample.

But take away the tire springing, for that of the solid tire is inconsiderable, its function being to take up "dither" or, scientifically put, "short vibrations," and failure to compensate for this loss by an increase in the suspension springs,, and the vehicle not only becomes extremely uncomfortable, but shakes itself to pieces. If the average car owner were content with a speed of fifteen miles an hour, the solid tire might be practical and fairly comfortable as well.

This has been demonstrated by a heavy steam car built in England and equipped with solid tires, which behaved, at a speed of twenty miles an hour, very much like the pneumatic in taking irregularities in the road. The same total absence of vibration and shock was noticeable. To accomplish this an elliptical spring with a minimum play of 6 inches and compressed to 50 per cent. of its total capacity by the normal load at all times. That is, the spring unloaded as shown in the sketch would show an opening of 12 inches. This, reduced by the normal load to six inches, resulted in a suspension sensitive to a weight of a few pounds, such as a small dog running about in the body of the car, though the latter weighed 1½ tons.

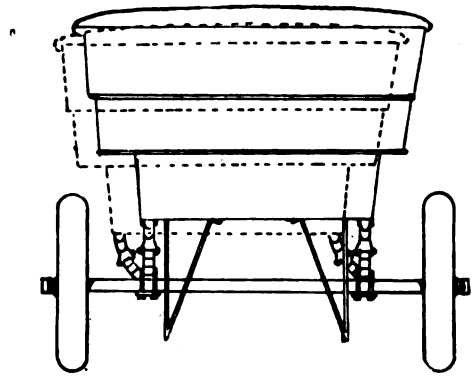

Fig. 2. Tendency of excessive lateral strain.

The theoretically perfect spring should give so readily that in rising over an obstruction the wheel should not lift the vehicle body at all, the axle rising and falling beneath. Practice, of course, does not attain this, but

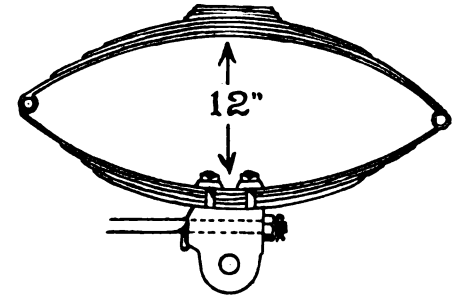

Fig. 3. Opening unloaded and articulation of spring attachment.

the combination of the pneumatic tire and half-loaded spring form a very close approach to it, while the size of the obstruction remains within the absorbing power of the spring.

But the double elliptic springs call forth quite a problem in their application to the automobile. According to all theories, the usual carriage spring attachment should be crippled, either longitudinally or transversely, by the first excessive shock received. The traction effort is solely on the running gear,

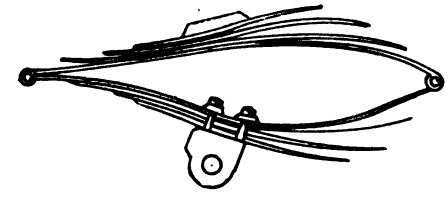

Fig. 4. Collapse from revolving about axle.

and whatever resistance the wheel encounters is resisted by the spring and its attachment unaided. The latter is usually nothing more than a pair of small clamps, top and bottom. The strains to which these small bolts are subjected are tremendous, but they very rarely give way.

It is probable that, so far as crippling longitudinally is concerned—that is, by allowing the axle to run back under the vehicle—that the ordinary attachment would suffice for

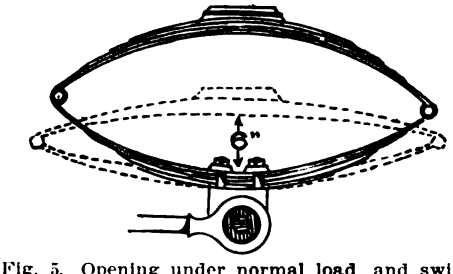

Fig. 5. Opening under normal load, and swivel method of attaching radius rod.

motor work as well, but in the case of transverse stresses the case is quite different.

In the first place, on account of the swing of driving chains, or the alignment of gear shafting, it is not permissible to have any

Digitized by Google

excessive side swing in the body of the car, as compared with its wheels, and in the second place, these side stresses will be infinitely greater in motor than in horse-drawn work. Even if it were possible to take the horse-drawn vehicle straightaway over the road at the same speed as a motor, it would be impossible to take an iron-shod horse around a corner at the same speed that cars are usually driven, and this also limits the speed. Further, the carriage is also iron-shod ordinarily, of which the adhesion on the average road is only 30 per cent. of the weight, while that of the pneumatic tire is 70 per cent., so that the latter results in more than doubling the maximum possible side strains. In view of this, it is necessary to introduce some device corresponding to the horn plates of a locomotive to prevent lateral stress on the springs. Fig. 2.

This might be done by means of vertical rods, dependent from each side of the frame, and located close to the springs, as shown in the sketch illustrating by the dotted lines the deflection caused by side stress where nothing is interposed to prevent it.

To take care of longitudinal stresses is not so difficult. The rear axle, reinforced by radius rods, will take care of itself, but the front axle must be supported. The most common expedient is the reach bar—a device of American origin in universal use to-day on horse-drawn vehicles of many types, but long since relegated to the limbo of antiquated carriage makers' lore, where the automobile is concerned. It consisted simply of one or two wooden struts connecting the rear and front axles, keeping them in alignment. To obviate its use, independent radius rods may be employed on the front axle also, and the result should be a vehicle of great rigidity, both longitudinally and laterally, and at the same time with a great springing capacity.

Fig. 3 illustrates a method of radius rod practice in more or less general use, i. e., articulation of the spring attachment to a live rear axle in order to insure a more even distribution of the weight over the journal. It will be noted that the rod does not point toward the centre of the axle, and that any excessive stress in the direction of its length will be apt to cause the entire axle box to rotate backward around the axle. Sudden braking on the engine shaft, and not on the live axle, has caused this in some instances, and when the axle box goes backward, both parts of the spring come together, resulting in its collapse, somewhat after the manner shown in Figure 4. This, of course, may be obviated by so attaching the radius rod that its axis produced intersects the centre of the rear axle, or, again, to make it swivel about the axle itself, as shown in Figure 5.

Yet another method of provision against this is the form of rigid attachment used on the Milnes-Daimler omnibus. No articulation of the radius end is employed, and its dead end is screwed directly into the axle box, allowing the play of the spring to account for any relative motion of frame and axle and the resulting angular movement of the radius rod. The deflection of the springs in ordinary use would be much greater than any caused by the radius rod.

It must always be borne in mind that a spring settles in use, and one which may show six inches open under load when first put in service will show less in a few days, and after that will not decrease perceptibly. The great secret of comfortable springs is not to have them too strong or too weak, but how to calculate them for a certain weights and conditions is another matter. And it is not only difficult to arrive at without experimenting, but likewise to have a spring maker build such a spring without more definite specifications than merely the service, weight and opening under normal load. The following formula from the Practical Engineer's Pocketbook has been found satisfactory for calculating spring sizes for automobile work, k being 40,000 for single and 20,000 for double springs:

$$d = \frac{l^3}{k\,b\,t^3\,n}$$

n = number of plates.
t = thickness in inches.
b = breadth in inches.
l = total length.
k = about 40,000 for single.
d = deflection in inches per ton.

An extensive automobile service is being organized by the French army administration, for use as convoys. The trains are built after the design of Colonel Renard.

Two Impulses with Every Revolution

THE ONLY SELF STARTING DOUBLE CYLINDER CAR IN THE WORLD.

This is the famous Elmore Pathfinder, which has demonstrated beyond a doubt the superiority of the two-cycle engine over the four-cycle engine. The most significant feature of the American Automobile situation to-day is the complete triumph of this impulse-every-revolution idea, or, with two cylinders, two impulses every revolution, as exemplified in the Elmore. That the Elmore does produce a constant torque; that it does utlize every particle of power and put a stop to waste energy; that it will take the steepest hill or roughest road at high speed, and that it has the most reliable self-starting engine in the world—for each and every one of these claims overwhelming proof has been produced.

The whole trend of expert and popular opinion is rapidly being directed toward the two-cycle engine.

You owe it to yourself to see this car, which will astonish you, not only by its fine appearance, but by its excess power and its extraordinary control on the high speed.

Send for our full line of literature, the booklet illustrating the 6,000-mile trip, our catalogue, explanation of our engine, and the opinions of people who have used our cars, all sent free, or, if you wish, we will send a 10x12 photograph of the Pathfinder on receipt of 10 cents in stamps.

HYDRAULIC CLUTCH

Another Effort to Eliminate the Evil of the Leather-Faced Varieties.

Hydraulic power as a means of overcoming some of the disadvantages inherent in the leather-faced type of cone clutch, now common, have seemingly come in for attention all of a sudden. Prior to the present year the course of development in the entire industry has probably no attempt on record to utilize this power for the purpose, while within the past few months no less than two systems have appeared to claim attention.

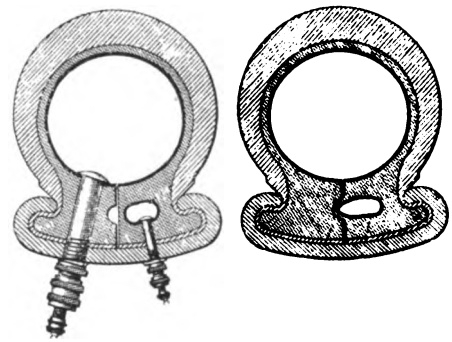
One of these, the Octopus, was described in the Motor World last week. The other, the Sparks-Boothby, likewise of English origin, differs radically from its compeer and possesses features of interest.

It will be noted by a reference to the sketches that in appearance it approximates closely to the ordinary type of leather coned clutch, but no facing is used, and when fully engaged there is no actual metallic contact between the external clutch member attached to the fly wheel and the internal sliding member, as a film of oil remains between the faces regardless of the amount of pressure brought to bear to force the clutch home.

A is the motor fly wheel keyed to crank (M). The casting (B), which forms the equivalent to the female portion of an ordinary clutch, is secured to the fly wheel by studs and nuts, as shown. It is so shaped that it forms a double cone, and is also provided with a stuffing box at H, through which the spindle (G) projects, thus forming an oil-tight case. The male portion (C) is mounted on the spindle (G), and is also stepconed, so that when in position in B, an annular chamber is formed.

Two slots are provided through C, into which two pallets (E) are fitted; these are shaped to fit the annular space, and are provided with rollers at F, which engage with the cam (J), which is mounted on a feather on motor shaft (M). The stop (D) is secured to the casting (B), and fits the annulus formed between B and C. The cam being always relative in position to stop D, positively withdraws the pallets as they approach the stop, and allows them to project again after passing stop (D) (springs not shown). The clutch shaft (G) is provided with a clip and trunnion ring, which is actuated by the clutch pedal in the ordinary way, a spring being used to return the clutch after being disengaged.

The whole of the case formed by casting (B) and fly wheel (A) is filled with oil through filler (K). In action the operations are as follows: Supposing the fly wheel to be revolving and the clutch pedal to be depressed (the gear being in), causing the shaft (G) with C to be moved into the interior of case. No resistance is offered the oil, as a considerable aperture is produced by the coned surfaces moving away from each other; but upon the pedal being gradualy released, this aperture is reduced in size, and resistance is offered between the pallets (E) and the stop (D), thus starting the car in motion. When the centre portion (C) is engaged in B, a joint is made which prevents the oil from escaping, except by the small passage (L), which conducts any pressure produced between stop (D) and pallet (E) to the back of the clutch, holding it firmly in position. The clutch is manufactured by the Gillett Motor Co., and has been exhaustively tested on a 12 horsepower car before being placed on the market.



"Jackrabbit II" is the name of a new racing car now being built by Warren T. Walker, of the Winston & Walker Co., Minneapolis, Minn. "Jackrabbit I" made its appearance last year. It was a two cylinder, 8 horsepower affair, and won in several of the Hamline races. This year's engine will consist of four cylinders capable of developing 40 horsepower.

"The A. B. C. of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price 50 cents. The Goodman Co., 154 Nassau street, New York. ***

TUBELESS TIRE

Misplaced Ingenuity that Avoids the Inner Tube and then Adds Two Valves.

One more of those single tube tires, or, as they are termed on the other side, a "tubeless" tire, is shortly to be placed on the market in England. While the improvement is claimed to relate to the outer cover of the tire and the application of a sealing air tube for the purpose of converting the outer cover in what is generally known as a "tubeless tire," it would seem to be more in the nature of a method of fastening the tire in place by means of the latter device. This will be readily apparent from the sectional drawings showing the deflated tire just placed on the rim and after inflating. Appended is the description of the new invention, which is known as the "Tolson-Holmes Tubeless Tire":

"For this purpose the upper or tread portion of the outer cover or tire has at each lateral edge, extending around the tire or cover, thickened rubber or canvas, or both, of which the cover is composed, so that when the cover or tire is arched and inserted in the rim such thickened edges form a substantial or solid base adapted to approximately fill up the space within the rim.

"Through one thickened edge of the cover and from end to end thereof, an opening is formed through which a small tube is inserted, and in the opposite thickened edge so as to be in alignment with the said tube when the cover is inserted in the rim, is provided a groove or channel.

"After the edges of the cover have been passed into the rim, as shown in Fig. 2, air is pumped through a valve into the small tube, which on inflation forces the rubber on the side thereof nearest the opposing edge of the cover tightly into the recess or channel (as shown in Fig. 1), and thereby makes a perfectly airtight joint between the opposing edges of the cover and seals it up. Air is subsequently pumped through a valve into the interior of the cover or tire to inflate it as pneumatic tires are usually inflated, the inflation of the cover or tire serving still further to seal the joint or joints."

In other words, in the attempt to do away with one tube, the usual inner bladder, another is merely substituted in a different place, thus complicating simplicity and rendering the appellation "tubeless" a contradiction in terms.

Will Issue Big Road Book.

None of the many automobile clubs or organizations having recognized the necessity of an up to date touring guide, the Hartford Rubber Works Co. has stepped into the breach and already has well under way a publication which, for the extent of territory covered and the thoroughness with which the work is done, should not only prove invaluable, but surpasses anything of the kind hitherto attempted.

An advance copy of the work, limited to a few pages, gives an idea of its completeness and the amount of valuable information that the finished volume will contain. This prospectus gives a sample of the maps, all of which have been specially prepared for this purpose, and the book is said to be the first to have this distinction.

Beside reliable maps, detailed lists of hotels, garages and repair men, with the exact limitations of the latter's facilities for emergency work are given. The territory covered extends from Cleveland, on the West, and Washington, on the South, to the Atlantic. Trips to the White Mountains, the Adirondacks and the best routes to Toronto, Montreal and Quebec are also given. It is one of the first works with any pretentions to up to date completeness that has not been compiled from old bicycle road books, and the amount of detail work entailed in its publication will doubtless be appreciated by the large army of tourists who have hitherto struggled in the dark. The price of the completed volume, handsomely bound, will be $2.

Seeks New Trial Because of Prejudice.

"If there is a prejudice against automobile owners," said Attorney James J. Quinn in the Hartford (Conn.) Superior Court on Friday, "that prejudice should be rebuked and jurors should be given to understand that all men, when they come into court, are equal, whether they drive automobiles or farm wagons."

Mr. Quinn asked Judge Edwin B. Gager to set aside the verdict for $200 recently given by the jury in favor of James O'Connor, of Wethersfield, against Sherman W. Freeman, of Hartford. Freeman is an automobile owner, and it was claimed by the plaintiff that one night last July the automobile driven by the defendant collided with his horse and wagon, killing the horse. O'Connor brought suit against Sherman to recover damages.

Mr. Quinn told Judge Gager that he believed the verdict was against the evidence, and he said that during the trial the feeling was rife in the courthouse that his client had a good case and should win, but it was said that he could not possibly do so, as he was an automobile owner, and the verdict of the jury bore out this assertion.

Judge Gager reserved decision.

Claremont and Pomona, two California towns are to be connected by an automobile stage line, under the management of the Automobile Livery Co., Los Angeles, Cal.

Widow of Oldfield's Victim Wants $5000.

Mrs. Ellen Scott, widow of John Scott, who was killed in the automobile accident at St. Louis, August 28, last year, when Barney Oldfield, went through the fence in a ten-mile race, has brought suit for $5,000 damages against George B. Sidener, one of the judges, and the Peerless Motor Car Co.

In her petition Mrs. Scott alleges that the accident was the result of carelessness and negligence on the part of the management, as the track was dusty and not fit for racing. She further states that her husband was employed as watchman on the grounds, and that his duties kept him near the railing where the accident took place.

Miss Ruby Must Pay Her Fine.

Miss Ruby Fullerton, of St. Louis, Mo., must pay the fine which was imposed upon her for driving her car at a greater speed than nine miles an hour in St. Louis county, in violation of an act passed by the General Assembly. An indictment was returned against her by the grand jury at the time, but Miss Fullerton immediately filed a demurrer by her attorney, asking that the indictment be quashed on grounds of unconstitutionality. Judge John W. McElhinney has sustained the indictment, and so that he "may not be misunderstood," as he expresses it, has handed down a written opinion in the case.

No other automobile has been so widely copied as the celebrated Mercedes, built by the Daimler Motoren Gesellschaft, lately of Cannstatt, now of Unterturkheim, Germany. But there is only one complete, authorized duplicate of this splendid machine. It is called the

AMERICAN MERCEDES,

and is built by the

The Week's Patents.

782,369. Acetylene Gas Generator. John S. Thomas, South McAlester, and George Hudson, Blanco, Ind. Ter. Filed July 5, 1904. Serial No. 215,294.

Claim.—1. As an article of manufacture, an acetylene gas generator, comprising a water tank open at the top and closed at the bottom, a submerged floating gas generating tank, open at the bottom and having a perforated top, centrally located and secured in said water tank, a carbid reservoir secured within the gas generating tank, means for holding the carbid reservoir in place, means for applying a downward pressure on the carbid within said reservoir, a cooling chamber having a cone-shaped roof secured within the water tank above the generating tank, condensing pipes connecting the gas generating tank and the cooling chamber, circulating pipes within the water tank for cooling the water therein, a water supplying can for maintaining the water in the water tank at a uniform level, means for securing in and removing the interior parts mentioned from the water tank, a jet pipe for permitting the gas to flow out, and a stopcock for regulating the flow of the gas, substantially as specified.

782,379. Rubber Tires. Clarence H. Bryan, Chicago, Ill. Filed July 28, 1904. Serial No. 218,470.

Claim.—1. The combination of a vehicle wheel with an elastic tire having apertures therein and means to connect the tire with the rim comprising members movable with respect to the rim and adapted to extend into the apertures, such apertures being of sufficient size to permit play between such members and the tire, when the tire is in use.

782,465. Vehicle Wheel. Edward L. Perry, Paterson, N. J. Filed October 5, 1904. Serial No. 227,252.

Claim.—1. A vehicle wheel and a suitable rim therefor, an elastic perforated tire held therein, and a plurality of gripping pins loosely supported upon the rim, and the outer ends engaging the perforation in said tire, substantially as and for the purpose set forth.

782,481. Friction Clutch Power Transmitter. Stockton Borton, Providence, R. I., assignor to Willcox & Gibbs Sewing Machine Company, New York, N. Y., a Corporation of New York. Filed March 23, 1903. Serial No. 149,150.

Claim.—1. In a friction clutch power transmitter, a driven pulley or wheel, a driving pulley or wheel for imparting rotary movement to the driven pulley by frictional contact therewith, bearings for the pulleys comprising a non-rotating shaft and anti-friction balls or analogous means interposed between the shaft and pulleys, a lever adapted to bear at one end against a non-rotating part of the bearings of one pulley to force the pulleys into frictional contact and at its other end to make contact with the driven pulley and act as a brake therefor, and a spring exerting its tension to force the pulleys out of frictional contact and the lever into braking contact with the driven pulley.

782,502. Attachment for Explosive Engines. William B. Hayden, New York, N. Y. Filed February 15, 1904. Serial No. 193,621.

Claim.—1. The combination of an electrical generator, a gearing for operating it, an engine for operating the gearing, a rotatable spring connection between the engine and gearing for operating the latter, said connection operated by the engine and adapted when operated to store up energy, means for discontinuing the operation of the generator and said gearing in advance of the discontinuing of the operation of the engine, thereby storing up energy in said connection, and means to release the generator so as to cause it to be operated by the energy stored in said connection.

782,520. Vehicle. Eugene Pearl, Passaic, N. J. Filed May 16, 1904. Serial No. 208,305.

Claim.—1. In a vehicle, the combination of the frame and body thereof, extensible connections between the body and frame for adjusting one relatively to the other, an individual controlling device for each connection, and operating means common to the several connections.

782,532. Lubricator. Glenn W. Thurston, Chicago, Ill. Filed November 18, 1904. Serial No. 233,382.

Claim.—1. A vacuum-operated lubricator consisting, essentially of an oil reservoir, an adjusting valve therein adapted to control the discharge of the lubricant, a dropper as described, a valve case having two chambers, one of which connects with the oil reservoir and the other with the point of lubrication, a cap closing the latter chamber, a valve in this chamber adapted to open under the influence of a vacuum in said chamber, and means for establishing communication between the two chambers, as set forth.

782,547. Variable Speed Gearing. Bassett M. Coffee, Richmond, Va., assignor of one-fourth to William J. Whitehurst, Richmond, Va. Filed December 31, 1902. Serial No. 137,255.

Claim.—1. A variable-speed gearing, comprising a drive shaft, a drive pinion fixedly secured thereto, a second pinion adjacent the first pinion loosely mounted on the said shaft, a casing loosely mounted on the drive shaft and having cutaway portions, a sprocket wheel axially and fixedly connected to the casing, two sets of planet gears carried by the casing and projecting through the cutaway portion, one set of which meshes with the fixedly-held pinion, the other set meshing with the loosely-held pinion, said planet gears also meshing with each other, a pair of brake rims mounted on the periphery of the casing, each having an internal rack face, one of said rims meshing with one set of planet gears, and the other rim meshing

with the other set of planet gears, a means for braking either one of said rims, substantially as shown and for the purposes described.

782,548. Controller for Automobiles. Edward N. Dickerson, Stovall, N. C. Filed November 1, 1904. Serial No. 230,926.

Claim.—1. In a motor car mechanism, the combination of a release pedal and a throttle and mechanism by which the operator of the release pedal closes the throttle and allows the throttle to be independently set when the release pedal engages the motor with the transmission mechanism of the car, substantially as described.

782,560. Elastic Power Transmission Device. George H. Harris, Stockton, Cal. Filed January 15, 1904. Serial No. 189,088.

Claim.—A device of the character described, consisting of a shaft, a disk loose thereon and having a projecting hub, a second disk fixed to the shaft, said second disk having a concaved channel opposing the adjacent side of the other disk, and said other disk having concavities arranged equidistant on its side with lugs projecting laterally from the ends of said concavities, other lugs projecting laterally from the channel of the first named disk and overlapping and spaced from the first-named lugs, elastic cushions interposed between the lugs, bolts extending through the lugs and cushions, other bolts parallel with the shaft and connecting the two disks, one of said disks having sprocket teeth and the other disk having slots for the second-named bolts whereby one disk is movable axially relative to the other.

782,590. Lubricator. George M. Wolcott and Robert Davidson, Detroit, Mich., assignors to Michigan Lubricator Company, Detroit, Mich., a corporation. Filed May 7, 1904. Serial No. 206,821.

Claim.—1. In a lubricator, the combination with the reservoir, of a sight-feed chamber communicating with the reservoir, there being an oil discharge port leading from said sight-feed chamber and a passageway connecting said oil discharge port with the top of the reservoir, and means for automatically closing the opening of the oil-discharge port into the sight-feed chamber upon the creation of an upward pressure within said port.

782,624. Steam Motor Car. Jean A. Rey and Jean M. B. Rey, Paris, France. Filed March 24, 1903. Serial No. 149,302.

Claim.—1. In a power system, the combination, with a furnace, a boiler, a motor and suitable connections, of a fuel pump, and the furnace, bewd wd wdewd wd dd a ater pump, valves located, respectively, between the fuel pump and the furnace, between the water pump and the boiler and between the boiler and the motor, and means for simultaneously operating said valves.

Veeder

"It's Nice to Know
How Far You Go."
Veeder Odometers.

If some one should set up mile-stones for you on every road you were to travel, you would think it a great thing, wouldn't you? For $10.00 you can have a Veeder Form B odometer (the kind that goes on the steering arm) hat will not only show the miles, but every eighth of a mile and the total mileage of your car as well. For $25.00 youcan have a Veeder Form D odometer right up in front of you on the dashboard, which will show the miles in tenths on two registers at the same time. One of these registers may be set to zero any time, while the other keeps a total record. ***Send for free Catalog.***

THE JONES SPEEDOMETER

The Pioneer of all automobile Speed Indicators. The first *practical* device put on the market. Its basic principle is the law of centrifugal force, unalterable, and unchangeable; insuring perfect accuracy and stability.

In the development of a thoroughly practical Speed Indicator, we experimented with a large variety of devices, employing the principles of hydraulics, pneumatics, magnetism, electricity, etc., but after exhaustive tests discarded them because found lacking in one essential or another.

Theoretical accuracy does not necessarily mean practical accuracy; nor does initial accuracy mean permanent accuracy.

The Jones Speedometer is the only instrument having a dial which can be read at a glance while travelling at high speed.
